In answer to an inquiry made by the Italian Ministry of Agriculture and Commerce as to the necessary expenses incurred by students of law and medicine in the University of Berlin, the *Akademische Revue* publishes the following statements derived from official sources. The cost of matriculation is 18 marks; examination fees in the medical faculty are 242 marks; promotion or graduation fees in the law faculty 355, and in the medical faculty 440 marks; for courses of lectures obligatory in order to pass the "Staatsexamen" and thus be admitted to practice or to hold office under the Government—in the law faculty 400 to 500, and in the medical faculty 900 to 1,200 marks; for printing doctor's dissertation, 150 marks; for the books of a law student 800, of a medical student, including instruments, at least 500 marks. These items would make the expenses of a law student, for fees of all kinds, in round numbers, 1,800 marks, while those of a medical student would be about twice as much. In

Erlangen and Giessen they are estimated respectively at 1,200 and 1,800 marks for a law student, and at 2,200 and 2,500 marks for a medical student, and this is probably the average for other German universities. To this amount must be added the cost of food, lodging, and clothing, making a total of 5,000 marks for a law student during a course of four years, and 7,600 to 8,000 marks for a medical student during a course of four and a half years. The entire expenses of a student of civil engineering during a course of four years are about 6,000 marks; those of a student in the philosophical faculty during a three years' course of study are considerably less. Indigent young men are exempted from fees by presenting a proper certificate from the authorities of their native place, and in some cases are even furnished with a "Freitisch," or free dinner.

At the beginning of the present year there were 16,606 students at the Russian universities, divided as follows: Moscow 3,888, St. Petersburg 2,625, Kiev 2,244, Helsingfors (Finland) 1,875, Dorpat 1,654, Warsaw 1,835, Kharkov 1,200, Kazan 835, Odessa 555, and Tomsk 405.

Hermann Sudermann, whose novels have been found by some to be rather uninteresting reading, but who has some force and vigor as a writer of plays, has just begun a series of little dramas, in one act, in which he proposes to study "how men behave some hours before going to certain death." He has just read some scenes from the first of these dramas at a meeting of representatives of the Berlin press. From a sketch of the play given in the *Tageblatt* one receives an impression which at this distance is less than overwhelming. The play does not come to any real conclusion, nor does it seem to treat with thoroughness the problem which the writer set for himself. But the journalists to whom it was read appear to have been satisfied, and they applauded the reader vigorously.

Lemcke & Buechner send us the first number (for January, 1896) of the *Centralblatt für Anthropologie, Ethnologie und Urgeschichte*; the editor being Dr. G. Buschan, and the German publisher Max Müller at Breslau. It is another of the numerous publications designed to keep specialists in touch with what is being done in their lines, through bibliography and reviews embracing the products of all languages. Each number will also contain a short original contribution. There are 118 signed notices, or *présis*, in this number. These are followed by two reports of anthropological meetings and conventions, a list of lectures announced to be delivered in the high schools of Germany, Austria, and Switzerland, and a *Chronik*.

The *Scottish Geographical Magazine* for February contains an account of the towns of northern Mongolia by Dr. A. Markoff, who was attached to one of those "commercial expeditions which are often dispatched by rich Russian merchants to inquire into the markets of Asia." His forecasts of the future of the trade between this region and Russia are not very encouraging, as Japan, "whose aim is to destroy the foreign trade," is seriously threatening its existence. In view of the danger to "European trade and Christian principles," an alliance is earnestly advocated between Great Britain and Russia—the greatest naval and the greatest military Power—an alliance which would also be "the surest guarantee of European peace." There is also in this number a useful map of the boundary lines of British Guiana.

—Although *Scribner's Magazine* for the current month is by no means a bad number to kill time with, there is—barring discussion of the instalment of Mr. Barrie's "Sentimental Tommy"—little or nothing in it to detain attention or call forth serious comment. Illustration and text are fairly well matched in value throughout, the balance inclining, perhaps, in favor of the former. Carnations, whether "firsts," "extras," or "fancies," or however prettily diversified their grouping, look uncommonly alike in process-pictures, even when these are printed in blue, and it needs an unusually lively interest in their growing and marketing to bear one out to the end of the space allotted them in the letter-press. "Florentine Villas" are, each in particular, a charming subject for either illustrator or writer to dilate upon, yet the chances are many to one that, if passed in summary review, their history or structural features, rather than their peculiar charm, will, as happens here, find a way into picture and page. H. C. Bunner's sketch of "The Lost Child" sets out with a promising flourish of circumstantiality and novelty, but wanes by degrees into a slightness which is not to be covered up by either the general readability of the whole or a final, sentimentally arranged peep at suburban tramping. Miss Mary Cassatt has been given the frontispiece for her "Child Picking Fruit," and William Walton for critic and commentator. For the profit of this number's contents to the reader, it is probably safe to select as foremost Miss Prideaux's bird's-eye view of "French Binders of To-day."

—The secretary of the New York Tenement-house Commission contributes to the *Century* an article on "Stamping out the London Slums" which, in view of the battle royal pending between the base and civilized elements in modern cities, is as interesting as it is instructive. Although Mr. Edward Marshall writes here of the work successfully undertaken by the London County Council in acquiring and rebuilding fifteen acres of plague-spot in the notorious parishes of Bethnal Green and Shoreditch, he is forced to point to the disastrous results which would flow from intrusting such a work to any of our own municipal corporations. His facts and figures, however, are strong appeals to the individual enterprise for which we are fortunately almost as conspicuous as for stupid blundering in our methods of city government. As a matter of business, and leaving out of consideration the saving in poor rates, in the cost of police and health boards, and the unfigurable saving in the morals of a community, sanitary tenements are shown to be a remunerative investment, even when, as in Bethnal Green, a park and generously wide, shaded streets are included in the provisions for outdoor life. In "A Personally Conducted Arrest in Constantinople" F. Hopkinson Smith deals attractively with mosques and Moslems, depicting several of the former in graceful drawings, and describing with humor some characteristics of the latter as he studied them in dragoman and police officer.

—Prof. Woodrow Wilson, besides a brief essay in the *Century* on "An Author's Choice of Company," supplies in *Harper's* an example of the way in which an author may, in his own words, "write himself back to his masters," since both vocabulary and phrasing, in the somewhat freely named paper "Colonel Washington," admit of little doubt what his own immediate choice of company has been while

writing it. In this account of the incipient stages of the French war, the picturesqueness of the novelist so interfuses the precision of the historian that there is often small difficulty in imagining that a posthumous chapter of 'The Virginians,' rejected by George Warrington's literary executors as out of proportion to the rest of his narrative, has at length found its way into the omnivorous contemporary magazine. Except this paper, after subtracting the large proportion of serial matter, there is little of significance in the number. Owen Wister's story "Where Fancy was Bred," though laid in the region of which he has become the interpreter, lacks the stronger features of his delineation of the Western borderland of civilization; somewhat more force, although it is unpleasantly harsh in character, is to be found in the bleak story of "Jane Hubbe's Salvation," by Helen Huntington.

—In the *Atlantic*, John Fiske writes about the brave earliest beginnings of our national life, and Henry Childs Merwin about some of the unforeseen and unprepared-for complications that have arisen from the introduction into it of a single one of the several unassimilated alien elements of population. It is encouraging and stimulating to look with Mr. Fiske, in "A Seminary of Sedition," away from the sorrier aspects of to-day to the time when the last defenders of the London Company's rights in Virginia made their determined stand against King and Privy Council, losing their cause in the mother country, it is true, but passing it on to indomitable younger hands in the colony. Mr. Fiske's sympathetic portraiture of the men, Nicholas Ferrar and his colleagues, who played the last round in the match with King James, imparts to this fresh chapter of history from his pen the vividness of recent events. Mr. Merwin, far from appearing as the antagonist of the Irish, in "The Irish in American Life," does cordial justice to their vivacious Celtic qualities, and forecasts the probable advantages of these qualities in fusion with the more sober Anglo-Saxon basis of the nation. Nevertheless, his summing up on the political side is depressing reading. In this connection it is worth while to remark another of the instances, more and more frequently to be met with, where opportunities of observation in the Old World have produced a frank seceder from the ranks of self-congratulatory patriots who believe we have the best possible conditions of existence, in the best possible world. This time it is Mary Hartwell Catherwood, who, through force of contrast, is reminded by the excellence of the dustless, smooth, ribbon-like "French Roads" of the "indifference of a rich nation to its bestial mire," and of the "bottomless ways" through which we flounder in "open winter or wet summer."

—Those who are interested in the theory of Weismann will not fail to study with the attention that it deserves a paper by Prof. Minot, which appeared first in the *Biologisches Centralblatt*, and then in the *American Naturalist*, and has now been issued as a separate reprint. His theory (which is not here brought forward for the first time) is naturally suggested by the remarkable capacity for the regeneration of lost parts which is common among the lower animals, which exists in man, and which has lately been found to be a property also of unicellular organisms. It follows from this that every cell is furnished in some way with the pattern of the complete or-

ganism, and with the power, more or less complete, to reproduce that pattern when occasion arises. Inheritance is therefore not an isolated phenomenon, and the idea that a continuity of germ plasma is essential to its carrying out is a pure fiction, wholly unsupported by fact. It is not a special substance, but a special condition which any cell may come into, which is the basis of reproduction and regeneration; this condition may be recognized anatomically by the fact that the protoplasm present is small in amount relatively to the size of the nucleus, and also highly undifferentiated. Physiologically such cells are known by the fact that they multiply rapidly. But he who runs as he reads will not find it easy to see why Prof. Minot regards the continuity of the germ plasma as a conception "which we prize so highly" when it is in the hands of Nussbaum (p. 91), and which we should unhesitatingly reject when it is urged by Weismann, nor yet in what way the theory of "panplasm" is fundamentally different from Darwin's theory of pangenesis. The "pattern," which each cell carries with it, it cannot carry in its head; if it is there, there must be some physical substratum for it, and if so, why may it not be called a collection of gemmules? But these are points which no doubt Prof. Minot would very readily be able to make plain.

—Of recent German works descriptive of African exploration and colonization, three deserve special mention. In 'Nama und Damara' (Magdeburg: Baensch) Lieut. H. von François gives a full account of what is known as "German Southwest Africa," including geography, botany, zoölogy, climate, agricultural productions, domestic animals, moral character and intellectual capacity of the native tribes, their religious conceptions and cults, family and social life, political institutions, prevailing customs, and the influence of European civilization. The maps and illustrations are excellent and there is a good index. Oscar Len's 'Wanderungen in Afrika' (Vienna: Litterarische Gesellschaft) is a careful and condensed record of studies and experiences made by the author, now professor in the University of Prague, during extended travels in the dark continent. The first of these expeditions was undertaken in 1874 and the last some ten years ago. The most interesting and instructive chapter for manufacturers and merchants is that on "Geld und Waare in Afrika," while that on "Thierische Kleinarbeit in den Tropen" is a cleverly written and valuable contribution to the important subject discussed by Darwin in his dissertation on worms. There is an impartial and not altogether favorable chapter on missionaries, and another on the Congo State, for the edification and instruction of European colonial politicians. Finally, we have a stately volume, 'Adamana' (Berlin: Reimer), by Dr. Siegfried Passarge, who accompanied, as physician and scientist, the expedition organized and sent out by the "German Cameroon Committee" in 1893-94 and conducted by Von Uechtritz. Although the expedition was undertaken chiefly from political motives, for the purpose of enlarging the sphere of German influence in the countries bordering on Cameroon, the scientific results attained through the energy and ability of Dr. Passarge are alone sufficient to justify the difficult enterprise. The clear and comprehensive manner in which they are presented is also highly commendable. Besides several excellent maps and geological and ethnographical charts, the work contains

twenty-one tables and nearly three hundred illustrations.

—A conspicuous feature of these recent records of African exploration is a more or less hostile attitude to missionary efforts, both Catholic and Protestant. Dr. Passarge is especially fierce in his denunciation of all attempts to diffuse among the negro tribes the Christian religion and even Christian civilization. The timely application of twenty-five lashes with the hippopotamus whip he deems a far better means of education and enlightenment than all the talk of missionaries about equality before God and brotherhood in Christ, which only serves to turn the head of the poor black and to make him an insolent and utterly useless individual. The spread of Islam, however, he regards as highly desirable, and thinks it should be encouraged by the European Powers as a mediating influence between negroes and whites, and an efficient aid to the maintenance of governmental authority. The republic of Liberia he characterizes as the "incredible abortion of philanthropic lunacy." In the German colonies the aborigines should have no opportunity of learning the German language, since this knowledge would bridge the gulf between rulers and subjects and undermine the supremacy of the former. Slavery, or rather serfdom (*Hörigkeit*), he declares to be the proper condition of the African, and that it ought not to be abolished. Slave hunting should be limited and controlled, unless such restraint should prove to be disadvantageous from an economical point of view. German capital is sent to Africa to be productive, and not to be squandered in humanitarian schemes. Dr. Passarge ridicules the German *Frauenvereine* on account of their lively interest in the welfare of their dark sisters. As the chief aim of these associations is to prevent the debauchery of native women by German officials, for which one of these gentlemen was recently tried and dismissed from the service, are we to infer that the author approves of such conduct? That a man of superior culture should in these days advocate such methods of dealing with the lower races is certainly a very strange and anachronistic phenomenon.

DEAN STANLEY'S LETTERS.

Letters and Verses of Arthur Penrhyn Stanley, D.D., between the years 1829 and 1881. Edited by Rowland E. Prothero, M.A., Barrister-at-Law, late Fellow of All Souls College, Oxford, author of 'The Life and Letters of Dean Stanley.' Charles Scribner's Sons. 1895. 8vo, pp. 454.

THE name of Arthur Penrhyn Stanley was once great in the theological world of England, and to a strange degree terrible to the orthodox; but he has left little trace of his influence on thought. In truth, he was not a thinker. He was a Liberal, perhaps a rationalist, but he did not come to definite conclusions. As a religious philosopher he was more dubitative than even his illustrious yoke fellow Jowett. He was not deep in research. He was not an accurate scholar. From want of accuracy his edition of the Epistles to the Corinthians was almost a failure. His Sermons and Essays on the Apostolic Age were saved from failure, not by their value as historical criticism, but by their power of awakening interest and by the graces of his style. His weakness as a scholar was seen when he entered the lists of controversy against a

man like Pusey, truly learned, however irrational and narrow. Stanley's great gift, as was truly said, was his picturesque sensibility. In painting historic characters, scenes, and occasions, he might almost have looked in vain for his peer. Apart from his biography of Arnold, his best work is his 'Sinai and Palestine'; his next best is his work on the 'Eastern Church.' But in historical topography he was always excellent. If he influenced theology, it was not by his theological writings so much as by the humanizing realism with which he treated Scripture characters and events. In this way he may be said to have produced a considerable and lasting effect.

The best letters, accordingly, in this collection are descriptions of historical scenes or of memorable occasions in France, Italy, Spain, Portugal, Egypt, the Holy Land, Asia Minor, Constantinople, Athos, Scotland, Sweden, and Russia. The description of Carnac is particularly vivid and impressive. Full of interest are all the notes of travel in Palestine, with the topography of which Stanley was so familiar beforehand from his studies that he was able to guide his guides. Here, as in the 'Sinai and Palestine,' he is curiously uncritical, and devoutly traces the locality of events which science has long since consigned to the region of myths. If he was a rationalist in religion, in sacred topography he was none. He fully believes that he has identified the spot at which Abraham parted with Lot, and we almost expect to find that he has identified the pillar of salt. About the scene of Jacob's rest, Jacob's well, or the graves of the Patriarchs, he has no sceptical misgivings, and he stops short only at the graves of Seth and Noah. He is the Boswell of historical topography, and distances all competitors by his unique possession of gifts somewhat akin to those of the unapproachable biographer. He describes occasions not less vividly and sympathetically than scenes: witness his descriptions in this volume of the All Saints' service in the Sistine Chapel and the "Doseh," or festival of the nativity of Mehomet, at Cairo. Catholic and Mahometan specimens are equally welcome to his ecclesiastical and historical museum. Stanley it was who discovered Ammergau.

Not all the fleas and robbers of Asia Minor could deter the enthusiast from going to the theatre at Ephesus where the worshippers of Diana shouted against Paul. Not all the risks of a revolutionary crisis could deter him from making his way to Paris in 1848. In the outward signs of difference he was rather disappointed, though he saw tricolors and trees of liberty everywhere, Gardes Mobiles in their white blouses shouldering muskets which they seemed too young to bear, and the windows of the Tuilleries occupied by patriots in red nightcaps under the glitter of royal chandeliers, as well as shot-marks and other traces of the conflict. Inquiring into opinion, he found much misgiving about the Republic and a general feeling that it would be transient. His hero was Lamartine—a weak hero, as events showed. He had interviews with Guizot, whom he found inclined, if events had not been so serious, to sit down and laugh over the follies of the people. Stanley remarks that a statesman had little chance of exercising influence over a people whose follies he did not share. Had he said "whose follies he did not affect to share," the remark would have been true.

Arnold, of course, appears. His influence over Stanley never ceased even after his death. Those who heard Arnold's inaugural lecture at

Oxford can witness to the truth of the following:

"Imagine that beautiful building [the Sheldonian Theatre] with the whole of the area and the whole of the lower gallery completely filled; the Vice-Chancellor in state; the Professor himself distinguished from the rest by his full red doctoral robes. It was certainly one of the most glorious days of my life. To listen once more to that clear, manly voice in the relation of a pupil to a teacher, to feel that one of the most important professorships was filled by a man with genius and energy capable of discharging its duties, to see him standing in his proper place at last and receiving the homage of the assembled university, was most striking and most touching. The lecture lasted just an hour. It was listened to with the deepest attention, and began and closed with a burst of general applause. I will not describe it because it is to be printed; but every one seemed perfectly satisfied. The most cautious man in Oxford was heard to break into an enthusiastic declaration that the two ideas which the sight of Arnold always, and especially on that day, suggested, were the ideas of truth and power."

To feel the full force of this we must remember that Arnold's name was the bugbear of High Church Oxford, so that the impressiveness of the homage was doubled by its being an involuntary tribute to a hero. A true Christian hero Arnold was, in his death as through his life. The account in this volume of his death is very touching. He died of *angina pectoris* in great pain. "Mary," he said to his wife, "I feel that God has been very good in sending me this chastisement. I felt such a rush of love towards God for the last two or three days." There is something in Arnold's deathbed which recalls, though remotely, the deathbed of Cromwell.

A very curious passage in Stanley's life is his intercourse with Jenny Lind, his adoration for whom seems to have gone the utmost length of purely Platonic love. This was the more remarkable, as her singing made no impression on him, he being, like Johnson, devoid of an ear for music. "Jenny Lind's arrival at Norwich," he says, "made a sensation not inferior to that made by the arrival of the Queen at Cambridge. But it was nothing compared with Jenny herself."

"However, all this, interesting as it was, was nothing compared with the interest of Jenny Lind herself. Her first appearance, except for its extreme simplicity and retiring bashfulness, is very plain and homely, much more so than you would suppose from the portraits of her. She was very much fatigued, and spoke but little at first, and was altogether so much occupied in preparing for the concert that the first day we saw but little of her. It was her appearance at the concert that first showed her extraordinary powers—I do not say of singing, for that produced no impression upon me—but of the fascination of her manner, of her attitude, of her curtsies, above all of her wonderful smile; and although this was all through most conspicuous in the animation of singing, yet it was to be seen more or less always when she became more familiar with us, and when we saw more of her. If I were to fix on the one epithet which characterizes her I should say it was *gifted*. Of course it is not often that one sees any one possessed with what is obviously a gift, and with all the circumstances of extreme delicacy and sensibility of organization corresponding; but it is still more rare to see any one possessed with such a perfect consciousness that it is a gift—not her own, but given her by God. Hence the deep conviction of responsibility, of duty of using it for the good of others; hence the great humility. Conceive a young girl having now for ten years lived in this whirlwind of enthusiasm and applause, and yet apparently not in the least spoiled by it, but always retiring to the lowest place, like a servant or a child. At the same time there were a dignity and resolution about her by which one could easily see at what an immeasurable distance all the rest

would be kept which must be otherwise constantly in her way. 'C'est un don, pas un mérite'; and when my mother spoke to her, on the last day, of her hope that, after having now successfully overcome the difficulties of ten years, she was for the future safe, 'Par la grâce de Dieu,' she said, 'oui.'

In the United States Stanley, notwithstanding some misgivings, had a good time, found the hotels not bad and the society pleasant. He met the notabilities, Winthrop, Phillips Brooks, Longfellow, Endicott, and others, and saw the historical places. He also studied American history for the first time in his life enough to be able to tell the meanings of Democrat and Republican. "Democrat," he informs his sister, "is Liberal, and Republican is Conservative; and, at the time of the war, Democrat was for slavery and Republican against it." He was particularly struck by some speeches which he heard at Salem, in which the political follies and corruptions of the United States were denounced with a vigor that he would have thought impossible, amidst a profound attention which seemed to him even more significant than the burst of enthusiasm. It is singular that the sight of the free-church system operating perfectly well in the United States should have had no effect in curing him of the inveterate establishmentarianism which he inherited from Arnold, though both of them were latitudinarians, and which he carried to the length of half-sympathizing with a persecuting establishmentarian like "bloody Mackenzie." In America he might have seen the churches living peacefully side by side, and even co-operating in good works, without the state control which he apparently believed to be indispensable not only to harmony but to order, though in his own country it was too plainly leading not only to unseemly litigation, but sometimes to indecent strife.

Stanley's Life having already appeared, Mr. Prothero and his coadjutors have judiciously given the greatest space in this volume to letters of general interest. Yet there is enough to recall to the minds of the few survivors of Stanley's circle his personal loveliness and social charms. If any one could have effectually poured oil on the waters of theological strife, Stanley would have done it; but the waves were running too high. In fact, his own indifference to dogmatic (if not to definite) conviction led him to underrate the value set upon it by others. Nor could he understand the natural alarm of Protestants at the attempt of Newman and his followers to convert a national establishment into an engine for restoring the dominion of the priest. At length he was himself, as a leading Liberal, inevitably drawn into the fray, in which he fought as hard as the rest, though always like a Christian and a gentleman.

Stanley's "Gipsies" is the best of all the Oxford prize poems, Heber's "Palestine" not excepted; but the specimens of his later poems included in this volume, while they show his grace and feeling, do not fulfil the early promise.

RECENT POETRY.

EMERSON once wrote to a youth who had daringly submitted some verses to him for the last volume of the *Dial*, "They have truth and earnestness, and a happier hour may add that external perfection which can neither be commanded nor described." The perpetual conundrum, What constitutes a good poem or determines which poem should be called good? never came nearer solution than by this seemingly vague formula. The merit which constitutes

it can neither be commanded nor described. Mr. Stedman may select well among his Victorian poets, or even criticise well; but when he gives a course of lectures to enunciate the positive laws of poetry, he succeeds no better than the rest. Even the laws of painting and sculpture are far less elusive. The much derided defence of the ignorant, "I know what pleases me," becomes, when sublimated, the essence of most of the criticism of the wise. "Toute discussion littéraire revient à ceci; j'ai plus de goût que vous." How can the critics be expected to agree about the poets when the poets do not agree among themselves? How can the critics assign their position when the poets cannot? Southey ranked his 'Madoc' with the 'Odyssey' and 'Coriolanus,' and thought that his poetry was to that of Wordsworth as turtle soup to "sparagass with plain butter." Matthew Arnold, in his letters, assigns himself a place between Tennyson and Browning, with certain advantages over either. Even in his judgment, of individual poems, the author's preference usually traverses that of the public or of the critics. Dr. Emerson tells us that his father was with difficulty induced to retain in his volume those fine early verses, "Goodbye, proud world; I'm going home"; and Whitman looked askance at his one poem which comes nearest to a classic, "O Captain! my Captain!" and did not like to be asked to copy it; it doubtless seemed to him too much of a concession to the ordinary laws of metre and rhythm.

All this is worth remembering in presence of a row of new volumes of verse, when we consider how much each meant to the author, and what a different thing it may represent to the reader. In William Watson's new volume, for instance, 'The Father of the Forest, and Other Poems' (Chicago: Stone & Kimball), American readers will note chiefly the courageous sonnet in which he called England to account for the forsaking of Armenia (p. 45)—a sonnet which lost him the laureateship, as an apocryphal rumor said, and thereby forfeited for him the honor of singing the glory of the Jameson raid. Yet the rest of the thin volume offers little to vindicate the early hopes which Watson created and which were enhanced perhaps by his period of illness; and the final Apologia shows a morbid consciousness rather than that simple joy of living which a chaste and healthy-minded young poet should feel.

A new English poet, C. W. Daimon, in his 'Song Favours' (London: John Lane; Chicago: Way & Williams), has a good deal of the flavor of his immediate sect, and also of that which belongs, ever welcome, to English country lanes. But he also has a stroke that must rather astonish Americans when, in celebrating young English poets, "The Sussex Muse" mentions Richard Realf, and thus curiously mistakes his position (p. 55):

"Realf I loved too, and fondly hoped that he
Would sing for me alone, and in my name
Please all the world, but very soon he left
My arms to go and seek another fame;
Leaving me of my latest bard bereft.
Still, he is dear to me,
And I was proud, when in America,
He struck for liberty with old John Brown,
Fighting beside him when he took the town
Of Harper's Ferry, in Virginia."

The peculiar inappropriateness of this appears to be that Richard Realf was not with Brown at Harper's Ferry.

The endless love of variety which marks Mr. Andrew Lang has now brought back to light one of the most utterly frightful books that ever appeared in print and then dropped out of it. 'The Death-Wake, or Lunacy, a Necromant in Three Chimeras,' by Thomas T. Stoddart (London: John Lane; Chicago: Way

& Williams), was first printed in 1830, and is now reprinted as a tribute to a man who combined the merits of being a Scotchman, a man of genius, and an angler. The power of the book in its phrasing and cadences is perfectly undeniable. It is curious to note how prolific Scotland has been in men of genius *manqués*, each of them *imperii capax nisi imperisset*, just falling short of the crown. Stoddart belonged to this class, as clearly as did the Sydney Dobell and Alexander Smith of a later day; and Mr. Lang's critics would perhaps predict that another name might yet be added to the list. The story itself has, as the editor himself points out, 'leprosy and lunacy' enough; and Professor Wilson rated it, on its first appearance, somewhere between "the weakest of Shelley and the strongest of Barry Cornwall," although the analogy to this last author is not clearly manifest. Those who were brought up on *Graham's Magazine* may remember this fearful poem as audaciously reprinted by Louis Fitzgerald Tassiro, under his own name, in that magazine for January, 1843 (and following), with the title "Agathè, a Necromant"; the theft being discovered by Poe, who condemned it, while praising the poem, although it beat him in his own line of horrors.

Whatever may be said for good or evil about the various men whose poems emanate from the Bodley Head, there can be no doubt whatever about the high quality of the women. 'Vespertilia' (London and Chicago) offers no ballads of such extraordinary power as those printed in 'The Bird Bride' under the name of Graham R. Tomson—although "The Wrecker of Priest's Cove" comes near them; but the new book has the special quality which it shares with 'A Summer Night,' by the same author—that of making the London streets thoroughly and essentially poetical. This, for instance (p. 43):

NOCTURN.

O the long, long street and the sweet
Sense of the night, of the Spring!
Lamps in a glittering string,
Pointing a path for our feet.

Pointing and beckoning—where?
Far out of thought, out of view,
Deep through the dusk and the dew:
What but seems possible there!

O the dark Spring night and the bright
Glim of the lamps in the street!
Strange is their summons, and sweet,
O my beloved, to-night!

This lady inscribes her volume "to Alice Meynell"—formerly Alice Thompson—and the latter, also from the Bodley Head, issues a reprint of her remarkable early volume 'Pre-ludes,' with some additions and subtractions, under the general name of 'Poems' (London: John Lane; Boston: Copeland & Day). The two poems that drew especial attention to her on their earlier publication are both here. Rossetti pronounced her "Renunciation" to be one of the three most perfect sonnets ever written by a woman. It has, however, been quoted so often that we will cite by preference the beginning and end of what Mr. Ruskin called, with some exuberance, "that perfectly heavenly 'Letter of a Girl to Her Own Old Age'"—a conception so wholly imaginative and tender as to recall some of the verses of that unique and fascinating child of genius, the Ellen Hooper of the old Emersonian days—she who wrote "I slept, and dreamed that life was Beauty." The English poem runs thus (placed with an appropriateness, perhaps accidental, on pp. 17-20):

A LETTER FROM A GIRL TO HER OWN OLD AGE.

Listen, and when thy hand this paper presses,
O time-worn woman, think of her who blesses
What thy thin fingers touch, with her carcases.

O mother, for the weight of years that break thee!
O daughter, for slow time must yet awake thee,
And from the changes of my heart must make thee.

O fainting traveller, morn is gray in heaven.
Dost thou remember how the clouds were driven?
And are they calm about the fall of even?

Pause near the ending of thy long migration,
For this one sudden hour of desolation
Appeals to one hour of thy meditation.

Suffer, O silent one, that I remind thee
Of the great hills that stormed the sky behind thee,
Of the wild winds of power that have resigned thee.

Know that the mournful plain where thou must wander
Is but a gray and silent world, but ponder
The misty mountains of the morning yonder.

Oh, hush: oh, hush! Thy tears my words are steeping.
Oh, hush, hush, hush! So full, the fount of weeping?
Poor eyes, so quickly moved, so near to sleeping?

Pardon the girl: such strange desires beset her.
Poor woman, lay aside the mournful letter
That breaks thy heart; the one who wrote, forget her.

'Be one who now thy faded features guess,
With filial fingers thy gray hair caresses,
With morning tears thy mournful twilight blesses.

'Fleet Street Eclogues,' by John Davidson (Dodd, Mead & Co.), is a reprint of a book first published two years ago; and it now comes to us in a form so simple and attractive externally, with such quiet distinction of paper, typography, and presswork, as instantly to suggest to the prejudiced mind a London origin, until a further glance reveals the imprint, now quite as trustworthy, of the University Press at Cambridge, Mass. The poetry itself has a more disappointing London flavor—that slipshod and whimsical handling now so common there. Yet the conception is good enough—a long series of conversations, on or before holidays, among a group of young journalists, some longing for the country, some bound relentlessly on toil. Here and there are charming bits of wayside landscape, like this (p. 107):

"Brian—Who has been out of London?
East—Once in June
Upstreams I went to hear the summer tune
The birds sing at Long Ditton in a vale
Sacred to him who wrote his own heart's tale.
Of singing birds that hollow is the haunt:
Never was such a place for singing in!
The valley overflows with song and chaunt,
And brimming echoes spill the pleasant din.
High in the oak trees where the fresh leaves sprout,
The blackbirds with their oboe voices make
The sweetest broken music all about
The beauty of the day for beauty's sake."

Then we slip into such sing-song as follows, which is at least interesting to Americans (p. 64):

"Sandy—And when the soul of England slept—
East—St. George for foolish England then!
Sandy—Lo! Washington and Lincoln kept
America for Englishmen!
East—Hurrah! The English people reigns
Across the wide Atlantic flood!
It could not bind itself in chains!
For Yankee blood is English blood!"

Another admirable piece of typography from the Cambridge University Press is 'Esther, A Young Man's Tragedy: together with the Love Sonnets of Proteus,' by Wilfred Scawen Blunt (Boston: Copeland). There are no love-sonnets in the English language, since Shakespeare—not even Rossetti's—finer, profounder, or of nobler cadence than some of these by Proteus, and they deserve their sumptuous setting. Whether they speak of longing, of happiness, or of remorse, such poems as those entitled "On a Lost Opportunity," "To One on her Waste of Time," "Sibylline Books," "Morte d'Arthur," and "What have I done? what gross impiety?" are entitled to this praise. It is to be regretted that they are prefaced by the sonnets called "Esther, A Young Man's Tragedy," which are on a distinctly inferior plane, though not without merit.

We cannot say so much for still another superb piece of bookmaking from this same press, 'Fringilla, or Tales in Versa,' by Richard Doddridge Blackmore, M.A. Oxon., with sundry decorative picturings by Will H. Brad-

ley (Cleveland: Burrows Bros.). Mr. Bradley's long black-and-white women, although a shade less brutal in expression than Mr. Beardsley's, are not less ugly; and it will be a standing wonder, a few years hence, that such beautiful typography should have been thus disfigured. The letter-press of the book is a bit of whim, like the illustrations, the "tales in verse" being written as prose. It contains many pretty descriptions, but the mode of printing does nothing to enhance them, except in the few humorous ones at the end.

American critics are now disposed to take the view that, while habits and manners tend to assimilate in the different English-speaking countries, we must expect, at least for a time, "a continued divergence in our literatures." This was the phrase used by Mr. Warner, a dozen years ago, in an acute paper on England in the *Century* magazine, the opinion being based on the steady accumulation, on this side of the Atlantic Ocean, of a body of associations, traditions, and studies of nature which no Englishman who has not lived long in America can even comprehend. Other authors, as Lowell, Higginson, Howells, Scudder, and Matthews, have at different times committed themselves to similar statements. If we were asked by an Englishman to show him the latest American volume that illustrates this view, we should select without hesitation the 'Poems' of Ernest McGaffey (Dodd, Mead & Co.). It is not that the author writes—and writes well—of crow and meadow-lark instead of nightingale and skylark; it is not that he describes Indians and frontiersmen; but that there is a broad outlook as over prairies and sierras, a wideness, as between ocean and ocean, a vast inland flavor, unmistakable as the smell of the sea. The author's very name is new to us—there is no key to his dwelling-place except one poem which seems to place it in Missouri; the volume has some of the crudeness of a first book, but also of its frankness and freshness. Mr. McGaffey is free from the turgidness and imitativeness of Mr. Cawein, and from the self-conscious pose which is spoiling the fine promise of Mr. Garland; but he has the sense of American atmosphere and American life, and produces something indigenous and true. Moreover, what he writes is terse, and leaves a picture on the retina, as in this example (p. 244):

OVERLAND.

A treeless stretch of grassy plains,
Blue bordered by the summer sky;
Where past our swaying, creaking stage,
The buffaloes go thundering by,
And antelope in scattered bands
Feed in the breezy prairie-lands.

Far down the west a speck appears,
That falls and rises, on and on,
An instant to the vision clear.
A moment more, and it is gone—
And then it dashes into sight,
Swift as an eagle's downward flight.

A ring of hoofs, a flying steed,
A shout—a face—a waving hand—
A flake of foam upon the grass
That melts—and then alone we stand,
As now a speck against the gray
The pony-rider fades away.

To this theory of diverging literatures Mr. Wallace Bruce would not be a convert. With a name of double-barrelled Scotch patriotism, combined with a Yale diploma of Bachelor of Arts and four years of residence in Edinburgh, he is surely that "star-spangled Scotchman" whom Mr. Black created out of another gentleman similarly situated. One of his poems was read at the Scotch-Irish celebration at Columbia, Tennessee; he addresses verses equally to Longfellow and Blackie, and strikes an average between the Hudson and the Tweed. His verse is not inspired, but is what

may be called bi-patriotic; and perhaps, after all, the function of such verse is as essential as that of genius. Mr. Charles Reekie, who was born in Scotland, is also pleasantly bi-patriotic in his 'Day Dreams' (New York: L. D. Robertson & Son).

It is due to Mr. Cawein to say that he has taken the very best way to remedy his own early defects by cultivating the habit of translation, and especially by dealing with German lyric poetry, as in his volume, 'The White Snake, and Other Poems,' translated in the original metres (Louisville: Morton). The title-poem fails to interest us, but the other translations show ability, and as the class of poetry with which he deals is usually simple and brief, it is a capital discipline. Yet we find still better translations from a wholly different source. Bishop Spalding of the Peoria (Ill.) diocese, whose prose work has long had more of the literary note than that of any Roman Catholic ecclesiastic in this country, has published 'Songs, chiefly from the German' (Chicago: McClurg). The poems are varied, and though he has had the indiscretion of publishing many new attempts at the old untranslatable Heine favorites, yet many are both new and good. Some are from Hugo, too; and there is shyly inserted at the very end this sonnet, apparently untranslated, and well worth quoting:

SUBLIME FOLLY.

Sublimest folly!—from their camps uprising
Two mighty armies, eager for the fray;
The drumbeat rolls, the brazen trumpets bray,
And guns and bayonets flash against the skies.

Now shall be shown on which side victory lies;
Swords gleam, the booming cannon hurl dismay,
The quick, sharp rifle-shots for death make way,
On high the bird of evil omen cries.

Men fall as in the field the full ripe grain
Where bending reapers swing the sickle's blade.
In ranks they fall, never to rise again—
But wherefore the dread holocaust thus made?
That past all doubt man may make this truth plain,
On honor, more than life, his heart is staid.

In Messrs. Copeland & Day's new 'Oaten Stop Series' the first volume is handicapped by a self-contradictory name. 'Dumb in June' is a bit of complaint that would be piquant enough for a verse or two, but becomes depressing when carried at the head of every other page through even a miniature volume; we feel at last that the poet has been dumb too garrulously. The poems themselves are meditative, sometimes arch, always neat, and occasionally graceful; under a more felicitous name they might even have a charm when collected. This is a good example (p. 29):

YESTERDAY.

My friend, he spoke of a woman face;
It puzzled me and I paused to think.
He told of her eyes and mouth, the trace
Of prayer on her brow, and quick as wink
I said: "Oh yes, but you wrong her years.
She's only a child, with faith and fears
That childhood fit. I tell thee nay:
She was a girl just yesterday."

"The years are swift and sure, I trow"
(Quoth he). "You speak of the long ago."

Once I strolled in a garden spot
And every flower upraised a head
(So it seemed), for they, I wot,
Were mates of mine; each bloom and bud.
Their hours for sleep, their merry mood,
The lives and deaths of the whole sweet brood,
Were known to me; it was my way
To visit them but yesterday.

Spake one red rose, in a language low:
"We saw you last in the long ago."

'Tis the same old tale, though it comes to me
By a hundred paths of pain and gloom,
'Till I guess the truth at last, and know
That yesterday is the Long Ago.

The second volume of the Oaten Stop Series is 'A Doric Reed,' by Miss Zitella Cocks; it has the attraction of some good Southern landscape, with a local coloring quite fresh to us; indeed, her "Sunrise in an Alabama Cambrake" has much of the flavor of Tennyson.

while this child picture is graceful enough for Austin Dobson (p. 68):

WHEN POLLY TAKES THE AIR.

A little wicker basket rolls
Along the pavement walk,
And at the sight the young and old
Begin to laugh and talk.
And wave fair hands, and kisses throw,
And cry: "Look here!" "see there!"
"This way it comes!"—and all because
Sweet Polly takes the air!

The newboys run and shout with glee,
And follow on behind;
The coachman and the footman gaze
As if they had a mind
To do the same; the good old priest
Stands still with solemn stare—
As down the shady avenue
Sweet Polly takes the air!

And all the while sweet Polly sits
In dainty gown and hat,
And smiles on one she loves the best—
Her pretty Maltese cat—
And softly coos, when pussy purrs,
Without a thought or care
How all the town turns upside down
When Polly takes the air.

'Under the Pines,' by Mrs. Lydia Ann Cooley (Chicago: Way & Williams), has some good touches of local coloring here and there, from East to West, and also, rather unexpectedly, a Harvard class-day poem in honor of the author's son. She has also this bit of terse philosophy, worth more than many that are longer (p. 15):

HEREDITY.

Why bowest thou, O soul of mine,
Crushed by ancestral sin?
Thou hast a noble heritage
That bids thee victory win.

The tainted past may bring forth flowers
As blossomed Aaron's rod.
No legacy of sin stands
Heredity from God.

'Pebbles and Shells,' by Clarence Hawkes (Northampton: Picturesque Publishing Co.), is remarkable as being the work of a young blind poet, who, of course, speaks of "seeing" nature with that curious and touching familiarity the blind employ. The portrait and biography precede, the latter expressing an admiration which the reader perhaps cannot wholly follow, even if assured that "the merits of some part of its [the book's] contents have been so signal as to elicit an autograph letter of approbation from Hon. Robert T. Lincoln, ex-Secretary of the Navy." Mr. J. E. Hayee's book 'The Old-Fashioned Garden' (Philadelphia: Winston) comes dangerously—but perhaps unconsciously—near to trespassing on the title of a volume by Mrs. Deland; it has pleasing descriptions, a tranquillity as of the Society of Friends, and is inscribed to Swarthmore College. 'Nature in Verse,' by Mary I. Lovejoy, is a rather meritorious "Poetry Reader for Children" (Silver, Burdett & Co.).

Mr. William W. Newell, in his 'Words for Music' (Cambridge: Sever), gives a vivid bit of local coloring in what follows (p. 45):

THE SCARLET TANGER.

A flame, a wandering fire,
With wavering desire
From bough to bough,
Thou winged, wondrous thing!
Of glad, of golden spring
The soul art thou.
A flame, a wandering fire.

Thy strange, thy scarlet gleam
Will gladden through my dream
The live-long year;
O pure, O holy May!
O blithe, O blessed way
I travel here!
A flame, a wandering fire.

Dr. Frank W. Gunsaulus of Chicago issues a volume, 'Songs of Night and Day' (McClurg), which is, like his previous volumes, thoughtful and cultivated, as well as high in tone, but which has not, perhaps, enough of free and lyric movement to justify its title. "Between Mine Eyelids and Mine Eyes" (p. 86) has perhaps the most of this desirable quality.

The late Eugene Field has undergone the

fatality that follows any literary man much beloved and admired, in the immediate publication and exaggerated praise of his slightest works. In this case the 'Echoes from a Sabine Farm' (Scribners), by himself and his brother, is reprinted in costly style, with illustrations—a dress, in short, which reveals the intrinsic poverty and triviality of these parodies on Horace, which might have been far more tolerable if seen, a scrap at a time, in the corner of a Chicago paper. We might then, by a bare possibility, have found some fun in the following, which we take at random and which is founded on Horace's "Persicos odi" (l. 88):

THE PREFERENCE DECLARED.

Boy, I detest the Persian pomp;
I hate those Linden-bark devices;
And as for roses, holy Moses!
They can't be got at living prices!
Myrtle is good enough for us
For you, as bearer of my dagon:
For me, supine beneath this vine,
Doing my best to get a jag on!

If there is fun in the slang of the bar-rooms, might it not permissibly stop this side of the masterpieces of the world's literature?

To revert once more to the Bodley Head, Miss E. Nesbit, before well known by her 'Lays and Legends,' gives us a volume under the title of 'A Pomander of Verse' (London: John Lane; Chicago: A. C. McClurg & Co.), a fairly pretty conceit, yet not quite substantial enough for a volume containing so many good things. These she classifies under the several ingredients of Ambergis, Lavender, Rose, Rosemary, Myrrh, Musk, and Bergamot; and we close with one of her gayer touches, which must chime with the impulse of many feminine fellow-sufferers (p. 88):

THE LAST DITCH.

Love, through your varied views on Art
Uniting have I followed you
Content to know I had your heart
And was your Art-ideal, too;

As, dear, I was when first we met,
'Twas at the time you worshipped Leighton,
And were attempting to forget
Your Foster and your Noel Paton.)

"Love's rhymes with Art," said your dear voice,
And at my crude, uncultured age,
I could but blushing rejoice
That you had passed the Rubens stage.

When Madox Brown and Morris swayed
Your taste, did I not dress and look
Like any Middle Ages maid
In an illuminated book?

I wore strange garments, without shame,
Of formless form and toneless tones,
I might have stepped out of the frame
Of a Rossetti or Burne-Jones.

I stole soft frills from Marcus Stone,
My waist wore Herkimer's disguise,
My slender purse was strained, I own,
But—my silk lay as Sargeant's lies.

And when you were abroad—in Prague—
'Mid Cherita I had shone, a star;
Then for your sake I grew as vague
As Mr. Whistler's ladies are.

But now at last you sue in vain,
For here a life's submission ends;
Not even for you will I grow plain
As Aubrey Beardsley's "lady friends."

Here I renounce your hand—unless
You find your Art-ideal elsewhere;
I will not wear the kind of dress
That Laurence Housman's people wear!

Waterloo: A Narrative and a Criticism. By E. L. S. Horsburgh, B.A., Queen's College, Oxon. London: Methuen & Co. 12mo, pp. 312 with maps.

THE study of military history at Oxford is one of the interesting features of university development. The demand would naturally arise out of the zest with which educated Englishmen have taken hold of their volunteer system, as well as from the fact that a university education helps to open the door to places in the regular army. In conformity with the modern tendency to specialize one's course of study

from an early stage in it, young men looking for army commissions have sought instruction in subjects connected with a military career. Modern authorities in military science are of one accord in asserting that generalship is to be learned only in a diligent and intelligent analysis of military history. More than one course of lectures upon this subject have been delivered by university teachers, and Mr. Horsburgh's book is the outgrowth of such a course upon the campaign of 1815.

His aim, as he tells us, has been to give, in a form easily intelligible to the ordinary reader, a comparative study of the events of the Waterloo campaign, with the criticisms of commentators upon them, reaching his independent conclusions when he finds expert authorities in collision. The task has been performed with admirable temper and judicial spirit. The author's knowledge of the principles of strategy is sound, and as he differs or agrees with one or another of the critical historians he gives weighty reasons for his conclusions. The presentation, therefore, of a candid and competent summing up of the latest opinions in a great controversy which has lasted eighty years, will find a welcome among all who love historical investigation, whether they be special students of the military art or of history in general. American students will particularly enjoy it because the author joins issue, on several of the burning questions of the campaign, with Mr. Roepes, whose book has already taken rank in Europe as a notable contribution to the great debate. They will be able to compare with great ease the arguments on both sides of such points of controversy, and, as both books are full of statements of the ground taken by other authorities, a very lucid understanding of the whole discussion may be got from these two works alone.

Rambles in Japan. By H. B. Tristram, D.D. Fleming H. Revell Co. 1895.

BEYOND the allotted period of three-score years and ten, but full of that sunny philosophy which comes from long travel in many lands, the Canon of Durham, whose name we associate with the Land of Moab, has visited the Land of the Rising Sun. In modest and unassuming style he tells us of his rambles over what for the most part are well-beaten tourist tracks. Like the average writer on Japan, he describes "some parts of the country seldom visited by foreigners," and, of course, he "had special advantages," etc. The value of the book does not consist in any novelty of experiences or observations, but is welcome and important because Canon Tristram is a naturalist. He loves life in all forms, whether of plant, fish, bird, beast, or man. His daughter, a missionary, was his cicerone and interpreter. His simple, limpid style makes his ten chapters pleasant and easy to read. A lambent humor plays over his pages. When a native gentleman given to tall stories tells of the growth of bamboo, as discernible between measurements made before and after his breakfast on the same morning, the Canon suspects that clogs have been changed for sandals, and that the case was one of human shrinkage of stature rather than of vegetable growth. There are not a few inaccuracies of statement and some mistakes in the book, but these are of no consequence, for, with the wisdom of the genuine scholar and keen observer, the Canon builds no high towers of speculation on scant observation of facts.

The work is liberally illustrated by Edward Whymper, from sketches and photographs.

Some of these provoke in the reader the delight of novelty and are very effective. Others, though we are bound to say but few, are old stagers upon which the curtain ought long since to have been rung down. Mr. Whymper's fault is that of Anglicising the faces of Japanese in a way that will certainly please any native Anglomaniacs who may be strutting around Tokio or Osaka—which latter city the Canon calls "the Manchester of Japan." The naturalist will enjoy the book for its many informing references to birds, shells, flowers, and fauna. The Canon explodes false theories as well as adds knowledge of facts. Showing that resemblance is not identity, he pricks the bubbles of rhetoric and science so called. The shells on the shore of the Sea of Galilee and in Japan are not the same. Much of interest is told about the missionary and native Christian work in the empire. The Canon, like a true philosopher, believes there is no real anti-Christian popular sentiment in Japan, but only an antipathy to things foreign and to a Christianity that smacks of the Yankee, Briton, and Frenchman, rather than of the Christ himself.

The book has a tolerable map and index. It is well worthy of its excellent ink, paper, print, and binding. The cover decoration in gray and silver, dashed with red, reminds one of a pretty Quakeress with enough color on her cheeks to blend all tints into a unity of charms.

The Book-hunter in London: Historical and Other Studies of Collectors and Collecting. With numerous portraits and illustrations. By W. Roberts. Chicago: A. C. McClurg & Co. 1896. Pp. xxi, 383.

Rare Books and their Prices: with Chapters on Pictures, Pottery, Porcelain, and Postage Stamps. By W. Roberts. Longmans, Green & Co. 1896. Pp. xxviii, 156.

LONDON is so important a book-market, and has been for 250 years such a place of resort for all who have books to sell or to buy, that any treatise on the subject is sure to contain a great deal which will be interesting to any reader. Such a treatise is hard to arrange in any logical way, and almost as hard to index in a satisfactory manner. The reader, therefore, finds that he must dip into it here and there, that he cannot select with certainty the chapter he desires to examine, and that this desultory way of reading has its own reward. Many curious bits of information which exactly answer some of his requirements will come in his way in the course of his casual reading of Mr. Roberts's 'Book-hunter' which it would never occur to him to look for. This is the good side of a book composed like the present one, but it is also necessary to state that the 'Book-hunter' is rambling enough. The author keeps close to the subject of his chapter, the subject he has announced, whether "Book auctions and sales," or "Book-hunting localities," or another; but beneath such title almost anything may be written down. Thus, in the chapter on book auctions, we are reminded that the first one known to have taken place in London was held on the last day of October, 1676, or, in other words, just at the time when King Philip's war was past, for the American colonists, and when Charles II. was feeling rich with the first instalment in his pocket of the pension which Louis XIV. had to agree to pay him. The chapter on Book-stalls is the natural place for anecdote, and accordingly anecdotes abound in it. The favorite, of course, is the one which relates the purchase of a

ten-pound book for "thruppence," and the finding of a rare tract in the sixpenny box outside "Old Brown's door" after the proprietor had stated that he possessed no copy and that it was very dear. Curious if saddening anecdotes are gathered together under the heading "Book Thieves, Borrowers, and Knockouts," but these are in no way more extraordinary than the stories which any old bookseller can tell from his own experience. Under "Humors of Book Catalogues" we come upon the following entry:

"Shelley—Prometheus, unbound, etc.
"———another copy, olive morocco, etc."

A very considerable number of illustrations are inserted in the volume, some of them "portraits" which no man could recognize, but some, also, interesting pictures of interiors and exteriors of shops. Further examination shows that there are a few half-tone portraits which must look something like the originals, and one of Mr. Quaritch that certainly does so.

The same author's 'Rare Books' is tastefully printed and bound, and is pleasant to handle and to read. Fifty pages are devoted to the book-market and as many to pictures, old and new. Pottery and porcelain have half as much space, and postage stamps occupy as much space as ceramics. The preface states that parts of the different chapters have appeared in the *Fortnightly Review* and the *Nineteenth Century*. So small a book cannot be asked to serve as an encyclopedia of prices, even of those obtained at auction sales. The chapters are essays on the subject of the constantly changing money value of works of art and curiosity, a subject very interesting to many people, and rather closely connected with the real or intrinsic value of those objects. It is agreeable to find that our author never forgets to insist upon real value as distinguished from price, and the personal character of many of his criticisms, although they may have the air of *obiter dicta*, or opinions for which he was not asked, adds immensely to the interest of the book. The opinions thus set forth will command attention as being well founded and based upon a large knowledge of the subjects under consideration. The only exception we should take is to the dissatisfaction which Mr. Roberts expresses at high prices for rare pieces. It seems to him that a Gubbio plate at a thousand pounds is a case of misunderstood valuation. But the great ease with which a thousand pounds is gathered in by many a "captain of industry," and the absolute impossibility of duplicating, in any really complete sense, the Gubbio plate, go to make the bargain less absurd than the bare statement of it may sound. Why should not the Mazarin Bible bring four thousand dollars? Many more people have the money to spare than can possibly own the book. On the other hand, Mr. Roberts's remarks on the exact amount of good sense there is in the broad-margin craze and the first-edition craze are most judicious. It need not be said that the book is extremely entertaining.

The Land of the Nile Springs. By Colonel Sir Henry Colville. New York: Edward Arnold.

THE literature about Uganda is considerable and increasing, but additions to it are still welcome, especially when they are as well written as the present one. Col. Colville succeeded to the special mission of the late Sir Gerald Portal as representative of Great Britain in Uganda, and it was he who definitely pro-

claimed the English protectorate. His duties as resident were of the most varied kind. Thus, he not only had to go campaigning against Kaba Rega of Unyoro, who has given so much trouble to every European in these regions from Sir Samuel Baker down; he also in Uganda itself had to put pressure on the wretched King Mwanga, besides with difficulty preventing the outbreak of a new religious war between the Catholic and the Protestant factions of the country. He had by turns to act as judge, diplomat, house builder, general—in short, in the various capacities demanded of a European ruling over inferior races, and requiring all the qualities which Englishmen have shown to so high a degree in building up their empire. He has narrated his experiences and adventures under these circumstances in a very "breary" manner. If at times the wit is a little elaborate and fatiguing, it is generally amusing enough. Here is the account of his first arrival in his province:

"As we descended into the valley on the farther side of which Kampala fort is situated, I saw the troops turning out ready to receive me; and feeling that I was not looking my best, either as regards clothes or features, began polishing myself up as well as I could, and was just beginning to feel that, although I was not exactly smart, an imaginative man might guess at the possibility of better things beneath the dirt, when my horse gave a flounder in a boggy stream which I had been too preoccupied to notice, and landed me fair on my head in a pool of black mud. Two minutes afterwards, with bugles sounding, drums beating, and the troops presenting arms, I entered the headquarters of my command, returning the salute with what dignity I could, and then hurriedly rushed into Arthur's hut and plunged my head into a basin of clean water."

In his campaign against Unyoro the only reliable portion of his troops were some Sudanese:

"When about an hour's march from the fort, I came upon the band of the Sudanese regiment drawn up along the roadside. After presenting arms (bandsmen carry rifles in Uganda), they turned to the right and followed me, whacking their drums and tootling on their old cracked bugles at their loudest. I wish I could have seen that procession—it must have been a very funny one. First, a big Sudanese soldier carrying a Union Jack; then a very seedy-looking Englishman in an old karkes coat, dilapidated breeches and gaiters, his feet bandaged in dirty rags, limping along with the help of a walking stick; then a small Sudanese boy laden with a field-glass, a camp-stool, and a big bunch of bananas; and lastly the full band of the regiment in single file, swaggering on with that sense of importance which only comes to those whose good stars lead them in the way of hitting drums."

Later he was enabled to add to them some recruits who had been in the service of the Congo Free State:

"I have said before that our troops presented a curious appearance, and although I had got accustomed to rather strange turn-outs, I confess I was fairly startled by the bewildering variety of these warriors' costumes, equipments, and appearance. To begin with, they were of all possible ages, colors, and sizes—doddering, grey-bearded old men, fine strapping youths, and pigmies, apparently from Stanley's forest, Abyssinian, Egyptian, and pure-blooded negroes, and strange crosses of each and all of them. The variety of their clothing was infinite, ranging from the nearest approach to nothing in which a military-minded person will appear before his commanding officer, to cherry-colored trousers and blue frock-coats with gold braid. And then their arms! breech-loaders, muzzle-loaders, double-barrelled 'scatter' guns, some with locks and some without, all were duly brought to the present on my arrival, and all their owners seemed equally satisfied that they were in possession of highly effective weapons."

Col. Colville has not attempted to produce

a work full of valuable information; he has merely written a record of his experiences and the chief events that took place during the time of his rule, until it was brought to an abrupt end by a sudden attack of fever. He has given us a very readable book. The paper and print are excellent, perhaps too excellent. Especially in a work of this sort, one would be willing to have thinner pages, less margin, and even a little smaller print in order to obtain a lighter, more convenient volume.

Crystallography: A Treatise on the Morphology of Crystals. By N. Story-Maskelyne, M.A., F.R.S., Professor of Mineralogy, Oxford. Macmillan & Co. 8vo, xii, 521.

This first part of the long-expected 'Crystallography' of the veteran Oxford professor, treats of the morphology of crystals "in the simplest form compatible with strict geometrical methods," and with such fulness as to make it the best book in the English language from which to obtain a full knowledge of the forms of crystals, their classification, their measurement, and their delineation. It is everywhere precise rather than concise, but for one who must help himself rather than depend upon teachers, and who will master crystallography, but is not able to use German or French books, the work is admirably fitted.

Advanced students will generally prefer the more logical method which deduces all the forms of crystals directly from the one law of rational indices, as developed in the last edition of Groth's 'Physikalische Krystallographie.' Most teachers, on the other hand, will sympathize with the author, who takes account of hemihedrism, or mero-symmetry, as a second law, and so reaches a natural grouping of the many forms of crystals in a way more easily appreciated by the beginner. It is significant of the conservative position of Prof. Maskelyne as a crystallographer of the

old school that a second volume, treating of the physical problems connected with crystals, is to follow this; in a modern German work this order would be reversed. The definition of the crystals, also, as "polyhedra with plane faces and without reentrant angles," stands in contrast to the definitions which put in the foreground the differences of elasticity of the crystal in different directions.

After a very brief statement of the physical properties of crystals, the author proceeds to develop the geometrical groundwork for the consideration of the crystal as a complex of planes obeying the law of rationality of indices and the law of mero-symmetry, and proposes many theorems, several of which are new, relating to axes and the change of axes, the rotation of planes, the relations of zones, and the stereographic projection of the faces. Then follows a full treatment of the measurement and drawing of crystals, with an exceptionally large series of illustrative examples. Next comes the fullest and the most interesting and original portion of the book, the treatment of crystal symmetry, and a thorough discussion, from the point of view of this symmetry, of the six systems, their whole forms, their half-forms, their combinations, and their twins. The schoolmen's "Deus cogitat mathematica" is exemplified, if anywhere, in the growth of the crystal, to the study of which the student will not easily find a more attractive guide than the book before us. Prof. Maskelyne writes not as one searching for the shortest methods to obtain the name of a mineral for further use, but rather as aiming to bring forward all the questions his subject suggests, and to devise the most elegant methods for their solution within the mathematical limits he has set himself.

THE LATEST EXPOSITION OF THE LAW OF WAR.

JUST PUBLISHED:

MILITARY LAW AND PRECEDENTS.

By WILLIAM WINTHROP,

Colonel United States Army, author of the Annotated Digest of the Opinions of the Judge Advocates General.

Second Edition, Revised and Enlarged.

Two volumes, octavo. 1,713 pages. Law Sheep, \$12.00 net. Sent, prepaid, to any address, on receipt of \$12 60.

The subject of Military Law as developed in this treatise, is not confined to that specific law governing the army as a separate community, but includes also the Law of War—regulating the relations of enemies and authorizing military government and martial law, and extends to the quasi civil functions which may be devolved upon the army, and to the legal relations in which its members may be placed toward the civil community.

In this new edition, the work has been carefully revised, citations added to later cases, and the changes made by late legislation and re-codification of the Army Regulations duly incorporated. That portion of the work devoted to the Law of War, which in the first edition was somewhat incomplete, has been materially supplemented and enlarged. Twenty-three hundred cases and trials are cited, and the entire work has been printed from new plates.

LITTLE, BROWN & COMPANY, Publishers,

254 Washington Street, Boston.

LEMCKE & BUECHNER,

Formerly B. Westermann & Co.,

812 Broadway, New York.

Will publish immediately:

Flügel-Schmidt-Tanger,

School and Hand Lexicon of the German and English Languages.

2 vols., large 8vo, half leather, \$4.50.

The German-English part separately \$2.00, the long-expected smaller edition of Flügel's 3 vol. Dictionary, half morocco, \$16.50.

A NEW ERA IN BOOKSELLING.

BRENTANO'S, 81 Union Square, announce an important change of policy. Hereafter they will sell books at SWEEPING REDUCTIONS from PUBLISHERS' PRICE. Bookbuyers will thus be afforded the opportunity to purchase from an unrivalled stock of Classic, Standard and Current Literature, at PRICES as LOW as prevail ANYWHERE, with the added advantage of prompt and intelligent service.

ALL the BOOKS of the DAY at LOWEST PRICES. Foreign Books.

Mail orders receive special attention.

Send for Brentano's Monthly List of New Books. Free on application.

The Nation.

NEW YORK, THURSDAY, MARCH 12, 1896.

The Week.

ON Monday the Senate showed signs of recovering from the fit of emotional insanity to which it fell a victim two or three weeks ago, when it dropped the affairs of Venezuela in order to take up those of Cuba. The speech of Senator Hale in opposition to the resolutions now pending was the first outright declaration of truth that has been heard in that body. He smote the heap of lies, piled up by Sherman, Morgan, and others, by which the ear of the country has been so grossly abused, and knocked it into bits. He has furnished a rallying-point for the higher intelligence of the country, and he was not in the least degree daunted by the mob in the galleries, who attempted to influence the course of debate by signifying their disapproval of what he said. The most popular untruth now afloat is a statement endorsed and promulgated by Senator Sherman, although not first set going by him, that Gen. Weyler, the Spanish commander in Cuba, is a brute and a butcher of defenceless men, women, and children, an enemy of the human race sent out by Spain expressly for the possession of these qualities. Senator Hale exposed this falsehood in a manner most painful to those who have propagated it. When he sent to the clerk's desk, to be read, a newspaper statement made by the Spanish Minister at Washington, which convicted Senator Sherman of glaring error, to call it by no worse name, there was a deal of squirming on the Jingo side. Objections were raised to the reading of the statement because it affected the character of a Senator—as though his character could be affected by an interview in a newspaper if it were not true. Objections were made on the score of the undiplomatic character of the communication—as though Mr. Sherman were exposed to injury from bad form rather than on the score of veracity. Finally, however, the newspaper extract was read at the clerk's desk, so that the answer to the charges made against Gen. Weyler goes into the record along with the charges themselves.

The cablegram published by the *World* on Saturday from Señor Cánovas, the Prime Minister of Spain, is well calculated to soften the asperities that have been aroused lately by the resolutions passed by our Congress, and especially by the intemperate language used by Senators and Representatives in debate. The substance of Señor Cánovas's dispatch is that Spain considers her relations with the United States unbroken until some act of hostility is committed. While the

present status continues she will avoid everything that tends to a rupture, and will suppress every demonstration in her own territory that can be considered insulting to the United States. She has already closed the universities at Madrid, Grenada, Barcelona, and Valencia, where the students have made hostile demonstrations, and will close all universities, schools, and establishments where like demonstrations take place. This repressive action on the part of the Spanish authorities is so contrary to all our ideas and practices that it may not be appreciated here, yet it is customary and necessary on the Continent of Europe, where countries, by reason of their nearness to each other, are in danger of taking fire from the thoughtless acts of irresponsible persons. Reference is made to the false charges of inhumanity against Gen. Weyler and the Spanish authorities in Cuba. Señor Cánovas says also that the insurgents have set at defiance the rules of civilized warfare, have repeatedly violated the treaties between Spain and the United States, and especially that of 1877, respecting the lives and property of American citizens in Cuba. Finally, he repeats what Señor Castelar said the other day, that no government could exist in Spain which should tolerate foreign intervention in the affairs of Cuba by a government which had previously recognized the rebels as belligerents.

We see evidences of some resentment on the part of those who think we ought to confine our hostility to England and not fritter away our energy by extending it to Spain. Admiral Meade is one of these. He delivered a lecture at Chickering Hall on Wednesday week illustrated by bloodthirsty stereopticon views. He had primed himself for Great Britain, and was evidently disturbed to find Spain filling so large a part of the Jingo horizon. For this reason he gave a considerable part of his time to showing that the action of Congress on Cuban affairs was unjustifiable and ill-timed. If we grant belligerent rights to the Cuban rebels, he said, we give the Spaniards the right to board and overhaul and capture on suspicion American vessels anywhere outside a marine league of our coast. The exercise of this right would so exasperate our citizens that it might lead to a war with Spain. Indeed! We fancy we hear Bill Chandler asking why that should be considered an objection. Some Princeton students, with a lack of taste that ought to be rebuked by the professor of æsthetics, on Thursday evening hanged in effigy the heir to the throne of Spain, who is about nine years of age. A crowd of ruffians in Leadville, Colorado, built a bonfire in the street in order to burn the Spanish flag. They had great difficulty in identifying

it in the stock of a dry-goods dealer in that town, but they found something that answered the purpose and they put it on the funeral pile. These students and miners will be much surprised to learn that Admiral Meade is not in favor of a war with Spain. Isn't war the thing we have been ramping and raving for, ever since the middle of December? But we ought to discriminate, says Meade, because Spain was friendly to us during the Revolution and during the civil war. She did not send out any *Alabamas* or any blockade-runners. Chandler and the students and miners might very well reply that that was probably because she didn't have any, and at all events that Great Britain paid for her fun with \$15,000,000 gold. Would you take her money and then fight her for the same score afterward? No, Mr. Meade, you cannot divert us from the *Hidalgoes* and the *Inquisition* by any such chaff as that.

"What is the war news to-day?" is the inquiry which citizens habitually ask each other nowadays. On Friday it was this, according to the *Tribune's* Old Pensioner at Washington:

"The feeling of irritation with the President and his associates has been growing more and more acute at the capitol for some time. Thus far there has been nothing but talk on the subject. Bitter speeches have been made in both houses, and still more bitter talk has been indulged in the cloak-rooms. The general discontent has ripened, and the situation seems favorable for a direct issue to be made, now that Mr. Cleveland indicates a purpose to disregard the practically unanimous expression of opinion by both houses on the Cuban question. By the most outspoken opponents of the President it is now said that if the Administration pockets the Cuban concurrent resolutions, a joint resolution will be passed and re-passed over the Presidential veto, and that if Mr. Cleveland still further persists in ignoring the wishes of Congress, the proper remedy will be found in the institution of proceedings for impeachment."

We cannot think of anything more wholesome at the present time than an impeachment of somebody for something. Anything which will draw attention away from foreign countries and fix it strongly on our own concerns will be a great blessing, and we can imagine nothing so well calculated to cure the prevailing hysteria and to cause introspection and searching of hearts as an impeachment of the President. The grounds for impeachment are unimportant. Nothing could be more silly than the idea of impeaching him for the exercise of a discretion committed exclusively to the executive. But that is of no consequence—nothing is of any consequence in these times. What we need is a change of excitement. We have become raw on our foreign side, and we want to be bruised in a new place. Give us an impeachment by all means, if not of the President, then of Secretary Carlisle for awarding the leaveings of the bond sale to Mr. Morgan, or of Secretary Morton for

stopping the free distribution of cabbage seeds.

The furious (or feigned) indignation of Western Congressmen over the President's home-missionary address is truly comic. Mr. Cleveland's remarks were but the ordinary platitudes of such occasions, only made a little more wooden and meaningless than ordinary. He drew it exceedingly mild compared with many an impassioned address on the same subject. The usual form of appeal is to picture the West as hotly contended for by the devil and good angels, with the chances decidedly in favor of the devil unless the mission debt is speedily paid off and contributions increased. Home-missionary gatherings are so accustomed to having the battle of Armageddon fought before their very eyes, with horns, hoofs, and forked tail well in evidence, that the President's gentle arraying of "tendencies" and "dispositions" against each other seems tame enough. Moreover, the free-silver Westerners are ludicrously ignorant of Presbyterian home-mission work if they think an endorsement of it means a fling at their benighted condition. Quite the majority of Presbyterian home missionaries are, we believe, laboring east of the Mississippi. Some are in New England, many in New York, hundreds in Ohio and Indiana and Illinois. How do the raging Montana and Idaho statesmen know that the President did not refer to the need of converting the gold-bugs of the East from the error of their way?

How completely public interest in the legitimate work of Congress has had to give way to the artificial excitement over congressional fireworks, is well instanced by the general indifference to the highly important amendments to the legislative appropriation bill passed by the House last week. These amendments involved a complete readjustment of the salaries of United States Marshals and District Attorneys. It is estimated that a saving to the Government of \$200,000 a year will be effected by the changes. The labor expended in drawing the bill was arduous, and the task of piloting it through the House most difficult. Yet the men who did this important work, and the whole discussion, in fact, were all but ignored by the press. The Washington correspondents report eagerly and minutely all the pyrotechnics, send out all sorts of rumors about wars, and dissensions in the cabinet, and partisan and Presidential manoeuvring, but have only to say, wearily and with an air of huge disgust, of this real work of Congress, "The House then resumed consideration of the legislative appropriation bill."

The memorial of the Chamber of Commerce, addressed to the commercial bodies and business men of the United States, on the subject of sound money may have

the effect possibly of heaping some of the Presidential candidates to make up their minds on the question. It invites the co-operation of the bodies and persons addressed "in an effort to create a strong public opinion in behalf of an unequivocal declaration by the political conventions of both of the great parties in favor of the maintenance of our existing standard, and of the elimination of all doubtful expressions in respect to the reopening of the mints of the United States to the free coinage of silver." All citizens are urged to exert themselves in favor of the election of delegates to the national conventions who will favor such a platform declaration. An organized movement of this kind by the men who represent the business interests and property of the land cannot fail to have a beneficial effect both upon the conventions and upon candidates. The spectacle of ten or a dozen Republican candidates "standing dumb" upon what is the leading issue of the day is one which is not to be contemplated with indifference. No man can be trusted to withstand bad financial legislation after he has been elected President who has not the moral courage to say he was opposed to it before election.

The Cincinnati *Commercial Gazette* had a most tempting headline on Monday week—"The Financial Question: Views of the Leading Republican Candidates for the Presidency." At last, then, we said to ourselves, the dumb have found their voice. The *Gazette* went on to say that it had telegraphed to all the candidates for "a clear definition of your position on the money question," and that the replies would be found below. Below was found a telegram from Quay saying that "if possible we must preserve the unity of the party"; one from Elkins declaring that he was "in favor of sound money"—and that was all. In derision of its own tongue-tied candidate, the *Gazette* published a telegram from McKinley perfectly blank; another from the bold Reed, also blank; Davis, Manderson, Allison, Culom, and Morton—all blank. Such scornful treatment is well deserved. As far as the country knows, the minds of all these candidates are as blank as their telegrams on the money question. They are all your true metaphysicians' *tabula rasa* on which the majority of the convention can write whatever it pleases—16 to 1, or 60 to 1, gold, silver, or lead. If their views do not suit, they can be altered. But was there ever before a party of great moral ideas, only three months away from its national convention, left absolutely in ignorance of the opinions of its leading men and Presidential candidates on the one great question at issue?

Secretary Hoke Smith's wise action in regard to forest preservation is worthy of the heartiest commendation. He has called upon the first forestry experts in

the land, with Prof. Charles Sprague Sargent at their head, to make a thorough personal investigation of the present condition of our preserves and report to Congress the results of their inquiry, including in their report a comprehensive forestry policy for adoption by the Government. This is the use of expert ability which we have so often advocated in reference to matters of much less public importance, and which is to be hailed with joy wherever it appears. In the face of a report from such a committee, Congress will have no excuse for listening to the specious arguments of the champions of timber thieves, railway grabbers, and other depredators of our forest preserves, but will be obliged to adopt for the country a scientific and adequate policy which will protect and develop the preserves for the enjoyment and benefit of the whole country. Secretary Smith has performed a genuine public service which will be remembered in his favor long after he has passed out of office. It is so seldom that anything in the way of really enlightened public policy comes out of Washington that one feels like appointing a day of thanksgiving when it appears.

Mr. Joseph Nimmo, jr., formerly Chief of the Bureau of Statistics, publishes a pamphlet on the subject of the Nicaragua Canal which ought to gain some attention in Congress. He says first that there "has never been any investigation made by a committee of Congress, nor by the executive branch of the Government in pursuance of any order of Congress, for the purpose of ascertaining the amount of tonnage which would annually pass through the proposed Nicaragua Canal." This is true. In like manner the promoters of the Corinth Canal in Greece went on without making any inquiry of this kind, and now that their work is completed they find that the traffic is not sufficient to pay the cost of keeping the canal in operation. It is true that the two cases are not parallel, since the journey around Cape Malea is an affair of only a few days, while around Cape Horn it is an affair of months. On the other hand, there is a Panama canal in actual progress, which is pronounced feasible on the present plan of lockage, and which will be in competition with that of Nicaragua. Therefore the whole traffic cannot be assigned to one of them. Mr. Nimmo estimates the whole amount of shipping passing through the isthmus at not more than 500,000 tons annually. He says that in the year 1890 the Nicaragua Canal Company asked the New York Chamber of Commerce to endorse their project on the basis of a statement that their traffic would be six to eight million tons annually. "This statement having been referred to me," he continues, "I found it to be the merest statistical juggle. I have a copy of that statement and should be glad to submit it to an official investi-

gation. In making up their prospectus, the Nicaragua Canal Company appears to have divided the cost of their project by *two* and to have multiplied the tonnage likely to pass through it by *twenty*."

Other objections cited by Mr. Nimmo are that the calm belt on either side of Nicaragua forbids that sailing vessels shall ever be employed on the Nicaragua Canal route; that no analogy exists between the Suez Canal and that of Nicaragua, because the former is a sea-level canal and has no railway competitors, while the latter requires 220 feet of lockage and will have thirteen railway competitors; that all fast freight and nearly all passenger traffic between the Atlantic and the Pacific Coasts of America must continue to go by rail; that none of the commerce of Europe with Asia will seek the Nicaragua route since the distance is greater than via Suez; and finally that "a fair investigation of the supposed political and military aspects of the Nicaragua Canal scheme will prove that it is of very small importance from those points of view." Accordingly, Mr. Nimmo proposes that before the Government is committed in any way to extend pecuniary aid by lending its money or its credit to the Nicaragua Canal, it shall order an investigation embracing the whole question of traffic and cost, set forth in detail, so that the figures can be tested by statisticians and engineers. This is surely a reasonable request, but Congress is laboring under emotional insanity to such a degree that nothing which looks like deliberation, if it relates to foreign affairs, has much chance of success.

Agitation in the South against the homicidal pistol-carrying habit makes slow progress against the prevailing sentiment which would not deprive a citizen and a "gentleman" of the right "to carry a gun." To date there is to be recorded the passage by the Mississippi Legislature of a law increasing the penalties for carrying concealed weapons, and the defeat in the South Carolina Legislature of a somewhat similar bill. The current belief at the South is that the law against the pistol-pocket places the law-abiding citizen at the mercy of the lawless. This belief finds expression in newspaper editorials and in the published views of officers of the law, and now it has been given place in the report of the grand jury of the Criminal Court of New Orleans. The judge having directed the attention of the jury to the subject, that body declares that, although the eleven cases of shooting which came before them emphasized the truth of the opinions expressed by the judge, yet they believe that "the best good to the community can be done by the repeal of the law," and "by allowing any man the right to carry weapons, concealed or not, the right which the Constitution of the United States granted

him in token of his individual freedom and responsibility as a citizen." The law should be abolished, the jury urges, because it "does not protect the law-abiding citizen, but the criminal." Only as an alternative proposition, "if the law must stand," is there a suggestion of more rigorous penalties. There is no doubt that this presentment of the New Orleans grand jury expresses the sentiment of very many people of that and of other places in the South—people, too, who would be offended if told that they were not good citizens. It is a manifestation of that lack of respect for and reliance upon the law which has its more emphatic expression in the execution of the judgments of the mob.

We regret to have to say that the outlook for a peaceable settlement between the American and British contingents of the Salvation Army is gloomy. Ballington Booth has opened a headquarters for the new American Army in this city, and is now looking for a name for it. Seceders from the British ranks are reported daily, and they will be put into a new uniform as soon as the style of it can be decided upon. In the meantime the relations between the rival camps have been much strained by the arrival from England of a Salvation Commissioner who is said to be the "ablest financier in the whole Army." He is going to examine the accounts and to see to it that all the property of the American Salvation branch is transferred to the British authorities. There is something decidedly ominous in this proceeding. Everybody familiar with the British character knows that there will be a desperate fight for every penny of that property. Not a cent will be yielded without a struggle, no matter how good American its quality may be. In fact, its American quality will add fury to the pursuit of it.

If the Italian disaster serves no other purpose, it is to be hoped it will help to call the attention of modern nations to the results of the military mania which is now disturbing the Christian world. Italy is one of the poorest countries in Europe. Taxation has there reached the last limit of endurance. After the unification of the kingdom, there was everything to be done in the way of reforms in education, administration, taxation, and communication, for Italy came out of the hands of her oppressors a hundred years behind the rest of Europe in many of the essentials of civilization. But she had hardly got free and independent when she set up an army of 600,000 men, and a navy of 12 battle-ships, 4 "port-defence" ships, 61 armored cruisers, and 147 torpedo-boats, and joined the great military "Triple Alliance." We know all that may be said for this, as matter of public policy—the use of the army in assimilating the population, and the danger from French jealousy. We will admit that it

may be defended; but we beg our Jingoese to mark what followed. Finding herself in possession of the army and navy, just like a poor man who has moved into a large house, she concluded she must have what other nations possessing the same armed force had, in the way of "colonial expansion." She must have some "natives" to fight and subjugate, as the French and Germans and Russians and English had. She must have "colonial expansion," as the mediæval kings had to have their wars, and as our Jingoese must have "keys" and islands and canals and trembling Dago dependents. So she went into Africa to found colonies. She established by hook and by crook an Italian protectorate of Menelek, King of Shoa, in May, 1889, and in October of the same year "a mutual protectorate." But Menelek is warlike, has secured plenty of rifles since then, has a powerful and fairly disciplined force, and does not want to be protected. To make a long story short, he thinks he can clear the Italians out of Africa, and he has defeated them in several serious encounters, and now in a great battle, with a serious loss in men, guns, and above all in prestige and self-confidence. All is dismay, confusion at home, the Crispi Ministry is overthrown, and the kingdom is on the verge of bankruptcy; but reinforcements are rushing forward, and there will probably be other battles and more defeats. It is no longer sufficient for a people to be happy, peaceful, industrious, well educated, lightly taxed. It must have somebody afraid of it. What does a nation amount to if nobody is afraid of it? Not a "ficus secco," as King Humbert would say.

The thing which is making the Italian Government most uneasy is the effect of the Abyssinian defeat on the Triple Alliance. Seeing how Menelek tasks their powers, Germany and Austria may well ask what they could do against France and Russia. It is the more annoying and depressing because Italy has not been able to achieve a single military or naval triumph, small or great, since she became a kingdom. She was defeated at Custozza, the one land battle of 1866, and at Lissa, the one naval battle, and though the army is a very fine one as far as physique goes, there is said to be wanting that sternness of temper which gives a fighting force its edge. It has been remarked that the stories and essays of De Amicis, who is the leading military writer in Italy, deal almost exclusively with the tender side of army life—the love of mothers and sisters, the longing for home, the affection between officer and orderly, the loneliness of the conscript, the friendliness of the people for the soldier; in fact, nearly every emotion but the martial ones. The grim side of war does not seem to present itself to the rank and file till they see the enemy coming down on them.

THE JINGOES AND THE BRITISH CASE.

THE reception of the British Case by our Jingo contemporaries reminds us of a story told by Gen. Thiébault, in his recently published Memoirs, of his reception at one of the Paris barriers when returning to the city during the Terror. At that time everybody moving about had to be furnished with a passport certifying to a number of qualifications necessary to constitute good citizenship. He presented his with a cheerful confidence, and the officer scrutinized it carefully. There was not a flaw in it, but the observation of the functionary was, "Canaille, tu es trop en règle; je t'arrête" ("Rascal, you're too regular; I arrest you"). In like manner the chief fault found with the Case is that it is too good. Some papers maintain that it "proves too much"; others say that it is good till the other side is heard. As it consists almost wholly in the citation of historical documents purporting to come from public archives, if the other side upsets it it must be in the main by showing that the documents in question are forged or garbled, or have not come from the place from which the British say they have come, or have been overridden by other documents lying in Venezuelan archives, and nowhere else. As a general rule, in default of actual occupation, the only proof of ownership of territory is long undisputed claim; but, of course, where the territory is largely wilderness the question of constructive occupation arises—that is, the question how much wilderness does occupation of one part carry with it. This has, we believe, come before our own courts more than once with regard to the territory transferred to us by Mexico on the Pacific Coast—such a question, for instance, as whether the ownership of the mouth of a river carries with it the ownership of the headwaters. Such questions are, however, comparatively easily settled.

We have no intention at present of going into any examination of the merits of the Case. We merely wish to point out the light which the general acknowledgment of its goodness throws on the way in which we have been carrying on this controversy for the past year. It is now plain, as we pointed out last fall, that not one of our writers on the Venezuelan side knew anything about the merits of the case. The articles in the newspapers and magazines were all *a-priori* concoctions, that is, deductions from the writers' conceptions of the general disposition of the English to "grab" territory and oppress small Powers. Whether the English were doing so in this particular case, neither Lodge, nor Chandler, nor Morgan, nor Roosevelt had the smallest idea. But they argued away as if they were in full possession of all the British could say for themselves. Mr. Roosevelt furnishes, in an article in the last number of the *L'achelor of Arts*, an amusing illustration of the muddled-headed way in which they did their work.

Writing on the Monroe Doctrine, he maintains throughout two contradictory theses, one that "the Monroe Doctrine is not a question of law at all, but a question of policy," and the other that there is a right and wrong in the matter, and that the facts might "show England to be in the right" in the Venezuelan matter, in which case "well and good." He adds, too, with delightful gravity:

"A very able member of the New York bar remarked the other day that he had not yet met the lawyer who agreed with Secretary Olney as to the legal interpretation of the Monroe Doctrine. This remark was chiefly interesting as showing the lawyer's own limitations."

He further remarks that this dictum of "the very able lawyer" had "little more significance than if he had said that he had not yet met a dentist who agreed with Mr. Olney." It is difficult to treat these enfantillages seriously. They make one sorry for a very useful and upright man, but as they appear in print they compel the observation that if the Monroe Doctrine were all policy and no law, the Venezuelan Arguments and Commissions and Cases would be as ridiculous as the Jingo articles. All the argumentation on both sides is an attempt to extract a rule of right from a heterogeneous mass of facts.

The true rule for volunteer and amateur publicists, when turning their attention to international questions, would seem to be, to avoid rigidly the assumption of two differing characters. If you appear as an advocate of your country or a defender of her policy, and a promoter of justifiable hostile feeling to some other country, you should not also appear as a jurist, and profess to know the law of your own pretensions. It is very rare indeed that policy and law can be argued in the same breath. When a man says, I care nothing about your law, my policy is to do so and so no matter what you say, you meet him with one set of arguments. You denounce him, and if need be fight him. When he says this matter is one of law, and my case is so and so, you meet him with another set. He appeals to a tribunal, seen or unseen, at which he must be met with facts, and before which abuse of his character and aspersions on his designs are out of place. For over a year, men occupying a position which ought to be high and semi-judicial, that of United States Senators, have been engaged in quasi-legal attempts to settle a dispute about property between two foreign Powers—without, as now appears, even slight knowledge of the evidence in the case—through newspapers, magazines, and stump speeches, in which they maintained that Great Britain could not be the legal owner of certain territory in South America, because we disliked to see European settlements on this continent and had said so freely seventy years ago.

If there were any use in talking to our esteemed contemporaries on the same subject, we would point out how much our

press, and our mental apparatus, which is known to foreigners mainly through the press, are discredited by this same application of our vituperative processes to quasi-judicial questions. Invective is ruled out of all courts in the world which sit on questions of law, and it is not asking too much of newspapers to confess their incompetency to pass on the legal rights of even the most disliked and despised foreign nation by means of general denunciation. As we have heretofore more than once pointed out, Great Britain and Venezuela stood before us, as regarded their historical claims, on precisely the same footing morally. Lord Salisbury was entitled to exactly as much credit as Señor Crespo, but no more. Great Britain was just as likely to be right as Venezuela—most travellers would say more so; but we were not travellers, we were simple observers or mediators. Weakness has no more to do with right than strength. The big man is just as much entitled to his watch and purse as the little one.

These are the obvious moral objections to our goings on about Venezuela during the last twelve months. The political ones are still stronger. We have, while nominally trying to see justice done, roused the greatest of all enemies to justice, the one which cares least for the distinction between right and wrong, the war spirit. We have seriously dimmed in the minds of a large body of the American people the idea of our own subjection to the moral law in our international relations. We have developed a fierce desire to display anywhere, and for any reason, our power to do violence, to drown arguments, to silence law, to strengthen throughout the world the reverence for might as against right, and to treat the services or uses of foreign nations to civilization and humanity as of small consequence compared to the demonstration of our ability to destroy their commerce, ruin their cities, shut up their colleges, and slaughter their young men, without similar damage to ourselves. This, and more, we owe to our pinchbeck jurists, and they ought to be, and we hope are, ashamed of their work.

CHANGE WITHOUT VARIETY.

THERE was a general expectation, which we confess we shared, that the present Congress would be a great improvement on its predecessor, to which, on account of its ignorance and obstinacy, we gave the name of "brutish Congress." We were compelled to admit that the country had made a great mistake in expecting more from the Democrats than it got from Mr. Reed's business Congress which passed the McKinley bill. The Fifty-third Congress turned out to be made of just the same material as the Fifty-first. It differed simply in having a different direction for its evil activity. Instead of devoting itself to levying enormous tribute

from the community for the benefit of the manufacturers, it devoted itself to playing tricks with the currency, and trying to fleece people who had more than \$4,000 a year. But each of these lines of action having turned out disastrously for the party which pursued it, we felt sure that the Fifty-fourth Congress would either hit on some middle course, or do nothing at all, and adjourn early.

There were signs early last year that an attempt would be made to get excitement out of foreign questions, but the promoters of this policy made little impression on the popular mind. The total failure of the Hawaiian enterprise showed how little prepared the country was for any sort of Jingo activity. The way in which the President dealt with that question, which we happen to know was the conception of Mr. Gresham's thoroughly upright and loyal mind, gave the public a most comforting assurance of four years of peaceful and legal relations with foreign nations, and of stern preoccupation, as far as the executive could command it, with our own sadly muddled domestic concerns. Had Mr. Gresham lived, we feel very certain these expectations would have been realized. We should have sat in tranquillity under the shadow of international law, of American precedents, and of a decent regard for the good opinion of mankind.

We are bound to presume that when Mr. Olney wrote his despatch in July last, he was under the impression, as we were, that the new Congress was in some way better than the previous one, made up of better material, and, in virtue of a longer experience, filled with more concern for the real interests of the country. But we can hardly make this excuse for Mr. Cleveland's message in December. Congress was then sitting, and the President must have known how little it differed from its predecessors, how small a stock of knowledge of public affairs, or credit, or finance, or currency it brought to the work of legislation, and how ready it would be to drop such things for a prize-fight, a bull-fight, a cock-fight, or a war, and how difficult it would be, if it once got away on a junket of this kind, ever to bring it back to sober business. There is a story in the life of the Vicar of Morwen, a wild Cornish parish, of the impossibility in the last century of keeping a congregation in church on Sunday, after the news came in that there was a wreck ashore. All the clergyman asked under these conditions was, that they would give him a fair chance by waiting till he got down from the pulpit. When Mr. Cleveland sent in his Venezuela message, he virtually announced that there was a wreck ashore, but he has found out that he must take his chance of getting down to the beach with the rest. There is no consideration for him on account of his pastoral character.

We hope he now sees the character of the body into which he flung this terrible

firebrand. He suggested to a body of idle, ignorant, lazy, and not very scrupulous men an exciting game, which involved no labor and promised lots of fun, and which would be likely to furnish them with the means of annoying and embarrassing him. They are richly, as he must see, availing themselves of their opportunity. They are determined to find somebody to threaten or challenge, and even if he gets Spain away from them, they will find another victim. They are out for a lark, and if they can do nothing else will "clean out a saloon." We are sorry for him in his trouble about these concurrent and joint resolutions, but we should have been sorrier if he had got off without any trouble. It would be a bad thing for our government if the "digging of holes" were pure pastime. Governments cannot be carried on for any great length of time in this way. We cannot convert our whole territory into a rabbit warren, with Presidents and Congressmen sticking out of the ground here and there. Agriculture, trade, and commerce and all the serious business of life have to be attended to.

But one thing is certain, neither the Fifty-fifth, nor the Fifty-sixth, nor the Fifty-seventh Congress will be any better than these last three, or so good as these last three, if there is not a strong and general effort by all classes and conditions, and above all by those who have the ear of the public, with voice and pen, to revive the practice of honest and frank popular discussion. There is not much use in correcting the errors of the present Congressmen with regard to war, because they are sure to begin to commit fresh ones in some other field. Their goings on about war are the products of precisely the same mental conditions as the goings on about currency and taxation. Childish in one, childish in all. The reason why a Congressman is so ready to fight England or Spain is the reason why he thinks the Almighty has put silver and gold in the ground in the proportion of 16 to 1, and why he thinks credit is an invention of the money power for the oppression of the poor. We are not contending with political errors so much as with sheer, crass ignorance, with imperfect civilization, and incomplete mental development. And the next Congress will be just as bad as this one, and some great calamity will overtake us if everybody does not get into the way of speaking out his honest thought.

Our present Congressmen are the product of thirty years of government by intrigue, concealment, and bribery. Open discussion, in which public men say exactly what they think without fear, seems to have died out with slavery and the war. There are many men in Congress who think about all this tomfoolery exactly as the civilized world thinks, but either hold their peace about it or pretend to admire it, because they fear that if they did not "take a hand in the racket," they would lose their influence. There are others, like Mr. Sherman, who excuse themselves

for fathering some monstrous folly, like his silver bill or the Cuban resolutions, by pretending that they did it to "head off" something far worse. The result is that both Congress and the public are left without that instruction on the great topics of the day, from competent men in public life, without which no government of a great nation can go on. Those who speak out among us are a mere handful, and generally do it with bated breath and many placatory clauses. Our present Government, for instance, is simply impossible for a community with an immense system of credit and foreign trade. To have an assembly of breech-clouted warriors, who are daily shaking their tomahawks at all strangers, presiding and legislating for a nation which has a stock exchange and banks in every town, and in which the poorest man is interested in the condition of the money market, is an absurdity. No such régime can last. But we shall have no change for the better as long as our leading men are afraid to let the warriors know that we have definitively broken with the old savage life, live by trade and industry, and take no scalps.

A CUBAN CATECHISM.

- (1.) Q. What is belligerency? A. Waging war.
- (2.) Q. What is a belligerent state? A. A state waging war.
- (3.) Q. What is a state? A. Any sovereign political organization having a definite territorial extent, regularly organized military forces, and an established government.
- (4.) Q. Does it matter what the origin of this organization is? A. Not at all. It may originate in the peaceful division of one state into two, or it may be established by revolutionists, cut-throats, and pirates.
- (5.) Q. Does it matter whether the organization has been lawful as regards the original state from which the new state has become separated? A. Not at all. If unlawful, the new state is a state *de facto*, or in fact; otherwise, it is a state *de jure*, or legally. It may be both.
- (6.) Q. Why must such a state have the features described in the answer to Question 3 to be recognized as a belligerent? A. Because without such features other states cannot have any dealings with it.
- (7.) Q. How is that? A. Without political organization, at the head of which some human being or body of human beings stands, it is impossible to communicate with it; without a definite territorial extent, it is impossible to find it; without regular military organization there is no discipline or responsibility, and acts of violence become robbery on land and piracy on the seas.
- (8.) Q. What difference does all this make to another state? A. It cannot compel justice to its own citizens who may reside or transact business there.

(9.) Q. Explain this. A. Unless it can collect taxes, it can pay no claims against it; unless it has efficient machinery for the administration of justice, it can redress no wrong, enforce no contract, and protect no property; unless it has a regular army, it cannot insure domestic tranquillity or obedience to its commands.

(10.) Q. Supposing an insurrection not to have military and political organization, who is responsible for it to other states? A. The state against which the insurrection is made.

(11.) Q. In case of such an insurrection in Cuba, who is responsible for destruction of American property, the lives of American citizens, and the interests of such citizens having business relations with the island? A. Spain.

(12.) Q. If Cuba were recognized as a belligerent? A. Nobody.

(13.) Q. If the United States should recognize Cuba under such circumstances as a belligerent, what would its own position become? A. That of a neutral.

(14.) Q. Would the obligations of our citizens be increased or diminished? A. Increased.

(15.) Q. How? A. By the fact that whereas now we can sell arms and munitions of war to any purchaser in Cuba, such arms and munitions would, in case of a recognition of belligerency, become contraband of war, and liable on any attempt at importation to seizure and confiscation by Spain.

(16.) Q. Might American vessels be confiscated? A. They might under certain circumstances.

(17.) Q. What redress would American owners have? A. None whatever.

(18.) Q. Is there any proof that a belligerent state now exists on the island of Cuba? A. None whatever.

(19.) Q. Assuming that to be the fact, to whom can we look for protection to American interests, or redress for wrongs to American citizens, if belligerency is recognized? A. To nobody.

(20.) Q. Why? A. Because the recognition of belligerency releases Spain from responsibility, without putting any one in her place.

(21.) Q. Why does it release Spain from responsibility? A. Because it is an announcement by us that we believe Cuba is a government capable of assuming the responsibility that we demand of every state. If Cuba is not such a government, so much the worse for us.

(22.) Q. What is the statement that the Cubans form a belligerent state? A. If made knowingly, a falsehood.

(23.) Q. That being the case, what can you say of the Senators and Representatives who pass a resolution that the fact exists? A. Some have made a false statement, and embodied it in a solemn public act; some have behaved like fools; some have done both.

(24.) Q. To give this resolution practical effect, is what they have done suffi-

cient? A. No; their resolutions are mere words.

(25.) Q. What more is necessary to accomplish recognition? A. Action by the President.

(26.) Q. Upon whom, then, does the responsibility now rest? A. Upon him.

(27.) Q. Would recognition by him lead to war? A. Very likely.

(28.) Why? A. Because the commerce between the United States ports and those of Cuba is constant, and some collision between Spanish and American ships would almost certainly occur. An armed collision having occurred, it might easily become impossible to restrain the war feeling excited on both sides by Congress and the press. When two countries go to war, it is not generally the result of a deliberate act on both sides.

(29.) Q. What is the most terrible responsibility that any one can assume? A. That of involving his country in a needless war.

(30.) Q. Is there any reason for thinking that the President will do this? A. No.

(31.) A. Why? Q. Because he knows, first, that Cuba is not a belligerent state; second, that Congress knows it; third, that the object of Congress in passing belligerency resolutions had nothing to do with Cuba.

(32.) Q. What was their object? A. To "put Grover Cleveland in a hole."

(33.) Q. Have they tried this before? A. Yes.

(34.) Q. Have they ever succeeded in doing it? A. No.

STYLISH OPINIONS.

AGAIN have we an example of how much better they do these things in France. To the lucidity and logic of a Frenchman, M. Pierre Lalo, does the world owe the discovery that we as much need a manual of fashionable opinions as we do of etiquette and dress. He has accordingly issued proposals for a 'Petit Guide des Opinions Elegantes pour 1896.' Instead of following the praiseworthy "society" editor of the *Tribune* into such discussions as "What Men are Wearing to Afternoon Tea," he addresses himself to the much more needed task of telling them what they shall talk about, and what views they shall maintain, after they get to afternoon tea. Clearly perceiving that a last-year's opinion is really more damning in the eyes of truly cultivated people than a last-year's hat, he applies himself to the work of giving opinions, to go with clothes, of the latest cut.

A few samples of the literary and artistic trousseau he stands prepared to furnish will show the merit and usefulness of his plan. Shakspeare, he tells his French patrons, you will still do well to praise moderately; all you need to know is that *Lear* was not a gay young lover, and that *Lady Macbeth* was for some reason desperately anxious to wash her

hands. This amount of knowledge, with assorted epithets, will amply fit one for moving in the most select circles. As for Goethe's works, all you need to remember is that they contain "a complete philosophy of life"; to read the books themselves would be a wholly unnecessary trouble. At the mention of Ibsen's name a sacred enthusiasm should glow upon your face, and broken interjections—"What daring!" "What force!"—should fall from your lips. It will be considered quite the thing, this year, to call him Henrik the Northman, and to speak of the "vast intellect" of this modern seaking. D'Annunzio is going out, and this season they will not speak of him in the most refined society. Shelley and Swinburne will be casually mentioned, but only in certain drawing-rooms—which, it will take no little social tact for you to make sure of in advance. The Russians are quite gone out, and so you need not trouble yourself to know even their names.

We cannot follow M. Lalo through his descriptions of musical and artistic fashions, valuable as they are. They are directed to French readers, and hence scarcely fitted for columns so carefully guarded from foreign contamination as these. But his idea is eminently worthy of praise and imitation, with such modifications as may be needed to fit it for this climate. Americans are certainly like Frenchmen in not being born with a full set of literary and artistic opinions. These, with their changing styles, have to be acquired, even in this country of unsurpassed opportunities, just as knowledge of fashions in dress and furnishings has to be acquired. With labor-saving guides and royal roads to knowledge provided so abundantly in the one case, why should they not be introduced in the other? It may be too late to catch this year's market, but a 'Guide to Polite Opinions for 1897,' prepared betimes, would be sure to meet with an enormous sale. We throw out the hint, with characteristic generosity, for what it is worth.

Such a guide would be only a fit recognition of the way in which literature and art have become socialized, so to speak. We refer to the great truth that books are now valued mainly for their social function. They are read only because they are talked about, and only in order to talk about them. Even so, and with the limits thus happily narrowed, an unpleasant deal of reading has to be done by those who aim to acquit themselves creditably in the best society. But a safe and condensed guide would serve all purposes and save much valuable time. Index-learning of this kind, that makes no student pale, would recommend itself mightily to those who are compelled to give as much thought to their complexion as to their conversation. This is the age of literary pemmican—of books about books, condensed masterpieces, shortened college courses, and learning while you wait—and why should we not have the thing carried

to its logical conclusion, and ready-made opinions put within reach of the humblest purse?

It may be demanded that we should ourselves essay an outline of the kind of manual we have in mind. But we cannot prophesy so far before the event. We can only say what we wish might be fashionable. If it were in our power, most gladly would we ordain the literary fashions for 1897 as follows: Criticism this year will all be "genial"; all book-notices will be "handsome"; foreign fiction will not be so much as mentioned in good society; the long-sought American novel will be found, twenty or thirty strong—. But we forbear. "The apprehension of the good gives but the greater feeling to the worse." Such a millennium can scarcely be due next year.

But though our courage and capacity are unequal to the task, we can see in the work of others bright promise of just the sort of thing needed. Here is Prof. Matthews's 'Introduction to American Literature,' for instance, which needs but a slight extension in order exactly to meet the case. He has a "brief chronology" at the end, in which we learn that the leading literary events of 1895 were the publication of Fuller's 'With the Procession,' Howells's 'My Literary Passions,' Roosevelt and Lodge's 'Hero Tales of American History,' and Stockton's 'Captain Horn.' This seems primarily designed to show how far we have got on since, say, 1841, when such crude pioneers as Cooper, Emerson, Longfellow, Lowell, and Poe were all we had to boast of in the publishers' lists. But it is clear that a little jump forward in this "brief chronology" would at once land us in 1896 or 1897, and, by simple expansion and due provision of graded adjectives, give us in American socio-literature just what M. Lalo proposes to furnish in French. We have Mr. Roosevelt's word for it that this work of Prof. Matthews's, which we should like to see extended in this way, is, as it would need to be, thoroughly American. (It should be said, in passing, that Messrs. Lodge and Roosevelt are just as firmly determined to found a patriotic literature as they are to have a patriotic war.) Mr. Bunner, too, has lately explained how this author got his truly American culture direct, as it were, and not in the painful and roundabout way via England which Lowell and Hawthorne had to pursue. That Mr. Bunner is an authority is clear from his figuring in Prof. Matthews's "brief chronology." So does Mr. Roosevelt more than once. Hence, of his warm commendation of Prof. Matthews, we can say with Dr. Johnson, "This, if not criticism, is at least gratitude."

POPE ALEXANDER VI.'S BULL, AND THE TREATY OF MUNSTER.

GEORGETOWN, February 11, 1896.

ON opening the volume entitled 'Venezuelan International Law,' the first document that

presents itself is the Bull of Pope Alexander VI., dated May 4, 1493, in which that Pontiff fixed the line of demarcation of the domains of the Crowns of Spain and Portugal in America. Of Roderigo Borgia, who filled the Holy See at that time, the world has held but a poor opinion; but this particular act of his has rendered him famous, while other acts have proved him infamous. The manner in which the historian Robertson characterizes the granting of the Bull is such as will not be discredited from by Americans. The following are Dr. Robertson's words:

"The Pope, as the Vicar and representative of Jesus Christ, was supposed to have a right of dominion over all the kingdoms of the earth. Alexander VI., a pontiff infamous for every crime which disgraces humanity, filled the papal throne at that time. As he was born Ferdinand's subject, and very solicitous to secure the protection of Spain in order to facilitate the execution of his ambitious schemes in favor of his own family, he was extremely willing to gratify the Spanish monarch. By an act of liberality which cost him nothing, and that served to establish the jurisdiction and pretensions of the papal see, he granted in full right to Ferdinand and Isabella all the countries inhabited by Infidels which they had discovered or should discover; and, in virtue of that power which he derived from Jesus Christ, he conferred on the Crown of Castile vast regions, to the possession of which he himself was so far from having any title that he was unacquainted with their situation and ignorant even of their existence."

Pope Alexander having given to Spain what did not belong to him, one cannot be surprised that the other European sovereigns did not admit the exclusive right of the most Catholic King to the New World. When Cabot went forth from England in 1497, he was commissioned by King Henry VII. (a very good son of the Church) to take possession of such lands as he might discover in the New World and to set up the royal standard there. King Francis the First of France not only desired to "see the clause in Adam's will which entitled his brothers of Castile and Portugal to divide the New World between them," but sent out Verrazano, in 1523, to prosecute discoveries in the northern parts of America, whence came the colony of New France. The Dutch traded to South America while yet they were subjects of Spain. When the Dutch threw off the yoke of Spain they were "not Christians, but Hollanders," as they are said to have told a sovereign of Japan. As early as 1581 the States-General of Holland passed resolutions (June 10 and 14 and July 7 and 22) declaring certain persons privileged to trade to the coast of Guiana.

In the latter part of the sixteenth century and in the early part of the seventeenth century, the three maritime nations set to work in earnest to found colonies in the New World. This movement was not confined to North America. It was in active operation in South America at the same time. There it was confined to Guiana, which was also known as the Wild Coast. While Englishmen, Frenchmen, and Dutchmen were severally building up a New England, a New France, and a New Netherlands, in North America, their respective countrymen were engaged in making settlements in various places in Guiana. In the case of England, it was one and the same man, Sir Walter Raleigh, who promoted colonies in Virginia and at the same time bankered after establishing English rule in Guiana. Owing to the difference in the conditions of life (notably as to climate), the results were unequal; but the colonizing intention was identical in the two regions. In either case settlements were

made in despite of Pope and Spaniard. It is to the absolute repudiation of the Spanish pretension to an exclusive right to North America that the republic of the United States owes its existence. The colonies whence it sprang were mainly founded at a time when Spain claimed the whole of North America. Did not Spain threaten to send ships to Virginia to remove the English colonists? (Bancroft's 'History of the United States,' 1876, vol. i., p. 111.) The Spaniards, indeed, recognized the Dutch settlements in Guiana before they recognized those of the English in North America. Even the Venezuelans admit that, by the Treaty of Munster, the Spaniards were good enough to permit that the Dutch might keep such colonies as they held in Guiana. The Treaty of Munster was made in 1648. Now what does Bancroft say as to Spanish recognition of English colonies in North America? Here are his very words:

"The first treaty relating to England and America between Spain and England was ratified in 1667 and made more general in 1670. Before that time, Spain had claimed not the territory of the Carolinas only, but that of Virginia, New England—in short, of all North America. By this convention she recognized as English the colonies which England then possessed; but the boundaries in the South and West were not determined." ('History of the United States,' 1876, vol. i., p. 533.)

There cannot be one standard for judging the rightfulness of making settlements in North America and another for making settlements in South America. If it was wrong for European nations to colonize in Guiana, it was equally wrong for them to colonize in North America. If any Americans hold that Pope Alexander's Bull gave the Spaniards an exclusive right to the New World, they must perceive that the only logical conclusion to such an admission is that the great Republic is possessed of much territory that was stolen from Spain. If restitution is to be made for the great wrong done, a beginning might well be made by handing over the State of New York to the republic of Venezuela; for did not England obtain the Dutch colony whence grew the Empire State by giving Surinam in exchange for it? And who does not know that if the Venezuelans "had their rights," Dutch Guiana (including Surinam) of to-day should form part of that republic? To Americans the situation should be a painful one. They have consciences. The Briton, unscrupulous and unprincipled, "always grabbing what does not belong to him," still carries a brazen front. He will probably tell you that when the Irish in America respect the Papal Bull which erected Ireland into a kingdom for the King of England, and not till then, will he have reason to think of respecting Pope Alexander's authority to give away what did not belong to him.

Venezuelans set great store by the Treaty of Munster, in 1648. It is hard to see how that treaty upholds their present "claims." By its fifth article, provision was made that each party should retain possession of what it "held and possessed." This, surely, did not refer to lands then unoccupied by any Christian Prince. Now, what were the respective possessions of the Spaniards and the Dutch at that time in Guiana? The Orinoco was "a forgotten Colony." Putting aside the missionary settlement of San Thomé, which was made on the Orinoco in 1576 and was destroyed by the Dutch in 1579 (a settlement, be it noted, only of Indians, besides the two religious fathers), it was not until 1591 that Berreo's settlement of ten Spaniards, at his town of San Thomé, was formed. That was eleven years after the Dutch had

made their settlement of Nova Zealandia, on the Pomeroon. Before this, the Spaniards had sent some expeditions into the Orinoco, which had suffered at the hands of the Caribs and by disease. The Venezuelans say:

"The first discoveries of the Spaniards had not, however, extended at first beyond the shores of the Orinoco, nor had those of the Portuguese extended further north of the Amazone; and it was only by virtue of successive and partial expeditions that both countries gradually extended their dominions with the right of first occupants" ('Venezuelan International Law,' p. 169).

But where is the proof of extension of dominion, or of occupation? The insignificance of the Spanish "holdings and possessions" in the neighborhood of the Orinoco may be gathered from the subjoined extract from the well-known work of the French philosopher, Raynal:

"In 1771, thirteen villages were seen upon the banks of the Oronoko, which contained four thousand two hundred and nineteen Spaniards, Mestees, Mulattoes, or Negroes, four hundred and thirty-one plantations, and twelve thousand eight hundred and fifty-four oxen, mules, or horses."

After stating that Columbus had discovered the Oronoko, Abbé Raynal says:

"The Spaniards, who could not pay attention to all the regions they discovered, lost sight of the Oronoko. They did not attempt to sail up this river again till the year 1585, when, not having found there the mines they were in search of, they neglected it. Nevertheless, the few who had been thrown upon this spot devoted themselves with so much assiduity to the culture of Tobacco that they delivered a few cargoes of it every year to the foreign vessels which came to purchase it. This contraband trade was prohibited by the mother-country, and this weak settlement was twice plundered by enterprising pirates. These disasters occasioned it to be forgotten. It was recalled to mind again in 1753. The Commodore Nicolas de Yumiga was sent there. This prudent man established a regular system of government in the colony that had formed itself insensibly in this part of the world" ('History of the European Settlements in the East and West Indies,' by the Abbé Raynal, vol. iv., p. 73).

Such as they were, the Spanish settlements were identified with the Orinoco rather than with Guiana. Raynal's view covers the period of the Treaty of Munster and comes down to 1771. It is well to be borne in mind that the scanty settlements of the latter date were on both banks of the Orinoco, not on the Guiana side only. Raynal's account confirms that given by the New Englander, Bancroft, in 1768, when he wrote that the Spaniards had then "no other possessions in this country, except their settlements on the eastern side of the River Oronoque, near the confines of its limits, and therefore can hardly be included among the proprietors of Guiana" ('Essay on the Natural History of Guiana,' London, 1769, p. 273).

As with the English colony of Carolina, in North America, in the seventeenth century, so, in the sixteenth, seventeenth, and eighteenth centuries in South America, did the Spaniards deem their possession of some isolated place "proof of the actual possession of an indefinite adjacent country." In South America the puny settlement at San Thomé, on the Orinoco, gave them a pretence to claim the whole of Guiana, a country of about 900,000 square miles, extending from the Orinoco to the Amazon. In North America they claimed Carolina, in like manner, as Bancroft tells us:

"It was included by the Spaniards within the limits of Florida; and the Castle of St. Augustine was deemed proof of the actual possession of an indefinite adjacent country. Spain had never formal-

ly acknowledged the English title to any possessions in America; and, when a treaty was finally concluded at Madrid, it did but faintly concede the right of England to her transatlantic colonies and to a continuance of commerce in the accustomed seas" ('History of the United States,' 1876, vol. i., page 484).

When the Dutch were establishing their colony of New Netherlands in 1621-1622, they were regarded by the New Englanders as "intruders." The Privy Council in England was appealed to by the English colonists, and representations were made in February, 1622, by Sir Dudley Carleton, the English Minister at The Hague ('History of the U. S. A.,' 1876, pp. 38, 39). All was done in vain. The Dutchmen remained in possession. Although North America had been discovered by a Venetian serving the Crown of England, as South America was discovered by a Genoese serving the Crown of Spain, it was physically impossible for the English of that time to occupy, hold, or possess the whole of that vast region. Hence, the French, the Dutch, the Swedes, and the Spaniards had each possessed themselves of portions of the northern continent. Each claimed more than it did, or could, possess, excepting, perhaps, the Swedes, whose settlement on the Delaware was looked upon as an encroachment by the Dutch. As the New England settlers had not occupied the Hudson and its neighborhood, the Dutch had a right to settle there. With even stronger rights could the Hollanders and Zealanders make settlements in Guiana, where vast regions were unoccupied by any Christian prince or people. They rightly held that Spanish possessions in Guiana meant little more than a mere château in Spain.

N. DARNELL DAVIS.

NAPOLEON AND ALEXANDER I.

PARIS, February 27, 1896.

YOU see sometimes, at the end of a warm summer's day, two large clouds moving slowly towards each other, gradually extending and getting darker and darker; they finally meet and the first peals of thunder are heard. I could not help thinking of this preparation for a great convulsion of nature while reading the third volume of M. Albert Vandal's great work on Napoleon and Alexander I. of Russia. The volume has for its subtitle "La Rupture." Like its predecessors, this huge volume of 600 pages consists of ponderous and elaborate diplomatic documents, drawn from our archives; it has a certain sort of solemnity which easily becomes fatiguing. The details of the incessant negotiations between the courts are often wearisome, and the author indulges in a profusion of considerations which are almost a burden on the mind of the reader. The style, too, is often pompous and elaborate, and is always wanting in simplicity and alertness; but you feel, at the same time, that the author has great sincerity and is constantly striving after historic truth. He spares no pains, he is absolutely impartial, and his seriousness is that of a judge.

The events he has to deal with, the actors whom he has to endue with life, deserve such a great effort. There was perhaps never in the history of our time a more extraordinary, a more solemn hour than that in which the fate of Europe seemed to be in the hands of these two men alone, Napoleon and Alexander. They divided the civilized world at Tilisi; they formed an alliance which for a time was irresistible. M. Vandal has told us in his two former vol-

umes how this alliance was induced and how it was formed; he has shown us, also, what dangers threatened it from the first hour, and what secret motives were actuating the two sovereigns who, in the eyes of the world, had become united on all points. Poland was the sore spot, the cause of a growing distrust between Napoleon and Alexander. Napoleon wished, in order to keep his hold on Germany, to make of Poland a sort of *état de pont*, an advanced sentinel; whereas Alexander looked upon a new Poland, rising resuscitated at the summons of Napoleon, as a sword piercing the vitals of Russia. He could not bear the idea of the reconstitution of the ancient kingdom which had been dismembered in the eighteenth century, and as soon as this dread entered his mind he prepared himself to put an end to the alliance.

Alexander complained first of the incorporation of the Duchy of Oldenburg in the French Empire. The duchy belonged to a prince who was connected with the Russian imperial family. "The true reason," says Joseph de Maistre, "which induces two men to cut each other's throats, is almost never the apparent reason which is given." M. Vandal is right in showing that the true reason was Poland. "The monstrous development of the French power, the progress of a frontier which moved and changed constantly, the recent seizure of Holland and of the Hanseatic cities, the extension of the territory of the Empire to the shores of the Baltic, the enslavement of Prussia, the growing exigencies of the Continental blockade, denoted a plan of universal domination which Alexander felt it incumbent upon him to resist. But the Duchy of Warsaw was the vanguard of France in the north, and at contact with it Alexander lost patience." In great secrecy he sent Prince Czartoryski to Warsaw, offering to the Poles to transform the duchy into a kingdom, united to his own empire, if they were willing to join the army of 200,000 men which he was silently forming against Napoleon—for he was then thinking of an offensive war. He knew that Spain was absorbing a great part of the French forces; he believed that the Saxon, Bavarian, Westphalian, and other German troops which were mixed up with the French troops, would not remain faithful if he could cut his way in Germany. He had first, however, to deal with the Duchy of Warsaw, with Sweden and with Turkey; if he made an offensive war, he could not leave enemies behind him. Bernadotte hated Napoleon, but was not yet absolute master in Sweden. Russia was carrying on a war with Turkey and negotiating at the same time. It was necessary, further, for Alexander, if he made an offensive war, to secure the neutrality of Austria; but since 1810 the relations of Napoleon with Austria had become intimate and were the scandal of Europe. The Emperor Francis had given his daughter to Napoleon, and Metternich was living in intimacy with him, turning a deaf ear to all the advances of Russia.

Alexander soon renounced the idea of an offensive war. Czartoryski sent him a disguised agent with a letter full of objections to the plan which Alexander had confided to him; Alexander sent to Czartoryski a second letter. "The difficulties are great, I confess; as I had foreseen them in great part, and as the results are of such vital importance, to stop half-way would be the worst thing to do." Alexander in this second letter said that he counted chiefly on "the general exasperation of Germany" against the French Emperor, and he set over against the 150,000 French and allies whom

Napoleon could find in Germany, 300,000 Russians, 130,000 Poles, Prussians, and Danes, perhaps 200,000 Austrians. As for Austria, he was prepared to buy her neutrality by the offer of Wallachia and Moldavia, in exchange for Galicia. His own armies were in complete readiness; everything was calculated and combined; it remained for the Poles of Warsaw to choose if they wished to abandon the French cause or to remain on the side of Napoleon.

M. Vandal shows us how Alexander was preparing the ground in Austria, where he had accredited a secret agent, just as Louis XV. used to have (read the 'Secret du Roi' by the Duke de Broglie). This agent delivered to Stackelberg, who was the Russian Ambassador in Vienna, letters from Alexander which had not been shown to Alexander's minister, Romanzoff. A secret correspondence of the same sort was kept up with the Prussian Court. In Paris, the official representative of Alexander was Kurakin, old, infirm, and of feeble intellect; behind this phantom was young Count Tchernitcheff, colonel of the guards, who had organized a complete system of military information. Tchernitcheff was one of those spies of society with whom Paris is well acquainted, and by whom it likes to be half deceived; he was a great favorite in society—it was said that Pauline Borghese, the handsome Pauline, was not insensible to his homage. He was in reality the vigilant eye of Alexander.

Alexander maintained mysterious relations with Talleyrand after Erfurt, and had accredited near him young Count Nesselrode. Soon after the interview, Nesselrode, who was then secretary of the Russian Embassy in Paris, presented himself to Talleyrand, and said to him in proper terms: "I am officially employed under Prince Kurakin, but I am accredited to you. I am in private correspondence with the Emperor, and I bring you a letter from him." Ever afterwards, they saw each other regularly. The secret was well kept. The French Ambassador in St. Petersburg was a soldier, Caulaincourt, recently made Duke of Vicenza; he suspected nothing. He was treated at court as *persona gratissima*, and was the object of the most delicate and constant attentions on the part of the Emperor. In the first days of 1811 Caulaincourt dined at the palace. The news of the incorporation of the Hanseatic cities in the French Empire had just arrived. "Do you know," merely remarked the Emperor to Caulaincourt, "that you have again new departments?" Caulaincourt tried to justify Napoleon: France was going to do a great work, to open a canal between the Baltic and the North Sea; the commerce of Russia would be greatly benefited by it. "Well," said Alexander, "it will not be Russia who will put an end to the amicable relations between the two countries." A few days afterwards Oldenburg was seized. Within a fortnight Alexander ceased to invite Caulaincourt; when he saw him again, he assured him that he would himself keep faithful to the treaties. "If Napoleon," said he, "comes on my frontier, if he wishes for war, he must make it, but he will have no cause of complaint against Russia. I give you my word of honor." Caulaincourt was under the charm of the Emperor. He did not understand him and perceive that the grace of his manner concealed a fixed and resolute purpose. We read in the memoirs of Countess Trembicka that Alexander's eyes never smiled like his lips: "His fixed gaze, almost alarming by its fixity, was never on his interlocutor, and seemed absorbed

in the contemplation of a mysterious phantom."

Napoleon, at the height of his power in the beginning of 1811, felt, nevertheless, that all he had tried against England with a view to obtain a general peace had been vain; he felt that the Continental blockade was useless so long as it was not universal and complete. Masséna was powerless before the lines of Torres Vedras, and Napoleon could not strike a decisive blow in Spain. A reconciliation between England and Russia was always possible. A Russian ukase, prohibitive of French goods, was considered by Napoleon as a sign of hostility, all the more that it had been signed by Alexander before the seizure of Oldenburg. Napoleon said, speaking of Russia, "There is a great planet taking a false direction." During three sleepless nights he meditated on the situation, and came to the conclusion that Russia was preparing for war and that he must prepare himself also. He will not await an attack, but forms privily the plan of a campaign in Russia. As usual, he fixes all the details of his enterprise; nothing is forgotten. He has to conceal carefully the importance and the object of his preparations, but this time his designs are understood. Alexander watches all his steps. Diplomatically, the advance is taken by Alexander, who secures Bernadotte and prepares the ground in Austria and in Turkey. M. Vandal enters into the minutest particulars regarding the diplomatic preparations and negotiations which preceded the great struggle. Napoleon was becoming more and more convinced that it was his mission to break the power of Russia; he was the representative of civilization, the true successor of Cæsar and Charlemagne, the true successor, also, of the kings who had always felt it their duty to place obstacles in the way of Muscovite ambition, and to surround the Slavic empire with a chain of allied Powers—Sweden, Poland, Turkey. Napoleon, with the clearest head and one most capable of entering into the smallest details, was also a man of imagination; if Alexander would not be his obedient ally, his power must be broken for ever.

The military preparations continued on both sides. Napoleon became convinced after a while that Alexander was getting ready for war, for a long and terrible war if necessary. The French Emperor had not allowed the public to know anything of his projects, his fears, his hesitations; but, once having made up his mind, he struck, as usual, a great blow, and felt a desire to expose publicly the intentions of his rival. The occasion he chose was the 15th of August, his birthday. On that date a grand reception took place at the Tuilleries. After the mass the diplomatic audience began. Napoleon took his place on his throne. The princes, the great dignitaries, the great officers of the Empire paid their respects first; then came the diplomatic body. Old Prince Kurakin, who was, as usual, covered with diamonds and decorations, was next to Prince Schwarzenberg and the Spanish Ambassadors. The Emperor made what is called "the circle," having here and there a foreigner presented to him by the Grand Chamberlain; on that day three American citizens were presented. After a while the Emperor walked towards Kurakin and began to converse with him. The Russians were very brave, but they bad, he said, been obliged to evacuate Rustchuk, their *île de pont* on the Danube. It was always better to be on both sides of a river, as he had learned at Lobau. And why did the Russians withdraw their troops from Rustchuk? It was because five divisions had been sent from Tur-

key to Poland. He did not understand these movements of troops in Poland. "I am," said he, "like the natural man; what I don't understand alarms me." Becoming more excited, he continued: "It is not the Duchy of Oldenburg that occupies you; you think I have designs on Poland; I begin to think that you want to be masters of Warsaw. Don't flatter yourselves; no, if your armies were camped on the hill of Montmartre, I would not cede an inch of the Varsovian territory. I have guaranteed it. You shall have not a village of it, not a mill. I do not think of reconstituting Poland—the interest of my people is not bound up with that country; if you force me into a war, I will use Poland against you." He could bring 800,000 men into line; he had every year 250,000 conscripts at his disposition. Kurakin could not get in a word, he was so moved and terrified. "Why did Russia," said Napoleon, "leave Turkey and turn on Poland? You are like the hare who has received some shot; he rises half mad on his hind legs, exposing his whole body to a new discharge." He thus entertained Kurakin for three-quarters of an hour, giving himself up to a premeditated passion. The poor Prince went away, sweating in his gilded coat, but merely muttering, "It is very warm at his Majesty's!"

Correspondence.

CAPT. JAMES MACKAY.

TO THE EDITOR OF THE NATION:

SIR: I am prompted by the remarks in the *Nation* of the 5th inst., on Prof. Woodrow Wilson's article on "Colonel Washington," in *Harper's* for this month, to mention an error which that writer has fallen into by following too closely the letters of Governor Dinwiddie, who always wrote of Capt. James Mackay and his independent company as from South Carolina. This statement is repeated by Prof. Wilson.

Capt. Mackay came to America as a young officer in Oglethorpe's regiment, and, after serving with that command for some time, he settled upon a tract of land on the Ogeechee River, to which he gave the name Strathy Hall, his home as long as he lived. He held offices of honor and trust in the colony of Georgia, and was for several years a member of the Council of the Royal Governor, Sir James Wright. The frequent reference to him by Governor Dinwiddie as from South Carolina is, therefore, rather remarkable.

General Washington was, however, a little more careful; for, in replying to a letter from Robert Sinclair, a Scotch relation of the Mackays, in 1792, he wrote:

"My acquaintance with Captain Mackay commenced in the year 1754, when I commanded the troops which were sent to prevent the encroachments of the French upon the Western boundaries of the then colonies. Captain Mackay then commanded an Independent Company, either from Georgia or South Carolina, and was captured with me by an army of French and Indians at a place called the Great Meadows. In 1755 he left the service, sold out, and went to Georgia," etc. (See 'Writings of Washington,' edited by Sparks, vol. xii, p. 303.)

Captain Mackay died at Alexandria, Va., early in December, 1785, and his death was thus noticed in the *Georgia Gazette*, Thursday, December 29, 1785: "Died lately, at Alexandria, Virginia, James Mackay, Esq., of this State."

WM. HARDEN,
Librarian Ga. Hist. Society.

SAVANNAH, March 7, 1896.

THOMAS HUTCHINSON'S 'STRICTURES.'

TO THE EDITOR OF THE NATION:

SIR: In his masterly and noble-minded 'Life of Thomas Hutchinson,' just published by Messrs. Houghton, Mifflin & Co., Prof. James K. Hooper gives, on pages 338-339, some account of an anonymous pamphlet issued in London, in the autumn of 1776, entitled 'Strictures upon the Declaration of the Congress at Philadelphia; in a Letter to a Noble Lord, etc.' Very properly, this pamphlet is attributed to Hutchinson by Prof. Hooper. "The document, though unsigned, gives indisputable internal evidence of its authorship." "That Hutchinson was the author is also the opinion of Dr. George E. Ellis." I have in my hand at this moment the means of placing Hutchinson's authorship of the pamphlet beyond the need of mere inference from internal evidence, namely, the very copy of it which was presented at the time by Hutchinson to his predecessor in office, and bearing on the title-page the inscription, "To Sir Francis Bernard Bart From the Author." These words are in the well-known handwriting of Hutchinson.

Yours faithfully, MOSES COIT TYLER.

LIBRARY OF CORNELL UNIVERSITY, March 2, 1896.

Notes.

CHARLES SCRIBNER'S SONS announce 'My Confidences,' the autobiography of Frederick Locker-Lampson; a new biography of Madame Roland, by Miss Ida M. Tarbell; 'A Handbook to the Labor Law of the United States,' by F. J. Stimson; 'Agnosticism and Religion,' by President Schurman of Cornell; a 'Hebrew History,' by Dr. Charles F. Kent of Brown University; 'Shakspeare and his Predecessors in the English Drama,' by Prof. F. L. Boas of Oxford; and a Walton edition of Dr. Van Dyke's 'Little Rivers,' limited to 150 copies of exquisite make.

'Books and their Makers during the Middle Ages,' by Geo. Haven Putnam, A. M., in two volumes; a second edition of this writer's 'Question of Copyright'; 'The History of Oratory and Orators,' by Henry Hardwicke; the fourth and concluding volume of the Writings of Thomas Paine, edited by Moncure D. Conway, together with a popular edition of the 'Age of Reason'; and a new and enlarged edition of 'The American Crisis,' by Frederick D. Greene, are soon to be issued by G. P. Putnam's Sons.

Frederick Warne have nearly ready 'By Tangled Paths: Stray Leaves from Nature's Byeways,' essays by H. Mead Briggs, arranged in a sort of monthly conspectus.

'Russian Politics' is the title of a work, by Herbert M. Thompson, shortly to be brought out by Henry Holt & Co. Each chapter will conclude with bibliographical references.

T. Y. Crowell & Co. will publish 'Southern Side-lights,' a picture of social and economic life in the South during a generation before the war, by Edward Ingle; 'State Railroad Control,' with a history of its development in Iowa, by Frank H. Dixon of Michigan University; 'Taxation and Taxes in the United States under the Internal Revenue System,' by Frederic C. Howe; and 'Proportional Representation,' by Prof. John R. Commons of Syracuse University.

A volume of translations from Euripides, Theocritus, Anacreon, and Sappho, by Miss Jane Minot Sedgwick, is in the press of George H. Richmond.

D. C. Heath & Co. promise a 'Compendium of United States and Contemporary History,' by Annie E. Wilson.

A volume of psychological sketches, 'Six Modern Women,' by Laura Marholm Ramsden, will be issued by Roberts Bros. Duse, Bashkirtseff, Kovalevsky, are three of the six.

William Doxey, San Francisco, announces 'Some Representative Poets of the 19th Century,' by Prof. Melville B. Anderson; 'A Sonnet-Book: Being Sonnets about the Sonnet,' selected by Prof. Anderson; 'Four-Leaved Clover,' Stanford University rhymes by Carolus Alger; 'Na-Kupuna: The Hawaiian Legend of Creation,' a poem in three parts; 'Hawaii: A Missionary Republic,' a history from 1890 to the present day; a 'Guide to San Francisco,' by Arthur B. Barendt; and 'The Wild Flowers of California: Their Homes and Habits,' described by Mary Elizabeth Parsons and illustrated by Margaret Warriner Buck.

The Hubbard Publishing Co. have nearly ready 'Turkey and the Armenian Atrocities,' by the Rev. Edwin M. Bliss and others, with many illustrations.

The Public Opinion Co., New York, will shortly begin publication of "The Hamilton Facsimiles of Manuscripts," documents which in part at least have a bearing on the Monroe Doctrine and the Cuban question.

The first gun, so to speak, in the literary celebration of the Gibbon centenary is a new edition of the 'Decline and Fall' in seven volumes, edited by J. B. Bury, M. A., Professor of Modern History in Dublin University (London: Methuen & Co.; New York: Macmillan). The form chosen is a handy duodecimo; the type, large and clear in a broad and somewhat condensed page. Mr. Bury has not abused his prerogative, either by undue expansion of his introduction or by his annotations and corrections. He adduces some interesting examples of Gibbon's painstaking alterations of the second edition both for greater accuracy and with reference to rhetorical improvement, and in a broad way reviews the quality of this classic work in the light of recent scholarship.

That not more instructive than agreeable work, 'The Burman: His Life and Notions' (Macmillan), which for pure entertainment would worthily find a place on the same shelf with the elder Kipling's 'Beast and Man in India,' has just been issued in a second edition substantially unchanged, and in a single volume instead of two. We spoke our praise of it fourteen years ago, and we shall only add that it merited a well-chosen set of photographic illustrations, in harmony with the elegant letterpress.

A new and enlarged edition of the Rev. Dr. E. C. Mitchell's 'Critical Handbook of the Greek New Testament' (Harpers) has just been issued, advantage having been taken of the completion of Dr. Gregory's 'Prolegomena' to Tischendorf's Greek Testament, and of the recent publication of Miller's fourth edition of Scrivener's 'Introduction,' to improve the first edition, published in 1880. The same general plan has been observed; the several parts treating of the authenticity, the canon, and the text of the New Testament. Part iv., about one-half of the volume, consists of thirteen tables and diagrams for reference; the lists of both the uncial and cursive manuscripts being very complete, with fifteen facsimiles. It may surprise some readers to learn how many manuscripts are owned in this country. In noticing the Apostolic Fathers, as Clement and Polycarp, we miss any mention of the late Bishop of Durham's notable editions, and there is a great dearth of references to German works of criti-

cism. We have observed some misprints in proper names, as *Edensheim* (p. 68), *H. B. Sweete*, and *M. R. Jones* (p. 78). The book will prove useful to the student unprovided with more extensive works.

In 1871 Count Benedetti published a volume entitled 'Ma Mission en Prusse.' It contained the most important of his dispatches as French ambassador at Berlin, and his entire correspondence with the Duke de Gramont (Napoleon's Minister of Foreign Affairs) during his mission at Ems, in July, 1870. Attacked by De Gramont, who declared his explanations to be "inexact," and contested his claim to have succeeded in the prime object of his mission, Benedetti prepared, in 1873, a new and in some points fuller statement of his negotiations with the King of Prussia. This statement, which he decided to hold back at the time, because of the death of De Gramont, now appears as the concluding essay in his volume of 'Studies in Diplomacy' (Macmillan); a large portion of a long preface is also devoted to the same historical episode. Nothing of importance is added to the disclosures that Benedetti made in 1871. The rest of the volume contains articles on the movement of European politics before and after the Franco-German war, reprinted from the *Revue des Deux Mondes*. The translation is faithful, but not idiomatic.

In his new novel, 'Dernier Refuge' (Paris: Perrin & Cie.), M. Edouard Rod again shows himself a vigorous and clever writer. The subject of the story is the favorite one of French novelists, but the share allowed to soul-life is large, preponderating even; and conscience is assigned a serious rôle. The plot is simple, and the characters are few, but strongly marked. At times the account of the inner struggles of the hero and the heroine is drawn out to a dangerous length, but the story as a whole is interesting and not lacking in true pathos.

"Contributions to Biology from the Hopkins Laboratory of Biology," III., published jointly by Stanford University and the California Academy of Science, is a paper of 70 pages and 29 plates on 'The Fishes of Puget Sound,' by Prof. D. S. Jordan and Edwin C. Starks. The work is one of importance. In connection with the names in the list many notes are given. Mainly the work is descriptive; fourteen new species and eight new genera are described, and, besides, there are six new generic names applied to other species. It is to be questioned whether some of the types are sufficiently distinct to warrant separation and higher rank. For instance, the new genus *Zalarges* is founded on a form which from figure or description is hardly separated from *Mauroliscus*, of Cocco, 1838; and, judging from the data given, the four new genera, *Podotheicus*, *Stelgis*, *Averruncus*, and *Xystes*, will on revision probably be run together.

No. 2 of the "Hopkins Seaside Laboratory Contributions," Stanford University, is an able article of thirty-seven pages and fourteen plates on 'The Cranial Characters of the Rock-Fishes, *Sebastodes*,' by Frank Cramer. The author, as a result of his investigation, rightly dissatisfies quite a number of the genera and species into which the genus has heretofore been divided; but he leaves us to wish his comparisons had been carried further, among the differences seen in the skulls of the sexes, for instance. His statement that these fishes abruptly disappear to the southward of the United States to reappear in the temperate and cold waters of western South America, is somewhat incorrect; they retire to greater depths under the tropics—that is all.

The 'Catalogue of Scientific Papers' compiled by the Royal Society of London (London: C. J. Clay & Sons; New York: Macmillan) is concluded in the newly issued eleventh volume (Pet-Zyb). We may remind our readers that the papers here indexed, by author-title solely, are for the decade 1874-1883. Among the weightiest English names is that of Lord Kelvin (Sir William Thomson), and a large number of entries occur under the names of our countrymen, the late C. V. Riley, and Henry A. Rowland, J. A. Ryder, N. S. Shaler, Charles A. White, Burt G. Wilder, etc. A few pages are devoted at the end to anonymous writers, and thus the 900th page of this superb publication is overpassed.

Legislation by States in 1895, briefly summarized and classified and thoroughly indexed, forms the New York State Library Bulletin "Legislation No. 6," a volume of more than 300 pages. This incomparably useful annual comparison is a perfect key to the more or less blind and wayward, largely imitative, and savingly if sparingly original and beneficent law-making in thirty-seven States and two Territories for the year just past. The student of tendencies could have no handier compendium, and it ought to be a check on all contemplated legislation. It will be sent to any address from the State Library at Albany for 35 cents. A new feature is a list of constitutional amendments voted on in 1894 and 1895, as well as those now pending.

Attention has heretofore been called in these columns to the merits of the German literary periodical *Exphorion*. The first number for 1896 (third volume) is fully equal to its predecessors in wealth and variety of material. There are contributions relating to Geibel, Fischart, Le-nau, Jean Paul, and several minor writers; a first instalment of a series of papers on W. von Humboldt (including some hitherto unpublished letters to Schiller), by Albert Leitzmann of Weimar; some fifty pages are devoted to Goethe—Richard M. Meyer, one of his ablest recent biographers, contributing a number of "notes," and Georg Witkowski of Leipzig, reviews (not all complimentary) of five recent books on Goethe. As many as two hundred periodicals, journals, "Beilagen," etc., have been ransacked for articles on subjects pertaining to German literature, yielding a harvest so rich and varied that it would be strange if every student of that literature did not find something of especial interest for him. The number of these titles and references cannot be far from a thousand. We renounce the task of even giving a complete summary of the contents of the number.

The *Archivio Storico dell'Arte* for September-October, 1895, makes up for less than usual wealth of reading-matter by a large number of reproductions after unbackneyed works of worthy masters. Several of Gaudenzio Ferrari's altar-pieces are published as illustrations to an article by Signor Giulio Bonola, on a triptych at Borgomanero. Signor Supino continues his admirable study of the Pisan sculptors with a paper on Nino and Tommaso. Sig. Calzini draws attention to the ducal palace at Gubbio, now dilapidated—its best carvings carried off to South Kensington—tottering, like the splendid town it once commanded, to a squalid ruin, but originally built, with scarcely less splendor than its more fortunate rival at Urbino, for the same Duke Frederic and by the same architect, Luciano Laurano. An even more sumptuous structure, built some sixty years later, the castle at Trent, still remains intact, with its exquisitely carved columns of Verona marble, its gorgeous ceilings,

and its brilliant frescoes by Dosso, Romanino, and Girolamo da Treviso, cared for by the Austrian authorities, who now use it as a barracks, in a way that should be a lesson to the fussy and slovenly art-commissioners of Italy. Signor H. Semper publishes a number of documents furnishing the names of most of the artists employed on this structure, and the precise date of their employment. Several book notices, with copious reproductions after Borgognone, Cossa, and Girolamo da Treviso, complete the number.

Some weeks ago we noted the discovery at Pompeii of the finest and most richly furnished house which the excavations there have brought to light. Good representations of some of the pictures on its walls appear in a late number of *L'Illustration*. One of these, a "Flying Group," composed of the figures of two women, half nude, veiled only by floating drapery, is most remarkable. It is full not only of grace, but of character and strength. Most of the paintings at Pompeii are no more than copies of celebrated pictures reproduced by clever hands; but this last fresco appears to be the original work of a serious artist. The house, which belonged to the opulent family of the Vettili, is to be preserved with all its luxury of decoration untouched. The pictures will be protected against rain and sun by glasses and awnings; the statues will be left on their pedestals, and the furniture and other objects will remain as they were found. It is expected that the same rule will be applied to all houses discovered hereafter, and this will add greatly to their interest.

The first volume of Henri Rochefort's 'Aventures de ma Vie' has been published by Paul Dupont, and within five days reached its eleventh edition. This is one of the greatest *succès de librairie* for long years. The buyers of the volume can hardly, one would say, have followed its chapters as they have appeared daily in *Le Jour*. There is a distinct lack in them of the vivacity and wit which characterize other writings of M. Rochefort, and they contain, too, a good deal of padding. M. Rochefort means to stretch his memoirs out to the extent of four volumes, and he uses his material with a sparing hand.

Scholars who have consulted at Venice the catalogue of manuscripts in the Marcian Library, have been aware at least of a manuscript appendix summarily describing the Greek codices acquired since 1740. These codices have now, under the auspices of the Minister of Public Instruction and the direction of Castellani, prefect of the library, begun to be described bibliographically in print. The first volume to appear takes up No. 78, being the MSS. relating to the Bible and its interpreters. It is provided with an index of codices and another of names. Such of the codices as are dated have their characters facsimiled, with obvious advantage to the study of palaeography.

The Museum of Natural History at Vienna has for a long time been in possession of an Egyptian mummy which was a puzzle to the savants. Its case resembled closely those which contain human remains, and yet the inscriptions upon the outside gave reason to suppose that it was the mummy of an ibis. It was so rare an object that the authorities of the museum were disinclined to open it and unroll its bandages. Recently, however, the idea seized them of taking it to the new school of photography, or "skiagraphy," whereupon the Röntgen rays revealed very clearly the figure of the skeleton of a great bird.

A national Hungarian Millennium Exhibition

will be opened on May 2 at Budapest by the Emperor-King in person, who will also be among the exhibitors in this display, in two sections, of "the intellectual and commercial condition of Hungary in past ages and at the present time." The Sultan of Turkey, by a certain irony, will also be a contributor. Fêtes and historical pageants within the walls of the Exhibition, in connection with a peasant village, will heighten the general interest. The architecture of the great building will be commemorative. Tourists may, therefore, well direct their steps to an historic city which in itself amply repays a visit.

—A remarkable collection is to be offered the coming week by auction. It is known as "The Frossard Revolutionary Collection," and includes, among other things, the so-called Trumbull collection of sketches, with a large addition of arms, relics, and mementoes belonging to Trumbull, the artist, and to Gen. Washington and his family. We looked with some curiosity at the owner's "proem" to the catalogue, hoping to find some proofs of the authenticity of these relics. They have been in the market for some years, and all efforts to trace them through a rather doubtful financial operation to Trumbull have failed. The internal evidence is against their being genuine productions of Trumbull's pen or brush; their historical value is worthless, as they represent impossible scenes and depict individuals in grotesque forms and situations. Astonishing as are the claims made in behalf of the sketches, still more astonishing are the descriptions of the relics and mementoes, each one of which seems to have been carefully described by Trumbull himself, as if he had prepared a full inventory of all his effects, however minute or insignificant. As examples: "Brass fire pan, brought to this country by General Lafayette, and used by him during the war. He presented it to General Lee, who afterwards gave it to me. J. T." An old tray brought from Scotland by P. Henry's father was presented to Trumbull by Patrick Henry, as was a brass blunderbuss. An old lock, presented by Gen. Washington to J. T., purports to have been "brought from England from his (G.W.'s) father's" house! This is but one degree removed from Mark Twain's Fragment of a Russian General. We are treated to Gen. Washington's wash-pan; also to three locks of hair; and an even more remarkable drawing in oil of Martha Dandridge at the age of eight and a half years, painted by John Smybert in 1741! Any one who has even a smattering of Revolutionary history and knowledge of the relations which existed between Gen. Washington and his staff and generals, will find great amusement from a study of this catalogue, and may be recommended to obtain a copy.

—Of late, honors are being lavished upon Herr Adolf Menzel, both at home and abroad; tardy recognition of his greatness as an artist, as well as of the influence he has had upon the development of modern illustration. The most recent distinction, his election as honorary foreign member of the English Royal Academy, is, of all, the most unexpected, since the Academy has always ignored black-and-white, and Menzel, distinguished illustrator as he is, cannot be thought anything but a most indifferent painter. However, the important point is that the attention he deserves has been called to him, so that his name is enjoying a prominence never granted to it before. No moment, therefore, could be

more appropriate for the appearance of the volume on Menzel in the *Künstler-Monographien* series (Leipzig: Velhagen & Klasing), prepared by Professor Knackfuss, the but little known artist who suddenly blossomed into notoriety by his collaboration with the German Emperor in that well-advertised, much-talked-about allegorical picture. Whatever may be one's opinion of the painting, there is certainly no question that the monograph is admirably done. No other book about Menzel contains such a representative series of his drawings, and these are, after all, the best and most significant record of his life's work. They begin with his early and not very interesting lithographs, done in the days before he had found French wood-engravers, and had trained German artists, who could reproduce his designs on the wood block. Then follow illustrations from the Works and History of Frederick the Great, which must ever remain the chief monument to his genius. There are a number of his wonderful battlefields, and of his portraits of famous men; above all, that little masterpiece which shows the famous round table at Sans-Souci, with Frederick and Voltaire sitting side by side. There are single figures from 'The Uniforms of Frederick the Great.' There are numerous studies, leaves torn from his sketch-book. There is, in a word, enough to give those who have not seen the original books he illustrated some idea of his knowledge, his power, his conscientiousness, and his infinite variety as a draughtsman. The reproductions by process are fairly well done and excellently printed, while all necessary facts and dates are duly chronicled in the text by Professor Knackfuss. To its other merits the little book adds that of cheapness: it costs but three marks in Germany. Altogether, it will serve as a useful catalogue to all students of Menzel.

—The French Academy, upon the motion of its venerated *doyen*, M. Legouvé, has just revived what is known as "la discussion des titres." When a candidate presents himself to the Académie des Sciences or the Académie des Inscriptions, it is the custom to discuss his qualifications for membership in the Institute. Then, at a second meeting, his name is voted on. This has not hitherto been the rule at the French Academy. Candidates for the Academy have made, as a matter of rigorous custom, a call upon each of the actual Immortals to ask his suffrage; at the time of election the names proposed were voted on without debate. This will be changed in the future, and the title of candidates to membership in the Academy will be discussed before the vote is taken. This is not the first time that M. Legouvé has put forward the present plan of discussion, nor in fact the first time that he has carried it. He proposed the change in 1868, and it was adopted in spite of the opposition of Guizot, who afterwards, however, changed his mind upon the subject. While it was in force, the names of four candidates came up, each of which gave occasion to fierce debates. Violent opposition was made to the election of Littré, of Renan, of Taine, and of Alexandre Dumas. If there is to be a French Academy at all, it would certainly seem that such men as these should be members of it; but M. Legouvé appears to think that unless there had been free discussion of their titles to membership, not one of them would have been elected. This discussion was given up some time about 1879, after the election of the Duc d'Audiffret-Pasquier, and just before that of M. Maxime Du Camp. "C'est trop tard ou

trop tôt," a wit said. M. Legouvé had at the Academy the support of M. A. Mézières, who was his seconder, and of MM. Gréard, Brunetière, and Jules Simon; but the literary men, as a whole, were against him—why, one does not exactly see; or at least one sees no good reason. It was said that they feared, since few of them are good speakers, that they would not be very well able to back their friends in the debates.

—M. Legouvé supported his proposition in a speech full of interest and of charm, which has since been printed at length in the *Temps*. He has just passed his eighty-ninth birthday, and has been a member of the Academy for more than forty years. But the only sign of age which his speech shows lies in its ripe wisdom and in the tolerance and understanding which length of days ought to bring. It is delightful to read what he has to say of Littré, and of Dupanloup as well; of De Sacy and Guizot, as well as of Renan, Taine, and Dumas. Towards the end, he rises to a noble eloquence; pleading for a deeper feeling of confraternity among members of the Academy, and for a wider tolerance of younger men still outside it, and for at least some desire to understand and appreciate their work. No more sympathetic words have been addressed to the younger school of French writers than these of the venerable and venerated dean of the Academy.

—Marceau, the young general of the French Republic who was killed in battle at the early age of twenty-seven, after having risen to the rank of general and distinguished himself in many campaigns and many battles, is one of the most attractive figures in the military history of the French Revolution. Born in the same year as Napoleon, and but a few months later than Hoche, his early career was full of promise for the future, and, had he lived, he might have attained to a fame equal to theirs. But the Fates willed otherwise, and the name of Marceau recalls rather brilliant promise left lamentably unfulfilled than splendid achievement. More than one excellent biography of Marceau has been published in France, and it is with no desire to depreciate the good will and hard work of Capt. T. G. Johnson shown in his 'François-Séverin Marceau, 1769-1796' (Macmillan), that we express our opinion that a translation of one of the recent biographies—of that by M. Parfait, for instance, or that by M. Maze—would have been more welcome than his original compilation from their volumes. Capt. Johnson is not very much at home in the recent literature of the French Revolution, and, indeed, it could hardly be expected that an officer bearing the letters I. S. C., indicating that he belongs to the Indian Staff Corps, after his name, should be so, and it would therefore have been wiser for him to translate rather than to attempt an original work. The setting of the biography is somewhat defective, and the author's use of authorities somewhat quaint, quoting, as he does, Alison as an authority, and praising the old-fashioned and theatrical work of Beauchamp on the Vendean war as "impartial"; but the events of Marceau's life are correctly given, with an enthusiastic estimate of his most attractive personality. Since there exists, to our knowledge, no other biography of Marceau of any length in the English language, Capt. Johnson's volume may be read with interest and profit by those who are so unfortunate as not to be able to read French, but it is evidently not intended to appeal to the scholar or to the student, since

it is without that most necessary part of an historical work, an index.

—Excepting an appendix on Superficial Anatomy, the new (tenth) edition of Quain's 'Anatomy' (edited by Professors Schäfer and Thane, and published by the Longmans) is now complete. The three volumes comprise eight parts, which may be had separately. Pending a review of the entire work, it may be said here that the two extremes of excellence are represented by the parts on the Nerves and the Sense Organs respectively. Not that, in the former, inaccuracies or omissions are many or great, or that there are wanting commendable features, e. g., the diagrams and tables on pp. 344-356. But there are fewest evidences of progress in respect to method and terminology. The complex cranial nerves precede the simpler spinal. That anatomic bugbear, the brachial plexus, is portrayed on too small a scale and without designation of fundamental features, the so-called "trunks" and "cords." Instead of the brief yet comprehensive designation, *vagus*, the clumsy yet descriptively incomplete *pneumo gastric* is evidently preferred, although there are perplexing and inexplicable inconsistencies, as on p. 269. The author is apparently in a state of toponymic transition, for, while systematically describing the thoracic nerves as "dorsal," and their ventral and dorsal roots and branches as "anterior" and "posterior," he nevertheless (as at the foot of p. 269) uses the modern and exact phrases "ventro-lateral" and "dorso-laterally," and then, as if alarmed at his own explicitness, suddenly relapses into the ambiguities that have so long constituted the opprobrium of anatomic teachers and the stumbling-blocks of their pupils. Professor Schäfer's account of the organs of sense is admirable and is well illustrated by 178 figures, many of them new. The facts and ideas of the new histology are everywhere apparent. The concluding "comparison of the modes of arrangement of sensory cells and nerve fibres in the different organs of special sense" might well have been in larger type. Professor Schäfer has reddited the histologic portion of the part on Splanchnology, but the gross anatomy has been largely rewritten by Dr. J. Symington, who has also added many excellent figures. The "Recent Literature" of each subject is a very helpful feature of this as of all the other parts. The phrases "alimentary canal" and "mucous membrane" recur with wearisome effect—the latter, for example, five times in fifteen consecutive lines. Why not use the unmistakable single words, *enteron* and *mucosa*, the latter practically warranted by the use of *sub-mucosa* on p. 90?

—We cannot be too often reminded that no farther away than the waist of our own continent there lies, almost wholly neglected by American archaeologists, a vast and splendid range of ancient ruins of the first class. Few tourists there have been so well fitted to judge them as Wm. H. Holmes, who visited Yucatan in January and February, 1895. His 'Monuments of Yucatan' (Part I. of "Archæological Studies among the Ancient Cities of Mexico") is of value as an authoritative fresh reminder how important are the Yucatec remains, and how imminent the need of serious, definitive study of them before the pry of tropic roots and the quarrying *paisano* shall have undone them past understanding. Probably nowhere else are such splendid vestiges going to wrack so swiftly. While Mr. Holmes's tour was too hasty and too conventional to throw much new light

on this impressive field, he has done large service in re-emphasizing so clearly the need of examination on Bandelierian lines—one ruin at a time (not necessarily the most sensational one first); measurement, excavation; study of and through present natives; all lighted by the broadest horizon of documentary and field experience. The proof-reading of the book is hardly creditable to the Field Columbian Museum, of which it is publication 8; and there are traces of other carelessness. Misspellings like "Le Plougon" may happen, but endemic bad grammar should not persist. Verb and substantive quarrel in number with surprising frequency. The Spanish is often incorrect, e. g., "Isa Mugerres" (p. 57). To speak of Indians as "the red race" is no longer tolerable in a scholar. The Indian is brown and calls us red, with a perception we might wisely learn. The "tigers" which figure in Yucatec architecture are of course jaguars, not tigers, and the author should hardly have been misled by the loose frontier Spanish *tigre*. To use without quotation-points or other danger-signals such words as "Cities," "Governor," "Palace," "Nunnery," with reference to the prehistoric Indian economies, is hardly more scientific than to say (p. 19) that the Yucatec tribes "finally lost their status as nations." Nor can Mr. Holmes have had in memory the far more numerous and vastly greater *huacas* of Peru when he wrote of Yucatan (p. 31): "No nation of builders, save possibly the Mound-builders of the Mississippi Valley, has ever equalled this people in the number, variety, and size of its terraces and pyramids." The illustrations are effective, though the panoramas are of much license.

THE YELLOWSTONE PARK.

The Yellowstone National Park: Historical and Descriptive. Illustrated with maps, views, and portraits. By Hiram Martin Chittenden, Captain, Corps of Engineers, U. S. A. Cincinnati: Robert Clarke Co. 1895. 8vo, pp. xvi, 397, 66 illustrations.

A work which can be appropriately dedicated to the memories of John Colter and James Bridger, "pioneers in the wonderland of the Upper Yellowstone," excites our interest in these worthies, and we enter at once upon the historical part of Capt. Chittenden's admirable monograph. This occupies about a third of the work; it is entirely original, the net result of much conscientious research, brings news to most readers, and possesses permanent value. Most of the voluminous Park literature is merely descriptive, or of the guide-book order, in which patriotism and politics are rapturously invoked with an eye to business; the present work is distinctively a solid contribution to knowledge. The author is one of several engineers to whom we owe the good roads through the Park; he is thoroughly familiar with its minutest details of topography; he has informed himself fully concerning the legislation for and administration of its affairs, as well as of all the schemes for spoiling this eminent domain; he is an excellent practical geographer, and he writes so well that we might suppose the present volume to be no maiden effort, did we not happen to know that it is such. By this single work Capt. Chittenden makes himself our highest authority on the subject, and, as we premised, his special merit is that of the histogeographer.

The origin of the English, French, and Spanish forms of the name is set a little back of Lewis and Clark, and traced to the Hidatsa word meaning "rock yellow river." The

obscure trail of Verendrye, about the middle of the last century, is of course crossed, but we have nothing definite to go upon till the time when the traders first came down from the Assiniboine to the Mandan settlements on the Missouri. The visit of the great geographer Thompson, 1799, is a turning-point, but we know that the N. W. Co. had sent men there before, in 1793 or earlier, and it is certain that some of the H. B. Co. were on the spot some years sooner. However, Thompson's Mandan visit was the first that bore any historical or geographical fruit; the word "Yellow Stone" appears in his unpublished MSS., and it seems from calculations furnished to the author by Dr. Coues that he even fixed the source of the great river with approximate precision. The first white man ever in the Park was John Colter, who invaded the haunts of the Tukurika, or Sheepeaters, in 1807, and discovered the two principal lakes in the Park, which Clark in 1814 called Eustis and Biddle—that is, present Yellowstone and Jackson Lakes. The map opposite p. 11 traces "Colter's route of 1807," among many other historical data of the utmost significance, and removes nearly or quite all the haze in which it was left even in the latest edition of Lewis and Clark. Colter was chiefly known to his contemporaries as the colossal liar who had the race for his life recorded by Bradbury and improved on by Irving; but "Colter's Hell" is located, and Colter takes permanent place in history for all that his Lewis and Clark record proves him to have been before he made on his own account his immortal discovery. This pioneer, of course, opened the whole trapper and trader period; and, passing the enigma of "J. O. R. 1819," we are taken on to the times when the figure of "Jim" Bridger looms up.

Bridger was a remarkable man, who never came fully into his own while he lived. He told the truth about "wonderland," but nobody believed him; he was called the "monumental liar of the Rocky Mountains," and perversely took revenge on his calumniators by deliberately making himself such, till Baron Munchausen must have turned in his grave. Capt. Chittenden tells some of these stories, and in comparison with them the "gyascutus" becomes a tame animal of entire probability! But all that we can understand; Bridger's pedestal is secure, and his further title to fame rests upon the fact that he led on to the next period, that of official exploration and survey, when the soldier and—not the priest, as usual in French and Spanish America, but—the scientist, followed the trapper and trader: for Bridger was guide to Capt. Reynolds's expedition of 1859-60, which Dr. Hayden accompanied as geologist. A small map shows the sources of the Yellowstone as understood at this time, when actual discovery was frustrated—fortunately, as the text proceeds to show, for reasons we can hardly find space to specify: suffice it, they appear clear and cogent. The prospector followed next, and the course of discovery went on in the way which was vainly expected to lead to the yellow sand of the gold-seeker's restless dreams. This wonderland does not exist; and the awakening was due to final discovery by three separate parties who visited the region in 1869, 1870, and 1871, respectively. By discovery the author means, he says, "full and final disclosure to the world" of the Yellowstone wonderland. All the particulars are given with minuteness and fidelity, but it is obviously impossible for us to follow them out here; nor would it be fair to tell so much that anybody should be satisfied without reading the book for himself.

At this point comes up the "park idea." Captain Chittenden handles this delicate theme as the conscientious and impartial historical critic should handle such a topic. The enthusiastic Catlin is easily shown to have suggested some park, but not this one. The specific idea started in camp at the junction of Gibbon with Firehole River, September 19, 1870, among members of the Washburn-Doane expedition, which included Gen. Henry D. Washburn, Hon. Nathaniel P. Langford, Hon. Cornelius Hedges (actually the prime suggester of what then shaped itself in the minds of the whole of them), Hon. Truman C. Everts, Hon. Samuel T. Hauser, and other civilians, with Lieut. G. C. Doane, Second Cavalry, commanding the military escort. The wonders which those great mountain ranges and snowy abysses had guarded for ages in secret were by this time fully disclosed; the rush to clutch laurels became something that neither beaver skin nor gold itself could have caused—it was more like the eruption of a geyser. Captain Chittenden needed all his caution and calmness to tread safely here, but he has come off well. In following up the political history he shows that the bill was steered through Congress mainly by the efforts of three men—Dr. Hayden, Mr. Langford, and W. H. Clagett. In judging the halo of the first of these three, a very ungracious duty at best, we think that Captain Chittenden has not strained his quality of mercy in striving to be just, particularly when we remember that most of the Congressional matters which popular tradition labels "Hayden" have the ear-marks of "Jim" Stevenson and "Black Jack" (Gen. John A. Logan). But this case is a peculiar one. In this part of his task, and also elsewhere in the book, where the biographies of Mr. Langford, Dr. Hayden, and Col. Stevenson are sketched, the author has acquitted himself most creditably; he has shown tact, discernment, and impartiality, and his verdict must be regarded as final.

After discussing the reasons why the Upper Yellowstone remained fortunately so long unknown, the author rapidly reviews explorations subsequent to 1871. They have been many, notable for various reasons; probably the most historically significant matters are those connected with the Nes-Percé campaign, when that great soldier and humanitarian, Chief Joseph, was pursued by such worthy foes as Gens. Howard, Gibbon, Sturgis, and Miles. The administrative history of the Park, including the Park dedicatory and protective acts, is set forth in sufficient detail, and with the same precision which marks the treatment of the other matters upon which we have touched. This concludes the formally historical Part I., but by no means finishes Capt. Chittenden's histogeographic labors. For these are resumed in another part of the book, so important that we wonder why it was relegated to the limbo of Appendix A. It is an integral part of the whole performance, being nothing less than an historical review of the several hundred geographical names of the Park mountains, lakes, rivers, geysers, and miscellaneous topographic and hydrographic features. There are probably more names to the square mile in the Park than in most of our settled districts of equal area, though there is not a single town or even hamlet, and the artificial features are practically restricted to a military post, some hotels, and the roads or trails, including, of course, bridges. The author has taken great pains with the always difficult task of tracing such names to their sources; his work is here entirely original, and he is to be felicitated on the amount of accurate information he has gar-

nered. On analysis of his lists, the names will be found to fall nearly all in two classes—the "personal" and the "characteristic." People had forgotten about the Gardiner for whom a main tributary now appears to have been named, and few could have guessed that "Heart" Lake was named, before 1870, for an old hunter, possibly one of Bonneville's men, named Hart Hunney, killed by the Crows in 1872. Bunsen Peak suggests the great scientist who investigated geysers and many other things; but how many of us knew that Kepler Cascade was so called for the twelve-year-old son of ex-Gov. J. W. Hoyt of Wyoming? No part of the book is better done than this, and none represents so much information in equal compass; it is admirable, and we should wonder why it was never done before, did we not know that in general admirable things are slow to mature. In some of these cases, the author gives extensive biographical data respecting the persons concerned, with their portraits in many instances. But long as is the list of claimants for this sort of fame, the author wittily reminds us, p. 287, that the Devil distanced them all:

"In the race for the geographical honors of the Park, the prize fell neither to the United States Geological Survey nor even to Colonel Norris [the irrepresable second superintendent], though each was a close competitor. It was won by that mythical potentate of whose sulphurous empire this region is thought by some to be simply an outlying province."

The reaction from this sort of thing was healthy and in good taste; it gave us the "characteristic" names, by studied efforts to carry out a system of geographical nomenclature which should abun personalities, with gratifying result. In these instances the tracing of a name to its source was generally easy, as it was mainly a mere matter of fixing a date, easily found in official records. The christening of the geysers the author regards as having been "singularly fortunate." There was no system; those interesting objects seem to have named themselves, spontaneously and as a rule felicitously, either in their characteristic modes of action, their shapes, sizes, or colors. One of the neatest names in the whole list strikes us as being that of Soluton Creek, as the issue of Riddle Lake; for the latter was never understood till the former was discovered.

About a third of the work is occupied by Part II., which is formally descriptive. It is interesting and attractive, particularly when the author is taking us over the tourist routes he helped to make and pointing out the "objects of interest." The Baedeker feature will commend itself to the average reader, and is an indispensable part of the work, but has not the great value and significance of nearly all the rest, for in the nature of the case it could hardly give us anything new. It is strongest in its general geography, weakest in the fauna and flora, weak in geology, and excellent in describing and explaining the geysers; in scenic effect, of course, the cañon and the falls take precedence. This portion is fully illustrated with views, with most of which the public is already familiar. An excellent folding-map shows by name and with great accuracy almost every point on which the author touches. This is better than any other we have seen, with the single exception of one of probably equal excellence issued by the present Geological Survey; Chittenden's is not quite so large a sheet, but is plain in its minutest details, and these are extremely numerous. Yet we must insist

that the little page-size "historical chart" opposite p. 11 is a still more important contribution to knowledge, and the most notable single feature of the work.

Part III. deals with the future of the Park. It discloses all the greed and selfishness of incessant scheming to destroy the place and defeat its purpose, whether by railroad encroachment, change of boundary, "segregation," or whatever specious pretext, as well as by the open lawlessness of poaching. Connected with this important matter, we find in an appendix the legislation and regulations now in force, the appropriations made, and other data for correct appreciation of the political situation. We hope Capt. Chittenden's wise and sound counsels will be heeded; they cannot be disregarded with impunity, unless the Park idea is to be abandoned. The railroad lobby has always been peculiarly plausible, persistent, and pernicious; but it is enough to hear in this case the declaration of the present able and fearless military superintendent, Capt. George S. Anderson: "Six months from the entrance of the first locomotive within the limits of the Park, there will not be one acre of its magnificent forests left unburned." The segregation subterfuge is met by the author in italics: "*Never permit the boundaries of the Yellowstone Park to be brought down into the valleys.*" No one can read his summary of the present case and future prospects without being impressed with its force.

We can challenge the date 1787 assigned (p. 38) to the old Northwest Company, and substitute 1784 with good reason; we also suspect that the Ducharme of p. 41 is one of the many Ducharmes who figure in the fur trade. But we have no disposition to pick small holes in such a piece of work as this. The Bibliography with which the book closes is in very bad form; any other order of the entries, or none at all, would have been preferable to the odd derangement which displays nothing so clearly as it does the hand of a novice at this particular business. It is fearfully and wonderfully compounded of a subject-index by catch-titles with an author-index to itself, in a single alphabet, together with some other surprising strokes of misguided genius which defy description. However, it makes only a dozen pages or so, easily mastered in a few minutes; and one result of our scrutiny is, that probably about 250 separate Park publications are represented by the 162 numbered entries in this curiously constructed puzzle. Aside from the innumerable fugitive pieces which the author did not intend to include, 250 publications may approximate the total of special Park books and articles of any consequence; and in closing we may apply balm to the wound we have just made by saying that certainly no future writer on the Yellowstone National Park can appear before the public in any serious performance without having first reckoned with Capt. Chittenden.

HANS CHRISTIAN ANDERSEN.

Hans Christian Andersen: A Biography. By R. Nisbet Bain. London: Lawrence & Bullen; New York: Dodd, Mead & Co. 1895.

Stories and Fairy Tales by Hans Christian Andersen. Translated by H. Oskar Sommer. With 100 Pictures by Arthur J. Gaskin. 2 vols. London: George Allen; New York: Dodd, Mead & Co. 1895.

"My life is a beautiful fairy tale, happy and full of incident," wrote Andersen at the beginning of his autobiography; and yet, although

it is twenty years since he died, no adequate life of the poet had appeared in English until Mr. Bain took up the fascinating theme. His treatment of the subject lacks, of course, the charm of the autobiographic pen, but it gives us instead a faithful picture of the man, in which, behind the childish vanity, the silly sensitiveness, and the flabby sentimentality, Andersen's genuine worth and amiability are steadily apparent. It was not difficult to make the narrative entertaining, but to preserve a discriminating balance between the whining, gushing, girlish man and the "good old poet" whom the people loved and kings delighted to honor, must have been no easy task. So relentless is Mr. Bain's presentation of the character that we have at times suspected him of a lack of sympathy with his hero; but close beside each instance of Andersen's folly some wholly generous trait appears, and we are drawn to him again, as when for a winning look or word we caress the child whom we thought to punish. The common source of all his faults and follies will be found in his excessive vanity, and as the autobiography of a vain man is the least trustworthy of human documents, Mr. Bain has placed his main reliance upon the extensive correspondence now available and upon the testimony of contemporaries.

Andersen was born in 1805 in the ancient city of Odense on the island of Fünen. Unlike most men of strong imaginative powers, his "*Lust zu fabuliren*" came not from his mother, though she appears to have had more wit and intelligence than Mr. Bain gives her credit for, but from his father, whose disappointed literary ambition was realized in the career of his son. In his early years Andersen was hampered by extreme poverty and in a measure also by his unprepossessing appearance. He passed through the struggles of his youth with a noble, if somewhat eccentric, perseverance. His personal appearance he himself never regarded as a disadvantage, for he thought himself distinguished-looking; but the vision of this long, lank, strangely clad youth, with his gawky ardor of speech and action, must have given many a would-be benefactor pause. The first person to whom he appealed in Copenhagen, when he went to the capital to seek his fortune, thought him mad and dismissed him summarily. Even in later years his singular looks and manner seemed to Victor Hugo so suspicious that, in response to Andersen's request for his autograph, Hugo wrote his name at the top of the sheet of paper. But, throughout his career, the chief stumbling-block was his inordinate vanity. His impatience of criticism, his blind confidence in the infallibility of his genius, his mad outbursts under just censure, excited the contempt and ridicule of his enemies and threatened to alienate his closest friends. He had, it is true, many crosses to bear, but the man who wears his heart upon his sleeve must not wonder if the daws peck at it. Robert Louis Stevenson speaks of Andersen as "thrilling from top to toe with an exorciating vanity, and scouting even along the streets for the shadows of offence." The late Prof. Boyesen called this a "cruel observation," but Boyesen himself, and now with much ampler details, Mr. Bain, have shown that Stevenson's characterization was essentially correct. Andersen's friends were obliged to treat him like a sick child, and, on the occasion of each new paroxysm of wounded vanity, procure for him the means to gratify his passion for travel. Collins, his life-long friend, sometimes took him in hand, condemned his conceits, and warned

ed him against the dangers of hypersensitiveness; but these salutary counsels only caused a fresh access of "hysterical whimpering." Unfriendly criticism made him "forget his God," and cherish thoughts "which no Christian ought to have." His first wish upon reading an adverse comment was to die, preferably abroad, far from hated and unappreciative Denmark. To him the towers of Copenhagen were "pointed like critics' pens." Indeed, his native land fares ill whenever one of her sons fails to enjoy his poetry. His rage reaches its climax in a letter of 1843: "The Danes are evil-minded, cold, Satanic. They exactly suit their wet, mouldy-green islands. I hate and loathe my country just as much as my country hates and bespatters me." It is fair to say, however, that he regretted this outburst.

Unfavorable criticism he attributed to envy, malice, or stupidity; once he denounced it as flat blasphemy, thus impiously to deny the gifts which God had given him. Although praise usually made him modest, his sensitiveness increased with his fame. He believed himself a great dramatist; his many failures taught him no wisdom, and occasional success confirmed him in his folly. He insisted that he was the victim of a conspiracy; that in his life-long effort to obtain a foothold upon the stage he had been defeated by a clique. Mr. Bain conclusively shows the absurdity and even ingratitude of this suspicion. Never was a man more generously assisted in his dramatic enterprises than was Andersen, but the vagaries of his vanity constantly led him to seek the causes of his failures outside of himself, and so exposed him to the charge of ingratitude. He resented the death of his kind benefactor, the good old King Frederick VI., as a personal grievance, because the *première* of the "Mulatto" had to be postponed in consequence. Similarly, for all the praise with which his novel of 'O. T.' was greeted he had no word of thanks; he heard only the voice of one malignant and anonymous critic. In 'The Story of My Life,' Andersen poses as a man of genius made wretched by cruel neglect, whereas his letters of the corresponding dates frequently show that he was enjoying some of the happiest triumphs of his life.

His vanity was the source of other foibles. It led him, though one of the most refined of men, into offences against good taste and into schemes of self-advertisement which were little short of vulgarity. Nor can he be entirely cleared of the charge of snobbishness. He loved to display the decorations which royal hands had placed upon his bosom, and his fervid patriotism during the Schleswig-Holstein war was yet not fierce enough to induce him to relinquish the Prussian Order of the Red Eagle. He was delighted when kings addressed him; and the moments he had spent beside a Grand Duke, holding his hand and shedding tears, furnished him with the sweetest joys of recollection. He refused to be classed with the common people, and was indignant at being obliged to sit at the theatre "beside the man who trims my hair." And when in his old age a statue was erected in his honor, he strongly objected to being portrayed as an old man, surrounded by children. "Children alone cannot represent me," he exclaimed.

"With all his ridiculous and irritating follies and foibles, Andersen was always the most lovable of creatures." Thus does Mr. Bain judiciously temper his candid statement of the man's faults with a full recognition of his amiable qualities. Simple as Andersen's character was, it was yet full of contradic-

tions. With a nature of transparent truthfulness, his autobiography is a tissue of misrepresentations; generous and warm hearted to a degree, he nevertheless censured severely upon slight provocation; of unmistakable sincerity, he formed ill-considered judgments on all manner of subjects, and his opinions were for the most part worthless; deeply grateful for every kindness, the lightest word of remonstrance could turn his thanks into complaints; filled with a childlike faith in all men, he suspected the motives of any who withheld from him unmeasured praise. He was fond of animals, but the revolting cruelties of the bull-fight pleased him by their theatric pictur-escence. Himself a child and always immature, with the keenest appreciation of child life and character, he nevertheless had no love for children, was generally embarrassed in their company, frequently avoided them, disliked to read to them, and was in turn regarded by them more with alarm than affection. His sympathy with childhood was a quality of his art and not of his nature.

This man was the author of the Fairy Tales, the first collection of which appeared in 1835. They won their way slowly. Two only among the leaders of Danish literature seem to have recognized their lasting value. The author himself set no store by them; they are "as good as nothing," he said, "a mere sleight of hand with Fancy's apples." But as their fame spread through Europe, his eyes were opened, and in later times he professed to have known their merit from the first. Fairy tales have been told and sung since speech was and fancy wrought, but never before had the whole of creation, inanimate as well as animate, been invested with such whimsical individuality and powers of appropriate language. Andersen's tales have the naïveté of the natural product with the beauty of artistic finish. They serve one of the highest purposes of literature: they keep the heart young, and in this rejuvenating power lies the assurance of their immortality. During a period of nearly forty years, Andersen continued from time to time to send his "benevolent little house elves" into the world. Though by no means the greatest of Denmark's poets, he was the first to attain universal fame. His Tales found their way to farthest India, where the "Story of a Mother" was a special favorite. America hailed them with delight, and misinformed enthusiasm started a subscription for their author, who was thought to be in poverty. Old and young were alike fascinated. "Won't you give us wee ones another tale?" the burly Thorwaldsen used to beg, and Andersen's readings of his own stories became one of the features of the social and literary entertainments of the Danish capital.

The Fairy Tales have had many translators, but the classic English rendering is yet wanting. Mr. Bain, in an appendix to his work, discusses the chief English translations; he finds them all inadequate, and especially so the version by Dr. H. Oskar Sommer, which has recently been issued by the same firm that publishes the *Life*. Dr. Sommer has indeed missed much of the charm of the original, which the German translations so admirably preserve; many graceful and characteristic touches are suppressed; others are misunderstood or misrepresented. It is, therefore, not without justice that Mr. Bain condemns what he calls Dr. Sommer's "obliterative method of interpretation." It is well known that Andersen never mastered the grammar of his native tongue; but, as the naïveté of his style is in no wise dependent upon these defects, the trans-

lator need be at no pains to hit off the original in careless English. Dr. Sommer's version is often infelicitous and occasionally disregards the laws of English syntax. As a whole, however, the translation reads smoothly enough, and some of the more serious stories are even excellent. In fairness to the uninformed reader, it should be stated that this collection contains only one hundred of the tales; nothing on the title-page or elsewhere indicates that it is not a complete edition. The illustrations, by Mr. Arthur J. Gaskin, are well conceived, if not always firmly drawn, and, with their quaint mediæval accessories, pleasantly preserve the spirit of fairyland.

Mr. Bain has an interesting chapter on Andersen's religious opinions. "I grew up pious and superstitious," wrote Andersen himself. He observed the Sabbath by doing no work on that day; but he preferred the blue sky to the stuffy church. The Scotch Sabbath repelled him. "All the houses are closed," he writes, "and the people sit inside and read their Bibles or drink themselves blind-drunk." He was anti clerical, but not anti-Christian. He gloried in the material progress of the age: "It is a scaffolding on which the spiritual edifice is to be built up." And he refused to recognize any antagonism between science and religion. "God can surely endure to be looked at with the little bit of sound sense he has put into our heads," he writes in one of his letters. In his latter years he busied himself with the philosophical aspects of religion, and it was to give the death-blow to materialism that he composed his last romance, 'To Be or Not to Be.' The generous Dickens stood almost alone in praising this work; others congratulated the author upon its failure.

Andersen's passion for travel led him from end to end of Europe. He came into contact with most of the eminent men of his time and has left interesting accounts of them. Mr. Bain's book is particularly rich in anecdotes of this class. For Heine he felt a sort of "devil-worship," a mixture of admiration and hatred which even votaries of Heine will understand. In a letter to Collin he makes this drastic characterization: "Heine is a witty babbler, impious and frivolous, and yet a true poet. His books are elfin girls in gauze and silk, which swarm with vermin, so that one cannot let them move freely about the rooms of respectably dressed people." In the chapter on Andersen in England, Mr. Bain has given the first adequate account of Andersen's relations to his English friends. Their cordial recognition of his genius he regarded less as a personal triumph than as a rebuke to the Danes, who "spat upon the glow-worm because it glowed." Chief among his English friends was Dickens, and the five weeks which Andersen spent at Gadehill in 1857 he considered the happiest period of his life. He published a detailed account of it in the *Berlinjske Tidende* of Copenhagen in 1860; this has recently been reissued in this country in German: 'Ein Besuch bei Charles Dickens' (Henry Holt & Co.), with a brief preface containing three errors of fact on the first page.

In Mr. Bain's work we have noticed but few errors. Travellers in Saxon Switzerland will scarcely recognize the Bohemian village of Herrnskretschken under the form of Herrens-Bretchen (p. 89). A singular lapse of memory makes Mr. Bain say on page 153 that Andersen's novel, 'O. T.' took its title from the initials of the hero's name. The real point lies in the fact that these letters were the brand-mark of the Odense penitentiary (Odense Tugthus). With the brothers Grimm Mr. Bain deals

rather cavalierly; he refers to them as "mere collectors," and the story of Andersen's first call at their house in Berlin he relates without a hint that there was more than one Grimm. Turning to the index, we find only Wilhelm entered, with a reference to the page on which this interview is recorded; but Andersen, in the 'Story of My Life,' expressly tells us that it was Jacob whom he met, and the sensitive Dane was indignant when he discovered that, although Grimm spoke Danish, he did not know the name of Andersen. The friends, however, who comforted him by saying that Jacob Grimm was thirty years behind the times, had a greater regard for Andersen's feelings than for the truth. Mr. Bain might have added that the relations between Andersen and the Grimm family subsequently became very cordial. Finally, on page 436, we read: "July 27th, five days before his death." As the date of Andersen's death is not elsewhere stated in this book, we are left to do our own calculating, and arrive at August 1. In point of fact Andersen died on August 4, 1875.

Studies in Early Victorian Literature. By Frederic Harrison. London and New York: Edward Arnold. 1895. Pp. 224.

In one of his delicious but pathetic letters Stevenson confides to Mr. Colvin a "hideous idea" that perhaps, along with himself and his correspondent, Frederic Harrison is now getting old. He adds: "Oh, this infidelity must be stared firmly down." On finishing Mr. Harrison's new book, we applaud this sentiment. Nothing in these brilliant and sensible essays on the Victorian prosaists betrays failing power—unless possibly one were malicious enough to infer a waning memory from the writer's proneness to repeat his own eloquence; or from his notion that the word *scientist* is still a barbarism; or from his writing several pages about 'The Saint's Tragedy' and 'The Spanish Gypsy' after promising to touch "no book of poetry, philosophy, or science." Sixty-four years sit lightly on the prophet of Newton Hall. He is the same vigorous voice, prelude brilliantly upon a thousand themes, and advancing safely into the complexities of a surprising number of them.

The present volume attempts a "mature estimate of the permanent influence and artistic achievement" of Carlyle, Macaulay, Disraeli, Thackeray, Dickens, Brontë, Kingsley, Trollope, and George Eliot. As a body of criticism it is full of knowledge, broad in grasp of historical relations, and measurably free from the bias of Positivism apparent in the writer's former collection of literary essays (1886). Mr. Harrison's attention is first fastened by the social earnestness which colors Victorian prose; but this fact does not prevent him from recognizing and reckoning values purely literary. Far less exacting in his critical ideals than Arnold, and inferior in technical knowledge to several living English critics, Mr. Harrison is outvied by no one in vigor of sympathy. He who erewhile sang the strenuous joys of Auguste Comte's library, who pleaded for a decent hearing for Bunyan, Rabelais, and other permanent people, now avows himself an ardent admirer of Mr. Meredith and Stevenson. He even proves an appreciative reader of Mrs. Wood, Ouida, Miss Broughton, and Mrs. Burnett. Notwithstanding this wide range of loves, Mr. Harrison's valuations are equable, even nice. They are regulated by a trained sense of what permanently interests humanity. They are corrected by a norm too often set

aside—the settled judgment of the public. And they take admirably into account that any judgment concerning the absolute value of a book must be tempered with regard to the formative influence of the work and the power required to produce it in its own day.

The date of the Queen's accession forms a curiously good dividing line between two generations of the really great English writers of this century. The Victorian age again divides into two almost equal parts with the year of Thackeray's death, 1863, the first part, as our author shows, being superior to the second in purely literary product. Mr. Harrison's book is concerned with the first Victorian period, but his characterization of the whole age is so comprehensive and in the main so just that we quote one pregnant paragraph. It perhaps over-emphasizes a little the enthusiasm for social reform:

"Our literature to-day has many characteristics; but its central note is the dominant influence of Sociology—enthusiasm for social truths as an instrument of social reform. It is scientific, subjective, introspective, historical, archaeological; full of vitality, versatility, and diligence; intensely personal, defiant of all law, of standards, of convention; laborious, exact, but often indifferent to grace, symmetry, or color; it is learned, critical, cultured; with all its ambition and its fine feeling, it is unsympathetic to the highest forms of the imagination, and quite alien to the drama of action."

As *pro-tempore* chairman of the public jury that has thought long and so has presumably attained to think right concerning each great Victorian, Mr. Harrison reports the findings neatly, and usually says the just thing. Of Macaulay: "If he had less philosophy than almost any historian of the smallest pretension, he has a skill in narrative which places him in a fair line with the greatest" (p. 86). Disraeli is properly scored for his vicious manner; but "his painting of parliamentary life in England has neither equal nor rival." The praise of Thackeray's style will strike most students as excessive, but none will deny the power with which the genius of this great, though not supremely great, master of the human heart is brought to analysis. The contention that in Dickens the really permanent thing is the man's humor, the greatest of this century, really seems needed in these days when young people sometimes praise 'Copperfield' for its taste in pathos. Of Charlotte Brontë the future will keep 'Jane Eyre,' a masterpiece "in the rare order of literary 'Confessions';" "one of the most creative influences of the Victorian literature" (p. 162). Another such influence, Kingsley, "was a kind of ferment" (p. 175); and "'Yeast' is his typical prose work" (p. 176). Of Trollope perhaps only the Barchester cycle will live, with 'Orley Farm' and the two 'Phineas Finns.' Such prophecies as these are perhaps as safe as prophecy ever can be. For it is by the past that they judge the future; and after all a Comtean eternity is not so very long.

The chapter on George Eliot, if judged as the final word of a Positivist Aaron concerning the art of a Positivist Miriam, is a trifle unbrotherly. We have no quarrel with the writer when he declares, "I never could count anything later than 'Silas Marner' as a complete and unqualified masterpiece" (p. 122). But it was a bad slip for him to confess, after dismissing 'Middlemarch' as "tedious and disagreeable," that "he cannot, after twenty years, recall the indefinite, lingering plot" (p. 217).

Mr. Harrison has felt, but not wholly es-

caped, the danger of impulsively magnifying one man or one piece of work at the expense of another. The 'Cromwell' is "the greatest of Carlyle's effective products"; 'Sartor' is "the most original, the most characteristic, the deepest, and most lyrical of his productions"; the 'French Revolution' "is destined to live long and to stand forth to posterity as the typical work of the master." Thus far we can follow and assent in the maze of superlatives. But we learn with regret that 'Friedrich'—in which we had timidly fancied a certain colossal unity unique of its kind—"is not a book at all." Again, we freely acknowledge a contrast between such a man as Thackeray and such a man as Stevenson in the degree of intensity with which each drank from the cup of life. But to class the latter—the author of the 'Foot-note to History'—as one who looks on life from a private box, where we see his kid gloves and his opera-glasses, is to paint in black and white. We should furthermore like to think it something else than mere patriotism that makes us smile when the beauty of Kingsley's 'Heroes' must be set off by the "sticky dulness" of the 'Tanglewood Tales.' Mr. Harrison is now and then fairly put to it for terms to differentiate the indefectibility he would ascribe. "The paper out of the *Spectator*," in 'Esmond,' "is the most perfect of all parodies in the English language" (p. 114); "'Coddingsby,' the parody of Disraeli's 'Coningsby,' may be taken as the most effective parody in our language" (p. 115). "Perfect," "effective"; *aliud et idem*. The author's large knowledge everywhere stands him in such good stead that when Thackeray as an historian is declared to enter into rivalry with Macaulay, we hope it is meant to compare these men merely in mastery of "the form and coloring of a past age." For 'Esmond' is marred by historical errors that Macaulay in his most remiss moments would hardly have made.

Mr. Harrison's own style keeps its wonted strength and wonted limitations. It is by turns witty, rhetorical, nobly earnest—never languid. Curiously compact of terseness and surplusage, it is prolix on one page, pure epigram on the next. Slight incoherences observable in the original *Forum* articles disappear in the revision. A few slips remain. Does the author mean *more fatal* when he says (p. 96): "Nothing is *less fatal* to true criticism than the habit of blindly overvaluing the inferior work of men of genius"? Mr. Harrison is usually free from those short cuts; but, "it is curious *how different a colour* may be seen in the main current of English literature produced before and after" the year 1837 (p. 10). On page 122 the italics seem to quarrel with the verb: "neither *Esmond* nor *The Newcomes*, nor *The Virginians* are in any sense the work of a misanthrope." From page 183 Dr. Hall might cull an example of that "gross vulgarism," the supererogatory *what*: "no criminal was so atrocious but what Charles Dickens could feel for him some ray of sympathy."

Studies of Childhood. By James Sully, Professor in University College, London. D. Appleton & Co. Pp. viii, 527.

READERS of the *Popular Science Monthly* will have become familiar with many of the chapters of this book, which have been reprinted with little or no change. Psychologists will also have found out both the excellences and defects of Mr. Sully's work. For the general reader the book is very interesting on account

of the great humanity of children. For the psychologist it is practically unavailable—a judgment which the following statements and reference may be taken to justify.

First, these chapters are in large part a collection of anecdotes gathered from the reports of parents, from the self-memories of literary people, from uncriticised sources generally. For example, Mr. Sully himself, after a very excellent account of the sort of sources which the child-psychologist ought to treasure in the present state of the science (chapter I.), cites a certain "Worcester collection" as not sufficiently severe in method to be relied on (p. 23); and then goes on in the body of the book to make more use of this collection than of perhaps any other single source, citing again and again a certain child C, who was very smart, and whose reported doings make good stories. We may cite the instances on pp. 66, 68, 74, 89, 102, 111, 114, etc.

Second, Mr. Sully confines himself largely to the period of child-life after the rise of speech (see p. 134), and with it of most of the functions on which fruitful observations may be made by the study of individual children. It is notorious that after the third or fourth year the mental life of the child becomes so complex that nothing but very wide statistical inquiry can be safely relied upon—and even that is of doubtful value. Yet just at this period of boundless variety and endless possibility he cites the occasional smartness or unconfirmed "conceit" of the individual child. Cases of this may be seen on almost any page opened at random (see extraordinary instances on pp. 114, 115, 118).

Third, there is a lack of psychological points of view and illuminating hypotheses which makes the chapters tiresome even to the appreciative reader. The chapter on the development of the thought of "Self," which of all the topics treated in the book might have been expected to contribute something general, since this self-sense is a late growth, has the same old weight laid (pp. 114, 444) on the child's use of the pronouns of the first person (a notion which no amount of criticism seems capable of laying), and no adequate recognition of the social function—possibly the one element on which Mr. Sully's cases might be expected to shed some light. And where Mr. Sully does venture on a general suggestion it seems to us to have all the uncertainty which we should expect from his sources. For example, he finds that the child reaches an anticipation of Berkleyan idealism (p. 118), and supports it with anecdotes which show very clearly, if they show anything, the influence of social imitation and the facts of spontaneous variation in childish conceits. See also the extraordinary aperçu on children's ideas of growth, that "the child cannot accept an absolute beginning of things." . . . "What more natural, then, than the idea of a rhythmical alternation of cycles of existence?"—all based on a few stories of children showing that old men are sometimes thought to grow small again.

Fourth, the anthropological references and analogies are extremely meagre and for the most part undocumented.

Disappointing, however, as the book is to those who had hoped that a psychologist of Mr. Sully's reputation would contribute something to child-study which would in a measure check the flood of superficial "contributions" to this so-called science in this country, yet his book has merits from other points of view. It is written in plain language, the style is entertaining, the children treated of are the choice ones, and the stories selected are the prettiest

of the pretty. Furthermore, many parents and teachers who do not aspire to become themselves reporters on their children for print, together with those who do, will do well to catch the spirit of humane and ideal appreciation of child-life which animates the book. We have thought it our duty to point out its essential inadequacy from a scientific point of view, since the air is full of "child study," and people with no preliminary training think they have only to jot down the occurrences of the nursery, whether at first-hand or not, and report them in a taking way, to contribute to science. That Mr. Sully should have lent the weight of his authority to this kind of science-made-easy, by using the material he has used even in a quasi-scientific and confessedly popular book, is very much to be regretted. We may add that our criticism of the work is mainly a confirmation of the following sentence from the publisher's advertisement of it: "These studies . . . require the reader to follow no laborious train of reasoning, and the reader who is in search of entertainment merely will find it in the quaint sayings and doings with which the volume abounds."

The strictures which we have passed on the material of the book, however, do not hold to the same degree of the reports which the author makes of his own observations in the "Extracts from a Father's Diary" in chapter xi.

An Indian Journalist: Being the Life, Letters, and Correspondence of Dr. Sambhu C. Mookerjee. By F. H. Skrine, L.C.S. Calcutta: Thacker, Spink & Co. 1895.

Travels and Voyages between Calcutta and Independent Tipperah. By Sambhu C. Mookerjee. Calcutta: Reis & Rayyet Office. 1887.

DOWN to comparatively a short time ago, a work like 'An Indian Journalist' would have been markedly exceptional. A noteworthy proof is afforded by it of the change which, within the last two generations, English education has effected in India, and more especially in Bengal. By acquiring a knowledge of the English language and literature, the native has, in many cases, become capacitated to understand the rule under which he lives, and the motives and policy of the far-off kingdom which ultimately determines and shapes that rule. By means of that acquisition he has also qualified himself, not infrequently, for intelligent personal intercourse with those to whom his interests are immediately intrusted; an advantage, equally to himself and to them, of incalculable value. Enabled, consequently, much as if he were an Englishman, to discuss the measures of the Indian Government, and wisely left free to do so, and also to arraign them within legitimate limits, he has now come to figure as a political critic and counsellor, and one with whose deliverances his alien legislators do well to reckon.

As a representative of his fellow-countrymen, rarely has any one hitherto appeared for whom can be claimed a rivalry with the esteem which was the due of the late Dr. Mookerjee, and which was explicitly accorded to his manifold merits. Highly appreciated as he was by those for whose behoof he spent himself in laboring, it was his condign good fortune to win the regard of the leading British authorities in India, and no less that of the numerous persons of distinction, outside his fatherland, to whom, as a letter-writer, he addressed himself. Nor, towards gaining this regard, was he ever known to bate a jot of the

sturdiest independence. Yet, at the same time that he thus respected himself, a sense of justice invariably prompted him to treat with befitting respect the opinions of others, even if they were his most virulent antagonists. A spirit of reasoned and reasonable conciliatoriness, while he could not but perceive that, to a patriot, it was the dictate of expedience, seems to have been, with him, a second nature.

After considerable practice as a miscellaneous essayist, Dr. Mookerjee, in 1882, founded, at Calcutta, a weekly newspaper, in English throughout, though bearing the Arabico-Persian or Hindustani title of *Reis & Rayyet*, which may be rendered, not inadequately, "Sovereign and Subjects" or "Prince and People." Chiefly by this and by his correspondence, he has, without question, merited lasting and honorable remembrance. In Bengal this is assured to him; and his broad-minded and discerning biographer was certainly justified in his forecast that, on the presentation of facts, it would be widely shared by those to whom his character and literary achievements had previously been unknown. As depicted, after long acquaintance, by Mr. Skrine, he was a man to challenge all but unqualified admiration, as for his sterling integrity, disinterestedness, and genial disposition, so for his ability and untiring energy. Many of these traits are abundantly evidenced, or else suggested, by the letters which are appended to the interesting memoir of his career, unfortunately a somewhat brief one, which terminated, in his fifty-fifth year, in February, 1894. The influential journal which he established, it is gratifying to be able to say, has been conducted, since his lamented death, in a manner redounding conspicuously to the credit of his successors.

The volume of travels named in our heading could have emanated from none but an acute and well-informed observer. The region of Bengal with which it has to do is one regarding which, in the main, hardly anything but dry statistics and the like has heretofore been accessible. Little appears to have escaped the notice of the author, in the course of his peregrinations, with respect to either the peculiarities of the people with whom he came into contact, or the geographical features, natural productions, and antiquities of the territories which he visited. He has, indeed, set in his pages an example which other Hindus would do wisely to copy. That he occasionally had experience of gratuitous discourtesy was only to be expected at the hands of such as those who debased themselves by it. To quote the words of Colebrooke, the illustrious Orientalist: "It is not to be dissembled that the European, that the descendant of the Gothic race, that the white man, and, above all, the Englishman, is full of prejudices, and governed, in his intercourse with men of other nations and other complexions, by a repulsive dislike of strangers, an unjust contempt and deep aversion, amounting, in an illiberal mind, to a contemptuous hatred of men of dark hue. The conduct of the lower British, in their dealings with men of color, in either of the Indies, is but too often influenced by such feelings." To a deplorable degree, however, till very recently, not merely to "the lower" British has Colebrooke's censure been applicable. That the indications are now steadily becoming more and more numerous and obvious of a much kinder attitude than of old to the people of India, on the part of the English functionaries dwelling among them, is a circumstance of auspicious omen to both parties indifferently.

The Origins of Invention: A Study of Industry among Primitive Peoples. With illustrations. By Otis T. Mason. 8vo, pp. 418. London: Walter Scott; New York: Charles Scribner's Sons. 1895.

THE object of this volume, so we are told, is "to trace some of our industries to their origins"—quite a different matter, we may remark in passing, from the *Origins of Invention*; and, judging the work from this point of view, it will be found to be thoroughly satisfactory. Especially is this true of what is told us of tools, etc., which, in a general way, may be said to foreshadow all mechanical progress, since man could hardly have taken the first step in his upward career, much less have traversed the broad expanse that separates "the digging-stick from the steam-plough," without some sort of an implement to be used either in "cutting, smoothing, pounding, or perforating." Indeed, so true is this that he has been called a tool-using animal; and although the definition is, perhaps, too broad, yet the fact that he has never been found without a device of some kind to aid him in his labors is so characteristic that it has been made the basis of a classification, in which the different stages through which he has passed have been designated as the ages, respectively, of stone and metal.

This classification is convenient, and, when limited to cutting-implements, as by Evans, Lubbock and others, it is fairly descriptive of the conditions that prevailed throughout western Europe in early times. Our author, however, does not find it altogether satisfactory, for the reason that it is not always and everywhere applicable, and because the sequence is not necessary. In this he is clearly right, for there are regions (pp. 110, 124, 128) in which there is no evidence that an age of stone ever existed; others, "in Africa, in Canada, and perhaps in Michigan, where the metal age is as old as the stone age." And in some of the Pacific islands, where there was no mineral having a conchoidal fracture, the natives, when first known to us, were living "in the polished or at least hammered-stone age," though their language, social system, etc., showed that "they were low in the scale of culture."

Bearing upon this point, and to some extent confirmatory of it, is the fact that recent experiments by the Bureau of Ethnology in making stone implements lead to the conclusion that neither the form nor the method of manufacture can be taken as proof positive of the antiquity of a specimen, or of the culture-status of the people who made it; that in fact "millions of roughly chipped stones formerly thought to be ancient, on account of their form, are only the refuse left by men who were aiming to make blades." Facts like these are far-reaching in their consequences, and, taken together, they show very clearly that aboriginal man, when choosing the material out of which to make his arms, implements, etc., did not proceed in any regular order, or according to any definite plan, but simply took that which was close at hand, and then worked it up in the easiest way possible. They also show (p. 126) that the only safe guide in determining the antiquity of a specimen is the geological position in which it was found.

Of the importance of these considerations to a proper interpretation of certain archaeological phenomena in our own country there can be no question; and it is for this reason that we have dwelt upon the point somewhat at length, when there are many matters of general interest in the volume that might rightfully

claim attention. Prominent among these is the fact that, in the infancy of the race, so many of our leading industries were carried on almost exclusively by the woman, while to day there are so few. Thus, for instance, there was a time when she was the farmer, the potter, the weaver, and the tanner. In a small way she was also the butcher, cook, shoemaker, etc., etc.; and as she plodded along over her daily tasks, carrying at her back a baby in a hood or in a papoose frame, she was unwittingly entering upon the path that led to the locomotive and the sleeping-car. Suggestive as is this phase of industrial life, it is incomplete in so far as it neither gives us an idea of the immense distance that separates some of our inventions from their rude prototypes, nor enables us to do justice to the efforts of our barbaric ancestors to settle some of the problems that have come down to our times. To complete the sketch, it is necessary to change the point of view, and then it will be possible to take up an invention, as, e. g., the electric light, and follow it back (p. 107) through the long array of lamps, candles, torches, etc., etc., to say nothing of all the various kinds of fats, oils, and gases that have been in use, until we come to a beginning in the pine knot. It may also cause us to abate somewhat of our self-sufficiency to learn that prehistoric man (p. 65) was familiar with the use of such devices as the wedge, the lever, and the inclined plane; and that before the time of Columbus the Polynesians (p. 361) "made canoe voyages from Tahiti to Hawaii, a distance of twenty-three hundred miles."

In view of such proficiency in the mechanic art, it would not be unreasonable to expect that a corresponding advance, or at all events a beginning, had been made in the learned professions, in aesthetics, etc., all of which are classed as inventions, though, except incidentally, they do not come within the pale of consideration. Accordingly, it does not surprise us to be told (p. 208) that an American Indian doctor not only practically cupped his patients, but that he appreciated the benefits arising from the use of massage and the Turkish bath; and that although he did not know it by the name that we do, yet he certainly practised the faith cure. Nothing is said of priests and lecturers, though they were to be found in every Indian village, as were painters and musicians; and when the women of a tribe, as was sometimes the case among the Iroquois, appointed "a speaker" or "an orator" to represent them in the council and plead their cause, they were simply employing an attorney, just as we do to day.

These are a few of the thoughts suggested by an examination of this volume, and, crude as they are, they give some idea of the extent of ground our author has covered and of the comprehensive manner in which he has dealt with the several branches of his subject. To any one acquainted with his method of work, or who has an abiding recollection of a previous volume in which he treated of 'Woman's Share in Primitive Culture,' it is needless to say that there is scarcely a page in the present book that the ethnologist may not study to advantage, and in which the casual reader will not find something that is instructive as well as interesting.

The Love Affairs of a Bibliomaniac. By Eugene Field. Charles Scribner's Sons. 1896.

THE late Mr. Eugene Field's humorous poems are well known, and had his name been withheld from this volume his identity would stand

revealed at least in the little scraps of verse scattered through it. The prose essays of which it consists are written in what may be called the mock-serious manner, one of the varieties of English humor which are part of the literary inheritance of the race. The names of those who have tried it are legion, those who have succeeded have been few. Just as every one who attempts the mock heroic must measure himself in verse with 'Hudibras' and the 'Dunciad,' in prose with Fielding, so the mock-serious at once recalls the masters of it—Sterne, Lamb, and the inventor of Hoses Biglow and Parson Wilbur. In the 'Love Affairs of a Bibliomaniac' we have all the machinery of this style—an imaginary friend of the author's, with a full account of his habits and character, extracts from his poems, and statements of his opinions; invented authors, fictitious quotations, and nonsense made to masquerade as fact. Of course, these things are greatly matters of taste, but for ourselves we confess to liking good nonsense quite as well as sense; and if a great deal of it is apt to weary, Mr. Field could plead that his book was a very little one. Some of the humor is overdone, and part of the success of the volume is due, no doubt, to the fact that Chicago is as yet still proud with the pride of an overgrown village in the fact that it counts among its inhabitants persons who can write something which other people call literature, and which will be "written up" in the newspapers, and, best of all, be sold at wholesale and retail, just as pork is. The pride of locality has puffed out the sails of many a reputation less deserving than that of Mr. Field.

We have liked best the account of the physical effects produced by the respiration of books (ch. xiii.); the fact that books breathe being supported by the well-known authority of William Blades, confirmed by observation, illustrated by the condition of the atmosphere of the reading room of the British Museum, where the consumption of oxygen by each volume has been found to be several thousand cubic feet of air every twenty-four hours, and reinforced by a series of experiments made by Huxley. Ringelbergius on the true method of procrastination, and Dr. O'Reil on the disease called "Catalogitis," could hardly fail to make even a good woman smile. If the humor were throughout as natural and unforced as in these passages, Mr. Field would have written a classic. A melancholy interest attaches to the volume, as the author died almost in writing its last lines.

The Gold Diggings of Cape Horn: A Study of Life in Tierra del Fuego and Patagonia. By John R. Spears. Illustrated. G. P. Putnam's Sons. 1895. Pp. xi, 319. 8vo.

THIS vivacious account of a two months' trip in an unfamiliar region is excellent reading. The information which it gives about the Cape Horn country, its people and resources, abounds in surprises to one who has formed his impressions of it from the accounts of the early voyagers. It is difficult to imagine, for instance, that the land which they pictured as the abode of snow and ice, the home of storms, is admirably suited for sheep-raising, with prairies covered with luxuriant grass, on which a snowfall of six inches is counted deep, and where cold sufficient to freeze the fresh-water ponds is rare; or that there should be a flourishing town of 8,500 inhabitants where Sarmiento's colony starved to death—a town in every respect like a Western mining camp, except that every zinc-roofed hut has its win-

dow-garden, "and many houses have bays and rooms set apart for great masses of potted flowers and shrubs." Gold-mining on the seashore, with the "pay streak" bearing "nuggets as big as kernels of corn," under water at high tide is no less a surprise. So, too, are the Yagans, the southernmost of all the Indians, who, in their original state, were skilful artisans, had many virtues, and showed such a remarkable mental development that from their language "has been compiled a vocabulary of over 40,000 words!" Their present degradation and dwindled numbers Mr. Spears attributes in part to the questionable means employed by the missionaries to civilize them. Whether his severe strictures are deserved, we have no means of knowing, but the tribe's history is only another sad proof of the incompatibility in the temperate zone of the red and the white man. There is a somewhat similar account of a less interesting race, the Tehuelches, the giant nomads of Patagonia, and their supplanter, the gaucho, or cowboy, as well as of the strangely successful Welsh colony on the Chubut River.

Two admirable chapters on the Patagonian beasts and birds, and an instructive account of the rising sheep industry, complete the subjects treated in this unusually fresh and entertaining book of travels. Some of the illustrations are very good, and there is an excellent index.

The House that Jill Built after Jack's had proved a Failure: A Book on Home Architecture. With illustrations. By E. C. Gardner. Springfield, Mass.: W. A. Adams Co. 1896. 12mo, pp. xii., 268.

THIS little book relates the experience of a young couple who had in hand the money for a new house, and tried to procure one which should be ideally comfortable and easy to live in. They employed an architect who displayed a great deal of good sense in his advice to the building family in question, and it is certain that the resulting plans shown on pages 239 and 241 are good ones and give the idea of a very comfortable house. In the course of the long debate to which the book is devoted, a good deal of good sense is retailed to the reader. Thus, on page 24, he is told to build a drain first of all, and to provide a cut off to keep surface water from the cellar; and in immedi-

ate connection with this the importance of having the cellar so high that a clean outlet can be got below its bottom is insisted on, even "if this happens to carry it above the surface of the ground"—in which case you are to "set the house on posts and hang the cellar under the floor like a work-bag under the table." On page 51 the evils of furring, of hollow partitions, and of floors hollow between flooring and plastering are pointed out, especially their mischievous qualities in the matter of carrying fire from floor to floor and from room to room. On page 53 the simple remedy for this state of things is pointed out in connection with praises of brick as a building material, and on page 57 mineral wool and such other materials for filling are described. In this way and with a great deal of chat and perhaps an unnecessary amount of preaching, the main principles of house-planning and house-building are laid down with sufficient clearness and fullness. As it frequently happens that the architect employed to design a small house—or a large one, for that matter—cannot be persuaded to give time and attention to the many details which make it up, it is well for the owners to have at least as much information as this book affords. As to the good taste shown in the designs for fireplaces, wainscoting trim, and the like, it is not easy to speak with much approval.

NEW YORK, THURSDAY, MARCH 19, 1896.

The Week.

PRESIDENT CLEVELAND's forthcoming order, bringing within the civil-service rules all the places still remaining outside them, will be one of the most notable public events in our recent political history. Coming upon the eve of a Presidential campaign, it will be an entirely unprecedented act, and will go far to convince the practical politicians of the party that the President is not a candidate for a third term. No man with aspirations for a re-nomination has ever dreamed of such a thing as putting for ever beyond the reach of spoils politics such a list of places as this which a Washington correspondent reports as likely to be included in the new order:

"The Mint service, the excepted places in the customs and internal-revenue services, all the places in the Indian Agency service below the physicians, and all the places in the Indian school service still unprotected; the Interstate Commerce Commission clerical staff, the clerical force in the navy-yards; chief clerks of bureaus and chiefs of division in the departmental service; and a host of small groups and classes which so rarely show themselves on the surface of public affairs as to have been generally overlooked in the planning of reform campaigns."

When, in addition to this, we consider that the President contemplates including all the fourth-class post-offices, except an insignificant few, in the same order, the full dimensions of this final sweep may be imagined. There will be no spoils left upon which to conduct the next Presidential campaign. The next President will have only some large places to distribute after he shall come into office on March 4, 1897, and the business of the Government will be the chief object of his attention. Will the politicians consent to fill the Presidency under these conditions?

Silver having been the real cause of the panic of 1893, it behooves all men of intelligence to see what sort of figure it is likely to cut if McKinley reaches the goal of his ambition. On Wednesday week the Ohio Republican convention, at which his "boom" received all the impulse that could be given to it by a single State, passed a resolution, drawn by McKinley himself, in close agreement with a speech made by him at Chicago on the 12th of February last. It is as follows:

"We contend for honest money, for a currency of gold, silver, and paper with which to measure our exchanges that shall be as sound as the Government and as untarnished as its honor; and to that end we favor bimetallicism, and demand the use of both gold and silver as standard money, either in accordance with a ratio to be fixed by an international agreement (if that can be obtained), or under such restrictions and such provisions, to be determined by legislation, as will secure the maintenance of the parities of value of the two metals, so that the purchasing and debt-paying power of the

dollar, whether of silver, gold, or paper, shall be at all times equal."

At first sight this looks like a mere repetition of the old juggles with words that have digraded both parties during the whole period of the silver and fiat agitation, but in order to understand it we must look at the course of events, at the repeal of the Sherman act, and at the new demands which the silver men themselves have made since that act was repealed.

What is meant by favoring bimetallicism? One of the methods proposed is by international agreement. This is intelligible, although remote, and, as we think, unattainable. The other method of reaching bimetallicism is "under such restrictions and such provisions, to be determined by legislation" (i. e., not to be interrupted by the veto power), "as will secure the maintenance of the parities of value of the two metals," etc. Those provisions now exist, and are sufficient for the purpose if administered by an executive who is determined to maintain the gold standard at all hazards and under all circumstances, and is known to be so. We have such an executive at present, and the main question, the chief issue, in American politics now is whether we shall have such an executive during the four years succeeding Mr. Cleveland's term. Making all allowance for humbug and cheating in platforms, we do not consider either the platform adopted by Mr. McKinley's friends in Ohio or the utterances of Mr. McKinley himself any such guarantee. If there is to be any more buying and coining of silver under parity clauses, "to be determined by legislation," there will be another panic, and it may be one which no executive could stem. The resolution does not propose any more buying and coining of silver, it is true, but it encourages the silver-men to expect it. It holds out to them a hope by which their support is to be gained if possible, and it leaves the next and future Congresses as much in doubt as the present one is concerning the true intent and meaning of the Republican platform, and thus leaves the financial question in the air, as it is now.

Senator Bill Chandler protests, with the alarm of an expert, against the corrupting use of money to promote the McKinley candidacy. The most appalling thing about it to him is, that the McKinley managers have "invaded Senator Quay's State," with demands that the Pennsylvania manufacturers give their money, not to their natural suzerain, Quay, but to the man who made them rich by his tariff bill of 1890. Pointing out the fact that McKinley himself has no money, the Honorable Bill wants to know where all the money is coming from that is now

"corrupting State and district conventions" in his interest, and asks, with the pain of an old-fashioned patriot, whether "our next President is to be controlled and dictated to by Mr. Hanna and a set of associates who have established their domination over a President by the money they have furnished for him and his uses."

These questions might better have come from a better man, but they are most pertinent and urgent coming from any source. The answer to them is written plain enough for the wayfaring man in the election of 1888. Quay looked after his own tributary manufacturers in that year, and one of them afterwards said openly that the McKinley tariff bill was only their just due, as they had bought and paid for it with their own money. They and the silver-men had the first mortgage on the Fifty-first Congress, and they foreclosed it without mercy. The men who are now so lavishly financing the McKinley canvass propose to forestall all competitors. By buying the nomination they get a clear first lien on the candidate. After the nomination, all negotiations in regard to the election will have to be conducted with them. Anybody who wants tariff favors will know what he has to do. The corruption will be all square and above-board, in the best tariff manner of perfect gentlemen. But the scale on which the preliminary operations are now carried on indicates what a monstrosity the next tariff bill will have to be to pay off all the debts. McKinley's zeal for "the American fireside" will no doubt be equal to it, but can the Republican party be expected to escape afterwards even with such a battering as it got in 1890? Bill Chandler's alarm at the prospect is well founded. Such a cynical preparation to buy the Presidency, with an equally cynical preparation to get the money back by legislative favors, has not before been seen. It portends the permanent retirement to the American fireside of public men who strike hands with the unblushing corruptionists.

The alarm of a great many Republicans at the probability of McKinley's nomination is due not alone to the fiscal and monetary policies for which he is supposed to stand. What they dread most is the possibility of a President of his deadly-dull intellect. Certainly no President since perhaps the first Harrison has been a man of such a shut-in mental horizon as McKinley. The volume of his speeches and addresses put forth a couple of years ago, in the interest of his candidacy, ought of itself to make his candidacy impossible. To elect a man President capable of saying of the Chicago Exposition that it was, "in its highest sense, the hallelujah of the universe for the triumph of civil liberty,"

would be, as Cardinal Vaughan has said of the recent 'Life of Cardinal Manning,' "almost a crime." In the same volume the judgment was expressed of Gen. Logan ("Black Jack") that his "success in both careers [military and legislative] is almost unrivalled in the history of men." To place an intellect equal to that in a position where it would have to pass upon the most difficult questions of personal character and public policy, would be to put a premium upon stupidity and invite national calamity.

Fresh light continues to pour in on the rôle of the present Senate in national affairs. Mr. Hoar, one of the oldest members of the body, turned it on last week. He said that the belligerency resolutions of the two houses had no weight or effect; that they were an attempt to interfere with the President's constitutional prerogatives. But he was most illuminating when he quoted an old judge in East Cambridge, Mass., as saying, in a charge to a jury:

"Gentlemen of the jury, circumstantial evidence is where a fact that is known proves a fact that is not known. If you see great activity in the navy-yard over there to-morrow, it is not a proof that war is approaching, but that an election is approaching."

"And so," said Mr. Hoar, "the extraordinary excitement shown by the Senator from Ohio in this matter is not a proof of any great disturbance in our foreign relations, but that there is a Presidential election at hand." That observation carries us into the very centre and essence of this whole Jingo business, not as it is to-day only, but as it has been for more than a year. Its motive when Lodge and Chandler started it was precisely what it is now. By keeping at it, these two worthies and others like them managed to get up the Venezuelan trouble, and were very near getting up a Nicaraguan trouble, and they are now trying to get up a Cuban trouble. There has been no war, and we do not believe they ever expected any war, but they have done and are doing enormous damage to the business interests of the country. The kind of body into which they have converted both the House and the Senate, is suited only for the government of a pastoral community, or an agricultural one which produced only what was necessary for its own use. No commercial nation, with a great system of credit, could possibly live long under it. For many months past they have made business plans for the future almost impossible. It was this which led to the favorable consideration of a proposal at the monthly meeting of the Board of Trade and Transportation last week for a joint petition to Congress from the various commercial bodies of the country to adjourn, and "give business a chance."

All anybody needs, in order to estimate the capacity of the great men of the Se-

nate, is to read the debates of the past few days on the Cuban question. These debates were started on a gross and confessed misquotation from an unknown book, some newspaper scraps, and a mis-translation. These interesting facts were brought out by Mr. Hoar, on Wednesday week. On Friday the fun grew more fast and furious. Mr. Sherman said the committee on foreign relations had been started into activity about Cuba by secret information from the State Department, communicated through Mr. Lodge. This naturally produced great curiosity, and Mr. Lodge rose to explain. The important communication from the State Department was the enclosure of a letter from Señor Dupuy de Lome, the Spanish Minister, giving his views of the military situation in Cuba. This seems to have been converted in Mr. Sherman's mind into an argument in favor of belligerent rights. Of course everybody was anxious to see how this psychological process was effected, but a demand for the letter was naturally met by the reply that it could be read only in executive session. We ask the public, when reading these debates, to remember that they are carried on by high officers of one of the most powerful governments in the world, that they have a most disastrous influence on the business and finances of the country, that they have filled the large towns in Spain with mob violence and hatred of the American name, and are diffusing vague dread of America and contempt for our government all through the civilized world. Moreover, if Mr. Hoar had not departed from the usual recent practice of his own party, and, instead of sitting silent and apparently approving the folly of the Jingo element, poured hot shot into them, we should never have known the depths of folly and incompetency to which they can descend.

The current number of the *Political Science Quarterly* contains a discussion of the Monroe Doctrine by two competent hands. Prof. Moore begins it and Prof. Burgess continues it. They are both of the Political Science Department, and are men of eminence in their fields. From Prof. Moore we have already heard a good deal on this topic, but nothing as long or as weighty as the present article from Mr. Burgess. These gentlemen complete the list, as far as our observation has gone, of those who, being familiar with, or authorities on, this class of questions, have completely and argumentatively condemned both Mr. Olney's law and Monroe. We have not heard, East or West, of one dissenting voice from this class (and they may be said to be the mind, as distinguished from the muscle, of America) concerning international rights and duties and policy. They all say that Mr. Olney's Monroe is as bad as his law in this, that his Monroe is not Monroe's Monroe; that his own Monroe is bad law and bad policy. Of course there are

some, especially out West, who put in the usual "placatory tag" about devotion to the real Monroe Doctrine, and readiness to die for it whenever called upon, but this does not affect their argument. Let Jingoese consider these writers and be wise. Prince Volkonsky, the Russian, lecturing at Columbia College last week, quoted from a Russian writer the term "zoölogical patriot," as the equivalent of our term "Jingo." This means that this kind of patriot is an animal whose habitat is, say, in North America, and who, in virtue of the fact that he was born within certain parallels of latitude and longitude, constantly wants to bite all animals of the same species born in other parallels. When he sees a Jingo of different origin, he is always eager to throttle him, without rhyme or reason. Prof. Burgess's protest against the psychological tendency to raise a political "doctrine" to the position of a "fetish," and rattle about it in "excited gibberish," is well worthy of careful Jingo perusal.

The London *Chronicle*, which is busy picking holes in the British Case by pointing out inaccuracies or misquotations, will probably not make much impression by this attack any more than by its grand exposure of Lord Aberdeen when Mr. Norman was here. In fact, it is not unlikely that, as the *St. James's Gazette* says, most of its discoveries are mare's nests. But it evidently does not share the opinion of some of our contemporaries here that the better the British Case is, the stronger the obligation resting on it to arbitrate. This is not the way arbitration has been hitherto looked at by the people who resort to it. If this view were generally adopted, it would produce some droll results—that is, my obligation to arbitrate would increase in the direct ratio of the strength of my title. A man claims my watch, for instance, in the street, and demands arbitration. There is not the shadow of doubt as to my right to the watch. I would say I bought it of so and so, and had worn it for twenty years. Then why on earth, the bystander would say, do you refuse to arbitrate? The decision would certainly be in your favor. Or suppose Spain claimed Florida, and insisted on our arbitrating because the legality of our original acquisition of it was so clear. As a matter of fact and long precedent, arbitration always connotes reasonable doubt, and the duty of arbitrating grows weaker, and not stronger, as the doubt declines. Still, we believe every nation should arbitrate in all disputes about facts, when asked to do so by another state. The peace and civilization of Christendom rest on the assumption that each state is not only sovereign but reasonable, and that it will not make claims that are absolutely absurd and do not deserve discussion or attention. So that even slight doubts ought to justify international arbitration. As to the jour-

nallistic operations now going on about this question, the time for putting the parties on either side "in a hole" seems to have gone by. No newspaper needs to expose the weak points of either case. The British have their counsel, and the Venezuelans have theirs, and we have a commission "watching the case," as they say in the London police courts, on our behalf.

The *Railroad Gazette* has a painstaking and profound article on the Nicaragua Canal, the immediate subject being the Report of the Board of Engineers recently submitted to Congress. The character of this board it considers of the highest type. It is therefore not surprised at the temperance and restraint with which its conclusions are announced. It is only surprised "at the amount which the canal company does not know about the vast work that it has undertaken, and at the light-hearted confidence with which it has asked individuals and the nation to embark on the most difficult engineering work ever undertaken by men." The question whether the work can be done at all is still to be solved. So far as our knowledge now extends, all that we can say is that perhaps it can be done for \$133,000,000 and perhaps not. The points upon which information of the highest importance is wanting are numerous, and the want is inexcusable. It is indispensable, for instance, to know the variations in the level of San Juan Lake, since "every foot of reduction in the minimum will cause a large increase in excavation throughout the entire summit level, including the costly work of the San Juan River and the east and west divides. Yet the canal company has no recorded observations of the lake level or other data relating to its regulation, for the eight years since it began work in the country." The means of curbing the streams on the west side, in the San Francisco basin, in order to prevent the washing away of the canal by the tremendous rainfall that often visits that region, are still altogether in the dark. So with the great Ochoa dam, the failure of which "would leave navigation stranded, wreck the valley below, and possibly wash Greytown into the sea"; it is not yet known what foundation this dam is to rest on, nor have any detailed plans or specifications been made, nor does anybody know what is the maximum rate of discharge of water that must be taken care of. The company estimates this maximum discharge at 63,000 cubic feet per second. The board estimates it at 125,000 and possibly 150,000. It would be "stupendous folly," says the *Gazette*, "to assume the burden of this enterprise without the further studies which the board advises."

We are assured by persons who are the best authorities on the subject, that the

proposal to legislate the Niagara Falls Reservation Commissioners out of office does not spring from a desire for spoils alone, but that there is behind it also a scheme for getting possession of the water-power of the falls for the benefit of a private corporation. The two objects would naturally go together. With a lot of spoils politicians in charge of the Reservation, the improper sale of its privileges for the mutual benefit of politics and corporations would follow naturally. The State has bought the Reservation for the benefit of all its inhabitants. There has not been a day since the bargain was completed when vandals of one sort or another have not been trying to break in upon it to impair its natural beauty and make personal profit for themselves out of its wonderful power. The present Commissioners have stood like a rock against all these efforts at depredation, and it would be a public calamity were they to be removed. Senator Ellsworth should bear in mind that the Reservation is not the property of Buffalo, but of the State, and withdraw his bill as an impudent assault upon the property of the people.

Mr. Arnold Foster, M.P., writes a searching article, in the columns of the *London Chronicle*, on the Jameson raid against the Transvaal, on the South African Chartered Company, and against government by chartered companies in general. The vice of these, he says, is "that a chartered company can only be established by confusing two things which are absolutely irreconcilable and ought never to be associated. I mean the prerogative of governing men on the one hand and the desire of making money on the other. The right to govern men is one of the very highest duties which can be intrusted to a man or a body of men. The pursuit of money cannot be described in any such terms." The pursuit of money is well enough in its place, but, when mixed with the functions of government, it becomes intolerable. This was the vice, in another form, of that method of public finance known as "farming the revenue," which prevailed in ancient Rome, and, coming down to modern times, was extinguished by the French Revolution. The facts of importance relating to this method of collecting the public taxes are brought together in an interesting way by David A. Wells in the current number of the *Popular Science Monthly*. As the publican's compensation depended upon the amount of his collections, he was really invested with the power of state to extort an income for himself from the provincials. The same principle underlies government by chartered companies. The company is invested with power to tax the inhabitants of the territory embraced in the charter for the purpose of making dividends for shareholders in another country. Not only is this a vicious plan *per se*, but it

operates to deaden the sense of responsibility among the rulers who are here to-day and gone to-morrow, answerable to nobody but the company. It is not alone the South African Company that passes under Mr. Foster's powerful censure, but the Niger Company as well.

The indignation roused in the Reichstag by the accusations against Dr. Peters, the former Imperial Commissioner in East Africa, contrasts refreshingly with the comparative indifference to the similar charges against Chancellor Leist and Assessor Wehlan. A thorough overhauling of the entire administration of the German possessions in East Africa will probably result. Prof. L. von Bar of Göttingen, writing in the *Berlin Nation*, has pointed out that, in spite of the cruelties perpetrated by Wehlan, the Imperial Government could try him only for having exceeded his authority, of which the limits are but vaguely defined by existing laws. According to the law of April 17, 1886, German subjects in all the colonies of the Empire are amenable to the criminal code of Germany if guilty of inflicting a personal injury upon a native or depriving him of his liberty, but Government officials as such have hitherto had almost absolute discretion in their dealings with natives. The legal status of the natives has not been defined, so that even a humane official would not know whether to treat native criminals as he would Europeans, or as German Consuls in foreign countries are expected to treat natives in such cases. Prof. von Bar suggests a simple code determining both the nature of the crimes for which punishment may be meted out to natives, and the limits of the power of officials. He admits, however, the difficulty of limiting the power of Government officials in case of war, though he pleads for at least more humane treatment of native prisoners of war.

German writers deplore the decline of the Reichstag, very much as we do the degeneration of Congress, and have very much the same explanation to give. The falling off in individual ability, and the paralysis of the higher legislative functions, are attributed to the rush of selfish and mercenary interests into Parliament. With the private business of manufacturers and agrarians to look after and to claim first place, how can the members be expected to attend to the larger interests of the nation? Factions now build themselves about some money-getting scheme, some bit of class legislation, not about any real political principle. Machine methods naturally follow. The present Reichstag is thought to reach low-water mark for unblushing assertion of private over public interests. Protection, and the passion for paying debts in depreciated currency, appear to be doing in Germany what we have long observed them to be doing here.

THE VALUE OF DISCUSSION.

THE course of events in the United States Senate for the last two weeks will go far to recover for us, in matters affecting our foreign relations, what was rapidly becoming the lost art of discussion. The Cuban resolutions were passed on February 28 practically without debate—debate, as distinct from great gusts and gales. Morgan had, indeed, paraded on the windy plains of Troy for the better part of two days, Lodge had contributed his quota of misinformation, and Sherman had spoken with the impetuous passion and blundering of his ardent nature; but of argument directed to the vitals of the question, there was none. A week later Senator Hale made his speech, asked some strategic questions, submitted some evidence. Then Senator Hoar began to display a strange desire to know what the facts were, and, in the running debate which followed, the whole case of the foreign-affairs committee fell in complete wreck. Such humiliating twistings and doublings as Lodge and Sherman have been driven to, it would be hard to match in the annals of Congress.

The surprising thing is, not that this should have happened, but that a week should have passed before it happened. Senator Hoar was seven days behind the newspapers in finding out that Mr. Sherman's argument was a mass of guesses and irrelevancies and falsehoods. Yet at the time the Senate sat dumb under the transparent imposition. Nothing but the luck of delay in the conference committee, with the chance it gave to hear from the country, prevented a thoroughly unsound and fraudulent policy from being adopted by the Senate almost unanimously and without one word of effective protest. This would certainly have been an entire surrender of the right and duty of public discussion of the most important public questions, by the men chosen for the express purpose of discussing them and letting the country know what was going on, what the action proposed meant, and what the reasons for it were.

This paralysis of debate fell on this Congress almost at its opening in December, in connection with the Venezuela upheaval. The principle was distinctly laid down then, in both House and Senate, that foreign affairs must not be discussed—that is, critical foreign affairs, with war and a panic just round the corner. Congress was to vote, not talk. So pleaded Mr. Hitt in the House, so it was maintained in the Senate. Representatives could ask questions about the pay of consuls, could express their views on foreign tariffs or life-insurance regulations, but the thing that became them when war was threatened was modest stillness and humility. The precedent set then it was thought would rule in the Cuban debate. It did rule at first in the Senate. In the House a few men found their voice, but debate, in the good old parliamentary sense of give and take, of argument, of

sharp inquiry, of raillery, and exposure of blundering, did not really show its head until Senator Hoar got on his feet. He has done the country a great service. Not only has he completely shattered the case of the foreign-relations committee, but he has so triumphantly vindicated the value of discussion that we shall not soon see Congress sitting by again, terror-stricken and tongue-tied, while the gravest matters of national interest are being hurried through in silence and secrecy.

Lodge made a noble protest against effective debate in the Senate—at least against any brother-Senator's bringing in evidence from the outside to convict him of falsifying. He planted his feet firmly on the Constitution and the "safeguards of the freedom of the English-speaking race." No Senator should be questioned elsewhere for language uttered in debate. But Story says of this constitutional provision that its intent was "to secure independence, firmness, and fearlessness on the part of the members." This is a very different thing from granting a Senator immunity when he runs away in a fright and tells lies. That is the kind of protection that Lodge wants. He had imposed upon the Senate with a gross mistranslation and a non-existent proclamation, yet when Senator Hale brought in evidence of the fraud, he stormed indignantly about the most precious heritage of the English race. But we may be sure that the English race never intended to erect a bulwark in front of a public representative across which nobody must venture in order to expose falsehoods. Such protection Lodge cannot enjoy unless he becomes Senator among the Cretans. The English heritage is free and full debate, and Lodge is enjoying that as much as any man can who has been so discredited and humiliated by it.

It cannot be denied that there has been for some years a disposition to hold public discussion cheap. Much of the public discussion we have had it certainly would be hard to hold too cheap. Lord Salisbury said the other day in Parliament that "discussion has very little to do with the decision which nations come to upon this question [protection]. They are guided each one by the belief that this course or that will be favorable to their own interests." This is an extraordinary confession to be made by one of the most voluminous debaters and dialecticians of modern times. But what became of his dialectics when he uttered this sentiment we cannot guess. The only way nations arrive at a belief that any course will be favorable to their interests is by public discussion of that course. Nations are not born with fixed and unalterable opinions. They do not form them in their sleep, or pick them up in the streets, but base them upon argument, or what passes for such, and frame them on consideration and weighing of reasons pro and con. Their ideas of what

is their true interest change from time to time, which could not be the case if discussion had no effect. Parliaments and Congresses have been in the past the chief means of furnishing argument for the people to form their judgment upon, and we must hail every indication that our own Congress does not really mean to abdicate its function of public education on the great questions at issue.

SENATORIAL DIGNITY.

THERE have been various discussions of a humorous character in the Senate during the past year, but none quite so humorous as the attempt to discipline the Spanish Minister for making a direct answer to a senatorial attack on his own government and its officers. The Senators resent this bitterly as an attack on what they call their "dignity." Now dignity is not a thing which can be taken on or put off at pleasure. An occasionally dignified man would be a ridiculous person. Nor is it a thing which can be supplied from outside sources. Each individual, or each assembly or tribunal, must be the sole purveyor of his or its own dignity. Dignity runs with the person, as the lawyers say, and not with the clothes or the building; and it is one of the most difficult things in the world, and especially in the modern world, to keep up. It necessitates a great deal of form and much self-restraint, and it needs, above all things, constant attention. All legislative bodies which try to maintain it have to be careful about what they say and allow to be said or done within their precincts. They have to have not only rules and regulations, but officers to enforce them, to secure decorum in debate, and to secure decorous behavior on the part of those whom they admit to witness their proceedings. They have to cherish what they call "order." They have to secure reverence from other people by strict attention to things on which these other people usually base reverence.

Judged by these standards, the days are gone by when the United States Senate could refer to its dignity without a meaning smile. The Senators have shown in a hundred ways that they do not care about their dignity, and therefore they cannot expect the public or foreign ambassadors to care much about it. For instance: Nothing, as history has shown, is more necessary to maintain public respect for a legislative body than the rigid exclusion of outsiders from participation in its proceedings. This means the exclusion of spectators from the part of the House occupied by members. This is carried so far in the English House of Lords and Commons that a spectator is not allowed to hang his coat over the rail of the gallery so that any part of it shall fall within the House. Not only is he not allowed to take part in the proceedings, but he is forbidden to indicate by any sign whatever that he is conscious that there are any proceedings.

At the same time he is forbidden to read, write, or munch food. These rules are based on principles of human nature, and they are justified by the experience of many ages and nations. Any legislative assembly in whose doings and sayings promiscuous outsiders are permitted to take part, has begun its decline—decline in dignity, in authority, and therefore, in a democratic country, in power.

Now the United States Senate has so far forgotten all this that it not only allows a crowd to invade its galleries, but to applaud the speeches vociferously or manually on any exciting topic. To set up a claim after this to have the proceedings regarded as so private and strictly "domestic" that a foreign minister may not notice them except through "the regular channels of diplomacy," is simply preposterous. Nothing is private or domestic which the general public is permitted to listen to or cheer. The Spanish Minister has as much right surely to go into the gallery and hiss Lodge or applaud Hale as has any Washington negro. We have not yet got to the point where the gallery loafer may arise and correct the orator, but we are surely coming to it.

In the next place, it is part of the "order" of every legislative assembly not to make personal attacks or charges against outsiders who are not subject to its jurisdiction, have not violated the law, and cannot reply to its oburgations; and this rule covers particularly the representatives and servants of foreign Powers. This is so ridiculously violated in Washington that, as we have seen recently, it is very common in both houses to load the officers of foreign governments with abuse, and to make charges against them of the most atrocious character, without a particle of proof, amid the cheers of the mob in the gallery. Senator Lodge has done this over and over; so has Senator Morgan; so have a score of others. Any foreign representative who is exposed to this sort of thing, is entirely justified in inferring from all the surrounding circumstances that he may use the privilege of all American citizens who are assailed by these scolds, and answer back. He has no good reason for supposing that they will take refuge in their "domesticity" or their "dignity," and ask him to make his complaint to the State Department. The State Department has no more jurisdiction of them and their behavior than the Minister himself. It cannot call them to account, and correspondence with it about them might last for a month, while the charge was traveling around the country and helping to influence the issues of peace and war. The title of a Senator to exemption from the lie direct rests on the assumption that he will make no personal attacks on anybody, unless absolutely necessary to the discharge of his business, or without careful inquiry and proof, and that he will be courteous and restrained in all mention of the officers of foreign Powers. Dignity and exemption

in these matters attach to the Senator as a member of the American Government, with quasi-judicial and quasi-diplomatic functions, and not to the Senator as a loose-tongued and blathering politician.

Another condition of senatorial dignity, which is equally disregarded, is abstinence from attacks on American citizens about personal matters. Any legislative body which allows members to settle on the floor their quarrels with outsiders about their own doings or capacity, necessarily becomes a byword and shaking of the head. Senator Lodge has done this more than once. He "gives fits" to his newspaper and other critics, in what he calls "his place," and thus puts on record in the *Congressional Record* matter which may be just as scurrilous and slanderous as that which he uttered the other day against the Cuban Captain-General, and naturally invites retort and contempt. In fact, there is nothing in the affairs of men to-day more calculated to excite ridicule than claims to respect which are not justified by behavior. This has furnished the comic element to hundreds of plays and novels, and will always do so. The ignorant, ill-mannered man demanding the honor due to the polished and accomplished gentleman, the shyster wearing the robes and wig of the judge of appeal, the skulker recounting his exploits in the field, the sneaking politician asking us to receive him as a Webster or a Clay, will amuse the world as long as men legislate, and print, and laugh. There was a great deal of comedy in the French Convention, which has largely been lost sight of through the fearful tragedies with which it was mingled, but our own Senate is reproducing a good deal of it without the accompanying horrors.

MADE IN FRANCE.

THE article of wise patriotism which our Congress is now displaying is flaunted as a purely American product. The truth is, as we have more than once remarked, that it is only a poor imitation of a French original. Between the present American Congress and the successive National Assemblies of France from 1789 on, a very close parallel may be drawn; and it is well worth while to follow it out in some detail.

In point of personnel and competence for its work, the analogy between our Congress and the ruin-dealing National Assembly of France is close and striking. We cannot do better than take Burke's analysis of the latter:

"Judge of my surprise," he wrote, "when I found that a very great proportion of the Assembly (a majority, I believe, of the number who attended) was composed of practitioners in the law. It was composed, not of distinguished magistrates, who had given pledges to their country of their science, prudence, and integrity; not of leading advocates, the glory of the bar; not of renowned professors in universities; but, for the far greater part, as it must in such a number, of the inferior, unlearned, mechanical, merely instrumental members of the profession. There were distinguished ex-

ceptions; but the general composition was of obscure provincial advocates, of stewards of petty local jurisdictions, country attorneys, notaries, and the whole train of the ministers of municipal litigation, the fomenters and conductors of the petty war of village vexation."

That would pass for a very accurate description of our House of Representatives. In it the narrow-minded country lawyers are in a large majority. That we get nothing better from them than we do is not surprising. The surprising thing would be that we should get anything better. What Burke said of the members of the French National Assembly is true of the members of any legislative assembly: "No name, no power, no function, no artificial institution whatsoever can make the men of whom any system of authority is composed any other than God and nature and education and their habits of life have made them."

But to the test not of individual capacity, but of achievement. The National Assembly met in the midst of terribly disordered national finances. In August, 1788, the Government had confessed bankruptcy, and paid its debts only in paper with a forced circulation. The army was utterly disorganized. The navy, from having been second only to that of England, was fallen into decay. In both army and navy, obedience and discipline were almost unknown. Domestic distress and anarchy were appalling. At one time nineteen departments were in open insurrection. The monthly deficits heaped up, and were met by heaping up rag money. In such a state of things, with remedial measures the crying need of the day, the Assembly was seized by a mad passion for a foreign war. Conflicts abroad were expressly urged as a way of diverting attention from threatening bankruptcy and other domestic difficulties. The sacredness of treaty obligations was openly renounced. Revolutionary and insurgent subjects of other governments were assured of the support of French arms. A causeless war was declared on April 20, 1792—a war which drenched Europe in blood for twenty years—and only seven votes were recorded in opposition (compare the minority of six in our Senate).

We leave the moral of all this to point itself, and pass on to the analogy between the methods of French legislative madness and our own. Almost from the beginning, the National Assembly made itself an instrument for recording the whims and passions of the mob. Shrewd Arthur Young noted as early as 1790 the alarming power of the galleries, "open to all the world." "The audiences in these galleries are very noisy; they clap when anything pleases them, and they have been known to hiss; an indecorum which is utterly destructive of freedom of debate." What came later everybody knows. Applause and hissing passed into ferocious cries and threats, into personal violence, into driving away large numbers of members by gangs of assassins. The picture which Burke gives of the final outcome is one which

should be printed in large capitals every day in our *Congressional Record*:

"The Assembly, their organ, acts before them the farce of deliberation with as little decency as liberty. They act like the comedians of a fair before a riotous audience; they act amidst the tumultuous cries of a mixed mob of ferocious men, and of women lost to shame, who, according to their insolent fancies, direct, control, applaud, explode them; and sometimes mix and take their seats amongst them, domineering over them with a strange mixture of servile petulance and proud, presumptuous authority."

Our Senate and House have not yet reached this depth of humiliation, but they are headed straight down the decline. Speaking to the gallery is the preliminary of speaking from the gallery. Frowning disapproval from the gallery, intended to dismay honest men speaking their honest thought, will, if tolerated, lead to kicks and cuffs administered outside, and to a physical terrorism equal to the mental terrorism already in existence. What our servile Congress is preparing for itself is the irruption before long of Carlyle's "dripping Menads" whom neither the Vice-President nor Mirabeau could restrain, and who "ever and anon break in upon the regeneration of France with cries of 'Bread; not so much discoursing!' (*Du pain; pas tant de longs discours.*) So insensible were these poor creatures to bursts of parliamentary eloquence!"

It would be interesting to pursue the analogy further. The Jacobin Club, for example, an outside and irresponsible organization, marching down every day to make the Assembly register its decrees, has a strong family likeness to our bosses and lobbyists and "owners" of Congressmen, who buy and sell legislation, put the screws on this man and make the other one howl, and unblushingly set themselves up as absolute dictators, in whose hands Legislatures and Congresses and Governors are but silly puppets. But we leave the parallel drawn only in broad lines. In character, in methods, in seizure by mad passions—above all, the passion for a brainless war—in slavish fear of the mob, in abdication of leadership, it cannot be denied that our Congress is harking back more and more visibly to the pattern set them a hundred years ago in France—to an Assembly of which Morris wrote to Washington: "This unhappy country presents to our moral view a mighty ruin. . . . The Assembly at once a master and a slave, new in power, wild in theory, raw in practice. It engrosses all functions though incapable of exercising any, . . . and the great interests of the whole depend on momentary impulse and ignorant caprice."

With Morris, we are confident that "such a state of things cannot last." But if it is not to go on to the further madness into which France fell, we must have, and that quickly, somebody, some voice, some leader, some organ of public opinion, at Washington, in every legislature, in the press, in every form of discussion and agitation, to furnish a rallying centre for "civic manhood firm against the crowd."

THE MEANING OF McKINLEY.

WHEN one reads every day of the way the Republican delegations are rushing for McKinley, one cannot help recalling the fact that the same class of men rushed for him and his policy with equal impetuosity at the election of 1898, and that he and his friends did in 1890 precisely the thing which his supporters hope he will do in 1898. We are fully warranted, therefore, in believing that if he is nominated and elected with a corresponding majority in Congress, he will do in 1898 the very things he did in 1890, and that the same results will follow. That is, his protectionist supporters will have such a keen appetite for high duties, and will feel so confident that they will get away with their "pile" before any reaction can come, that they will pass another McKinley tariff, the working of which will utterly disgust, not the rank and file of the Republican party, which no high-tariff bill can disgust, but the large body which hates extremes, likes a quiet life, and turns the scales at elections, and makes nowadays nearly all the principal States in the Union more or less uncertain at Presidential elections. For the feeling which is gaining ground most rapidly in the United States to-day, whatever McKinleyites may think, is not a desire for either a low tariff or a high tariff, but for stability in politics and business.

We believe this feeling has been growing, all through the Northern States at least, during the last four years, just as the anti-slavery feeling grew between 1856 and 1860, and under the same class of influences—that is, the excesses and exorbitant pretensions of the champions of slavery, which had kept the country in a continual turmoil for the previous quarter of a century. We presume no intelligent observer of these times now doubts that if the slaveholders had kept quiet, and had been content with what they had, either slavery would be in existence to-day, or they would before now have got rid of it by some peaceable compromise, and possibly by means of pecuniary compensation. It was the cloud their restlessness cast on the future of the government and on business, rather than pity for the blacks pure and simple, which finally bred the Northern determination to be rid of their system at whatever cost.

The high-tariff men seem now to insist on taking their place as disturbers of government and business. When they get into power they set up a tariff so extreme in its protection that the public will not live under it. When they are driven out of power by this very excess, far from profiting by the experience, they spend their time in ascribing every ill that folly and ignorance or the "act of God" may bring on the country to the abandonment of their experiment. The first chance they get, they set to work to persuade the country to try it again, and execrate the moderate or middle course on which it has entered for the sake of peace and quiet.

Nay, they go further than they ever went; for in order to show that of all the problems that beset the nation, foreign and domestic, the only thing they care about is the tariff, on which they were so terribly defeated in 1892, they single out for the Presidency the one conspicuous man in the party who has nothing to recommend him except his connection with that tariff. This is probably the oddest thing in the history of the party. Every other candidate the Republican party has nominated since its first Presidential convention has had some sort of fame in arts or arms. He has been a powerful debater and a courageous politician like Abraham Lincoln; or a great soldier like Gen. Grant; or a respectable soldier and a man of cultivation like Gen. Hayes; or an eminent legislator and soldier like Gen. Garfield; or a conspicuous lawyer and soldier like Gen. Harrison. Major McKinley has not one of the merits which carried these men into the Presidential chair. He has no connection with anything for which the party has ever stood; except the high tariff; and what gives a touch of drollery to his candidacy is that the high tariff to which he gave his name is the only one on which the party was ever defeated. There is in his candidacy, however, something droller still. It is proposed to put him at the head of the nation in an hour of great financial trial because of his views on finance, in spite of the fact that he has failed in business and is a silver-man. It may be nothing against his character that he has failed, but think of selecting such a man as the chief financial adviser of a great nation. In every other parliamentary country a bankruptcy disqualifies a man even for a seat in the Legislature. McKinley's elevation to the Presidency will, in fact, closely resemble the well-known opéra-bouffe decoration of the Colonel for his rapid flight from the field of battle.

The nomination, if made (and we still can hardly believe that it will be made), will serve the useful purpose of showing how completely indifferent the party has become to all subjects of legislation except the tariff as a means of making money for manufacturers, and above all how indifferent it has become to stability in business, because it evidently cares nothing about the reaction which experience shows would probably follow McKinley's election and the legislation of his Congress. What the business men of the country have discovered, or are daily discovering, is that nothing is now so necessary to the United States as steadiness in legislation, and especially in currency and taxation. The experience of recent years all points in this direction. Ask any business man in the country who owns any capital—that is, who has any money to invest, or who has credit enough to borrow—what his most ardent desire as a business man is, and he will almost certainly tell you, a cessation of perturbation of every description. He wants peace

with foreign nations, he wants a policy in finance and currency that is pretty sure to last—that is, which will not excite violent opposition as soon as it is entered on, and which will enable people to calculate fairly what the value of their property will be ten years hence.

This is the heart's desire of everybody who wishes to provide for his own old age or for his children. It is just now a growing desire, and we believe the party which by the character of its legislative nominations makes the best promise of satisfying it, is the one which will be surest of the future during the next half-century. To pick out a man who has failed in life, and who is noted for the feebleness of his intelligence and for the scarcity of his convictions, is, on the other hand, a sort of hoisting of a storm-signal, an announcement of strife and trouble, action and reaction, wars, rumors of wars, and the uncertainty which always waits on persistent attempts to make men behave unnaturally. We have bred among us a large body of persons who have learned the art of making money out of legislation, and who resent interference with their business as the slaveholders resented interference with property in slaves; and the political work of the next ten years will probably be their pacification and subjection to the régime of equal rights.

THE AFRICAN TROUBLE.

THAT another crisis in the Sudan would follow the Italian reverses in Abyssinia has been generally expected. The news of such things spreads with such furious rapidity in the Mussulman world that it was feared by many that the capture of Khartum in 1885 would put the French on the defensive in Algeria. A new generation, too, has grown up since the British attempt to bring the Mahdi to reason, and there is, therefore, a fresh swarm of recruits for a crescentade. If what Mr. Curzon says be true, that the Mahdi is now able to put 300,000 men in the field, the situation is really serious, for there are not many troops in the world that are able to resist the rush of the Sudanese, who have the immense advantage of wanting to die—a quality which a German military writer says makes a man the most terrible of all opponents. They twice broke British squares, and were overcome only by being exterminated, and boys of sixteen lying wounded on the field bit the surgeon who tried to help them.

That the Mahdi or Khalifa wants to aid the Abyssinians, who are Christians, is unlikely, but he knows the Europeans are in trouble, and thinks his opportunity has come. There is no question whatever that, but for the presence of the British, he could easily go to Cairo and Alexandria and set up once more a fanatical Mohammedan Power on the shores of the Mediterranean. The bearing of all this on the relations of the European Powers is even more interesting than its bearing on the

fate of Egypt. The probable effect of the Italian defeat on the Triple Alliance was the very first question which the disaster started. The effect of it on Italian prestige and finances was plain enough. Would it seriously diminish the Austrian and German estimate of the value of the Italian alliance? Would it make the alliance seem less formidable to France and Russia? Would it consequently increase Russian boldness in Turkey and China? Would the German Emperor's escapades in Africa weaken the British disposition to stand by Italy in Africa although his ally?

These questions seem to be now all fairly answered. Austria and Germany are to maintain their consideration for Italy, and England is to continue her support of Italy, as an indispensable ally in the Mediterranean. She is to be helped out of her scrape in Abyssinia at whatever cost, the Abyssinian disaster being regarded in London as a menace to Egypt; to all of which Russia responds by giving King Menelek the Grand Cordon of St. George, which at such a time is a very open expression of sympathy. If Mr. Curzon's account of the Mahdi's force be true, the campaign will be anything but a promenade. There is considerable uncertainty as to the quality of the native Egyptian troops. They are, of course, immensely improved under their English officers, and have been successful against the Dervishes in several small affairs, but these were cowed Dervishes fresh from defeats by the British. How they will stand the younger horde remains to be seen. If their places have to be taken by British troops, the enterprise will be anything but welcome to the British public. The last campaign in the Sudan, coupled with Gordon's death, was both sorrowful and humiliating, which accounts somewhat for the reported lack of enthusiasm on the part of the London press.

Those who are at all familiar with social conditions in Sicily will get an idea of the magnitude of the problems which are being neglected, perforce, in Italy, in order to carry such Jingo enterprises as the war with Abyssinia. Many parts of Italy are getting into a condition not far removed from that of Sicily, in order to enable the country to cut a fine figure in uniform among the Kaisers, and show how much it can do in the way of destruction. We do not wish in any way to underestimate the value of the work of civilization which the European Powers have been doing in Africa within the present century; nevertheless, it is plain that all are not equally well fitted for it. Some, like the British and Dutch, and to some extent the Germans, are colonists by nature, and follow their armies with swarms of outlanders, who plant and reap and strike roots into the soil and build up governments. But others, like the French and Italians, make colonies which are seldom more than sickly hot-house plants kept up by Government subvention and ruled by mili-

tary men. Italy has far more passion for emigration than the French, but less passion for fighting. Neither of them has shown in this century any taste or capacity for founding new states. Their efforts to carry the national civilization into savage lands have been simply Jingo enterprises, of which this Abyssinian war is the most inexcusable and the most wasteful.

One marked peculiarity of the Jingo is his inability to bear defeat. He enjoys his "extras" greatly while they bring the news of victories, but defeats make him load his own Government with execrations, if not try to overturn it, and cause him often to pack up his traps and leave the country if there be any danger of his having to do any fighting himself. These expressions of Jingo character have all shown themselves in Italy within the last few weeks. Where the army is to come from which is to seek Menelek out in his mountains, and lay him low, and enable Italy to turn her attention to the work of peaceful restoration, does not as yet appear. The heart of the people is evidently not in a war in which disasters like that of Abba Carima are probable; but one of the articles in the Jingo creed is that when you go to war you must not count the cost, and that it is base to consider the misery wrought by your defeats. The Abyssinian campaign will probably delay the work of Italian regeneration twenty-five years, and yet how long Italy has waited for it!

Correspondence.

THE PARTHENON INSCRIPTION.

TO THE EDITOR OF THE NATION:

SIR: Your issue of February 6 contains a reference to the attempts at deciphering, by aid of the nail-prints, the bronze inscription which once stood upon the eastern architrave of the Parthenon. Your readers will be gratified to learn that this difficult task has now been successfully accomplished by an American student. The initial difficulty lay in securing accurate representations of the nail-prints. These are forty feet above the ground, and inaccessible except as one be lowered from the overhanging gison blocks some twelve feet above them. In spite of numberless difficulties and hindrances, and certainly at some considerable risk, the work of procuring paper prints or squeezes from the perilous vantage-ground of a swing in mid-air was begun about the middle of January last by Mr. Eugene P. Andrews, a member of the American School. Great patience, persistency, and technical skill, as well as coolness of head, were essential to the work.

The nail-holes appeared in twelve groups between the spaces once occupied by the bronze shields, and only one of these groups could be copied in a day. Sometimes the day's work resulted in failure, but finally three weeks of persistency brought the copies to completion, and the first careful review of them showed that decipherment was only a question of scholarship and patience, for the variety in the order of the nail-prints surely betrayed the indi-

viduality of the letter-forms. As a rule, only three nails were used to a letter, but the order or relative position of the holes proved to be much the same in all the different occurrences of the same letter.

The first word to emerge was *αἰσχρολόγια*. It made itself peculiarly vulnerable by its possession of two omicrons, two rhos, two taus, and three alphas (one of them, however, obscured). From this key Mr. Andrews proceeded with his unravelling until, after a fortnight, he was able to make a public report at a meeting of the School, giving practically a complete reading of the inscription. Two proper names alone have not yet been deciphered. The reading is as follows:

ἡ ἐξ Ἀρείου πάγου βουλὴ καὶ ἡ βουλὴ τῶν Ἰ καὶ ὁ
ὄμιλος ὁ Ἀθηναίων αἰσχρολόγια μέγιστον Νέρωνα Καίσαρα
Κλαύδιον Σεβαστὸν Γερμανικὸν Θεοῦ Υἱὸν στρατηγούντος
ἐπὶ τοῦτο ἀελίτας τὸ ὄρεον τοῦ καὶ ἐπιμελητοῦ καὶ
νομοθέτου Τ. Κλαυδίου Νουρίου τοῦ Φιλίνου ἐπὶ ἱερείας
. . . (name of priestess) τῆς . . . (father's
name) θυγατρὸς.

The reference to the eighth term of Novius's generalship fixes the date of the inscription at 61 A. D. It probably accompanied the erection of a statue of Nero, possibly just at the front of the Parthenon. The important historical bearings of the discovery it must be left to Mr. Andrews to set forth in the official publication. The importance of the subject, the difficulty of the task, and the brilliant and successful method of decipherment, have combined to awaken here more general public as well as scientific interest than has attached to any other archaeological event of the year.

BENJ. IDE WHEELER.

ATHENS, February 26, 1896.

CUBA LIBRE.

TO THE EDITOR OF THE NATION:

SIR: Everybody knows that what the Jingoos are really aiming at is the annexation of Cuba. The most depressing feature of most of the things which are being said and written about Cuba all over the country is, not their foolishness, but their hypocrisy.—Yours truly,

X. Z.

CHICAGO, March 12, 1896.

["One of the most accomplished and distinguished officers of the Navy," as the *Bangor Whig and Courier* avouches, writing in praise of Mr. Boutelle's opposition to the Cuban resolutions, thus states the case.—ED NATION.]

"Free Cuba, which our people are so eager to bring about, means in plain English an exchange from the misrule of Spain to perpetual anarchy, when revolution will succeed revolution in one endless chain. Look at the so-called republics of Central and South America for object-lessons. . . . Grant the independence of Cuba to-morrow, and who would be President of the new republic? Gomez, a foreigner, or Maceo, a mulatto without a particle of education. . . . Then would succeed a reign of terror. President Gomez would retain power until Gen. Maceo, in command of the army, wanted his place. Within a year or eighteen months there would be a revolution. The sugar and tobacco crops would be destroyed, property of Americans confiscated or burnt, and this without redress, for in the quicksands of such political life there is no solid foundation of responsibility. This is no mere fancy sketch. . . . The alternative is the annexation of Cuba. Humanity would in time demand such a solution of the question; but that means the occupation of the island for some years to come by a strong military and naval force. Are we prepared for that?"

PERSONAL FICTION AND FACT.

TO THE EDITOR OF THE NATION:

SIR: In the interest of decorum, and as a favour to one of your old contributors, I hope you will admit this letter to your columns.

Thirteen years ago Mr. Gilbert M. Tucker, referring to an article of mine published in the *Nineteenth Century*, expressed himself, with respect to something in it, as follows:

"That such rubbish should be written by a recognized authority in philology ceases to be surprising when it is understood that the author is, not a Briton, as might be supposed, but one of those extraordinary Americans of the Henry James, jr., stripe [*sic*], who seem to regard it rather as matter of regret than otherwise, that they were not born in Europe. But, that the editor of such a magazine as that in which this effusion appeared should think it worth while to print, and presumably to pay for it," etc., etc.

In *Our Common Speech*, a book which he has recently brought out, Mr. Tucker repeats the professed description of me given above, but embellished by two significant touches. To the words "not born in Europe" is now added, "and who commonly out-British the British themselves in reviling the customs of the United States." Moreover, for "the Henry James, jr., stripe" is now substituted "the 'Carroll Gansevoort' stripe," with a footnote explaining that Carroll Gansevoort figures, in a novel, as a New Yorker who "would have considered himself disgraced if he wore a pair of trousers, or carried an umbrella, that was not of English make." To the best of my self-knowledge, I am just about as comparable to an anthropophagite as to such a phenomenon.

Of my personal predilections, over and above the preference I have acknowledged for good English to bad—as, for instance, *stripe* for *stamp*, and similar slang of the stums and the gutter—my assailant has not the slightest inkling. As to my "reviling the customs of the United States," he would, without question, have tried to justify the charge had it been susceptible of even a semblance of justification.

Again, his grounds for talking of my having written "rubbish" consist of fragments of two sentences, one of which, as he first quoted it in the *North American Review*, and as he quotes it in his book, is so transformed, by the elision, unindicated, of part of it, as to vitiate its purport materially.

"Saepe intereunt animi meditantos necem."

It is now only six months short of fifty years since I came to live among Englishmen; and, throughout that somewhat protracted period, precisely like nearly any other American, I have always been prompt, and not seldom at the cost of rude handling, to defend my countrymen, their institutions, and their conduct, so far forth as I have thought them defensible. At the same time, dispassionate observation has convinced me that there are certain ways of the Old World which our compatriots, here and there, would profit by imitating. In particular, persons of the type of Mr. Tucker would obviously do well to cultivate, in some matters, the ethos which prevails among the better classes of civilized foreigners. The instruction which seems to be alone likely to weigh with them may, however, be obtained without their going so far afield. At home, quite as well as elsewhere, they may assuredly learn the simple lessons in policy, that coarseness of language and a low tone of thought will recommend them to none but their æsthetic and ethical compeers, and that

practices akin to the use of loaded dice are attended with peril of exposure.

Your obedient servant,

FITZEDWARD HALL.

MARLBOROUGH, ENGLAND, March 6, 1896.

Notes.

FURTHER spring announcements by Henry Holt & Co. are W. Fraser Rae's 'Life of Sheridan'; Chevrillon's 'In India,' translated by William Marchant; 'Animal Symbolism in Ecclesiastical Architecture,' by Prof. E. P. Evans, with many illustrations; Francke's 'Social Forces in German Literature'; and Mears's 'Emma Lou, Her Book,' the humorous diary of a Western girl.

The Merrymount Press, D. B. Updike, Boston, will have ready before Easter a costly folio 'Altar Book,' containing the order for the celebration of the holy eucharist according to the use of the American Church, with collects, etc. It will be very elaborately adorned with borders and initials, and will be bound in pigskin. The edition will be limited to 850 copies.

Southey's *Life of Nelson*, edited, with an introduction and notes and a certain amount of compression, by Albert F. Blaisdell, will be added by Ginn & Co. to their 'Classics for Children.'

Dodd, Mead & Co. invite subscriptions to a limited edition of 'The Journal of Capt. William Pote, jr., during his Captivity in the French and Indian War from May, 1745, to August, 1747,' an inedited document of much interest and historical and genealogical importance, discovered only six years ago in the manuscript, by Bishop Hurst, who furnishes a preface. Mr. Victor H. Paltsits of the Lenox Library will supply an historical introduction, annotations, and an index. Illustrations and maps will add to the attractiveness of a luxurious piece of bookmaking.

Stone & Kimball, Chicago, have in preparation a series of letters from Japan, by William E. Curtis, and 'The Damnation of Theron Ware,' by Harold Frederic.

Mrs. Martha Foote Crowe of Chicago University will edit, and A. C. McClurg & Co. will publish shortly, the first of a series of four small volumes of "Elizabethan Sonnet Cycles." The edition will be limited.

In the autumn we are to have from Houghton, Mifflin & Co. an entirely new Riverside edition of the Writings of Harriet Beecher Stowe, in some sixteen duodecimo volumes, with bibliographical introductions and notes. For a large-paper edition Mrs. Stowe has already written her firm and handsome autograph.

The Messrs. Putnam's uniform "Mohawk Edition" of the works of James Fenimore Cooper is sure of a welcome. It is generously conceived, the typography is bold, clear and elegant, and the several works comprised in the thirty-two large-12mo volumes are to be had separately at a very reasonable price. There is no editorial apparatus. If we may judge from 'The Spy,' which leads off, there will be a frontispiece illustration in each volume, and a vignette upon the rubricated title-page. The binding is in a tasteful red cloth, and the new series is designed to range on the shelf beside the "Hudson Edition" of Irving.

Mr. R. H. Davis's sketchy magazine articles remain what they were, though now collected into a volume, 'Three Gringos in Venezuela and Central America' (Harpers). His frank

audacities of ignorance about many matters, and the boyish gravity with which he dispenses good advice to perplexed statesmen, must be taken as a part of the abandon and light-heartedness which make up the main charm of his book—and that it has a charm of its own, alight as it is, is undeniable.

A second edition of Colonel Winthrop's 'Military Law and Precedents' has been issued by Little, Brown & Co., Boston. The original work was recognized at once as a most complete and authoritative guide in courts martial and all the other military courts and boards which have judicial powers. Great care has been taken to collate all the American and English authorities, and, in the new edition, to bring down the law and the rulings to the present date. This fulness of treatment results in two stout law octavos, but the space is usefully filled with matter which makes the work a necessity to general law libraries, as well as a vade-mecum for judge-advocates and military tribunals. The same author has also prepared a new and annotated edition of the 'Digest of the Opinions of the Judge-Advocate General.'

We have had for some time on our table the illustrated 'Handbook of the New Public Library in Boston,' compiled by Herbert Small (Boston: Curtis & Co.). It is a very thorough and minute description of the costly building (which is a monument as well as a bookcase), and should satisfy the most ardent curiosity of visitors. An example of the editorial painstaking is shown in an identification of the printers' marks which form so happy a feature of the external decoration. There are professional chapters on the Architecture of the Library, by C. Howard Walker, and on the Significance of the Library, by Lindsay Swift.

After the *Yellow Book* the *Pink*. The editor of the *Savoy*, the newest illustrated quarterly (London: Leonard Smithers), professes catholicity. "We have no formulas," he says, "and we desire no false unity of form or matter. We have not invented a new point of view. We are not Realists or Romanticists, or Decadents. For us, all art is good which is good art." And he further disclaims originality for originality's sake, and audacity for the sake of advertising, as well as timidity "for the convenience of the elderly-minded." Of this last defect there is indeed little in his pages, but we will not answer for the absence of the other two. The general effect of the publication is that of an avatar of the *Yellow Book*, with most of its contributors, only a little the worse for wear. Mr. Beardsley appears in a double, or rather triple, rôle, as artist, poet, and romancer. His drawings have lost their chief charm in his abandonment of pure black and white and his feeble introduction of hatchings, while they are as unpleasant as ever in type of face and forms; and his so-called Romantic Novel is entirely unintelligible except as a description of his drawings. The other "artists" of the number are noticeable only for their utter incompetence. Amid this rubbish the two drawings by Sandys and the one by Whistler, which illustrate Mr. Pennell's article on "A Golden Decade in English Art" (1860 to 1870), are strangely mismatched, and their sturdy quality sets one to wondering what has happened to England since such men illustrated and Thackeray wrote.

"The Decoration of Book-Edges," a paper by Cyril Davenport, occupies the post of honor in *Bibliographica*, Part VIII. (Scribners), and deservedly. An interesting theme is treated agreeably and with authority. W. J. Hardy's

"The Book Plates of J. Skinner of Bath" is a contribution both to the collector's fad and to the history of engraving in England, and Henry R. Plomer quarries from a legal document matter of great interest for the printer's art in discoursing of "John Rastell and his Contemporaries." Robert K. Douglas's "Chinese Illustrated Books" maintains the level of excellence of the foregoing articles in a very even number, which Austin Dobson enlivens with an account of "Pickle's 'Club.'" Mr. Douglas points out what Japanese art owes to Chinese, and remarks on the employment of our familiar Western device of showing in a cloud the dream supposed to be filling the mind of the sleeper beneath. His pictorial illustrations are very attractive.

The most significant article in the *Harvard Graduates' Magazine* for March is that by the Rev. C. F. Dole, which advocates the merging of the Divinity School in the general courses of the University and the non-segregation of its attendants. This writer's contention is that a clergyman cannot have too broad an education, and that there is no special mystery of the craft—as, e. g., pulpit rhetoric—which exacts a professional training; on the other hand, that it would be an advantage to have the divinity courses made attractive and accessible to all the students of the University without regard to their aim in life. "I would," says Mr. Dole, "permit no course of study to be considered as for 'ministers' only." As for Hebrew scholarship, "the average minister, both for training his mind and for practical benefit and helpfulness, had far better make a study of music." The report of progress in the matter of a University Club seems to show that this enterprise is assured of success in view of its generally acknowledged need and the character of the chief promoters of it. Portraits of the late Rev. S. F. Smith and of President Holyoke (after Copley) adorn this number.

In the March number of the *Gazette des Beaux-Arts*, Mr. Bernhard Berenson, in discussing the Italian pictures he found in New York, Boston, and Newport, draws attention to the fact that within ten years there will remain scarcely an Italian picture worth the buying, as all the better kind are being rapidly bought up by the public collections of Europe. Mr. Berenson deplors the inaccessibility of the few Italian masterpieces we are fortunate enough to possess. In the New York Historical Society's rooms he instances a Piero della Francesca, and other precious works, equally kept in murky apartments, and, even thus, to be seen only as a very special favor, and never thrown open to the public.

Bulletin No. 2, New Series, Division of Entomology, of the United States Department of Agriculture, a pamphlet of 100 pages, contains numerous hints of importance to horticulturists and farmers, or others who suffer from the depredations of insects and are exercised in finding means of prevention. The paper is entitled "Proceedings of the Seventh Annual Meeting of the Association of Economic Entomologists." The topics discussed include gypsy moths, cutworms, leaf beetles, scale insects, chinch bugs, borers, other insects, insecticides, spraying apparatus, traps, prospects of benefits from importations of parasites, etc., etc; and many suggestions are made concerning habits, methods, and results, which should prove beneficial in preventing waste of time and labor in needless experimentation by individual farmers or others. Technical Series No. 1 of the same division is a 'Revision of the Aphelininae of North America,' by L. O. How-

ard, Entomologist. The Aphelininae are hymenopterous insects parasitic upon the scale insects which are so destructive to fruits, plants, and trees. The parasites have proved themselves efficient aids to the husbandman. The paper contains 44 pages, on which are illustrations of a number of the species. The Department of Agriculture also publishes "North American Fauna, No. 10," a paper of 100 pages and 12 plates on North American Shrews, by Dr. C. Hart Merriam and Gerrit S. Miller. The work makes a good appearance; it is evidently very carefully done, and contains much that is of permanent value. The plates contain illustrations of the skulls and teeth of different species of the little mammals.

—No day in the calendar of the Wisconsin Historical Society will be more red-lettered than the 29th of February, 1896. On that day it received from Rome a long desiderated monograph, 'Bressani's Breve Relazione d'alcune Missioni, editio princeps' (Macerata, 1653, pp. 128). This book was one of those immortals which are not made mechanically but grow naturally. Bressani, a native of Rome, labored eight years in Canadian missions, was captured, tortured daily for months, burnt by inches, then ransomed by the Dutch and shipped to France. Only one of his fingers remained un mutilated, but he took passage westward in the first vessel bound for Quebec, and made his way to the Huron mission on Georgian Bay. He worked there, bating no jot of heart or hope, till its hopeless collapse in 1648. His heart's desire was to die preaching on and on towards the Pacific, with his face thitherward, "had not the inscrutable decrees of God disposed otherwise." Ordered back to Italy by his Superior in 1650, he survived for two and twenty years, "bearing in his body the marks of the Lord Jesus," an object-lesson in martyrdom, and provocative of endless curiosity. His book is a mere transcript of the answers he must have made many a time. It was the more needed because the Jesuit Relations, which had already, for a score of years, brought out an annual volume in Paris, were printed only in French, a tongue not understood of the people of Italy. Bressani's booklet (6x8 inches, in flexible vellum binding), speaking of few things save what his own eyes had seen, was suited to the purses and proclivities of the plain people. Most copies of it must have come into the hands of persons who had no other book, and who by continual use used it up. One specimen, obtained from Rome in 1850 by Father Martin of Montreal and translated by him into French, he believed to be the only one then in America. Perhaps it was. Winsor, however, mentions four, and some others appear in bibliographies—as one that sold in 1892 for \$40 (Gagnan). The Wisconsin copy shows the bookplate of a monastery, now perhaps extinct. Some twenty years ago Father Martin's original, the unique jewel of St. Mary's library, unaccountably vanished, spirited away, no doubt, by some one who had learned that stealing relics of the saints is a very pious fraud. But in reading Bressani—a dose given to work a long time after—he was cured of his casuistry, and he has just made restitution of the stolen goods. *Gloria in excelsis!* cried the overjoyed librarian, as he opened the wrapper of the Martin Bressani coming forth to him in resurrection, and increasing his faith in all varieties of conscience money.

—Jesuit authorities have never lacked worldly wisdom. They showed it while exacting frequent and full reports from all their labor-

ers in the Canadian missionary fields, and every year publishing the information thus obtained, condensed in a handy duodecimo. The thirty-nine volumes thus produced onward from 1639 embody the observations of able and well-trained men, often the first explorers of a terra incognita, and always snappers up of significant trifles unconsidered by others. A mass of material to serve for the history of the New Dominion in its earliest period was thus accumulated and fastened in a sure place. This treasure has no parallel in any one of our thirteen colonies. Nor has it been paralleled in subsequent Canadian history, though it has been well supplemented in several lines. Gleanings from the Relations are early traceable even in Protestant writers, but the preëminent value of those documents was not plain till within the last half century. It began to dawn on Sparks and Bancroft, and was still more clear to Parkman. Meantime, the *editio princeps* (called Cramoisy from the name of the publisher) was either entombed in European libraries, or worn out in the hands of private owners. The series in its entirety baffled the endeavors of many collectors, no matter how long their purses. The first American who became master of a complete set was James Lenox. Who has done likewise? Forty years ago, wanting two, the Canadian Government reprinted the 39 Cramoisy, rolling up thirteen of them in each of three corpulent octavos. This reprint, if found at all, is held at fifty dollars. It was followed by O'Callaghan and Shea with a sort of Cramoisy, limited, however, to a hundred copies of one and twenty-five of the other. Hitherto, however, the Relations have remained in the original French, and hence continue to be a sealed book to all students whose linguistics have not carried them further than the novels of Zola. Accordingly, no news can be more welcome to students of history than the prospectus of a Cleveland publisher that he has in a good state of forwardness a complete reissue of the Jesuit Relations. Here will appear the original French, and, page by page, an English translation by a scholar who has made a life study of the French, and especially the Canadian dialect, of the seventeenth century. This edition of 750 copies will be illustrated by every species of note which may best elucidate the text; it will include Relations of a kindred character not in the Cramoisy; it will abound in maps for lack of which the journeys described have been obscure; it will present portraits of all worthies in the Relations whose lineaments are known, and will be especially rich in facsimiles of their most memorable writings. This historic boon fitly comes from Cleveland, midway between the east and west limits of the Jesuits, and under the editorship of Reuben Gold Thwaites, Secretary of the Wisconsin Historical Society, which stands without a peer in the West, and possibly in the East, as a quarry of material for building up the fabric of northwestern history.

—In the *Journal des Débats* of February 19 M. Alfred Rambaud prints an instructive article on "La Russie qui lit." His information is largely drawn from a series of studies published in different Russian reviews by N. A. Rubakin, who concerns himself with Russian literature, not in regard to its writers, who are many and some of them very great, but in regard to its readers, who present a far less satisfactory object of contemplation. In the first place, Russia has far fewer readers than any other modern nation. In 1896 less than 30 per cent. of her conscripts were able to read at all,

and the number of readers at the present time cannot be higher than 35 per cent. Even this low figure does not fairly represent the true ratio of the lettered and unlettered, for the conscripts are drawn from the younger, and consequently the better educated, portion of the male population; and, besides, there are in Russia many more schools for boys than for girls. It is perhaps doubtful whether out of the hundred and twenty-five millions of the empire more than twenty millions know their letters. What have these twenty millions to read? In every country it is the newspapers and magazines which are most read. Russia has but few of these—nine hundred only, according to Mr. Rubakin's reckoning; that is to say, seven times fewer than Germany, and five times fewer than France. For a million of inhabitants Switzerland has 230 periodicals; Belgium, 153; Norway, 89; Spain, 68; Greece, 36; Servia, 26; and Russia only 9. There is a corresponding scarcity of books, and an especial lack of new books. A large proportion of the latter are pirated from foreign authors, most of the native books being republications. The first year after the expiration of the copyright on Pushkin's works, 163 editions were brought out, amounting to about two million copies. There is a great dearth, too, of public libraries, there being hardly more than in Japan. The number of these is, however, increasing. In 1890 there were but three—at St. Petersburg, Moscow, and Odessa. In 1886 there were only forty-nine; since then, libraries have considerably increased in number, but most of them are as yet but ill furnished with books. In 1887 there were in all Russia only 1,271 book-stores. Of all the Russian writers, Tolstoi is the one who is most read; Turgeneff and Dostoyevsky dispute the second place. Of translations, most are from the French; for every German book that is translated there are two or three English and a dozen or fifteen French ones. It is not, however, the works of the greater French writers that are most in vogue, but rather those of men like Gustave Aymard, Xavier de Montépin, and Ferdinand de Boissgobey. Dumas père, however, stands well on the list; Zola towards the bottom, but much above Cooper, Dickens, and Walter Scott. There is no demand for French or English classics.

—The Imperial Government of Japan permitted Col. W. Taylor, Army Medical Staff, detailed by the British Government, to accompany their army in the field in the late Chinese war, and his report of their 'Medical Military Arrangements' in 1894-5 has been published with a promptness unusual for public documents on either side of the Atlantic. In one sense it was unfortunate for science that the Chinese, notwithstanding thousands of the new arm were in their arsenals, preferred the older weapons, and in some instances used bows and arrows, and that the Japanese troops which were equipped with the new magazine gun were not engaged. Therefore the effect of the long-range small-bore, when used on a large scale, is not yet determined. Although not taxed to nearly its capacity as a whole, the Japanese medical service, at the front and on the line of communication as well as at the base, was admirably managed. With a forethought that English-speaking nations, and especially we ourselves, might well practise, the Japanese had given their officers and men constant opportunity to master in time of peace every duty, and to be practically familiar with their entire equipment. It was owing to the careful regard of that principle that, as Col.

Taylor expresses it, the actual work of the Medical Department was "easy, smooth, and efficient," and that that department was "able to go through its first campaign with such brilliant success." Notwithstanding the occasional necessary overcrowding, "there were no cases of septicæmia." That speaks volumes not only for the Japanese but for the future. It establishes a record, a mark below which military surgery hereafter should not fall, but doubtless will. But to those, whether medical or lay, who remember what appeared to be the pathological necessities of the Rebellion, the surgical millennium would seem really arrived when that could be truthfully written. Very singularly, although the gospel of cleanliness and of asepsis was scrupulously followed within the hospitals, sanitation properly so called outside of them was not provided for by the regulations, and it was only after a long time that the Japanese seemed to be awake to its importance. When aroused they acted with their usual intelligence, energy, and thoroughness, and, as in the case of Kinchow, they placed in a good sanitary state "a town which had been occupied for hundreds of years by the filthiest people in the world." The Japanese system is by no means perfect. For instance, their transport service is under dual control; and as no man can serve two masters any more successfully in the nineteenth century than in the first, some of the disabled who required moving suffered.

—One instance of the gallantry of the medical corps is noted at Wei-hai-wei, where, as a regiment exposed to the sudden action of the quick-firing guns of seven vessels had many men killed and wounded in a very few seconds, and was obliged to fall to the ground and crawl to shelter to escape annihilation, the medical officers, separately and accompanied by stretchers and attendants, walked across the beach in the face of an incessant hail of bullets, "and in twenty minutes stretcher-bearers, attendants, and medical officers, walking quietly and coolly away, had removed every dead and wounded officer and man from the beach, the Chinese ships having kept up a continuous and terrific fire upon them all the time." As the historian well remarks, "it was a splendid deed of heroism that can never be forgotten," and "it will be an enduring proof of the efficiency in the field of the Japanese medical service." Their special addition to the *armamentarium chirurgicum* appears to be the use of straw ash, which, free from grit and enclosed in antiseptic gauze bags as devised by Dr. Kikuchi, was applied as pads to the wounds and was very serviceable.

—There are many signs that Germany, of all countries the most conservative as concerns the emancipation of woman, is actively bestirring herself. In a single recent number (March 1) of *Die Frauenbewegung* we find reports of several public meetings in various parts of the fatherland well attended by women and men of standing, interested in the furtherance of the cause. In Berlin, at a large meeting called by Frau Schulrat Caner and Frau Rechtsanwalt Bieber, the "position of woman in the projected new civil code" for the German Empire was discussed with remarkable ability; of the speeches given in full in the journal mentioned, that of Fräulein Anita Augspurg, cand. jur., deserves especial mention. That the leaders of the movement are not lacking in practical sense and ability is proved by the measures adopted for pleading with the members of the Reichstag in favor of

more just legislation than the present draft of the new law provides. At another meeting in the same city, Prof. Dr. Med. Waldeyer, formerly noted for his hostility to the woman movement, acknowledged his conversion, and stated his conviction that man is not justified in denying to woman an academical education; and Sanitätsrat Dr. Küster upheld the present agitation on ethical grounds. At Stuttgart, Pastor Gerok is reported as doing good service to the cause of woman by a series of addresses before steadily increasing audiences; while a high military officer from the ranks of the nobility, Oberstleutnant von Egidy, is advancing most liberal views at Brunswick, vindicating for woman the right enjoyed by men to all the intellectual and material possessions of the race.

MR. PUNCH.

The History of "Punch." By M. H. Spielmann. With numerous illustrations. New York: The Cassell Publishing Co. 1895. Pp. xvi, 592.

THERE are families in which *Punch* is not known, or is known only as a "paper" to buy now and then, and there are families in which the volumes accumulate with the passing years, and prove much more valuable as a permanent possession than they were in the form of weekly flying leaves. It would be interesting to search the writings of cultivated Englishmen and Americans and to bring together the numerous citations and allusions, the quoted sayings, and the narratives confessedly original with *Mr. Punch*. Many of his sayings have passed into the language as bywords, the true origin of which is unsuspected. And yet it is not as an epigrammatist that *Punch* is most successful. Epigram is not common in English wit, and humorous fun knows it not. Parody, on the other hand, is *Punch's* own particular ground; and there are almost no parodies anywhere better than *Mr. Punch's*, more close to the original, more delightfully humorous, or more poetic. It argues a wider reading than is generally thought to exist by Englishmen of English poetry that parodies on the works of the masters of verse, ancient and modern, should be expected to make their way in such a fashion. The verses are that kind of fun which clings to the memory, being often excellently well composed, masterly in rhyme and metre. Sometimes they have become favorite poems, even of the reader who does not know the originals.

Of original verse *Punch* is not as lavish now as in olden times. There was a day when Thackeray was a member of the staff, and when such poems as "Little Kitty Lorimer" and the ballads of Policeman X, the Peacock and the Bul-bul, and "What makes my heart to thrill and glow," were to be looked for from week to week. "The Mahogany-tree" came out in *Punch* at the right time—that is to say, at Christmas, in one of the early years—and its original title was, appropriately, "*Punch* Singeth at Christmas." Some of the Thackeray songs have never been reprinted, we think, but, whether reissued or not, there is not much better comic poetry than the "Three Christmas Waits." The three waits are Louis Philippe, a Chartist rioter (not named), and Smith O'Brien; need it be said that the year of the poem is 1848? Years before, at Christmas time 1843, the "Song of the Shirt" appeared in *Punch* with a border around it filled with little figures having no relation to the poem. Eight pages further on is another poem,

evidently by the same writer, in whose hands pathos and humor were one, "The Pauper's Christmas Carol." A few weeks later is a little poem in six short stanzas, also by Hood, when near his end. This is called "Reflections on New Year's Day," and the reflecting personage is evidently a very poor man who thinks that the wishes offered him for a happy new year might take the form of something to wear. To find the equal or the companion to these poems in force and pathos we have to turn to the volume for 1865 and read the poem on the death of Abraham Lincoln, beginning "You lay a wreath on murdered Lincoln's bier." Tom Taylor was not Tom Hood, nor a poet in the sense that the older man was a poet, but, under the stress of this strange event, which suddenly reminded the London public that there was pathos and eventful living across the Atlantic, a strenuous poem was written. The poem on the death of Prince Albert, December, 1861, was in no way worthy to compare with the last, nor is it common in the later volumes to find anything serious or strong; but in January, 1875, there is something fine—"Rough Voices from the East End," which speak in these words:

"Which Parson says it is
Our dooty to be grateful,
Even when bread's ris,
And meat no end a plateful.

"Now, it's easy to like skittles,
Or bagatelle, or pool-board,
But without a meal o' wittles
Tain't many waites School-Board.

"Which larning 'elps a kinchin
If he've the heart to con it,
But that's 'ard, with hunger pinchin',
And a board with nuffin on it."

Nonsense of the well-known type appeared in *Punch* as early as 1845, a year before the publication of Lear's first "Book of Nonsense." Long afterwards *Mr. Punch* began the publication of more verses of the sort, "to be continued until every town in the Kingdom shall have been immortalized." In fact, each stanza had to do with a town, e. g.:

"There was a young lady of Birmingham—
When the bishop came down there confirming 'em,
She sent him some frogs,
—And some nice little doos,
And a tract about feeding and worming 'em."

At a later time *Mr. Du Maurier*, who had written other most amusing verse which it is said to have to pass in silence, started similar verses in French under the general title, "Vers Nonsensiques." Among these there was one at any rate in unintelligible argot unless it was in gibberish.

Punch's prose, like his verse, was more literary in the early days, and has been more a matter of current satire and comment during the past twenty years. In 1845, Mrs. Caudle's Curtain Lectures were going on, and other things only less celebrated by Douglas Jerrold preceded and followed them, such as the "Story of a Feather" and "Our Honeymoon"; the last an admirable piece of writing, and more gentle in its satire than was the habit of the savage Jerrold. At the same time and later, Thackeray's Snob Papers were in course of publication in *Punch*—the same which now make up the "Book of Snobs." There is a good deal about Jeames, with some papers that have not been included in Thackeray's collected works. There were the "Letters to a Young Man about Town," there was "*Punch* in the East" and other contributions by the Fat Contributor, there were the Epitaphs on the four Georges, there were the stories by "*Punch's* Prize Novelists," of which "Phil. Fogarty, by Harry Rolliker," is the most famous, and there were many things which one cannot but suppose to be Thackeray's work, such as the Bashi-Bazouk Papers in 1865 and the "New Portrait of Prince Albert"; but indeed there are a host of things which seem to be the work of Titmarsh. Sometimes there were pieces of solid reading apart from Thackeray's continued essays. There was, for instance, that queer romance, "The Naggletons," which ran through many numbers, twenty years ago; and forty years ago there was the very clever story, "Miss Violet and her Lovers," which the readers of *Punch* seem generally to neglect—the nearest approach to a serial novel that *Punch* ever made.

Of late years, as we have intimated, the fun in *Punch's* prose is more local and temporary—more a part of the news of the day. None of it all is better than Mr. Lucy's wonderful analysis of Parliamentary doings, beginning in 1881. (It is to be feared that American, and even some English, ideas of the cleverness of repartee of members of the House may be based upon the "Diary of Toby, M. P.," rather than upon fact.) But Mr. Anstey and others have kept up the old traditions, as in "Voices Populi" and in "Travelling Companions."

So far we have written without much reference to the book under consideration, but we must take from it now the statement that the famous dialogue, "'What is mind?' 'No matter.' 'What is matter?' 'Never mind,'" is not from *Punch* at all. To be sure, nobody said that it was, but it is a relief to know that one need not hunt through 110 thin volumes or 55 thick ones in search of it. On the other hand, it was a *Punch* joke, with an excellent illustration to it by Charles Keene in his youth, which expressed the extravagance of London in a few words. One "Feebles body" says to another: "E eh, Mac! ye're sune hame again." And the other answers: "E-eh, it's just a ruinous place, that! Mun, a had na' been the-erre abune'twa hoours when—Bang—went saxpence!!!" Mr. Spielmann's volume reproduces as the best—that is to say, the most popular—joke in *Punch*, that which appeared in the Almanack for 1845. It was an advertisement, at least in appearance, and the newspapers of the day would supply the prototype of it:

WORTHY OF ATTENTION.

Advice to persons about to marry—Don't!

Mr. Spielmann expends two pages upon this immortal joke and on its origin, and it appears that, after many claimants and many attributions had been dismissed, it was finally agreed that it came from the regular staff in the regular way, and was really the invention of Henry Mayhew.

Still, however, it is illustration, and not text, which makes *Punch* dear to the after-world and the foreign world; to people who are not of London and to those who open the volume years after its issue. The pictures do not often need any intimate knowledge of the political talk of the day; the purely political caricatures, including very many of the large "cartoons," seem, even to many well-instructed students of *Punch*, inferior to those of purely social character. There is in this great unsorted and non-catalogued mass of illustration something for every lover of pictures, from the little six-year-old girl who is delighted with the train of cars which she finds simulated in the row of tea-cups drawn apparently by a steaming and bubbling teapot, to the older connoisseur who loves the beautiful landscape effects of Leech or the strong characterization of Charles Keene. To name the artists of *Punch* is to name the most celebrated and the most deservedly celebrated draughtsmen of the modern English world, always ex-

cepting George Cruikshank. John Leech and Charles Keene are certainly the most artistic of them, with Harry Furniss in a good second place. George Du Maurier, even more popular than Leech, is narrow in his art, but full of grace and charm. Richard Doyle was certainly the best illustrative artist that ever lived who could not draw the figure under any circumstances. Sir John Tenniel, better known by his large cartoons than in any other way, formal, cold, not often humorous, at least in *Punch*, has yet a popular charm, hard to explain. Randolph Caldecott made a few drawings for *Punch*—eighteen in all—scattered over ten years. Linley Sambourne is the most individual and independent artist in all the world of illustration; he has developed a style of drawing which is all his own, but his gift at humorous design seems to have been born in him, and even as early as 1867 his astonishing headpieces and initials, which were all he was allowed to supply, prepared those who could see originality, under feeble execution, for what was to come when he had mastered his methods. The celebrated drawing of *Punch's* centennial dinner, "The Mahogany Tree," dated July 18, 1891, may be called his greatest achievement.

It is unnecessary to mention the failures, for *Punch* generally abandoned his failures—turned from his evil ways without delay. Thackeray can hardly be called a failure, in spite of the hideous ugliness of his drawings and their lack of skill and knowledge, for they were at least very well fitted to their text, and were funny. It is impossible, however, to omit mention of the one long-continued series of worthless drawings, namely, that begun in 1866 and known to be by Miss Bowers. Mr. Spielmann rightly says that this artist had the gift to see a joke; but it must always remain a mystery that her feeble artistic work should have been allowed to disfigure *Mr. Punch's* gallery. There is allusion to it on page 539 of Mr. Spielmann's volume, with but a word or two as to its quality. Finally, the work of the latest years finds its best expression in Mr. J. Bernard Partridge and Mr. Phil May—real artists, both of them.

As for the book itself, it is of course capital reading, and contains, of course, a vast amount of information which one is glad to possess. The authentic account of the weekly dinners, and the diners, and their initials and ciphers cut on the table-top, is alone reason enough for this book's existence. The illustrations are nearly all of value. On the other hand, the need that every one must feel of a book of reference to *Punch* is not well supplied, as allusions to any particular subject, article, writer, or artist are scattered throughout these many pages, and the index to the volume, which would need to be very full if it were to serve all its purposes, is very far from being complete. To have the index pages interleaved, and to write upon the extra pages your own references to the mention and description of your own favorites, would be the way to utilize this book.

CRETAN PICTOGRAPHS.

Cretan Pictographs and Pre-Phœnician Script. By Arthur J. Evans, M.A., F.S.A. Pp. viii, 146. London: Bernard Quaritch; New York: G. P. Putnam's Sons. 1895.

THE accomplished keeper of the Ashmolean Museum at Oxford has published a book of more than common interest. That Cretan antiquities form the study of classical archaeolo-

gists is a matter of course, and Mr. Evans's travels in Crete have yielded much that is worthy of close attention from this necessarily limited and exclusive class; but the bearing of his discoveries and discussions is wide, and the student of civilization even with slender archaeological equipment will be fascinated by the suggestions of the volume.

The kernel of the matter is this: Mr. Evans has discovered in Crete a large number of objects bearing signs somewhat resembling the Hittite, and others inscribed with linear characters hitherto unknown. By comparing still others, found on Ægean Islands and remoter parts of the Eastern Mediterranean basin, he has reached highly important conclusions as to a great chapter in the history of ideographic, syllabic, and alphabetic signs. These are put forward tentatively and with reserve, but the very moderation of the author gives his observations additional weight, and, however his facts may be finally interpreted, they are sure to modify considerably the views of the relation of ancient Mediterranean peoples which have been recently current. Many of the objects examined are inscribed stones of small size, used apparently as seals and ornaments; others are vases and jars, of stone and of clay; a few are implements and ornaments of metal. The picture-signs, or "pictographs," inscribed on them represent a great variety of common things—human and animal figures, or parts of them; heads, arms, legs, eyes; birds and fishes; tools, weapons, and musical instruments; fences, gates, and doors; household vessels, ships, trees, and flowers, sun, moon, and stars, mountains and valleys. There are also geometrical figures and other designs not easily classified. These are so placed and grouped as to make it wholly probable that we have to do with a system of ideographic signs, designed to communicate ideas or classes of ideas through the eye. Mr. Evans has found, in all, some eighty-two of these picture-symbols.

A comparison between the Cretan discoveries and objects found in Egypt, Asia, several Ægean Islands, and the Peloponnesus yields interesting results bearing on the age of the symbols and on the extent of their use. One well-established connection seems to be that with the best age of Mycenaean civilization, borne out by objects excavated at Mycenæ and at Hisarlik. Another is with the art of the eighteenth Egyptian dynasty, and in particular with objects from Kahun and Tel el-Amarna, found by Mr. Petrie. The Cretan picture-writing was, then, apparently developed to a high degree prior to B. C. 1500. But this is not all. There is a much earlier class of the inscribed stones, resembling in important respects early Egyptian scarabs. For this comparison it is not necessary to tread on Egyptian soil. At Hagios Onuphrios, in Crete, near the site of Phæstos, a deposit has been found, in an ancient necropolis, containing (besides the inscribed seal-stones) figures, pottery, implements, and ornaments, all of pre-Mycenaean times, and reaching back—on the evidence of similar primitive objects from Amorgos in the Ægean, and from the lower strata of Hisarlik—2,000 or 2,500 years B. C. More conclusively still, while these Cretan seals show the influence of Egyptian scarabs of the twelfth dynasty, prior to B. C. 2500, a considerable number of such scarabs themselves were found in the same deposit. The picture system was, then, in use in Crete as early as this date. A further step is made possible by the observation of a group of Cretan hieroglyphic seals of extremely archaic appearance, showing no trace of Egyptian influence, and not con-

nected with any Egyptian finds—presumably, therefore, much earlier. In these Mr. Evans sees direct evidence of the prevalence of the Cretan pictographs nearly or quite as early as B. C. 3000, and their origin must of course be much earlier still.

The light thus thrown on the relations of the Hittite symbols is plain. If, for 1,500 or 2,000 years, the Ægean islands and the Peloponnesus were familiar with a pictorial script, of which some characteristic signs strongly resemble certain Hittite hieroglyphs, the inference is natural that the script which is traceable at so many points in Western Asia and Asia Minor in particular was not developed without Ægean influence, or at least was not without Ægean kinship; and the possibility arises that a clue to the one set of symbols may give at length the true clue to the other.

But there is something of still greater importance. Besides the pictographs there is also a considerable group of linear signs on seals, vases, building-stones, and other objects found in Crete, at Mycenæ, and in places under the same influence. Some have been discovered at Kahun and Gurob in Egypt, where they appear as foreign signs. Thirty-two linear characters in all have been noted. Some of these occur as early as the time of the twelfth Egyptian dynasty. Mr. Evans regards them as "quasi-alphabetic," or, more exactly, as syllabic. They appear, like the pictographs, to have been in wide use. They are relatively abundant at Mycenæ, while the pictographs are not, which is interpreted to mean that they early drove out the pictographs, while in Crete, the proper home of both, the two lived together for a long time. It is apparently possible, in a dozen cases or more, to trace the derivation of the linear sign from the pictograph. We seem to have going on before our eyes, as we examine these objects, the process of transition from picture-system to syllabary of which evidences more or less distinct are found in Babylonia and Egypt, but without trace of influence from either of them. We learn also that the energetic people or peoples who inhabited the Peloponnesus and the whole Ægean basin 4,000 years ago were not destitute, as has been often supposed, of a medium of written communication, and that when Phœnician traffic brought Phœnician letters, it was not as the supply of a total lack, but as a better substitute, that they made their way.

This brings us to the matter of crowning interest. Mr. Evans raises the question, to which, with great self-restraint, he offers no positive and sweeping answer, whether the Phœnician alphabet itself may not be largely indebted to this linear Ægean script. This almost takes one's breath away. Nothing has seemed more certain than that the alphabet is Oriental. But with the Cretan discoveries the question becomes inevitable. It cannot be denied that on this point hypothesis has still a tolerably free field. De Rougé's theory of alphabetic development from the Egyptian hieratic signs—plausible and strongly urged—has held its ground more because no other satisfactory explanation was offered than because of its intrinsic strength. Deecke's attempt to explain the Phœnician letters from the Assyrian cuneiform signs failed miserably, and even Dr. Peters's scholarly endeavor to avoid Deecke's disaster by substituting, far more wisely, the ancient Babylonian character, has not convinced the scholarly world. The Tel el-Amarna tablets, witnessing to the cuneiform signs as the medium of intercourse between Egypt and Palestine in the fifteenth century B. C., have interfered with all these theories.

It would be curious enough if facts should at length show that the alphabet welcomed by Greece as a foreign gift, is really the descendant of an emigrant from Crete, coming back as a princely benefactor to the children or successors of its forgotten ancestors.

The points to which Mr. Evans calls especial attention are these: Of the 32 known signs in the Cretan linear script, 15 appear in the Cypriote syllabary. But Cyprus is very near to Syria. Half-a dozen signs actually correspond in form, some of them strikingly, with old Semitic letters (Sabeian, Moabite, Phœnician). Eight agree closely with signs on potsherds found by Mr. Bliss in the earliest strata of Tel el Hesi (before B. C. 1500). The Philistines, in whose territory Tel el-Hesi lies, came from Caphtor, and Caphtor is Crete. Indeed, some of the early pictographs—e. g., the figure of a kneeling camel—point to ancient commerce between Crete and Syria, and the names of several Phœnician (Hebrew) letters, *Aleph, He, Cheth, 'Ayin*, etc., are names of objects which appear in the Cretan pictographs. The suggestion of this possible origin for the alphabet is most attractive, and no serious objection to it at present appears. Mr. Evans summarizes the evidence as follows:

"The Cretan pictographs give us a good warrant for believing—what even without such evidence common sense would lead us to expect—that a primitive system of picture-writing had existed in the Ægean lands at a very remote period. The antiquity of these figures is indeed in some cases curiously brought out by the fact, already pointed out, that they actually exhibit the actions of a primitive gesture-language. Furthermore we see certain ideographic forms, no doubt once widely intelligible on the coasts and islands of the eastern Mediterranean, reduced to linear signs which find close parallels in Cyprus and Phœnicia. Finally, some of the names of the Phœnician letters lead us back to the same pictographic originals which in Crete we find actually existing.

"To the Phœnicians belongs the credit of having finally perfected this system and reduced it to a purely alphabetic shape. Their acquaintance with the various forms of Egyptian writing no doubt assisted them in their final development. Thus it happened that it was from a Semitic source and under a Semitic guise that the Greeks received their alphabet in later days. But the evidence now accumulated from Cretan soil seems at least to warrant the suspicion that the earlier elements out of which the Phœnician system was finally evolved were largely shared by the primitive inhabitants of Hellas itself. So far, indeed, as the evidence at our disposal goes, the original centre of this system of writing should be sought nearer Crete than Southern Syria" (p. 98).

The racial connections of the men who invented the pictographs and developed the linear script from them receive little fresh light from these discoveries, although Mr. Evans seems to show the probability that there were early Greek settlers in Crete, and that the system was employed (in part, but not originally) by those who spoke Greek. The language of the inscribed objects preserved to us is unknown as yet.

Certain bye-paths of the discussion we have of necessity left unnoticed; e. g., the part played by Crete as a transmitter of Egyptian culture on its way to remote parts of Europe. The development of the main theme is certainly sufficient to establish the remarkable significance of the book.

BOOKS ON ART.

Evolution in Art, as Illustrated by the Life-histories of Designs. By Alfred C. Haddon, Professor of Zoölogy, Royal College of Sci-

ence, Dublin, Corresponding Member of the Italian Society of Anthropology, etc. London: Walter Scott; New York: Charles Scribner's Sons. 1895.

Renaissance Fancies and Studies. By Vernon Lee. Being a Sequel to 'Euphorion.' London: Smith, Elder & Co.; New York: G. P. Putnam's Sons. 1896.

The Florentine Painters of the Renaissance. With an Index to their Works. By Bernhard Berenson, Author of 'Venetian Painters of the Renaissance,' 'Lorenzo Lotto: An Essay in Constructive Art Criticism,' etc. G. P. Putnam's Sons. 1896.

La Culture Artistique en Amérique. Par S. Bing. Paris: 22 Rue de Provence; New York: Dyssen & Pfeiffer. 1896.

The Illustration of Books: A Manual for the Use of Students; Notes for a Course of Lectures at the Slade School, University College. By Joseph Pennell, Author of 'Pen-Drawing and Pen-Draughtsmen,' 'Modern Illustration,' etc. London: T. Fisher Unwin; New York: The Century Co.

Studies in the Science of Drawing in Art. By Aimée Osborne Moore. Boston: Glun & Co. 1895.

THESE six books are exemplifications of the numerous and distinct points of view from which the fine arts may be regarded. The first of them is the work of "a biologist who has had his attention turned to the subject of decorative art," and deals "with the arts of design from a biological or natural-history point of view"; its object being "to show that delineations have an individuality and a life-history which can be studied quite irrespectively of their artistic merit." The work calls for review from a scientist rather than from a critic of art, but even an art critic can feel, though perhaps he cannot quite appreciate, its admirable tone of scientific caution and unbiased investigation. The volume opens with a detailed consideration of the decorative art of British New Guinea "as an example of the method of study," after which more general ideas are taken up, and "the materials of which patterns are made" and "the reasons for which objects are decorated" are illustrated from the arts of various peoples in various ages, the whole concluding with a statement of "the scientific method of studying decorative art." Many most interesting examples of the change of patterns through evolution or degeneration are given, and the "life-history" of many designs is ingeniously traced. What is admirable, however, in Prof. Haddon's treatment of his subject is less the conclusions he has drawn than those he has refrained from drawing. In the face of the liberal theorizing which leads one archaeologist to derive almost all known patterns from the lotos, while another, with equal assurance, derives them all from something else, it is refreshing to find an insistence that resemblance is not necessarily identity, and that our knowledge of facts is often too small to justify certainty in inference. The point is often made that any given pattern must be studied on the spot where it appears, and all the ascertainable facts about its origin there must be mastered before we can be sure whether or not it is the same pattern which occurs elsewhere and which it closely resembles. The final conclusion would seem to be that given on page 173, in a quotation from W. H. Holmes, that "we are absolutely certain that no race, no art, no motive or element in nature or in art, can claim the exclusive origination of any one of

the well-known or standard conventional devices, and that any race, art, or individual motive is capable of giving rise to any and all such devices"; and the author's temper is shown by his statement that he has "been mainly concerned to provide an efficient tool for other workers," rather than himself to "elucidate the multitudinous designs and forms which beset us on every hand."

It is to be regretted that a work otherwise so laudable should be marred by the pestilential heresy, stated in the chapter on wealth as a cause of decoration, that "coin is always of less intrinsic worth than its nominal value; and as money transactions increase, the nominal value bears absolutely no relation to the real value, as in the case of paper money." On the next page this has become a statement that certain objects used as a medium of exchange in Torres Straits "cannot be regarded as money, as they have an intrinsic value." Nothing worse than this has been seen since the financial teaching of the Rollo Books and Jonas's wooden currency, and it is entirely unnecessary to the course of Prof. Haddon's argument.

The standpoint of Vernon Lee is that of the amiable dilettante, interested in art as a part of general culture. There is much charming writing in the volume and some keen-sighted analysis. The description of the "humaneness" as of "a nice child" of Fra Angelico, with his "gayly dressed angels . . . leading the little cowed monks—little baby black and white things with pink faces, like sugar lambs and Easter rabbits—into deep, deep grass quite full of flowers"—and of the early Venetians with their music-making angels, is very apt and delightful. More serious contributions to criticism are the ideas that art, in its slow development, takes years to perfect an ideal with which it started, so that it is the feeling of the age of St. Francis which is finally embodied in the painting of the epoch of the Tyrants, and that often it is neither the personality of the artist nor Taine's "race, environment, and moment" that determine the characteristics of a given art, which are rather the result of technical processes and training. Hence the difference between Greek and Tuscan sculpture may be considered as resulting less from the difference of Greek and Italian racial instinct, or of ancient and mediæval feeling, than from the fact that the Greeks were primarily modellers of clay and the Italians hewers of stone; the technical methods proper to either art leading the Greeks to the realization of actual form at the finger ends, and the Florentines to the suggestion by effect of light and shade on a church front. The book ends with a tribute to the memory of the author's master, Walter Pater, one who, "by faithful and self-restraining cultivation of the sense of harmony, . . . appears to have risen from the perception of visible beauty to the knowledge of beauty of the spiritual kind," thus showing the possible higher uses of merely æsthetical cultivation.

Mr. Berenson is nothing if not modern, and the views he has set forth in his latest book are, at first sight, bewilderingly novel. His psychology, however, as has been said of Spenser's allegories, will not bite, and one soon begins to perceive that his "tactile values" are little else than our old friends significant drawing and sense of form. What his doctrine amounts to is that this significant drawing, this "realization of the material nature of things," was the vital element of Florentine painting, and not story-telling or the excitation of religious emotion; that Giotto possessed the talent for it in the highest

measure, but was hampered by the lack of technical knowledge; that the study of technical means occupied the school for 200 years, sometimes leading to mere naturalism or mere display; that occasionally in this time a master arose, comparable to Giotto in power, and, with the new knowledge, achieved a new expressiveness; that Michelangelo, coming at the right time and with the right nature, pushed significant drawing to its furthest limit; and that, after him, the job being thoroughly done, nothing was left for Florentine art but rapid decadence and academicism. The view-point, though not so new as it seems, is not that of the average critic, but it appears to make little change in the familiar perspective. Giotto, Masaccio, Leonardo, and Michelangelo still stand like giants, dominating the landscape, with Botticelli only a little lower; and even Fra Angelico's permanent charm is duly accounted for.

The "Index to the Works of the Principal Florentine Painters" at the end is interesting as giving the results of the latest criticism, including Mr. Berenson's own, and is useful and welcome. In some cases one would be glad of the reasons for the attribution, notably in that of the famous "wax head of Lille," which Mr. Berenson gives to Leonardo. The common attribution to Raphael has little to sustain it, but we confess to an equal incredulity towards this later venture. We do not know what Leonardo's work in sculpture was like, but we see no reason to suppose that that pupil of Verrocchio did anything resembling the wax head.

The point of view—that of the travelling foreigner in this country—has to be especially reckoned with in considering M. Bing's pamphlet on artistic culture in America. Judging from a prefatory epistle, M. Bing seems to have been commissioned by the Directeur des Beaux-Arts to make a report on the development of art in the United States, and these hundred-odd pages are the result. One would be tempted to believe, at first, that the report might have been written without crossing the Atlantic, for the only American painters the author seems to know well are those who have taken up a permanent residence abroad. About the home-keeping talents he makes strange blunders, such as transforming J. Alden Weir into "Alden Wierd," calling George Fuller a "strict imitator of the French manner," and Inness a "faithful translator of the familiar sites of his own country." Mr. D. W. Tryon would perhaps be surprised to find himself labelled as a follower of Inness, and Mr. Winslow Homer would certainly find some difficulty in recognizing himself in the following description:

"Clever at bringing before us in characteristic compositions that lively people, the negroes, and the curious aspects of their easy manners, he is also fond of evoking, in a fabulous world, strange scenes created by his imagination."

If Mr. Bing knows little about American painting, he knows and cares less about our sculpture. After mentioning an "equestrian statue of Washington" by Greenough, unknown to the rest of the world, he disposes of contemporary sculptors, "Jes Ward, Launt Thompson, Saint-Gaudens, Warner, MacMonnies, Herbert Adams," in one sentence as having not yet learned "the art of animating gesture in a natural manner, or of expressing in the features the sentiments of the soul." It is when Mr. Bing begins to deal with architecture that he reveals the reason of his attitude. He is one of those who come to the consideration of

American art with a fixed notion that a new people should produce something entirely new, and that all art which resembles what has been done in other countries is therefore negligible. In our architecture he finds this new thing, and the cold critic of our painting and sculpture becomes the enthusiastic admirer of those high buildings which we, in our ignorance of what we have done best worth the doing, are trying to suppress by act of legislation. Of one other form of American art is M. Bing, and with more reason, a hearty admirer; but his praises of American stained-glass are, however unjustly, likely to be discounted as possibly influenced by his commercial relations with a well-known firm of manufacturers.

Mr. Pennell writes of the "illustration of books" with the authority of an accomplished illustrator, and as he is here giving practical instruction to students of his own art, his knowledge is valuable. In his preface he quotes, from a letter of Mr. Lewis Fraser, of the *Century's* art management, that gentleman's opinion that it is "a good, practical book, likely to be of much use to the young illustrator, and save the art editor many a pang and many a sorrow." No one should know better than Mr. Fraser what is wanted, and his endorsement is better than anything we could say. There are eleven lectures in the volume, dealing with the question, "What is illustration?" with "the equipment of the illustrator," "methods of drawing for reproduction in line" and "the reproduction of line drawings," "the making of wash drawings and their reproduction by mechanical process," "the reproduction of drawings by wood engraving," "lithography" and "etching," "the printing of etchings," "photogravure and photo-lithography," and "making ready for the printing-press." Under each of these heads a good deal of technical information will be found, while the author's opinions are little obtruded.

'The Science of Drawing in Art' is a discourse on the proper method of teaching drawing to beginners, and the theoretic part, which deals with the laws of optics and of perspective and their application to primary instruction in drawing, contains much that is sound and that might prove useful. Unfortunately, the merits of a particular mechanical aid to the study of form in its perspective representation are early insisted upon, and the praises of this invention and detailed instruction in its use soon become the dominant note of the book. The machine is an ingenious one, and its occasional use by an intelligent teacher might be beneficial, though we are inclined to doubt the efficacy of such appliances, but insistence upon it again and again savors of the disguised advertisement.

The Works of Joseph Butler. Edited by the Right Hon. W. E. Gladstone. 2 vols. Oxford: Clarendon Press; New York: Macmillan.

THIS fruit of Mr. Gladstone's old age has been many years ripening. In a letter to Mr. James Knowles, dated November 9, 1873, and printed in the *Spectator* of December 13, 1873, he said: "Bishop Butler taught me, forty-five years ago, to suspend my judgment on things I knew I did not understand. Even with his aid I may often have been wrong; without him I think I never should have been right. And oh! that this age knew the treasure it possesses in him, and neglects." A devotion of sixty-eight years may well culminate in an

edition so complete and sumptuous as the present. All that printer's art and editor's pains can do to set forth and make attractive the work of a shrinking and lonely student, has now been done.

In addition to reproducing Butler's purest text, and providing full indexes and occasional notes, Mr. Gladstone has elaborately "got up" the 'Analogy' and the 'Sermons' after the style of a skilled coach's preparation of Aristotle. Bagehot remarks that, "without detracting for a moment from Butler's real merit, it may be allowed that some of his influence, especially that which he enjoys in the English universities, is partially due to that obscurity of style which renders his writings such apt exercises for the critical intellect, which makes the truth when found seem more valuable from the difficulty of finding it, and gives scope for an able lecturer to elucidate, annotate, and expound." One might almost think the sub-headings with which Mr. Gladstone breaks up these pages to be largely undergraduate annotations, made with the fear of the examiners before the eyes, so anxious are they to show you just how the argument is getting on, to put you on your guard against supposing that something is being proved which is not, to resume and anticipate the course of the reasoning. In their form and flavor, moreover, there is something unmistakably donnish, as may be inferred from these specimen titles of sections: "Sum of results on behalf of well-doing as such ἀγαθόν"; "God takes the side of the vir bonus"; "To presume extinction at death is ἀλλόγειρον irrational." It would seem that minds in need of such sign-posts would need a more legible lettering, while those quick to take in the polyglot directions could find the road without any directions. At any rate, and however it may be with the 'Analogy' as still perhaps a text-book to be "got up," the same process carried over into the second volume certainly adds a new terror to sermons. In place of this departure from Butler's own edition, we think a more useful one would have been the modernizing of his punctuation, which often puzzles like an obscurity of thought. The following sentence, for example, taken from the "advertisement" to the 'Analogy,' will show how much present-day controversialists have gained in punctuation if not in modesty: "On the contrary, thus much, at least, will be here found, not taken for granted, but proved, that any reasonable man, who will thoroughly consider the matter, may be as much assured, as he is of his own being, that it is not, however, so clear a case, that there is nothing in it."

What may be called Mr. Gladstone's prolegomena to Butler he has reserved, he intimates, for a third volume, of *Essays*, shortly to be published. The scattered notes which he has here provided aim at little except illumination of the text by Scriptural and patristic citations and by references to Aristotle. Occasionally we are given a genuine bit of scholastic refining, as in the explanation of Butler's undeniable confusion of "suffering" and "punishment." But all this seems going unnecessarily far to get light on Butler. He had his eye fixed on the arrogant delictic arguments of the early eighteenth century. The whole 'Analogy,' in fact, is a huge argument *ex concessis*. Granting all you may, he retorted upon the delists, about "an intelligent Author of nature and natural Governor of the world," I will force you to admit that revealed religion is no more unreasonable than natural religion. No doubt he did it. His argument was at the time immensely successful. He

closed the mouths that he meant to close. With the ultimate questions that underlie both his position and that of the deists, he did not concern himself. Probably he was not vividly conscious that there were such questions. It has been said that, beside Hobbes or Hume or Jonathan Edwards, he was but a child in metaphysics. His great, his absorbing aim was to answer objections against Christianity. It is almost pathetic to find him, in his sermon "Upon the Ignorance of Man," dwelling on the consolation that, anyhow, "our ignorance is the proper answer to many things which are called objections against religion." He was the great answerer of contemporary objections; and a mind saturated, like Leslie Stephen's, in the literature of contemporary objection, has better illustrative and explanatory resources to draw upon than Mr. Gladstone's general theological stores.

The fact that, as Mr. Stephen has recently observed, the 'Analogy' has made no impression on European thought, however esteemed in England, however venerated at Oxford, is no doubt due in part to its immediate and practical purpose. It aimed simply to show that, judged by the standards which the deists called rational, Christianity was not irrational. But Lessing points to the deeper inquiries which necessarily lie behind Butler's, when he asks, Does, then, the reasonableness of Christianity lie wholly in its being not unreasonable? ("Also besteht die ganze Vernunftmässigkeit der christlichen Religion darin, dass sie nicht unvernünftig ist?") To this the 'Analogy' has little to say. Moreover, the extension of its argument beyond its first intention has proved dangerous. Pitt is not the only man to think it conjures more scepticism than it lays. If revealed religion is so completely analogous to natural, what becomes of the evidence that it has been revealed at all? The battle-ground has greatly shifted since Butler's day, and the analogy of Christianity to nature-religions is now perhaps the most powerful argument to reduce all alike to one level. Butler used analogy as a lever to bring Christianity up to the rational level of deism; the modern study of comparative religion finds analogy pulling it down and divesting it of its supernatural attributes.

But, whatever the fate of Butler's arguments, the attractiveness of his cautious, frank, and serious mind must long remain. Never was controversialist fairer. He sets up no men of straw. The objections as he states them often seem more deadly than as they were originally presented. He will glide over no difficulty. "It is his unique distinction among theologians that, while writhing in the jaws of a dilemma, he refrains from positively denying that any dilemma exists." His open-mindedness, his modesty, his moral earnestness, his enthronement of conscience in theory and in life, give him a personality of his own. Characteristic phrases show the manner of man he was. "Everything is what it is, and not another thing." A writer is "not to form or accommodate, but to state things as he finds them." "Things and actions are what they are, and the consequences of them will be what they will be; why, then, should we desire to be deceived?" "For, after all, that which is true must be admitted, though it should show us the shortness of our faculties." One wonders what would have been the fate of such an honest theologian turned loose in the modern world with all its facts undreamed of in his philosophy. We suspect it would have been something other than to have left an unpleasant suspicion that he died a Papist.

In New England Fields and Woods. By Rowland E. Robinson. Houghton, Mifflin & Co. 1895.

It is hard to say whether these charming sketches appeal more to the dweller in the town or in the country. As Richter said of Music, they speak, to those whose lives are pent up within walls of masonry, of things that they have not seen and shall not see; for Nature is shy with casual acquaintances and reveals herself only to her constant companions. Yet few of those who spend their lives in the country have seen the sights that this author has seen, or heard what he has heard. We need not read far to be convinced that he may justly claim to have been born in Arcadia. He has drawn the chipmunk to him with his music, and enticed him to frolic with a herd's-grass head gently moved before him. He has seen the toads, thought voiceless by common mortals, making melody under the influence of springtime and love. The ways of many beasts and birds are known to him, and he has only gentle words for even the most despised among them. He has not scorned the friendship of the humble bull-frog, and tells us how he has tickled him first with a rush and then with finger tips while "his flabby sides swelled with fulness of enjoyment, his blinking eyes grew dreamy, and the corners of his blandly expressionless mouth almost curved upwards with an elusive smile." He is a sportsman, and it is easy to see that his rod and gun have been as much a part of him as his clothes or his books, and yet he earnestly entreats his fellow-sportsmen to restrain the impulse to kill with larger and kinder thought.

Nevertheless, Mr. Robinson knows the strange power of the sportsman's instinct, and has felt the quickening of the blood when game is at hand, as well appears when he discourses of anglers. There are contemplative anglers, as out of reverence to the master of the craft he admits;

"but how is it with him who comes stealing along with such light tread that it scarcely crushes the violets or shakes the dew-drops from the ferns, and casts his flies with such precise skill upon the very hand's-breadth of water that gives most promise to his experienced eye? . . . Eye and ear and every organ of sense are intent upon the sport for which he came. He sees only the images of the clouds, no branch but that which impedes him or offers cover to his stealthy approach. His ear is more alert for the splash of fishes than for bird songs. With his senses go all his thoughts, and float not away in day-dreams. However much he loves her, for the time while he hath rod in hand Mother Nature is a fishwoman, and he prays that she may deal generously with him. Though he be a parson, his thoughts tend not to religion; though a savant, not to science; though a statesman, not to politics; though an artist, to no art save the art of angling. So far removed from all these while he casts his fly or guides his minnow, how much further is his soul from all but the matter in hand when a fish has taken the one or the other, and all his skill is taxed to the utmost to bring his victim to creel. Heresy and paganism may prevail, the light of science be quenched, the country go to the dogs, pictures go unpainted and statues unmodelled, till he has saved this fish."

The essays on the characteristics of the months and seasons of the year are marked with exquisite appreciation, and impart to the reader in a wonderful degree that strange sense of the onward movement of life, animate and inanimate, which is properly felt only by those who pass their days out of doors. We should be glad to quote from them, but must content ourselves with noting the true Virgilian feeling which is displayed in the choice of epithets. If they are sometimes cloying, it is not from in-

eptness, but from abundance. But to many readers the brief biographies of the humbler sort of animals, those despised by the sportsman and frowned on by the farmer, will be not the least pleasing parts of the book. Altogether we feel no hesitation in advising both those who love Nature and those who would learn how to love her, to possess themselves of this guide. Every one who reads these pages, and those who have read the essays in *Forest and Stream*, where most of them have appeared, will suffer a thrill of pain at learning that a curtain of darkness now prevents the author from beholding the scenes that he so tenderly appreciated, and the humble "acquaintances with whom he was once on familiar terms, but who now and hereafter can only be memories." Yet if the power of vision is gone from him, let him take comfort in the thought that he has passed it on, and that many will see who but for his eyes would have been blind.

Appenzell: Pure Democracy and Pastoral Life in Inner-Rhoden. A Swiss Study. By Irving B. Richman, Consul-General of the United States to Switzerland. With maps. Longmans, Green & Co. 1895.

Swiss constitutional history deserves all the attention which is paid it, and the conservative democracy of the pastoral cantons ought not to be left out of sight for the sake of experiments like the Initiative and the Referendum. "Totus mundus se stultitiam novas constitutiones demandans," said Francis II. of Austria in the early part of the century, and the tendency has not yet been checked. Meantime the cantons have changed their constitutions, too, but without losing that hold on the past which is the surest guarantee of sound political growth. We have heard that, in the canton of Uri, people who deny the authenticity of the Tell story are put in the stocks. This, perhaps, is a little too conservative, but, at present, mankind is in no danger of disturbing the equipoise by such reactionary freaks. Uri, it must be remembered, is traversed by an international railway, the St.-Gotthard. What must we expect from Appenzell Inner-Rhoden, which has been for an equal length of time a paradise of the Capuchins, and is approached only by a *Zooetgasse* of unusual slowness? With Uri and Unterwalden Obwald it forms a group of communities where conservative democracy can be better studied than anywhere else in the world.

Mr. Richman's study of pure democracy and pastoral life in Inner-Rhoden seeks its justification in a saying of Prof. Dändliker: "The history of this land forms a peculiar link in the great chain of popular risings in the Middle Ages. It shows more essentially than does even the history of the Forest Cantons the contrast between the aristocracy and the people, between the rulers and the ruled." Taking this as his point of departure, Mr. Richman proceeds to give us a book which is a decided success. Life in the days of Hilpa and Shalum might have enabled one to read Zellweger's 'Geschichte des Appenzellischen Volkes' and the other voluminous cantonal histories of Switzerland. As it is, the thing cannot be done, and were it not for Mr. Richman we should probably know nothing at all about Appenzell save what is to be gathered from Scheffel's story of 'Ekkehard' and picturesque descriptions of Landgemeinden. We do not mean to imply that Mr. Richman is a mere compiler. He knows Appenzell personally, his comparisons and contrasts are

suggestive, and he observes a just sense of proportion in handling his subject.

The book is divided into three parts: (1.) Scenery and Climate. (2.) History. (3.) Contemporary Life. Mr. Richman gives more space to political growth and institutions than to the domestic and agricultural branches of his subject; but his interests are not exclusively political, and the alternative title, "A Swiss Study," does not claim too much. He makes the Appenzellers stand out as they are, from the poor burghers, who has a share in the Ried, up to Herr Landmann Sonderegger. His description of the Suter case is the most graphic piece of writing in the book, and his discussion of the Mark system the most valuable. Slips are few and unimportant. A few, however, may be mentioned. The Ill of the Aarberg does not flow into the Rhine at right angles. One should not state authoritatively that the Rhetians are a branch of the Tuscan race. *Sämbtiser sea* is doubtless a slip of the pen. Mr. Richman, who is a great stickler for German forms, should not write *Otto* the Great. He calls Rudolf of Habsburg King of Germany, rather than Holy Roman Emperor, whereas he uses the imperial title in the case of most of the German sovereigns. Mr. Richman is mistaken if he supposes that Freeman described only the Landsgemeinde of Uri. He, as well as Bayard Taylor and Mr. Boyd Winchester, has written of the one in the Auser-Rhoden at Trogen.

It will be seen at a glance that these errors are microscopic, and there are no more serious ones. The three historical maps are very useful. Why do not all books of this sort have such maps? We should also have welcomed a photograph of the distinctive head dress worn by the Appenzell women. It and the Capuchins at the Landsgemeinde are the two things which take the traveller in Appenzell most directly back to the days before the French Revolution. Even the Swiss of the French cantons get along "sans faire un cas majeur d'une logomachie." The French type of democracy has not influenced the Inner-Rhoden, and the above-mentioned emblem reminds us of the fact.

We cannot refrain from making this admirable monograph of Mr. Richman an excuse for adding a note about a discovery of our own in Appenzell Inner-Rhoden. The Weissbad, one of the original whey-cure resorts on the Sitter, sends out an announcement of its attractions which is as funny as "English as She is Spoke." It is a pamphlet of sixteen pages, written in the most serious vein, and doubtless translated into all the tourist languages. We subjoin three extracts:

"The friend of the history of the life of nations will be astonished to find here a people of mountaineers that though so near the great arteries of trade lives as retiredly and simply, as originally and naturally as the inhabitant of the town knows only from historic tradition of our ancestors."

"The Weissbad offers also the best occasion to the cure-like usage of the cow's milk, of the goat's milk, and in our times also of the buttermilk so effective in many cases. An authority writes: Many guests in the Weissbad who cannot or only with aversion drink neither cow's nor goat's milk in pure state in the flat land and in the most low grounds, sip here with pleasure, and the best success the substantial, aromatically smelling milk of the Alps that owes its origin not to the watery grass of the plain or even to the feeding in the stable with every sort of cheap products of agriculture without value, but only to the dry aromatic herbs of the Alps and to flowers and every kind of buds and to the tender resinous sprouts of pines which the free going animals seek out of the less vigorous vegetation in a free choice, in a slow, natural

feeding, with a rapid changing of the substances, in a continual motion."

"It is a quite peculiarly charming place, a most pleasing spot of the earth where the Weissbad is situated. It is a whey-place of the true stamp. Already with the coming in vogue of the whey-cures, it has known to procure a very good reputation and to keep it without interruption, and it has well deserved it. Among the guests there is an unconstrained agreeable commerce far from that stork-like stiffness which poisons the air in many such establishments. The proprietors neglect no occasion to render the sojourn in their establishment agreeable to their guests and care earnestly for the wants of every one. Every day brings new amusements, and he whose end of the cure has irrevocably come on, parts only with difficulty from the society in the Weissbad that has become a large family to him."

We confidently claim that this Appenzell English does not suffer by comparison with the extracts published by the Harvard Committee.

An Advanced History of England, from the Earliest Times to the Present Day. By Cyril Ransome, M.A., Professor of Modern History and English Literature in the Yorkshire College, Victoria University. With maps and plans. Macmillan. 1895. Pp. xx, 1069.

WHEN Alice in Wonderland found herself the centre of a dripping and dragged menagerie, eager to get dry by any means, the Mouse commanded attention while it recited "the driest thing I know," which proved to be a Child's History of the Norman Conquest. It would seem that in the earlier parts of English history Mr. Ransome had emulated this harangue, for he has reduced them to a very moderate compass by the process of leaving out every anecdote, authentic or not, which gives life to bygone ages. In whichever of the two ways offered by him we take his book—an "advanced" treatise for those who have already studied his 'Elements' and 'Outlines,' or a convenient compend for general readers—he is so determined to admit none but the latest lights that he is often very dim. A more jejune and unsympathetic account of Alfred could hardly be.

As he draws near later times, his narrative is better; and particularly of his battles there are clear descriptions and useful plans. He aims particularly at portraying "character," and asks special attention thereto. Yet, besides Alfred, several persons of the first eminence, as Edward I. and Hampden, find but dull portrayal, and other of his judgments are, to say the least, paradoxical. When Edwy is dragged back to the brutalities of the wedding banquet by Dunstan, he is only a petulant boy, and the arch-monk is a wise statesman; but when William Rufus is under discussion, we are told to distrust the traditional blackness of his nature because the monks were his chroniclers. To say King John's character is "not easy to draw"; that Cromwell was an opportunist, who never saw far ahead in peace or war; that Catherine of Braganza was fitted to make Charles an excellent wife, and her husband a man of consummate ability, sounds strange enough. Perhaps Mr. Ransome is at his best in his handling of the Civil War, though it is painfully evident that he owes his inspiration to Prof. Gardiner; while in the reign of William III. it is amusing to see how he absorbs and reproduces Macaulay while trying, by a few sporadic touches, to persuade us, and perhaps himself, that he is original. With Montrose's campaigns in 1644 he inserts a map of Scotland "after 1603" which ought to have been given for 1745, and is hardly useful for an

earlier period. As far as the interest and judgment of the book go, there are many places deserving of praise, such as the treatment of the politics of the times of North and Burke; or of censure, as the reactionary handling of Clarendon's church legislation. But, as with Mr. Oman's history a short time ago, no one without abundant space at his command has room to discuss Mr. Ransome's literary and philosophical merits and demerits, preoccupied and teased as he must be by the mistakes, so unpardonable in a manual of history, which if not rigidly accurate is worthless.

To begin with errors in proper names, some arising from looseness, some from misprints, and some from absolute misunderstanding: "The Pilgrims of 1620 named their settlement 'New Plymouth'" (p. 493). The location of the first settlement had been called Plymouth long before, and New Plymouth, like New Hampshire or New Jersey, was the name of the colony. "Dublin Cathedral" (p. 524)—which one? Christ Church or St Patrick's? Winthrop's emigration is hopelessly confounded with Endicott's; and the Massachusetts capital is called "New Salem" (p. 530), which preposterous name is repeated (p. 822) in discussing the Boston Port Bill. The Governor of Massachusetts in 1636 was not Sir Harry Vane (p. 531), which is a blunder sadly common among ourselves. Arundel should be Arundell (p. 626), and Salton Saulton (p. 647). Lady Russell was not of the Winchester family (p. 630). Halifax was not a Marquess at the times indicated (634, 638); Bentinck, impeached in 1701, was never Duke of Portland, nor Montague Earl of Halifax (p. 699). Shippen is spelt Skippen (p. 765); Washington's camp was not at Great Meadow (p. 790), and the adjacent river was not named Mononhangela! Burgoyne of Saratoga was not Sir John (pp. 825, 827). It was not "Green" who hemmed in Cornwallis at Yorktown (p. 831). Cartwright is spelt Cartright (p. 851). Mackintosh was not Sir James when he defended Peltier (p. 881), Fulton's steamer was not the *Claremont* (p. 938), and Sharman Crawford is misspelt Harman (p. 1009). For false dates, we have the Dutch peace of 1609 put into 1608. The title of King of France was given up on the union with Ireland January 1, 1801, not, as here stated, at the peace of Amiens (p. 876). William IV. dismissed Melbourne in November, 1834, not 1835 (p. 950), and Gladstone tried to repeal the paper duty in 1860, not 1861 (p. 1009).

To say (p. 646) that Baxter was a much worthier man than Dangerfield, is like saying John Jay was a much worthier man than John the Painter. Mary of Modena had given birth to living children before James Edward (p. 656); Anne's son was never created Duke of Gloucester (p. 698). The present reigning house of Italy does not represent Henrietta of Orleans (p. 699). The Act of Settlement forbids any foreigner, even if naturalized, to sit in Parliament—a serious omission in this book. The silly old story of Franklin's coat is repeated (p. 822). Washington was forty-three, not forty-two, in 1775 (p. 825). Lord Ashburton did not retire with Fox (p. 836). The Rohilla charge against Hastings was not adopted (p. 845). It is true Lord Ellenborough's appointment to the Cabinet "was not drawn into a precedent"; but it followed the precedent of Mansfield nearly fifty years before (p. 869). Like Mr. Oman, Mr. Ransome lumps the Berlin decree with the Milan decree, as the Milan decrees (890). Like all English historians, he names only the *Shannon* and the *Chesapeake* in the War of 1812; he says Lincoln was elected as an Abolitionist (p. 999), and that Con-

gress passed an act emancipating the slaves (p. 1000).

It is an ungracious task to point out such errors; they do not exhaust the list. They all occur in the last half of the volume, and they have been identified in a rapid reading and without consulting any rare books. The sensation of weariness produced by their frequent and needless occurrence quite unnerves one for grappling with the more serious questions in which one would gladly encounter Mr. Ransome if he did not make one pay too high an entrance fee.

Lakes of North America. By Israel C. Russell. Boston: Ginn & Co. 1895.

A SUBJECT of school study which is represented chiefly by text-books is manifestly in a position far inferior to that occupied by one about which a rich and varied literature has grown up. It is in great part from this difference of position that geography suffers in comparison with history or the classics. Those who are interested in the elevation of this great common-school subject, now the target of so much well-deserved criticism, cannot do better than build up for it a foundation of good books for general reading, addressed to an audience fairly represented by the intelligent high school teacher. As a standard of what such books ought to be, Geikie's 'Scenery of Scotland' may be named, and Kirchhoff's 'Länderkunde des Erdtheils Europa,' prepared by various collaborators, is a good example of Continental work. In this country, we have not as yet produced many books of the desired kind. Shaler's writings have hitherto reached further towards the goal than those of any other author; the National Geographic Monographs recently established by the National Geographic Society of Washington bid fair to become in time important resources for studious geographical reading, if they can be maintained. The many valuable essays in scientific periodical literature need not be here considered, for they come to the attention of a very small number of the readers who need the information they present.

Russell's 'Lakes of North America' is at present the best example in this country of the kind of books that geography needs. In the first place, it is not a compilation, but in great part the result of original study. The author is admirably qualified for his task, having had wide experience in exploration and observation all over our country; his Alaskan journeys being probably better known than his studies in the far West, by reason of their having served as the basis for some popular magazine articles. It has happened that some of the subjects particularly assigned to him while a member of our National Geological Survey included various types of lakes, namely, those lying among the displaced lava blocks of Oregon, in the glaciated cañons of the Sierra Nevada, and in the desert troughs between the mountain ranges of the Great Basin of Utah and Nevada. It is good fortune for geographical readers to have one so well equipped by his own researches turn to their presentation in popular form.

An outline of this book may be briefly made. It opens with the origin of the basins in which lake waters may collect; a moderate position is here taken on the most vexed process, that of glacial erosion. The movements of lake water and the geological functions of lakes are next discussed, thus leading to an interesting chapter on the topography of lake shores, in which, here as everywhere else, the treatment

must follow that of the classic essay by Gilbert, to whom Russell dedicates his book. The relation of lakes to climatic conditions follows. This is particularly important in our national geography, for in the East we have innumerable lakes that result from former glaciation, while in the West many lakes of the past have been lost through the aridity of the existing climate. In fuller illustration of the origin and functions of lakes, special histories are given of certain important examples; those associated with the retreating ice-sheet in the Laurentian basin, and those connected with the humid and arid climates of the West, receiving most attention. All this supplies precisely that background of knowledge which the explorer, traveller, or teacher should possess, and which at present he so generally lacks. The illustrations, mostly taken from various publications of the Geological Survey, serve excellently to point the moral of the text.

Korean Games. By Stewart Culin. Philadelphia: University of Pennsylvania; New York: Dodd, Mead & Co.

UNLESS we mistake, this book marks an epoch in the study of the games of the world. It is a serious attempt to lift the whole subject out of the uncertain region of folk-lore and to set it within the domain of science. If we be permitted to coin a word to connote the fact, kairology would be the one. Kairos was the Greek god of the nick of time; and, being not a personality, but the graphic representation of an idea, is enough of an abstraction for our purpose. The bas-reliefs represent him as riding on winged wheels (or, in other words, as an ancient bicyclist) and holding usually a pair of balances. The diction of Mr. Culin, though admirably clear, shows a great many circumlocutions and instances of tautology that might have been avoided by adoption of the term kairology or some similar coinage.

The handsomely printed and lavishly illustrated volume is not, as might be supposed, a teacher of Far Oriental pastimes, albeit caterers to our home pleasures may find here material with which to enrich our stock of children's amusements. On the contrary, here is a profound study of the significance of Korean games. Although Mr. Culin has never in the flesh visited the Far East, he knows more about the Chinese world of ideas than most aliens dwelling in "the Chinas." His previous monographs on the methods of diversion and for obtaining luck, as he has seen them played by the men of the cue among us, show unusual insight and ability while working in the galleries of this mine. He has in this instance wisely selected the little country of Korea for illustration and proof of his main thesis. In the Peninsular Kingdom processes of thought that have become obsolete, even in China, still survive. The mythic concepts underlying Korean culture are wonderfully vivid and easily discoverable.

So far from attributing the origin of games to the inborn tendency of the human animal, akin to that of the kitten or puppy, to amuse itself, Mr. Culin, correctly, we think, regards games, not as conscious inventions for purposes of pleasure, but as survivals from primitive conditions under which they originated in magical rites and chiefly as a means of divination. There is a striking sameness in the widely distributed games of all nations, inasmuch as they are based upon certain conceptions of the universe once common to all peoples. Among civilized men the religious origin of games is as popularly forgotten as is in

Christendom the evolution of the theatre from the church. In Korea (as in old Japan, which borrowed so freely from her) the analysis of the universe, the enrolment of the people, division of the city into wards and of the country into provinces, classification of the seasons of the year, of elements, of colors, and of musical notes of the scale, are all made on the basis of four and one, that is, of the four cardinal points and the middle. The fairy and folklore as well as the serious literature of Korea (and of old Japan likewise) is saturated with notions based on this concept. Such science as the peoples in the Chinese world had was made by the assigning all facts and ideas in accordance with this "law of heaven and earth." In the application, however, of the formulae and categories to things and thoughts, difficulties were encountered in making the right assignment. An unclassified fact, or the notion that was supposed to represent one, was just as abhorrent to the Chinese-minded man as an uncorrelated specimen is to a modern man of science. How to secure revelation, in particular instances, of the place of the fact or idea in the scheme of the universe, was the problem of the learned. The solution was usually arrived at by a resort to magic. The processes made use of were at first religious. Gradually, however, as other methods prevailed, divination became only an accessory to religion. As the mental climate changed, the primitive essays left the hands of adults for those of children. Nevertheless, in both Korea and Japan to-day, worship and amusement are still closely joined, both as to time and place (even as summer sanctification and sea-bathing join hand in hand on the New Jersey coast). So, also, the element of joyousness was never wholly absent from the actual divination, and was especially prominent when the answer was favorable and the category reached.

Further, in the games of children, which, in every land, mirror the more serious business of their elders, the questions sought to be answered seem as relatively important as in the religious divination. Hence, to this day in the games of Korea, as we know by reading, and those of Japan, which we have repeatedly seen, we can re-read ancient history and religion. The games, while retaining much of their original character, often survive in two forms—that of the rite, with the element of luck; and that of the play, for the sake of pure fun.

In Korea, as in ancient Arabia, the arrow is the basis of the two principal systems of divination—one of the single and the other of the multiple rod and flat implement. Mr. Culin's detailed explanations remind us, and make very clear the reasons, why so many natives have arrow scars on body, face, and eyes, which even foreign surgical science, much to their grief and injured pride, cannot remove. The pack of cards and bundle of rods (for divination or gambling) are but expansions of the unit and mystic number. After the luminous and learned introduction, the text proper describes more or less fully ninety-seven Korean games, with their variants and with illustrative explanations from Japan and China. This part is full of tempting bits of information about what every close observer of child-life in the Far East has seen. It recalls pleasant memories of the sunny life of the children who live so much in the open air of summer, and who find such plentiful diversion when winter compels in-door and sedentary occupations. As often as possible, Mr. Culin attaches to his descriptions whatever historic data, plausible theory, or literary reference may be gleaned from other

authors. One of the most interesting chapters is that on Korean chess, about which Mr. W. H. Wilkinson has written in the *Korean Repository*. Dominoes and playing-cards are treated at length both descriptively and with explanations as to origins by reference to the four points of the compass. The indexical matter is abundant. Besides numerous diagrams are twenty-two Korean plates, many of them in colors.

If the study of games can reach the dignity of science, this work deserves the praise of being one of the first contributions to kairology made in this country. Despite the lack of the promised contribution which was to have been furnished by Mr. Frank Cushing, this work is complete in itself. Mr. Cushing expects to expand his running comparison of the games of the two continents (America and Asia) into a volume more or less like the present, on American games in general.

Krishna Kanta's Will. By Bankim Chandra Chatterjee. Translated by Miriam S. Knight. London: T. Fisher Unwin. 1895. Pp. 264.

THE wealth of modern Bengali literature, the curious product of the imposition of modern and European ideas upon an ancient and Asiatic people, is hardly realized at the present time. It is much the fashion, even in administrative circles in India, for Anglo-Indians to sneer at the inhabitants of Lower Bengal who lead busy and laborious lives round about the fertile delta of the Ganges River. Mr. Kipling, for instance, whose point of view of things Indian has been influenced by his residence in the Punjab, and who feels the contempt of the Punjabis for the unwarlike Bengalis, delights in representing Bengali characters in his stories and in his poems as behaving in the most undignified manner. It is true that the Bengalis have no love for war, and that they form a race of peaceful cultivators and merchants; their fear of pain is instinctive and exaggerated, though they do not fear death; and they constantly have recourse to the weapon of the weak, dissimulation, and have thus gained the unenviable reputation of being a race of liars. But though their physical frames are weak and their dispositions unwarlike, the Bengalis are intellectually by far the quickest, the most versatile, and the most assimilative of Western culture of all the peoples of India. The spread of Western ideas through familiarity with English books has not extinguished Bengali literature, as had been expected by some of the statesmen who opposed Macaulay's scheme of Anglicizing Indian education; on the contrary, there has been of recent years a vast revival of Bengali vernacular literature, both in prose and in verse. The language has been purified and developed, and has been made a fitting instrument for the expression of more complicated thoughts and emotions than it was before. Modern Bengali literature is especially rich in works of the imagination. Poetry, the drama and fiction make up a large proportion of the 1,300 books annually published in the province of Lower Bengal. Of the poems and plays it is difficult to judge because of the absence of translations into English, but several Bengali novels have now been made accessible in translation, and it is possible to form some idea of Bengali fiction.

Bankim Chandra Chatterjee has been acknowledged by all his contemporaries as the most distinguished of the modern Bengali novelists. He was a typical Bengali Babu, was educated at the Hugli College, graduated at Calcutta University, and entered the Govern-

ment service. He rose to the rank of a Deputy Magistrate and Collector, received the title of Rai Bahadur, and was made a C. I. E. His Government duties left him leisure to pursue a busy literary life, and he had published a large number of volumes when his lamented death occurred at the age of fifty-seven in May, 1894. 'Krishna Kanta's Will' is the fourth of Chatterjee's novels that have been translated into English, and it is an excellent type of the author's strength and weakness. To Western minds, the plot may seem somewhat weak, not from lack of striking incident, for there are a murder, the forgery and theft of a will, and other complications, but because of the descriptive matter which checks the progress of the story as a story. The characters defined are few and simple, and the scene is laid entirely in a small Bengal village. The human passion of which the novel treats is the usual theme of Western novelists, love. The hero, a handsome young Bengali, and the nephew of a rich Zamindar, who has been happily married in childhood to an adoring child-wife, falls violently in love with that most unhappy outcome of Hindu civilization, a girl widow. With considerable skill, the author represents the deplorable position of the Hindu widow, Rohini, and the moral effect of her enforced degradation upon her. At the bidding of the child-wife of Gobind Lal, she tries to drown herself, but she is rescued by Gobind himself, and eventually, after Gobind has made a strenuous effort to throw off his infatuation and has been disinherited by old Krishna Kanta for his supposed infidelity to his wife, he leaves the new-made heiress and goes to live with Rohini. The child wife's father resolves on revenge, Gobind Lal is aroused to a fury of jealousy, and murders Rohini, and the child-wife herself pines away.

This is a tragic tale indeed, but one that brings home the curses of Bengali, and indeed of Hindu, civilization—child marriage and the cruel lot of widows. Incidentally, there are in this novel some charming descriptions of Bengal scenery and some curious illustrations of the wide difference between the European and the Asiatic fashion of looking at things. The following vehement attack on female servants is sufficiently curious, perhaps, to deserve quotation: "Brahmananda Ghosh was a poor man. He could not afford to keep many servants. Whether that is an advantage or a disadvantage, I cannot say; whichever it is, he who keeps no women servants is free from four things—cheating, false reports, wrangling, and dirt. The gods have embodied these four things in the maidservant" (p. 44).

A Collection of Historical and Other Papers. By Rev. Grindall Reynolds, D.D. To which are added seven of his Sermons. Published by the Editor at Concord, Massachusetts. 1895.

FOR personal friends of Dr. Reynolds and his coreligionists this volume will have added interest and value on account of the too brief sketch of his own life and the longer one of his father; but for others its appeal is almost entirely in virtue of the group of historical and local studies which take up about three-quarters of the book. Dying at the age of seventy-two, Dr. Reynolds's life and his father's covered one hundred and thirty-nine years, and perhaps it was his personal interest in so long a period—for his father's life was as interesting to him as his own—that gave his mind a bent in the direction of historical and antiquarian studies. It is certain that he had such a bent,

and the judgment of Senator Hoar, who writes an introduction to the volume, is that if he had given himself wholly to such studies, he would have distinguished himself in them to a remarkable degree. He would have brought to them, as the papers in this volume show, a searching curiosity, a judicial fairness, a comprehensive view of his subject, and a very lucid and agreeable style of writing.

Four of the chapters deal with subjects of general interest, and of these the two on the northern campaigns of the Revolution are the more valuable because of their instruction for the present time, showing, as they do, how these campaigns found Canada extremely friendly to the colonies, and left her alienated from them and in closer sympathy with England than before the war began. If Anglophobia could have its way, this chapter of history might repeat itself. Of seven Concord chapters, two on the old Concord church afford a good example of the evolution of a New England church. One on the Concord fight is a very careful account of that momentous business, and "Concord during Shays' Rebellion" is a valuable contribution to our understanding of one of the obscurer episodes of "the critical period of American history." Of the "Miscellaneous Papers," that upon "saints who have had bodies" is a vigorous statement of the physical advantages of intellectual activity to which the time since it was written has furnished many fresh and lively illustrations.

BOOKS OF THE WEEK.

The Nation.

NEW YORK, THURSDAY, MARCH 20, 1896.

The Week.

POPULIST ALLEN took a pretty accurate measure of Warrior Sherman on Monday, when he said that the Ohio Senator, he guessed, thought the time had about come for him to make his usual retreat. Mr. Sherman in fact made it with much muttering and scowling, but he made it, and those terribly urgent belligerency resolutions which a month ago must pass instantly and without a word of debate, are all tied up again and as far from passing as ever. The net result up to date is a fresh shock to business, further discrediting of Congress, and special humiliation for the Foreign Relations Committee, and Mr. Sherman in particular, but not the slightest benefit to the struggling Cubans. The struggling Cubans, in fact, have cut no figure in the whole debate. The resolutions have been from the first solely for the benefit of struggling Congressmen. Their determination not to let one of their number get more glory out of it than another has been all along as obvious as it has been heroic, and Monday's bids for fame by Senators Mills and Platt let us into the secret of the whole scramble. Lord Rosebery in a speech the other day gave a definition of the function of the Cabinet, as made by Sir George C. Lewis in a letter to the Prince Consort. Sir George said: "I find the Cabinet to be an institution intended to prevent individual Ministers from immortalizing themselves at the expense of the country." Our Senate, our foreign-affairs committees, have been such institutions. But they are now designed rather to promote a free-for-all race for immortality precisely at the expense of the country. Each man tries to out-roar the other; and as for Cuba or our own country, why, they may go hang themselves along with common sense and law.

Senator Sherman cannot open his mouth on the Cuban business but out there flies a blunder. The ignorance, for a chairman of the Foreign Relations Committee, he had before displayed, was surpassed on Thursday last. He roundly asserted that the Cubans had but one representative in the Spanish Cortes. Thereupon Senator Hale offered to show him a list of the members of the last Cortes, in which figured the names of forty-five Deputies from Cuba and Porto Rico, together with those of fourteen Senators. Anyhow, affirmed the Ohio Senator, waiving that point, the Spaniards did not keep the promises they made at the close of the last insurrection, and here is a letter from Martinez Campos himself to prove it. But the letter itself,

when read, spoke of "promises never fulfilled" as having given "rise to the insurrection of Yara." Evidently Senator Sherman had not the remotest idea what the insurrection of Yara was. It was the beginning of the former rebellion in 1868. Martinez Campos, therefore, was alluding to a condition of things before that date, and innocent Mr. Sherman made him refer to events subsequent to 1878. We are ashamed of the insurgent agents for not having coached Senator Sherman more carefully. His frequent and ostentatious blunders are hurting their cause. We cannot say that anything of the kind can hurt him, for Senator Hoar, at the very moment of exposing him, paid a tribute to him as "the most illustrious political figure on this continent."

Senator Gray's preference for the Senate Cuban resolutions over those of the House, is hard to understand. He has defended them as more "courteous" and "respectful" than those passed by the House. Now, the fact is that the Senate resolutions, in the only points in which they differ from those of the House, are more studiously offensive. They affirm that "the friendly offices of the United States should be offered by the President to the Spanish Government for the recognition of the independence of Cuba." Speaking to that very point in the House, Mr. Hitt said:

"Every gentleman, on hearing that suggestion made or that proposition presented to him, must think in a moment what would be the response if a proposition were made to our Government, for example, by the British Minister, presenting resolutions adopted by the British Parliament asking and desiring us to consent at once to the independence of Texas, of Florida, or of Michigan. How long would he remain in Washington after presenting such a proposition as that—after the self-respect of our Government had been thus insulted? I think, gentlemen, you will agree with me that the proposition of our committee is one far more prudent and likely to be far more effective."

The House resolutions limited themselves to offering "friendly influence" to secure "a government by the choice of the people of Cuba." Resolution for resolution and insult for insult, we do not see much to choose between the two. Both are gratuitous and dangerous meddling with something with which Congress has nothing to do, and for passing upon which it has, as the debate has shown, neither the knowledge nor the fit temper.

It is impossible to say how much importance is to be attached to the meeting between the free-coinage Republican Senators and certain Pennsylvania manufacturers which took place at Washington on Friday, but obviously it must tend to confirm the free-coinage Senators in their determination to resist any tariff legisla-

tion that is not accompanied by legislation in the interest of silver-miners. It is safe to conclude, also, that the meeting would not have taken place at all without a definite purpose. Probably the purpose is to bring a pressure upon the coming St. Louis convention to adopt a free-silver platform, and, failing in that, to nominate a candidate for the Presidency who will attract the votes of the Populists, and the silver contingent of both the other parties. The name of J. Donald Cameron was suggested for such nomination. If the movement goes so far, it cannot be denied that Cameron is the man to head it. He is a silver-man of the most pronounced and fanatical type. He is also a politician of long experience, and he has sufficient reputation in the country at large to make a good run if any straight-out silver-man can. In short, if there is to be a Republican secession, Cameron is the most formidable leader that could be found. There is a disposition among the Republican leaders to make light of the meeting, but a movement which can count the electoral votes of several States as almost certain at the start, is not a negligible quantity.

At all events, a double-meaning platform will no longer suffice. It will be repudiated by the silver wing of the party and by the gold wing as well. The Ohio deliverance, penned by McKinley himself the other day, has met almost unanimous disapproval in the East. The Republican press in general has repudiated it, and declared that it will not answer the purpose in this campaign, however well it may have served in former ones. The truth is, that the Eastern Republicans are just as tired of humbug and uncertainty on the money question as the constituents of Senators Teller and Carter are. They are in no better mood for a compromise than the latter; and even if their leaders were, it would be unsafe to risk the vote of their States on an uncertain platform. New York in particular is in a shaky condition. There are so many local troubles here that any serious misstep regarding the financial question would take the State out of the Republican column if the Democrats offered anything better. Will they do so? Looking merely at the elections of 1894 and 1895, the Democratic party is already beaten. Still, it has "a fighting chance." If it takes an unequivocal position for sound money—if it declares, for example, that, in the absence of an international bimetallic agreement, it favors the maintenance of the gold standard by the United States—and if it nominates a candidate for the Presidency who is as sound as the platform, it may yet carry the election.

It is a serious misfortune to the Republican party that at the present time the

two great forces at work to capture its Presidential nomination are the bosses and the high-tariff interests. Quay and Platt are working to control the nomination in the interest of machine politics. They hope to set up in Washington the boss government which they are conducting in Pennsylvania and New York. The high-tariff interests are hoping in a somewhat similar way to put McKinley in the White House, and thus set up a high-tariff government for their personal benefit. As Senator Chandler says, they paid off McKinley's debts when he failed in business, and he is under great obligations for that. If now they can pay all the political expense of his nomination and election, they will put him under fresh obligations to such an extent that if he gets into the White House he will be more completely "their man" than any President we have ever had. That they are spending money freely for him, nobody who is familiar with political methods can doubt for a moment. His "boom" has all the marks of a boom with boodle behind it. It is making formidable progress, but not so formidable as appears, for there is a tremendous amount of "claiming" made in its behalf. If its chief opponents were not bosses of such odious character as Platt and Quay, there would be much less cause of anxiety about it. The real intelligence and character of the Republican party have not as yet taken a hand in the struggle, but it is high time they should if they are to exert much influence on the nomination.

The Boston *Transcript* thinks that "the chances of Mr. Reed's success as an aspirant for the Republican Presidential nomination will be greatly improved by Massachusetts Republicans speaking out in their approaching State convention boldly and unequivocally for sound money, as the term is understood by those who advocate the present gold standard," adding that "Massachusetts is the backbone of Reed's support in this section." We beg leave to ask if Reed's own backbone has not something to do with the question, and to suggest that, if it has, it is time that it be put in evidence. What is the use of a State convention "speaking out" in favor of any principle if the candidate in whose interest it "speaks" is himself silent? Does not the *Transcript* know that Mr. Reed is as dumb as an oyster when the silver question is mentioned to him, and that he does not hesitate to characterize as an impertinence any attempt to draw him out on the subject? Mr. McKinley deserves some credit for drafting the currency plank of his own State convention so that it can at least be characterized, if it can be characterized only as a wobble. But where does Mr. Reed stand? If he too is a wobbler, which way does he wobble most? It would be interesting to know this, but to know it from the Speaker himself, not by

the mouth of the Massachusetts Republican convention.

In signing the Raines bill, Gov. Morton reviewed several objections to it of more or less weight, but he passed over the most serious one without any notice whatever. We have no doubt that, except among liquor-dealers, drinking men, and their allies, he will find pretty general acquiescence in his approval of the restrictions the bill places on the liquor traffic, even if it does gobble up so large a proportion of the revenue derived from the liquor tax in cities. But he makes the value of the bill to depend on its being "fairly worked out by competent and faithful officers," and does not say one word as to the mode in which "these competent and faithful officers" are to be provided. This, however, is the point on which the bill has excited the opposition of the friends of good government in this State, and it is this mode which is destined to work its failure, if fail it does, and in failing, to spoil the Governor's fair fame. We do not think we exaggerate or distort, when we say that the bill makes the best provision that can be made by legislation, for the infidelity and incompetency of the officers who are to execute it; for it provides that the places of all the sixty special agents shall be deemed "confidential," and, therefore, shall not be filled by competitive examination under the civil-service regulations. Governor Morton must not suppose that the public do not draw inferences as to what this means. It means, in their belief, that these appointments shall be made for political reasons, without regard to fitness, and, therefore, shall be made on the suggestion or by the designation of Thomas O. Platt, for the strengthening of his machine, which already has excited so much alarm and anxiety.

The new corrupt-practice law which has just been enacted in Ohio, makes the tenth thus far put on our statute-books. The other nine States having such laws are New York, Massachusetts, Colorado, California, Missouri, Michigan, Minnesota, Indiana, and Kansas. Of these, the most comprehensive and rigorous are the statutes of California, Missouri, and Minnesota. The others are half-way measures, of varying degrees of usefulness, whose chief effect is to compel a certain amount of publicity in campaign expenditures. The Ohio law is modelled substantially upon the Missouri and Minnesota law, placing limits to the expenditure which candidates may make, the maximum amounts depending upon the size of the electorate, as follows: One hundred dollars for 5,000 voters; \$1.50 for every 100 voters above 5,000 and under 25,000, and \$1 for every 100 voters above 25,000 and under 50,000. Any expenditure in excess of such amount is unlawful, and makes void the election of the violator of the

law. All candidates and committees and agents are required to make sworn itemized returns after election of all money received and spent, under penalty of \$1,000 fine. The law is an excellent one, but, like all similar laws, it will depend for its enforcement upon public sentiment. None of the laws of the kind at present nominally in force are executed with much rigor. The California law is practically a dead letter, and the Missouri law, while somewhat better observed, is still not pressed as it should be.

The call which was published on Friday, for a conference to promote the establishment of a permanent system of arbitration between this country and Great Britain, may fairly be considered the most wholesome movement of the present year or of any recent year in our history. We can think of nothing better calculated to restore confidence to the business community and sobriety to the field of politics than this projected meeting. The first name in the list of signers of the call is that of the Chief Justice of the United States, the second is that of the General of the Army, and the third is that of the ranking Admiral of the Navy. The other signers will be recognized as among the foremost citizens of the land. The list would have been much larger undoubtedly if there had been more time to circulate it, but it is large enough for the purpose of showing that the intelligent, thoughtful, and God-fearing people of the United States are most desirous of having practical steps taken now to put the relations of this country and Great Britain on a basis where they will not be exposed to war and war's alarms in sudden and unexpected ways. Arbitration may not be suited to every possible case of difference between nations, although it is most desirable that it should be. The great advantage of it is that it stands in all cases as a buffer between hot heads, and prevents a nation from plunging into war headlong. It interposes a period of discussion and reflection. There is good reason to believe that both countries are now in a mood to enter seriously upon the negotiation of such a treaty as is proposed in this call, and there is little doubt that the conference itself will be worthy of the exalted intentions of its promoters.

The social level of American Salvation, as it is to be fought for by Ballington Booth's new organization, continues to be lifted slightly nearly every day. The uniform which the leaders designed for the lassies has been changed in order that it may be more becoming to the wearers. It was to be brown in color, but it will be cadet blue, since brown is not only a trying color to the complexion of most lassies, but spots easily and fades quickly. The new bonnet is thoroughly approved by the lassies. It has less poke than the old British Salvation bonnet, being much

more natty, and giving the features of the wearer more publicity and the advantage of a more becoming surrounding. When its color and trimmings are made to conform to the cadet blue of the uniform, the happiness of the lassies will be complete. A change is proposed also in the name of the new army. Objections are made to bringing the name of the Deity into the title, and it will be amended probably from "God's American Volunteers" to simple "American Volunteers." When all arrangements are completed, the Volunteers will take the field against sin in a thoroughly genteel manner, offering quite a contrast to the noisy and rather vulgar British methods.

We do not think a better case for compulsory arbitration has ever occurred or is likely to occur than the trouble between Italy and Abyssinia. Abyssinia has undoubtedly "a doctrine" which excludes the Italians from making any settlement on that continent, and has been held firmly for over a century by the predecessors of King Menelek. Menelek does not seek to meddle in European affairs. He simply asks to be let alone, and that, if the Italians have a lawful colony on the coast, its boundaries shall not be enlarged. Every fact in the case will justify our asking the Italians to arbitrate or take the consequences. If it be asked what authority we exercise over Menelek, we answer, just as much as we exercise over the Spanish-American states. Menelek may dispute our sovereignty over him, and deny that our will is law in his part of the country; but so would Brazil, and Chili, and the Argentine Republic, and Mexico, which does not prevent our claiming the right to protect them against foreign aggression, and to supervise their treaties. Besides, Menelek's feelings should not hinder us in the least from calling the Italians to account for their treatment of him. It is with Italians we have to deal, because they are apparently stronger than Menelek, and it is a cardinal doctrine of American polity that in all disputes between weak states and strong ones, except ourselves, the strong state is surely in the wrong. We therefore strongly advise the appointment of a commission to find out the rights and wrongs of this matter, and then to stand by its judgment. We are perfectly aware of the responsibility we incur in giving such advice, but it does not frighten us. To the timorous souls who think this might get us into a war with Italy, and who ask, Are we ready for war? we say emphatically, There will be no war. To those also who are afraid of the effect of such a move on the stock market, we answer that there would be as much money made by private information as would be lost by the public news. But anyhow we do not think much of men who set their pockets before the glory the country would acquire by the assertion of her jurisdiction over another continent.

The news of the British advance up the Nile valley has created a great sensation in Europe, particularly among the French, who profess to believe that the reasons assigned for the advance by the British are a mere subterfuge, and that the true cause is to make a pretext for holding Egypt for a still longer period and more solidly. Mr. Curzon communicated to the House of Commons on Tuesday week the information on which the advance is based, and which consisted of reports of merchants, of refugees from Khartum, and of despatches from the British Consul at Suakim, announcing the appearance of the Dervishes within fifty miles of that place, and the proclamation of a holy war by the Mahdi's successor, who has on hand one of the biggest "doctrines" in the world. He makes out a fairly good case, but the political observer who treated the whole affair as a counterstroke against France and Russia in retaliation for the Armenian fiasco and its British humiliation, would not be far wrong. If such it be, it is ably planned. It resuscitates Italy, and so far strengthens the Triple Alliance, fastens the British hold on Egypt and the Mediterranean more firmly, and warns Turkey that she would do well to find other friends than Russia. It helps to dissipate the queer belief, which doubtless led to the Kaiser's congratulations to Krüger, that England would not go to war. The Conservatives are evidently determined on a Jingo policy.

The humiliating position in which British diplomacy was left by the Armenian failure is of a sort that any ministry would be glad to obscure by some diversion. Mr. Curzon's statements in Parliament on March 3 confessed the full measure of the triumph of the Sultan. The Government accepted a motion trusting that "further endeavors will be made to ameliorate the lot of the Christian population in Asiatic Turkey," but Mr. Curzon distinctly warned the Commons that it must not be supposed possible that such endeavors would be made "by force of arms." He deprecated the habit of speaking of the Armenian negotiation as "a failure." Lord Salisbury had wrung substantial reforms from the Sultan, but, if you pressed Mr. Curzon on that point, he would "not say that we have any guarantee that the reforms will be carried out." Mr. Bryce then read from the record to show that, even in the matter of announcing the reforms, the Sultan had shuffled and procrastinated from month to month, and finally, on November 7, had said he would not announce them at all. That was the whole of it—a promise insincerely made and then cynically withdrawn. What a situation and confession, after the loud threats of Lord Salisbury last summer!

The emphatic declaration of the English Chancellor of the Exchequer, that

Great Britain, although entirely willing to confer with other nations in an international conference, would have no bimetallicism in her own currency, is exactly what was expected and predicted when Sir Michael Hicks-Beach was designated for that office. This declaration will go far to silence the bimetallic faction in Germany, since the Prussian Diet some time since voted that it would be inexpedient for Germany to adopt bimetallicism without the coöperation of England. In fact, the bimetallic agitation in Germany has now so far subsided as to be under control. It is still squirming in France, however; the agricultural classes being under the delusion that the price of wheat is in some way connected with silver, and that if this metal were remonetized, the farmers would be more prosperous. The French Government, it should be observed, is not restrained by any act of the legislative body from trying this experiment at any time, since the law of 1876 provided merely that the executive branch of government might limit or suspend silver coinage at its discretion. The Ministry can open the mint to silver to-morrow if it chooses, at the ratio of 15½ to 1. The effect of such a step would be the same kind of commercial and political convulsion that would follow free coinage in this country at 16 to 1.

The royal commission on the relief of agriculture in England has reported in the usual fashion of royal commissions. There is a long majority report, a strong minority report, and a long setting forth of individual views by two members who are unable to agree with either majority or minority or with each other. This makes the plaything nature of the commission complete. Salisbury can say to the embattled farmers that he gave them their commission, and that if the commission had been able to agree, he would have been only too happy to take their recommendations into consideration, and see if Parliament could do anything not inconsistent with the laws of trade and the duty of securing a cheap food supply. As it is, he can only advise them to be patient and shuffle the cards and believe that his heart is filled with the tenderest sympathy for them. It is hardly worth while to look in detail at the proposals of the majority. They relate chiefly to easing off the land tax and providing a system of Government loans for agricultural improvements. Both propositions are, of course, stated in the conveniently elastic terms that mean what you please. Taxation of land should not go beyond "a reasonable rate." Government loans are to be "carefully guarded," and given only to "encourage thrift." No one but a wicked man would deny either proposition; but the supernatural wisdom necessary to put either into the exact terms of a statute does not grow on every M. P.

THE BAYARD CENSURE.

MR. BAYARD will probably take no notice of the vote of censure passed by the House, and his course will probably receive the approval of nine-tenths of the intelligent and thinking portion of the community; and this for various reasons. The principal one is that all censures of a public officer, in order to have effect, should plainly have in view the good of the service, and should emanate from some body whose judicial-mindedness on this point is not open to suspicion. No one would think of attributing to the House any desire that our Ministers abroad should not be partisan, or should be selected for their non-partisanship. If a bill were introduced to-morrow to make our diplomacy a permanent profession, to be filled by men divorced from politics and bound to discretion by the rules of their order, as diplomats are in European countries, it would not have a chance of passing. Nothing, probably, would the Republican majority in Congress resist more strenuously than an attempt to deprive them, in case they won at the next election, of the chance of giving foreign missions to all leading Republican partisans. If one of these partisans had been in Mr. Bayard's place before the Edinburgh University and had protested against and criticised "British free trade" as something unsuited to our country and prejudicial to its best interest, and had denounced its advocates here as "un-American," he would have been secretly applauded by this very House of Representatives, and no notice would have been taken of his escapade. Everybody believes, and many know, that the trouble in Mr. Bayard's case is due to the fact that the wrong or has been gored. Had he taken a slap at free trade before a British audience, he would have been applauded as a manly American, who looked the "played-out aristocracy" boldly in the face.

The indiscretions of other kinds on the part of our Ministers abroad during the past eighty years have been very numerous, but they have never been noticed when the party of the culprits was in a majority in Congress. In other words, there are two kinds of indiscretion, one blameworthy and one praiseworthy, and this distinction runs through every department of the public service—army, navy, and post-office. When a naval officer, for instance, commits the outrageous offence of criticising the political policy of his superiors, and denouncing their use of his arm of the service, he is loudly applauded by the party to which he belongs in and out of Congress, and his well-merited punishment is treated as an act of tyranny. In truth, party feeling is a subtle poison which runs through every branch of the government, but is of course more deadly in some than in others. When we consider the temptations under which our Ministers abroad labor, to make themselves offensive to the community to which they are accredited,

and the applause which such conduct would win for them from such a body as our present Congress, their reserve and good manners are something marvellous, particularly as but few of them have had diplomatic training.

Another thing which stands Mr. Bayard in good stead is the House's own want of discretion. In every field of human activity, a person clothed with the right of censure is in some way the superior of the person censured, either morally or officially, and every such person is bound to set a good example. In all services, public and private, ever since society was organized, censure, by such superior, of faults to which he was himself addicted, has been held to be indecent and ridiculous. The licentious father lecturing the fast son on continence, the drunken officer sitting in judgment on the drunken soldier, the swearing parson preaching against blasphemy, and the defaulting bank president denouncing the pilfering teller, have furnished the comic element to many a tale or drama. We pointed this out when the Senate was raising a hullabaloo about the indiscretion of the Spanish Minister in exposing the falsehoods and blunders of some of its own members.

Our remarks then apply with equal force to the House now. He who exacts discretion from others must be himself discreet. A legislature which insists that public servants must on all occasions, small and great, keep within their own sphere and attend strictly to their own business, must follow its own rule. The present House of Representatives has surpassed all its predecessors in neglecting its proper business and taking up that of other people. It was its duty, when Mr. Cleveland sent in his Venezuelan message, to refer it to the Committee on Foreign Relations, to get a careful report from that body, and to debate fully such report afterwards. Instead of this, it abandoned the duty committed to it by the Constitution, and voted without inquiry \$100,000 for semi-warlike purposes. It has neglected another of its great duties in doing nothing to restore order to our finances. It has usurped the constitutional prerogative of the executive in passing undebated resolutions about the internal affairs of four or five foreign countries. It has, in fact, sought to censure foreign-governments for not coöperating with each other in their foreign policy. There is hardly any branch of indiscretion which a deliberative body can commit that it has neglected. The result is, that there is probably no subject on which the public listens to it with more impatience than the subject of discretion, because there is apparently no subject about which, judging from its course, it knows less, and it is considered the most ignorant body which has yet met in Washington. Nothing could be more farcical than its notion that its debate on Mr. Bayard was something important. It was important in the gallery, but it

made the judicious grieve all over the country.

One thing more must be said. We do not attempt to deny that it was indiscreet and imprudent for Mr. Bayard to say what he did as to the effect of protection on the politics of his own country. But there are degrees in indiscretion, as in every other offence against rules and regulations of which man can be guilty, and Mr. Bayard could hardly have been indiscreet at all with so little damage to his diplomatic character as on this occasion. For we do not believe there is a thinking observer of any creed or party in the United States, even if he be a protectionist, who can deny or explain away what thirty years, not of high tariff but of getting high tariffs passed, modified, and changed, has done for the public life of our country. It may be a good thing to have high or prohibitory duties, but that the annual practice of selling the right to levy them to manufacturers, of enabling whole classes of men to calculate the exact sum which easily purchasable legislation will put in their pockets, has driven men of eminence from public life, has corrupted politics to a degree hardly known since the fall of Rome, has created the boss system, and is thus threatening democratic government itself with overthrow and eclipse, no reflective man will deny. It was doubtless folly of Mr. Bayard to say this before a foreign audience, but it was folly of the sort of which Galileo was guilty when he promulgated the motion of the earth round the sun, at Rome. Galileo was locked up, and Bayard is censured, but they nevertheless both spoke "God's truth," which shall never fail.

FOREIGN IMMIGRATION.

MR. LODGE has been one of the prime movers in the troubles from which the country now suffers. He began a year ago or more to create the perturbation in our foreign relations which, during the last few months, has been so disastrous to business, and has done so much to turn public attention away from our domestic difficulties. He has always, however, reserved for himself a little shelter in the shape of something of comparatively small consequence, which would not seriously affect his own character as a demagogue, and yet enable him to make a display of interest in our domestic affairs. One of these is civil-service reform. Another is copyright. Neither of them seriously attracts public attention, or is likely to damage him or lessen his influence with the class which he most cultivates. Whenever one resents his attacks on the currency, or his tariff madness, or his military propagandism, all of which are likely to affect seriously the character of the nation, the answer always is to see how faithful he is to civil-service reform and what a good friend to international copyright. To these political sentry-boxes he has now added hostility to illiterate immi-

gration, which he says is "a subject of the greatest magnitude and the most far-reaching importance":

"The injury of unrestricted immigration to American wages and American standards of living is sufficiently plain and is bad enough, but the danger which this immigration threatens to the quality of our citizenship is far worse. That which it concerns us to know, and that which is more vital to us as a people than all possible questions of tariff or currency, is whether the quality of our citizenship is endangered by the present course and character of immigration to the United States. To determine this question intelligently, we must look into the history of our race."

We do not need to look into the "history of our race" to get to the bottom of this matter. The history of our own country is enough. Every one must regret ignorant immigration. There is no doubt that it does lower the quality of our citizenship, and that it has a tendency to breed demagogues. But the question with us to-day is whether, and to what degree, it is responsible for the evils which now afflict us. What are those evils? They are, first, a tariff which, high or low, it seems impossible to settle in any manner which will not make it a constant menace and disturbance to business stability. We care not whether it be a high or low or middling tariff; human nature demands a stable tariff. Our next evil is a mixed, disorderly, and redundant currency, the various denominations of which are maintained at par with each other by borrowing money quarterly. Our third evil is a widespread popular passion for foreign aggression, and the conversion into a military republic of one which was intended to be, and has been until now, a peaceful, trading, manufacturing, agricultural republic.

Now to which of these evils has the foreign immigration, large as it is, ignorant as it is, contributed anything? The States which contain most foreign-born citizens, as we have often pointed out in these columns, have been soundest on the currency question—much sounder than Mr. Lodge or any of his leading companions. On the management of the tariff, which is really our American system of taxation, during the past thirty years the foreign population has exerted no influence, or next to none. It has been almost exclusively in the hands of American manufacturers and their American Congressional allies. Any falsehoods or delusions which have helped to maintain it at an extravagant height, or have led to sudden and violent changes in it, have been spread among the foreign population by intelligent and educated Americans. The irredeemable-greenback movement and the silver movement, with all their absurdities, are of purely native origin, and are most deeply rooted to-day in the States which have received the least foreign immigration. The present prevailing desire, of which Senator Lodge has been himself a chief promoter, to get up disputes with foreign nations which would entail enormous expense, and, if persisted in, seriously change the character of our

government, is absolutely native-American in its origin and maintenance. There are very few foreign immigrants, even of the peasant class, who have not clearer conceptions of international morality and of the *convenances* of international intercourse than such men as Morgan and Vest, for example.

The matter on which the influence of the foreign immigrant has been most potent is city government. But the only city in the Union in which this has been visible, palpable, and overwhelming, is New York. The government of New York has been undeniably Irish, and we admit shockingly bad. But, alas, the government of the other cities, Philadelphia for example, which is in native hands, is just as bad and some say worse. So is that of St. Louis, Chicago, and Cincinnati. In all these cities the chief leaders in the work of corruption have been Americans by birth, and as a general rule it is Americans who have taught the foreigners the tricks of the trade. As to foreign illiteracy, to which Mr. Lodge attaches so much importance, we affirm that it has not done us a hundredth part of the mischief wrought by native illiteracy. Mr. Lodge himself, for instance, was taught to read and write when he was a child, and has, in maturer years, had the best educational advantages the country affords. But, in spite of this, a very large proportion of the educated and thinking men of the country look on him as a citizen who does more damage to the nation than a hundred thousand, or, we might say, a half-million, ignorant Europeans. At no period in the history of the country has so much damage been done to our government as within the last ten years by the Congresses which we have been in the habit of calling "brutish." They have exhibited ignorance and folly in about equal proportions—ignorance about nearly everything with which it behooves a legislator to be acquainted, trade, commerce, industry, finance, currency, foreign relations—and yet every member of them knew how to read and write, with different degrees of proficiency, it is true, but all fairly well. Some had even read books and dictionaries. So it is quite plain that making foreigners read and write at their port of entry would not necessarily make them desirable additions to our voting population, or to our halls of legislation.

Take again the boss system, which is so rapidly changing the character of our State governments: Who devised it? Who carry it on? Who are its main supporters? Why, the native-born country voters of New York and Pennsylvania, just as much as the Irish laborers and liquor-dealers of New York city or Philadelphia. It is not Paddy or Hans who is seen hurrying to No. 49 Broadway every Saturday. In truth, the most marked characteristic of a great deal of such lamentation as Mr. Lodge's over foreign illiteracy, and of a great deal of the legislation of the day, is the desire to find some mechanical substi-

tute for character, something which will dispense with the necessity of being honest and true and upright, and loving one's country in other ways than showing readiness to fight foreigners about matters which do not concern us. Does any one suppose for one moment that if the ruling passion at Washington and Albany to-day were a sincere desire to do what was best for the country, what was most likely to promote the comfort of the poor, and the safety, honor, and welfare of the nation, as these terms were understood by its founders, the existence among us of five times as many illiterate foreigners as we now have could not be witnessed without concern?

McKINLEY IN PRINCIPLE AND IN SCHEDULE.

SOME of McKinley's Ohio friends are trying to reassure alarmed Eastern Republicans by saying that their great man is no high-tariff extremist, despite all that is said. He stands committed to no "schedule," they say, only to the general "principle" of protection. His election to the Presidency would not mean, therefore, the reenactment of the McKinley tariff, but simply a reaffirmation of a general policy for this government. Hence there is no reason to fear that Republican success under McKinley would lead to such scandalous selling of legislation as shocked the country and crushed the party in 1890.

All this, instead of reassuring, should redouble the alarm of conservative Republicans. Nothing is more dangerous in politics than a vague "principle" with which all sorts of juggler's tricks may be played. The "schedule" we know: all its bargainings, its rotten spots, its oppressiveness, its little hidden traps and snares. These have been exposed over and over again, and we have, as it were, got used to them. But a "principle" means an entirely fresh set of intrigues and tricky surprises and evils that we know not of. The original McKinley abominations were born of a principle. There was no tariff schedule in the platform of 1888; only a principle in its vaguest and blandest form. But it proved, when the time came to turn it into law, a fruitful mother of mischief. Like a "doctrine," of which, in politics, we have seen such terrible examples of the enormous embarrassments, a "principle" of this kind is more to be dreaded than any conceivable "schedule." In the latter case we have an evil, if it is an evil, which is clear and definite, and can be fought with the ordinary weapons of political discussion, and in the open daylight; in the former, we have to do with a malefic jinn, shut up in a bottle till after the election, and then released like a vast and shifting fog-bank, under cover of which all sorts of foul creatures come to birth.

What McKinley's "principle" really means is a check signed in blank, and

payable, in legislation, to every manufacturer who turns in *his* check for the campaign fund. That is the way it worked in 1890, and that is the way it will work in 1898. Republicans whose supersensitive stomachs revolted at some of the nauseous doses administered to them in the first McKinley bill, had to listen to mysterious whisperings about "the obligations of the party," "heavy contributors to the campaign treasury, you see," and that sort of thing, besides public remarks about "fat-frying." Usually, the only defence was that the general "principle" was, of course, wise and beneficent, but that many of the details were necessarily iniquitous; and would you sacrifice the blessed whole for these petty defects? There is no reasonable doubt that the same sort of thing is now planning, only on a larger scale. The men whom "the unauthorized loquacity of common fame" now declares to be backing McKinley's canvass with huge sums, and some of whose names and letters Senator Chandler pledges himself soon to publish, will infallibly exact the uttermost farthing if their candidate and his party are successful. That is what the vague talk about McKinley's "principle" truly means—the right of the men who are buying his nomination to take the next tariff bill and sit down quickly and write in it what rates they please. As against such a principle as that, honest men will take a schedule, however vicious, every time.

Putting outright corruption like this one side, it is easy to see that a glittering principle like McKinley's opens wide the door to the most preposterous abuses. Clothe the greatest outrage in the garb of the principle, and it must be admitted to the best protection society. Free silver, bounties, loans to farmers, minimum wages, the right to work, the right to loaf and shirk without starving, insurance against accident and old age, pensions for the million—any or all these schemes have but to vindicate their title to be classified under the principle, and the party is powerless before them. Like the enormities expertly drawn out of the bowels of the Monroe Doctrine, they will impose themselves, not by their own merits, for they have nothing but demerits, but by hanging on to the skirts of the principle. Good Republicans will be saying ruefully about them, as they did about the terrible consequences of the Doctrine, "Well, of course, we don't approve of that kind of thing, and we never dreamed of seeing it brought forward; still, if it's a part of the 'principle,' there's no help for us."

This is no fancy picture. If the Republican party goes into the campaign with McKinley and his principle, and elects him President, it is going to unchain the most formidable political passions that this country has seen. It is going to guarantee, in advance, comfort and prosperity to every voter, and to bring upon the Treasury raiders ten times as numerous and ten times as ugly as the Coxeys

band. The party's promises to pay will be presented by the thousand, and no payment in smooth prophecies will be accepted. McKinley cannot get off next time by alleging that wages have been increased to the amount of \$200,000,000 of gold which never got into the country. Deluded workmen will angrily demand to see the color of the cash. All the shiftless and unfortunate, all unprosperous merchants and unsuccessful manufacturers, socialists and agitators, labor reformers and abolishers of poverty, will be let loose upon a government that has undertaken to care for them all; and what strength will it have to withstand them?

Concrete protection we can endure. We have worried along with it for thirty years, and can put up with it for another generation if necessary. But abstract, indefinite protection, a principle that is susceptible of fresh and dangerous application every quadrennium; protection that means paternalism in government, class legislation without end, and an abandonment of the law-making power every four years to campaign contributors—this is something which no free people or republican government can tolerate and remain free and republican.

THE MAORIS.

AT SEA, March 1, 1896.

NOTHING in New Zealand, which I am just leaving, has interested me more than the condition of the Maoris, the native inhabitants. Their history and their present status differ from those of most of the aboriginal races who have been, or are in process of being, replaced by whites. New Zealand is slightly less in area than the United Kingdom. It was discovered by Tasman in 1642. Cooke, one hundred and twenty-seven years later, was the first European known to have set foot upon its shores. The number of inhabitants was then estimated at from 100,000 to 150,000—the vast majority upon the northern, or the smaller, of the two islands, the climate of which best suited their constitution. There were evidences that the population was not as large as at a previous period. The decline may have been due to the extinction of the moa, which served for food, or to the increase of tribal warfare. Tradition points to the peopling of the country from some of the northeasterly Pacific groups six hundred years ago. Hochstetter and others are inclined to place the date at a more remote period. Similarity in language to some of the other Polynesians would appear to favor the former theory; divergence of character, due to residence in a more bracing climate, the latter.

The Maoris* form one of the most important families of the brown Polynesian stock, that which is believed to have developed its characteristics to the highest degree. They were skilful hunters and fishers and good agriculturists. Their larger houses and canoes, their weapons, ornaments, and utensils were beautifully finished and elaborately carved or painted. Their instruments were of stone, wood, or shell. With these they felled the giant kauri pine, dug out and fashioned sea-going canoes capable of carrying one hundred warriors, and

scutched and wove their native flax into delicate fabrics. Their forts, or paha, were skilfully constructed on commanding sites. Their beautiful language is comprehensive, delicate, and expressive. The most insignificant insects, the smallest plants, the principal stars, are designated. They had no writings. Their songs and proverbs, their legends and traditions and mythology were transmitted orally from father to son. The year was divided into months and seasons. They believed in a future state, and had an elaborate system of temples, priests, omens, and sacrifices. They held slaves; they practiced cannibalism, believing in the transfer, to a certain extent, of the qualities of the victim to his devourer.

The Maoris welcomed the advent and settlement of Europeans. The usual results followed. Runaway convicts and sailors, rough whalers and traders (too many of them imbued with all the acuteness born of education and civilization and the devilry born of grasping avarice) contributed their utmost to degrade. Devoted missionaries gave themselves to the work of enlightenment; never elsewhere at one period did the results of their labors appear more hopeful. Settlers purchased wide domains in exchange for a few axes, trinkets, and Jew's harps. Spars for the British navy, fibre for the manufacture of sacking and cordage, were bartered for spirituous liquors, arms, and ammunition.

In 1835 the Maori chiefs, with the advice and approval of the British Resident, the principal missionaries and merchants, entered into a confederation, issued a declaration of independence, hoisted a national flag, and instituted an annual assembly. Nothing came of this arrangement. They were capable of adopting white ways to the extent of chartering a British vessel and conquering and enslaving the Moriori inhabitants of the Chatham Islands, 500 miles distant; but the working of a regular constitution and a united assembly was beyond their training and capacity. Increasing complications arose between the natives and the ever-swelling number of white settlers and traders, until, in 1840, the treaty of Waitangi was concluded. The tribes ceded the sovereignty of the islands to the British Crown, which guaranteed to them "the full, exclusive, and undisturbed possession of their lands and estates, forests, fisheries, and other properties, so long as it is their wish and desire to retain the same in their possession"; but the chiefs "yield to her Majesty the exclusive right of preemption over such lands as the proprietors thereof may be disposed to alienate." At this period the Maoris are supposed to have numbered about 100,000.

All might have been well, a new chapter might have been opened in the relations between a white and a colored race, if this treaty had been faithfully adhered to. But it was not to be. In such relations the most scoundrelly whites have it ever in their power to embroil in contests with overwhelming force and drag down to ruin the noblest colored. The treaty was broken by the whites in their lust for acres. "Oh! earth, earth, earth!" wrote Bishop Selwyn from New Zealand, "such has been our cry. The Queen, law, religion have been thrust aside in the one thought for the acquisition of land." The wars which ensued were perhaps the most iniquitous that ever were waged by a civilized country. "If we cannot keep the military engaged here on one excuse, we will on another," said a colonel at the time to a dignitary of the church, who repeated the speech to me. Nearly 10,000 British were at one time in the field. The

*The peculiarities of the race are ably summarized in Wallace and Keane's 'Australasia' (London, 1884).

Maoris fought with desperate courage and showed high military ability. In 1864, at the unsuccessful assault on the Gate Pah, near Tauranga, I am told, a British regiment lost more officers than had any one regiment at Waterloo. The Maoris upon many occasions showed true nobility of character. They were at first astonished that the British troops, ministered to by clergymen who had taught them the Decalogue, should fight on Sunday. Upon the slain body of one of their principal generals, Henare Taratoa, was found an order of the day. It began with a prayer and ended with the text: "If thine enemy hunger, feed him; if he thirst, give him drink." When the Gate Pah was eventually abandoned by its defenders and occupied by the British, it was found that the stores of water had run out, and that the wounded British who had fallen within the works had been supplied by the Maoris at the risk of life by water carried in through the besieging lines.

The Imperial Government at length became sick of the business. It intimated to the colonists that they should make and keep their peace with the Maoris. The home troops were withdrawn and the war died out. But the Maoris had, in the words of Bishop Selwyn, conceived "an utter loss of faith in everything that is English—clergy and all alike." They withdrew within themselves. They fell back on their old beliefs, strangely mingled with the cosmogony of the Old Testament, in the form which became known as "Hauhaism." Miracles, unknown tongues, inspiration from heaven, messages of angels were alleged in support. The bones of many Maoris who had been interred in Christian churchyards were removed to mountain heights clear of white pollution.

The Maoris now number 41,000 in the North Island and 8,000 in other portions of New Zealand. The decadence of the race, while partly due to drink and to diseases arising from vice, is mainly to be attributed to other causes. Freshly introduced diseases, such as phthisis, work out with more deadly effect in fresh soil.* Surcease of tribal wars has led to the abandonment of healthy hill habitations. Inexperience in the use of clothing, neglect of the most common sanitary precautions have worked out evil. The principal cause has doubtless been the change in ways of life and thought—the numbing influence of the impact with civilization. Former ambitions, former incentives to exertion, are gone. All their arts, all their industries were strained towards preparation for war, the difficult support of life. War is at an end. Thanks to the way in which they fought, they still retain 10,000,000 acres (not all of the best land) against the 60,000,000 acres held by 700,000 whites. Rents derived from lands leased to whites, and improved methods of agriculture applied to lands under their own care, enable them easily to supply the wants of nature. But a small proportion have as yet acquired civilized wants or civilized ambitions. I saw them under all conditions—from the lowest (yet no lower than I have seen too many of the white inhabitants of a civilized country ground down by long ages of oppression) to where they went about well dressed, driving good buggies, men and women riding on well-appointed horses and employing approved agricultural machinery. In the main they impressed me as children playing with life, somewhat in the spirit of the

Australian aborigines who used to exclaim: "Plenty big fool white fellow, make road for black fellow to walk on." Yet there is still a pride and reserve such as I have seen in no other native race. At a tourist resort around which they lived in large numbers, I was but twice asked for money, and then only by children in a somewhat shamefaced manner. They charged highly for admission to view natural curiosities within their domains; but all was at tariff rates, and there was no suggestion of *pour-boires*. They offered nothing for sale where much would gladly be bought. The curiosities sold as native in the shops appeared most likely to be of white manufacture.

In remoter districts there is perhaps something of the open, sunny disposition of old times. In such dealings as I had with them I ever felt as if I were being weighed and used, a member of an unreliable race, simply as far as it suited their convenience. European clothing has been adopted and is generally kept clean and in good order. Flowered hats, in the newest fashion, are much in vogue with the girls. The faces of many of the older men are elaborately tattooed. Many of the women, old and young, are likewise marked from lip to chin. Their demeanor in a crowded land court was as dignified as that of a white gathering. There was no more intoxication among the crowd brought to town by interest in the land cases, around the opposite drink-shop, than I should have seen at home. In this court and that drink-shop I seemed to view in startling contrast the opposite poles of the order to which they are now subject. Beyond a few lawyers and clerks in lower grades, none give themselves to business, few to steady employment. I could not hear of a Maori help, servant, gardener, or groom. There is no current Maori literature. They do not purchase books; newspapers only upon rare occasions. Public notices relating to land affairs are, in the North Island, printed in Maori as in English. The portions of the Government Gazette referring to the desired sale or desired partition among individuals of tribal lands are published in the vernacular.

The Government and people of New Zealand (excepting the liquor-dealers) are now well disposed towards them. At hotels, in horse-cars, on railroads, steamboats, and by the roadside I could not distinguish any difference between the treatment of white and Maori. Apart from considerations other than race or color, there is no feeling against intermarriage. In a considerable town, where I spent some days, both postmaster and schoolmaster had Maori wives. In conversation regarding a young man who had lately been promoted to £800 a year in the public service, it came out incidentally that his wife was colored. In the central and western districts of the North Island, Government interferes as little as possible with them. Roads, even, are not made there without their full permission. The Upper House of Legislature of New Zealand numbers forty four and the Lower seventy-four. The Maoris have, under the Constitution, two representatives of their own race in the former and four in the latter. Like their white sisters, Maori women have the franchise. Maoris are also eligible as ordinary representatives. Maoris can elect whether they will vote for the constituted Maori representatives or for the ordinary representatives of the district in which they reside. They hold annually, after the manner of the Indian National Congress, an assembly for the discussion of their affairs and the instruction of their Parliamentary representatives.

Temporary wooden buildings are erected for the accommodation and entertainment of the delegates and the hundreds of interested visitors who come from all parts of Maoriland. The next will meet at Waihi at the end of the present month.

New Zealand maintains an efficient system of State education—in no department more admirable than in relation to colored citizens. There is a native school department, and wherever there is a likelihood of attenders a native school is established and maintained at the cost of the State. The teaching is somewhat more elementary and practical than in the ordinary schools. There are sixty-five such, maintained at a cost of £15,000, besides four high schools for advanced Maori scholars. Maoris may attend white schools, if such are convenient, and, vice-versa, white children the Maori schools. It is the policy of the Education Department, as white settlers increase in or on the borders of a Maori district, to merge the native schools into ordinary State schools. I visited several of the pure Maori; Maori in which there were a few whites; and one lately Maori now converted into a State school. This last was especially interesting—eighty boys and girls, about equally divided as to race, mixed in their seats and classes. Surely the manners and dispositions of the dark-skinned cannot be of a low type, or the parents of the white would never submit to such an admixture. It is considered inexpedient to attempt to enforce compulsory attendance on Maori children as on white.

It would be impossible to judge as to the character and extent of religious feeling among the race. Doctrinal Christianity has never recovered its pristine hold. Hauhaism prevails to a certain extent. Mormonism has made some way. The Maoris are eminently seekers after "some new thing." I asked a clergyman as to the number belonging to different denominations in a certain district. He apportioned so many hundred to one, so many to the other. "But," I said, "I counted only five in church, and five coming from mass." "Oh," he rejoined, "it is doubtless pretty much the same as with whites at present." That is perhaps the case.

It would be rash to dogmatize regarding the future, where Hochstetter, whose book, written in 1863, is the best authority on the geology, fauna, and flora of New Zealand, is likely to have proved so far wrong. He predicted that by A. D. 1900 the Maoris would be reduced to 29,325, and that they would be extinct by A. D. 2000. For the first time a census does not register a diminution in numbers. Educational and other influences are perhaps beginning to tell favorably. One of the enumerators in the last census reports that there is a marked decrease in general drinking habits, and adds that tribal intermarriage the Maoris "now recognize as being a means of staying their hitherto decline." An admirable handbook on hygiene is used in the native schools. It is specially directed to pointing out, in the kindest spirit, the respects in which Maori customs are deficient. In the latest edition I remark several footnotes to the effect—"This was true in 1884," "This is not true now in 1894," etc. Intermarriages will probably increase in number. Looking to the long future, the race is more likely to be absorbed than to maintain its individuality. The degree in which Maori blood may influence the character of the future New Zealander will depend upon the extent to which the population of the islands is increased by immigration or by internal expansion.

D. B.

* All interested in the subject of disease as a factor in the decadence of native races should procure from the Government Printer, Wellington, New Zealand, Parliamentary Paper A.3, 1894, which embodies a treatise on the question by Surgeon Andrews, R. N.

NAPOLEON AND ALEXANDER I.—II.

PARIS, March 11, 1806.

IMMEDIATELY after the famous diplomatic audience of the 15th of August, 1811, when Napoleon made his complaints to Prince Kurakin, Napoleon left for Saint-Cloud and worked without interruption with the Duke of Bassano. He had all the diplomatic correspondence placed before him. Was he, was he not, to make war on Russia? He examined the question as a mathematical problem. Much was to be said on both sides, but all the arguments led him finally to the necessity of a war, and of an offensive war. At the same time the war must be deferred, as many diplomatic negotiations were to be entered into. The date fixed was June, 1812; up to that moment time must be gained.

The military preparations were made as secretly as possible; they extended from Dantzic to Italy. The Emperor, with the minuteness which was one of his characteristics, and which seems so amazing when you read his correspondence, saw to everything; he gave his orders for his German allies, for the army which was to operate on the northern coast, the camps of Holland and of Boulogne, the army of Italy, the Guard; he prepared everything for the most formidable campaign which he had yet undertaken. Prussia had almost ceased to exist as an independent power; the King had become a mere vassal of Napoleon, and was in mortal fear of losing his crown. There was in Berlin, however, an ardent anti-French party. The Chancellor Hardenberg favored an alliance of Prussia with Russia; the King wrote secretly to the Tsar, on the 16th of July, asking him to come to his help if he was in danger; Scharnhorst, who had reorganized the Prussian army, left secretly for St. Petersburg and arranged a plan of campaign with the Emperor. Military preparations were made in Prussia which did not escape the eye of Napoleon. Nothing could be more unpleasant to him, if he had a war with Russia, than a sort of resurrection of the kingdom of Frederick the Great; he had asked Frederick William to allow him to occupy Prussia, and to give him a small auxiliary force, in case he had to enter the Russian territory—a force which he considered more as a hostage than as a help. For a moment, he thought of asking Prussia to disarm, and, if she refused, to suppress her entirely as an independent kingdom. With the army of Davout, the garrisons of the North, the troops of the Duchy of Warsaw, of Saxony, and of Westphalia, he thought himself able to do it. The King of Prussia was in a state of mortal anxiety.

Would the Tsar help him? If not, what was he going to do himself? Scharnhorst was in conference with Alexander, but the Tsar interposed difficulties: he was not willing to take the offensive and to enter Prussia. A military convention was signed on the 17th of October, 1811, in which Alexander promised, if Napoleon invaded Prussia, to advance his own troops towards the Vistula. This did not, however, put an end to the perplexities of Frederick William; how could he alone resist Napoleon? He felt in the end condemned to the French alliance. Davout had already prepared a plan of occupation, it may be said of annihilation, of the Prussian kingdom. Scharnhorst went from St. Petersburg to Vienna, hoping to detach Austria from the French alliance, but he obtained nothing from Metternich. On the 12th of January, 1812, the King accepted all the conditions imposed by Napoleon. An

auxiliary corps of 42,000 men for the Grande Armée, the occupation of the cities of Prussia by the French troops—such were the most important of these conditions.

In February, 1812, all the elements of the Grande Armée were ready, and began to be gradually and silently put in motion. A general concentration took place towards the Russian frontier. Tchernitcheff had spies in the various departments of the War Office, and was aware of all the preparations. Several of these spies were arrested and accused of high treason. One of them was the porter of the Russian embassy. Kurakin, who was ignorant of this porter's relations with the secret agents of Tchernitcheff, made a complaint, but his porter had not been arrested in the embassy itself, and he had no more to say. Towards the middle of April, all the movements ordered by Napoleon had been executed. The winter in Paris had been extremely brilliant and animated; but war with Russia was in everybody's mouth—the negotiations had become a mere veil on both sides. Alexander, having signed a treaty of alliance with Sweden, separated from Speranski, who was the representative of the French alliance. The party hostile to Speranski went so far as to accuse him unjustly of treason. On the 17th of March, Speranski had work as usual with the Emperor Alexander. He remained three hours with him, and, when the door opened, Speranski was seen to come out, his eyes full of tears, making incoherent gestures. The Emperor appeared a moment, and said merely, "Adieu, Prince!" and, a moment after, "Adieu again, Michael Mikhailovitch." The same evening, Speranski was arrested, put in a kибитка, and taken to Nizhni. The court was in a state of exaltation, and it was said in St. Petersburg that the sacrifice of Speranski was "the first victory over the French."

Bernadotte had become very ardent against Napoleon; he denounced him as having the wildest projects. "They write to me," said he to Suchtelen, the Russian Minister, "that he hopes to have done with Russia in a couple of months; then he will go to Constantinople; he speaks of attacking Persia, of establishing himself in Ispahan, and in three years from this time he will march on Delhi and attack the English in India."

On the 5th of May, Napoleon showed himself at the Opera with the Empress; it was his farewell to Paris. On the 9th, early in the morning, he took his departure from Saint-Cloud; hundreds and thousands of carriages left Paris on that day, following the imperial carriages. It was said that the Emperor was making a mere inspection of his armies. The *Moniteur* announced that "the Emperor has left Paris in order to inspect the Grande Armée on the Vistula. Her Majesty the Empress will accompany his Majesty as far as Dresden, where she hopes to have the happiness of seeing her august family." Napoleon went by way of Châlons, Metz, Mainz, Wurtzburg, Bamberg, travelling like an Asiatic potentate, and finding everywhere his vassals. Thousands of peasants kept the roads in perfect repair where he passed; and, in the night, great fires were kindled near the roads. In Dresden, the Emperor took possession of the Residenz; he lived in the magnificent rooms which had once been inhabited and embellished by Augustus II., the Elector King. The princes of the Confederation of the Rhine arrived one after another—the princes of Weimar, of Coburg, of Mecklenburg, the Grand Duke of Wurtzburg, the primate of the Confederation; then came Queen Catherine of Westphalia,

Prince Eugène, the Emperor and Empress of Austria, Count Metternich, Prince Hatzfeld. For several days, Napoleon kept a Court of Sovereigns, but in the intervals of the great dinners and theatrical representations he worked with the Duke of Bassano and the Prince of Neuchâtel, the chief of staff. In the evening, at the theatre, Napoleon could look, as he had been said already to have looked, at Erfurt, on a "parterre de rois." He was in the great box, placed in the middle, between the two Empresses; the kings, princes and princesses, ladies and gentlemen, were placed according to the rules of the protocol. One night, after a representation of an opera of Paër's, there was a sort of apotheosis: the centrepiece was a revolving sun, with the inscription "Moins grand et moins beau que lui." The Emperor of Austria bowed mildly to Napoleon, who said, shrugging his shoulders, "Il faut que ces gens-là me croient bien bête." The King of Prussia arrived last, more like a victim than like a guest. It seemed as if all the sovereigns tacitly recognized a supreme authority; and, during these Dresden days, Napoleon appears as the Emperor of Europe.

On the morning of May 29, Napoleon took leave of the Empress, of the kings and princes, and started for the north. Marie Louise left for Prague, where she was allowed to stay some time with her parents. Napoleon went to Posen, without stopping an instant. He reached the Vistula at Thorn, where he found his army in its quarters on all sides. Thorn was the centre of a chain of armies which was no less than two hundred leagues in length. Half a million of men were waiting for his orders. He made a rapid visit to Davout at Dantzic, and also to Murat. Seven corps d'armée advanced in order towards the Niemen. On the night of June 23, Napoleon in person made a reconnoissance on the river with Berthier, each dressed in a Polish uniform, with a lancer's shapska. He was a very good topographer, and chose a place near Kovno for the passage of the river; all the details of the passage were prepared by him. The troops were arriving on all sides: the Emperor placed them. He had a fall from his horse, on one of his excursions, but did not hurt himself. Caulaincourt, who was on the staff, heard Berthier, galloping by him, say: "This fall is of bad omen; we ought not to cross the Niemen." On the other side of the river, no troops, no sentries, were seen. Napoleon expected some resistance, and was almost disappointed in not finding any. He asked Caulaincourt: "Have the Russian peasants any energy? Are they of the same stuff as the Spaniards? Do you think the Russians will abandon Wilna to me without fighting a battle?" He was very anxious to have a battle; he hoped that the Russian nobles would make a revolution and overthrow Alexander. The river was crossed in admirable order, the troops marching as on parade; a whole night and a whole day were necessary for this operation. Napoleon witnessed it; the soldiers had built for him a sort of throne made of branches and of turf. He crossed the river early, and became almost intoxicated with the splendid military spectacle under his eyes; he was very gay, even jovial; he hummed between his teeth the air of "Malbrough s'en va-t-en guerre."

On the very day when Napoleon crossed the Niemen, Rostoptchin, who had been appointed Governor of Moscow, wrote to the Tsar: "Your Empire has two powerful defences, its extent and its climate; the Emperor of Russia will be formidable at Moscow, terrible at Kazan, invincible at Tobolsk." Alexander left

Wilna on the 17th of June; there was much division of opinion among his councillors and military advisers, but it was finally resolved that the principal Russian army, under Barclay de Tolly, should retire from Wilna to Drissa, and that Bagration, with a second army, should remain on the flank of the French army. When it became known how superior the Grande Armée was in numbers, Bagration also was ordered to retreat. Alexander made a last effort. Balakhoff, his aide-de-camp as well as his Minister of Police, was sent to Napoleon with a final offer of negotiation and of peace. Alexander gave him a letter for Napoleon, but instructed him to say to the Emperor that negotiations could be opened only if the French recrossed the Niemen. "So long as a single soldier remained in arms on Russian soil, he would himself neither pronounce nor hear a word about peace." Balakhoff took a few Cossacks and a trumpeter with him, and arrived at the French line. He was conducted to the headquarters of the Prince of Eckmühl, whom he found occupied with the routine of his work, and who did not conceal from him the fact that he considered his mission the means of gaining a little time. Napoleon exulted when he heard of Balakhoff's arrival. He said to Berthier: "My brother Alexander would already like to come to terms; he is afraid. My manoeuvres have thrown consternation among those Russians; in two months they will be at my feet." Meanwhile, he was in no hurry to give an audience to Balakhoff, and asked Davout to keep him, as he wished to see him only after having entered Wilna. He hoped to fight a battle before Wilna, but was allowed to enter it without meeting with any resistance. The Russians had burned the bridges and their stores.

It was only a few days afterwards that Napoleon sent for Balakhoff, on the 30th of June. Their conversation took place after Napoleon's breakfast, while he was taking his coffee. Napoleon as usual was eloquent, varied; he went over all the incidents which had preceded the war; he complained of Alexander's advisers; he put a hundred questions; he was sometimes angry, sometimes most amiable. He asked Balakhoff to dinner in the evening, with Berthier, Duroc, Bessières, and Caulaincourt. After dinner, after some very improper questions about Alexander's sojourn in Warsaw and his visits to a certain Madam S—, with his usual studied versatility he suddenly asked: "Which is the road to Moscow?" Balakhoff reflected a moment, and said: "Sire, this question is meant to embarrass me. The Russians say, as the French do, that all roads lead to Rome. You can take which one you like to go to Moscow; Charles XII. took the Poltava road." The answer is so clever that we ask if it was really made; it is at any rate in Balakhoff's official report on his mission.

Notes.

COPELAND & DAY, Boston, will publish directly 'Lyrics of Earth,' by Archibald Lampman; 'Undertones,' by Madison Cawein; 'The Road to Castaly,' by Alice Brown; 'In Soul and Sense,' by Hannah Parker Kimball; 'In the Village of Viger,' by Duncan Campbell Scott; and 'The Captured Cunarder,' by William H. Rideing.

'The House: An Episode in the Lives of Reuben Baker, Astronomer, and his Wife Alice,' by the late Eugene Field; 'Cinderella, and Other Stories,' by Richard Harding Davis;

Robert Louis Stevenson's 'Poems and Ballads,' now first collected in one volume; and a series of volumes of "Stories by English Authors," arranged according to the countries which are the scene of the action, are among the promised publications of Charles Scribner's Sons.

G. P. Putnam's Sons, resuming an old conjunction with the house of John Murray, London, in this particular, will bring out a new edition of George Borrow's 'The Bible in Spain' and 'Lavengro,' the first in two volumes. They announce also, for speedy publication, the 'Hastings Chess Tournament,' the seventh of the ten volumes of Ford's 'Writings of Jefferson,' and the fourth of Roosevelt's 'Winning of the West.'

Early spring announcements of Edward Arnold embrace 'In the Far Northwest: A Record of a Canoe Journey of 4,000 miles from Fort Wrangel to the Pelly Lakes, and down the Yukon to the Behring Sea,' by Warburton Pike, with illustrations; 'The Exploration of the Caucasus,' by Douglas W. Freshfield, in two volumes, with panoramic and many other photographic illustrations; and 'The Art of Reading and Speaking,' by Canon James Fleming.

Macmillan & Co. have nearly ready an 'Atlas of Nerve Cells,' edited by M. Allen Starr, M.D.

'The Wind's Will,' a college story, by Rey Tillotson; 'The Romance of Guardamonte,' by Arline E. Davis; 'A Pretty Bandit,' by Frank Bailey Millard; and 'Out of a Silver Flute,' by Philip Verrill Mighels, are in the press of J. Selwin Tait & Sons.

Charles H. Kerr & Co., Chicago, will publish 'A History of the American Tariff, from Washington to Cleveland,' by Eugene C. Lewis.

But six months have elapsed since we favorably reviewed Statham's 'Architecture for General Readers' (Scribners), and we now have in hand a second edition, revised. This compact treatise is attractively printed and bound, and freely illustrated, has its index and its list of plates and cuts, but, strange to say, has no table of contents, though the text is unbroken except by paragraphs in either of the two parts into which the work is divided. Dependence for a general view is solely upon the headlines.

Lovers of Dartmoor will welcome the new edition of Rowe's 'Perambulation of Dartmoor,' which has been issued by the enterprise of an Exeter bookseller, Mr. James Commin, and published in this country by Messrs. Putnam. Samuel Rowe, Vicar of Crediton, was an excellent specimen of the antiquary of the last generation—learned in an old-fashioned way, leisurely and gossip, and with a weakness for Druids; and both the original edition of this his work of love, published in 1848, and the reprint of 1886, had become difficult to procure. It has now been revised and enlarged, by Mr. J. Brooking Rowe; there are additional chapters on the geology and botany of the moor by competent writers; there are two-dozen charming engravings of Dartmoor scenery from drawings of Mr. F. J. Widgey; and the needs of the pedestrian are amply met by four large-scale maps. Altogether it is a solid and handsome book, in whose five hundred pages tourists, topographers, and antiquaries may all browse with pleasure; and it reflects much credit on the "local" publisher and the "local" printer.

The centenary of Burns is now "on," and his admirers will find much satisfaction in the uncommonly pretty two-volume edition of the Poems just brought out in London by Clement

Wilson, and in Philadelphia by J. B. Lippincott Co. Mr. James A. Manson proves a judicious editor, refraining from overloading the notes, which are relegated to the rear of volume II, along with the glossary and index to first lines, and furnishing a sufficient introductory sketch. There is no embellishment besides the typography, which is elegant and not trying to the eyes, though condensed.

We have already noticed the appearance of the first volume of the Muirheads' translation of Helbig's Guide to the 'Public Collections of Classical Antiquities in Rome' (Leipzig: Baedeker). The publication of the second (1896) completes a most useful book. Intended to guide the student of archaeology or the cultivated layman through the Roman museums, it takes up the different works of art in the order in which they naturally meet the eye, gives a description of each, and refers the reader to larger books in which may be found either pictorial illustration or fuller verbal treatment. To each description is prefixed a paragraph naming the provenance (when possible) of each piece of sculpture, and indicating the restorations which it has suffered. All the public museums are included except the Falcian in the Villa di Papa Giulio. The accounts of the sculptures in the Square of the Capitol and of the collections in the Museum delle Terme are absolutely new. The volumes are of the regulation "Baedeker" size, are provided with an excellent index, and will be indispensable alike to the student and to the intelligent traveller.

The growing interest in "sociology" which is just now felt in France is illustrated by the fact that M. Ch. Baye has recently taken the trouble to translate into French the 'Grundriss' of the Graz Professor, Ludwig Gumplowicz (which appeared so long ago as 1885), under the title 'Précis de Sociologie' (Paris: Chailley). The American reader who shall make the acquaintance of Prof. Gumplowicz's work for the first time in this garb will find in it some very vigorous and suggestive criticism of previous writers, especially of Comte and Spencer, and an interesting account of one but little known save by professed psychologists, viz., Bastian. In the constructive part, he will find much confident theorizing with little definite evidence, and a principle put forward as fundamental—that civilization always began in conquest—which looks very much as if it had been suggested by the peculiar history of the Austro-Hungarian monarchy. It is a small matter, but one would like to know what the circumstances are in Prof. Gumplowicz's part of the world which have produced a scorn, so fine and so much in evidence, for any opinion that seems to be tainted by "Biblical" or theological influences.

'La Force du Mal,' by Paul Adam (Paris: Colin & Cie.), is a work in which the influence of Zola is visible. It is not open to the reproach of obscenity, as so much of the work of Zola himself, but it contains passages written in the veriest naturalistic vein, for which many readers will feel instant and instinctive repulsion. The descriptions of choleraic cases are no doubt faithful, but are also loathsome, however closely connected with the story. But the book is strong and presents strong characters—those of the young doctor, who sacrifices the certainty of wealth and a brilliant career to principle and truth, and of the girl who becomes his wife and who is of the same metal. The clear recognition of duty and the brave acceptance of poverty and calumny are the points which the author appears to emphasize, and are those which raise

his work above the level of the average "naturalistic" novel.

"Jean Rolland" is the masculine pseudonym of Margaret Belin, a writer who would greatly improve her work by a diminution in the length of her analyses, which are neither subtle enough nor profound enough to warrant their excessive development. This improvement is not found in her last book, 'Sous les Galons' (Paris: Colin), and the more the pity, for she has a simple and attaching subject which, when she gets fairly into it, she makes distinctly interesting. In this volume she has certainly kept the good wine for the last, and totally neglected Boileau's wise precept: "Le sujet n'est jamais assez tôt expliqué."

If any reader is inclined to look with suspicion on Roger Dombre's 'Tante Rabat-jole' (Paris: Colin), because it is marked "for young girls," let him not think he will waste time in reading it. The story is of a charming young girl and is delightfully told, with the verve of Gyp, to whom the book is dedicated, and the wit of De la Brète. It takes and keeps the attention, and "young girls" whose parents may buy it are not likely to get at its lively pages until the parents have read every one of them.

The sixth volume of Jules Lemaitre's 'Les Contemporains' (Paris: Lecène, Oudin & Cie.) is composed mainly of a long and appreciative article on Lamartine, whom the critic puts on a very high pedestal indeed. His reasons for so doing are set out at length and will not be accepted as sufficient by every reader. The other important article is on "L'Influence récente des littératures du Nord," an influence never cordially admired by Lemaitre, and which he believes to have spent its force and to be on the point of disappearing altogether, thanks to a possibly near-at-hand reaction of the Latin spirit.

The thin index to Conrad's 'Handwörterbuch der Staatswissenschaften' is now followed by a "first supplementary volume" (Jena: Gustav Fischer) as thick as the last of the original six. Although the supplement contains articles upon several new subjects, it does little towards bringing the performance of the book as a whole into harmony with the promise of its title. The new subjects are, for the most part, such as might well have been embraced even within the restricted plan of the original volumes. One new article, indeed, is broadly entitled "The State," but the writing of it was intrusted to Adolf Wagner, and he, of course, treated the subject exclusively "in its economic aspects." Thus the whole field of political philosophy, like the fields of international and of public law, is still excluded, and the misnamed 'Dictionary of the Political Sciences' remains in fact a dictionary of political economy, theoretical and practical. The justification of a supplementary volume must be sought, therefore, not in the new rubrics which it introduces, but rather in the fresh material with which it elucidates subjects already treated in the body of the book. The publication of the 'Handwörterbuch' began in 1890. Since that date the principal countries of the world have taken censuses, whose results (except our own) are now available. Diligent use of these results, and of other recent statistical reports, is exhibited in not a few articles, notably in those on population, trades and occupations, corporations, strikes, and trade unions. The articles on such diverse subjects as factory laws, canals, industrial arbitration, paper money, the social democracy, and the German state pensions give excellent summaries of recent legislation. Particularly

worthy of mention are the account of the recent reform of the Austrian currency, by Prof. Zuckerkandl of Prague, and the description of the Italian banks, by Prof. Ferraris of Padua.

Albert Bielschowsky's 'Goethe, sein Leben und Werke' (Munich: Beck) is to be completed in two volumes, of which the first, containing 520 pages, has just been issued. The author presents the results of his careful researches in a compendious and remarkably readable form, and enters sufficiently into the minor details, which may often seem trivial, but which really invest the lives of great men with human interest. Especially charming are his account of the poet's sojourn in Italy, and the critical analyses of "Iphigenie" and "Tasso" as the literary fruits of Goethe's immediate contact with classical art and antiquity. The second volume will appear in the autumn.

As an evidence of the general diffusion of elementary education in Bavaria, we note that of the 29,759 men enrolled for military service in that country during the years 1894 and 1895, only ten were unable to read and write. In Prussia 514 recruits out of 157,854 were found to be deficient in this respect.

Interesting from an ethical point of view are the recently published statistics of India, which show one convicted criminal out of every 274 Europeans, one to 509 Asiatics, one to 709 native Christians, one to 1,361 Brahmans, and one to 3,737 Buddhists.

There lies before us a little book, 'The Maxims of Chanakya,' translated into English by K. Raghunathji, author of 'The Dancing Girls of Bombay,' 'The Beggars and Criers of Bombay,' &c., &c., &c. (Bombay: Printed at the Family Printing Press). Chanakya was Prime Minister of the famous King Sandrokottos, about 300 B. C., founder of the greatest dynasty of Ancient India, and well known to the Greeks, whom he called Yavanas (*Ἰάβανα* or *Ἰάβες*, i. e., the Ionians). Listen now to Raghunath's version of a maxim: "The wise have declared that the Yavan (the Greek or Muhammadan) is equal in baseness to a thousand outcastes; and hence the Muhammadan [why not at least "Greek or Muhammadan"?] is the basest of men." Here is *fin de siècle* hatred for Islam projected back, by jingo, to a time some eight centuries anterior to the Hejira! And what could surpass this precious blunder, unless perhaps the delightful confusion of the venerable Bengalee Baboo who mixed up Moses and his Ten Commandments with the Laws of the Twelve Tables! Was it intended that the products of the "Family Printing Press" should not get outside of this Hindu Jingo's "Family"?

Mr. Edward Field, one of the Record Commissioners of the City of Providence, has sent out a small edition (250 copies) of the 'Tax Lists of Providence during the Andros Period, 1686-89,' together with a list of persons liable to a poll tax in 1688. He has added some schedules of taxable property of the same date, making a most acceptable contribution to the history of a colony which has been very unfortunate in respect to its archives.

The quarterly bulletin of the Boston Public Library contains a list of recent additions arranged according to subjects with author and subject indexes, and a chronological list of Spanish and Portuguese fiction. Its publication ceases with this number, and its place will be taken by monthly lists of new books, which may also contain special bibliographies and topical reference lists, though these may appear separately.

The House of Commons has finally settled the vexed question of the Sunday opening of

national collections, by voting "that it is desirable that the national museums and art galleries in London should be open for a limited number of hours [on Sundays] after 2 P. M., upon condition that no officer shall be required to attend more than six days in the week, and that any one who may have conscientious objections shall be exempt from Sunday duty." A substitute Sabbatarian motion, rejecting Sunday opening and offering the sop of three weekly evening openings, was lost by a vote of 178 to 93. In the course of the debate, Sir John Lubbock, trustee of the British Museum, stated that its trustees were in favor of opening the collections to Sunday visitors. The mover of the resolution reported a petition from 109 London trades-unions, and referred to the favorable report of a committee of four bishops and a dean, who ventured the opinion that Sunday opening "would not be a desecration." It is worthy of remark that this revolution in the use of the British Museum, the National Gallery, and the great collections at South Kensington should be conceded by a Parliament unique in this generation for the size of its Tory majority.

The University of Pennsylvania has decided to establish upon the "George Leib Harrison Foundation, for the Encouragement of Liberal Studies and the Advancement of Knowledge," twenty-seven new scholarships and fellowships, of the aggregate annual value of \$13,200. Of these, eight, of the value of \$100 a year and free tuition, are open only to graduates of the University. Fourteen fellowships, of the value of \$600 a year, less \$100 devoted to publication or equipment, are open to the graduates of any institution, may be held for two years, and are intended for candidates for the degree of Ph.D. Five Senior Fellowships, of the value of \$800 a year, may be held for three years, and are open only to those who have taken the degree of Ph.D. at the University. Further particulars may be had by addressing Mr. Jesse Y. Burk, Secretary of the University, Philadelphia.

Particulars concerning three fellowships for 1896-97 in the American School of Classical Studies in Rome, and a necessary blank form of application, may be had by addressing Prof. Samuel Ball Platner, Temporary Secretary of the Managing Committee, at Western Reserve University, Cleveland, Ohio. These scholarships, of \$600, \$600, and \$500 (Christian Archaeology) respectively, are open to bachelors of arts of universities and colleges in the United States and other American students of similar attainments. Residence for the full school year of ten months will be mainly in Rome, with possibility of travel and study in Italy and Greece.

—We are kindly permitted by Prof. Breasted of Chicago University to make the following extracts from a private letter from Mr. W. M. Flinders Petrie, dated Luxor, February 14, 1896, and summing up this explorer's winter work in Egypt:

"The Ramesseum is of Ramses II.—the only thing left unchanged. The chapel of Uazmes was rebuilt by Amenhotep III., as his ring was under the door-sill. The temple next south is of Tahutmes IV.—yet unnamed in maps. Next is a big tomb of Khonsu arduus, goldsmith of the temple of Amen, XXV. dyn. Then comes the levelled plain with a scarp of rock-gravel on the W. and N., marked ——— on maps; and on the plain—but later than its levelling—was a temple of Queen Tausert, as sole ruler, 'Tausert, setep en Mut, Sat Ra, mery Amen,' who has left us in foundation-deposits 500 scarabs and plaques of colored glass with cartouches, and 1,300 glazed objects, besides three slabs with the names. Then south of that is the so-called temple of Amenhotep

III., which is really the funeral temple of Merenptah. That beast smashed up all the statues and sculptures of Amenhotep II. to put into his foundations, and wrecked the gorgeous temple behind the colossi for building material. We have a few fine pieces of Amenhotep III.; and the upper half of a fine black granite statue of Merenptah. I am now going to clear two small temples north of the Ramesseum; so you see we are getting through the field of temples here at a pretty good rate. Quibell is doing the Ramesseum, and I am doing the others. We make complete plans of all the buildings and foundations. This sort of clearing up is what 'exploration' should be, and not merely the elaborate clearing out of one building. The whole lot of half-a-dozen templesites we shall clear up, and fix historically, for about \$2,500 or \$3,000. . . . I bought a piece of a stele dedicated by the 'Royal son,' Ahmose, called Sapa'r., explaining his name. He is figured as a boy. Bent anta was probably mother of Merenptah, as her name occurs in his temple ruins, but no other relatives."

—Mr. E. K. Chambers has done good service to letters in the 'Poems of Donne,' which he has contributed to "The Muses Library" (London: Lawrence & Bullen; New York: Scribners). He has carefully revised the text on the basis of the old printed copies, very properly rejecting most of the manuscript readings introduced by Dr. Grosart into his exasperating edition; he has made an attempt (valiant, but not uniformly successful) to regulate the punctuation, and he has added a body of notes. These notes, though they contain a good deal of bibliographical information, and are particularly rich in details about the persons to whom Donne's poems are addressed, are very weak on the exegetical side. Few authors need notes more than Donne, and Mr. Chambers has passed by many difficult places in silence. *Per contra*, he has taken pains to explain a number of words which must be familiar to everybody who is likely to read Donne at all, and which, besides, are perfectly accessible in all the dictionaries. Nor are his explanations always free from vagueness. "Mithridate," for instance, is defined as "an antidote, so called from Mithridates VI., King of Pontus, who took elaborate precautions against poison." The volumes are so pretty, however, and contain so much that is good, that one is disinclined to pick flaws. Mr. Saintsbury contributes an introduction written in his usual jolting style.

—The preface to the Rev. William Cunningham's 'Modern Civilisation in some of its Economic Aspects' (London: Methuen) describes the book as "an elementary treatise on political economy." It is, we believe, Dr. Cunningham's first comprehensive book on the subject, and, so far as his economic notions appear in this brief "sketch of the mechanism by which business affairs are carried on," they seem to differ less, at bottom, from the notions of other English economists than both be and they have at times assumed. Dr. Cunningham's method of presentation, however, is fresh and attractive. For example, his third part, corresponding to the traditional book on Distribution in the traditional treatise, is entitled not "Wages, Interest, and Rent," but "Hiring, Investing and Letting." In other words, Dr. Cunningham, as becomes an historical economist, describes processes instead of criticising concepts—his economics are realistic. But economic realism, as he understands it, leads by no means to economic materialism. On the contrary, it demands the adequate recognition, in addition to self-interest, of other real forces, such as family feeling, public spirit, and religious influence, each contributing its share to that industrial self-

discipline which alone can assure the fruits of material progress. In his discussion of the relative efficiency of self-discipline and of legal discipline, Dr. Cunningham enters a well timed protest against the current tendency to speak of philanthropic legislation as socialistic whenever it distributes among the poor the taxes collected from the well-to-do, and to advocate reforms of all sorts under the name of "practical socialism." So far from being socialism of any sort whatever, all state action which aims, as wise philanthropic legislation does, to awaken and to strengthen the sense of responsibility, is distinctly individualistic. Such legislation avoids the greatest weakness of socialism, the failure to furnish an incentive to persistent exertion.

—Every amateur who chances to light upon a report of a trial by the Spanish Inquisition is so impressed by its skillful blending of cruelty and injustice that he hastens to communicate it to the world as though it were a new discovery. Thus in the *Revue Bleue* of February 8 we find a long account of a couple of cases against the dead in the tribunal of Ciudad-Real, in 1484, involving the confiscation of a large number of estates of wealthy New-Christians. They suffice to prove the thesis of the writer in contradicting the assertion of a certain school of historians that the Spanish Inquisition was a milder institution than its predecessor, but in themselves (and herein lies their only interest) they are merely commonplace examples of the daily routine of the Holy Office performing its function of stripping the descendants of their property and turning it into the royal coffers. In admitting the Inquisition into their dominions, Ferdinand and Isabella had shrewdly reserved the confiscations for the royal treasury, instead of allowing them, as in Italy, to inure to the benefit of the Church; so that greed and fanaticism joined hands in purifying the lands of the so-called heresy of the Judaizing Christians, forcibly converted since the days of San Vicente Ferrer. The process was neither better nor worse than that which had been followed since the thirteenth century, but the results were more profitable, for the victims were more numerous and more opulent. Possibly, moreover, their persecution may seem to us more odious, for it is easier to sympathize with steadfast adherence to the ancient faith—older in the Peninsula than Christianity itself—than with the devotion of the Albigenses to the upstart dualistic Manichæism whose principles were fundamentally irreconcilable with the Christian faith.

—A writer in the Milan *Corriere della Sera* of February 29 inquires what may be the cause of the rapidity of the decadence of the Italian Parliament, amid the general decline of all parliamentary bodies. He would trace this decadence beyond 1876, which many consider the date of its beginning, to the occupation of Rome as the capital of united Italy, and the temporary adoption of the Ludovisi palace constructed by Bernini in 1650, and furnished in the time of Innocent XII. with a huge semicircular court-yard, whose conversion into a hall produced the present Chamber of Deputies of Montecitorio. This makeshift contrivance was for the seating of 508 Deputies, or for 450 in actual attendance in the most exciting times, as this writer believes. He compares the dimensions of the hall with public spaces and with the projected substitute for the present French Chamber, to accommodate 900 Deputies, and finds Montecito-

rio twice as capacious as the latter for half the seats. He moralizes very judiciously on the physical effects of such vastness on debate—the premium it sets on mere lung power and gesticulation, the exaggeration it perforce imposes on the simplest statements or rhetorical devices. "The smile," he says, quoting a French writer, "which a pleasantry might have provoked in a parlor, becomes a sonorous peal of laughter in an assembly; an objection to an opponent made with diffidence in a small committee is transformed into a violent apostrophe in the midst of five hundred persons." The first remedy he suggests for Italy's case is of course a smaller hall, in which speaking and hearing will be easy and calm persuasion possible. But he also puts his finger on the evil of over representation, so well illustrated by the number not only of our own Congressmen but of our State legislators—a crowd in which mediocrity and corruption flourish, business drags, and historical and legal consistency is all but lost sight of.

—It is gratifying to notice the prosperity of the Asiatic Society of Japan, and it will be good news to those who do not already know it that the invaluable Transactions, now numbering twenty-three volumes, in fifty-eight numbers, can be bought for prices averaging \$1.50 a number in silver yen, which in American money is really but half price. Vol. xxiii. contains two excellent papers, by W. G. Aston in English and by Maurice Courant in French, on the Ōnmun, or phonetic alphabet of Korea. Both writers practically agree that the "clerk-method" of writing Korean in abbreviated Chinese ideograms was invented in the seventh century, but that the true Ōnmun, a phonetic alphabet of twenty-eight letters, is the work of a Korean statesman of the fifteenth century. Dr. D. C. Greene has an illuminating paper of fifty-one pages on the Tenrikyō, or the Teaching of the Heavenly Reason. This influential Japanese Shintō sect was founded by a woman named Miki, within the present century. The article is well worth reading in connection with Mr. Percival Lowell's 'Occult Japan.' Mr. Clay MacCauley writes felicitously of the Japanese landscape, but his discourse on "Silver in Japan" is not considered orthodox enough to go in as a body article, and hence is printed in small type in the appendix. As a rule, the Supplements to the Transactions are of even more value to special scholars than the varied contributions in the Transactions proper, and that to vol. xxiii. is no exception. Prof. Basil Hall Chamberlain, the indefatigable traveller, not content with his Aino studies, has, after hearing the Luchuan (Loochooan) language in its own home, as well as discussing it with educated natives in Tokio, written "An Essay in Aid of the Grammar and Dictionary of the Luchuan Language." It is more than probable that this study of a master will bear fruit in further researches into the Japanese language itself, besides throwing valuable light on Shintō and the archaeology of ancient Japan, especially in the southwest. The first sample of Luchuan speech given to the outer world was by Captain Basil Hall, the grandfather of this present distinguished Anglo-Japanese scholar.

FOSTER'S COMMENTARIES.

Commentaries on the Constitution of the United States, Historical and Juridical. By Roger Foster. Vol. I. Preamble to Impeachment. Boston: The Boston Book Co. 1895.

MORE than sixty years have passed since the

appearance of Story's 'Commentaries on the Constitution of the United States.' Changes of the utmost importance in our constitutional and political history have taken place during these years. The development of the slavery controversy, culminating in secession and civil war; the partisan bitterness of Reconstruction; the experiments with tariffs and finance; the expansion of interstate commerce, and the admission of new States, have profoundly affected judicial interpretation of the Constitution, while the researches of numerous students in the field of American history have made available a mass of material relating to the origin and early growth of our political institutions which was virtually unknown even a generation ago. It is a high tribute to the value of Story's work that his 'Commentaries' is still the classical and indispensable treatise on the law of the Constitution, and that thus far the works of later writers have supplemented without superseding it. Nevertheless, there has long been need of a treatise which, by its broad and thorough survey of the whole field of judicial decision and historical research, should do for American constitutional law in 1896 what Story's treatise did for it in 1833. Mr. Foster's 'Commentaries,' of which the first of three volumes has lately appeared, is quite the most ambitious of recent attempts to deal with the subject in a large way.

There are certain qualities which are indispensable to a writer who would successfully expound a national constitution. He must have abundant knowledge joined to power of clear and accurate statement. He ought not to parade his learning, but will need skill in grouping his material effectively; and to do this he must have an intelligent sense of proportion. He must be free from partisanship and had better refrain from prophecy. To crown all, he must have a certain charm of manner, a gift for easy and dignified expression, without which his work, however valuable for reference, is likely to be uninteresting, and may be dull. How far Mr. Foster has met these requirements can be judged more fairly when the remaining volumes of his 'Commentaries' shall have appeared. He unquestionably has considerable learning; he has labored industriously and accumulated a great store of facts. But he does not always wear his learning easily, as is shown, for example, by the unnecessary and wearisome length to which the quotations and abstracts from 'Elliot's Debates' are prolonged. Similarly, the appendix to chapter i., a fourteen-page account of *Lilburne* and the 'Agreement of the People,' is interesting, but its appropriateness may be questioned.

One does not expect a legal treatise to be easy reading; but Mr. Foster does not lessen the natural difficulty by writing in a style which is almost uniformly dry and hard, and not seldom inelegant and inaccurate as well. On page 11 we read that "even the power to regulate trade upon waters wholly within the United States was vested nowhere, unless in a bay or river entirely within a single State"; on page 324, that "the natural imitation of the practice in the mother country had made the colonial legislatures elected directly by the people." The readmission of Georgia after the civil war was delayed by "a hitch in the proceedings" (p. 255). Chapter xii. has for its title "The Presidency and Other Officers of the Senate." Occasionally the meaning is obscure, as when, among Constitutional guarantees of State rights, there is mentioned (p. 276) "the right to have representation in the House of Representatives otherwise apportioned in

accordance with population, unless a State for any reason except crime denies the right of suffrage to any of its male inhabitants who are twenty-one years of age, and citizens of the United States, except for crime." We are told on page 301 that the blending of legislative and executive powers has "spread into all countries where civil liberty is enjoyed, except a few like Germany, . . . and perhaps two or three countries in Central and South America besides the United States, where the presidential form of government prevails." The most extraordinary example of loose writing that we have noted is the following sentence on page 180: "By the Missouri compromise in 1820, it had been provided that slavery should not be allowed in the territory acquired from France, north of the parallel 36° 30', which, when extended to the Pacific, included all but a small fraction of what are now the States of Texas, New Mexico and Arizona, the Indian Territory, Oklahoma, and a large part of Southern California."

The arrangement of Mr. Foster's work leads him to make brief mention in the present volume of a number of topics whose fuller treatment is deferred; it will be better, therefore, to withhold judgment in regard to some general subjects until the later volumes shall have appeared. The most noticeable portions of the present volume are those devoted to discussions of the doctrine of nullification, the legality of secession, the constitutional history of the Confederate States, Reconstruction, direct taxes, and impeachment. Mr. Foster has no difficulty in demolishing the theory of nullification; but the force of his argument against the legality of secession is likely to be weakened a little, in the minds of some readers, by the attempted justification of Southern feeling on the subject (pp. 110-115). The section on the constitutional history of the Southern Confederacy, while by no means exhaustive, is a welcome addition to our rather scanty knowledge on that point. The discussion of impeachment, which fills nearly a third of the entire volume, is painstaking and thorough; in particular, the history of impeachments in the different States is here presented at length, collected, we believe, for the first time. We note two errors in this connection. On page 605 it is stated that "in Massachusetts, judges may be removed by the Governor and Council or the address of both houses of the Legislature." The passage should, of course, read "on the address," etc. In commenting (p. 637) on the absence of impeachments in Maine, it is said that "the annual election of the Governor and other State officers has made it easier to punish their misconduct by action at the polls." Maine no longer has annual elections, biennial elections having been substituted by the constitutional amendment adopted in 1879.

The dealings of Congress and the Federal Government with the Southern States during the period of Reconstruction are subjected to a searching examination. At Mr. Foster's hands the story becomes a gloomy tale of vacillation, intimidation, and fraud; but he tells it with plainness and directness, and with more than his usual force. In his opinion, "the validity of the acts of Congress" is "open to investigation," and, "in view of the language of the Constitution, the decisions of the courts on cognate questions, and the action of Congress in other respects towards the States which were the seat of the insurrection, it seems impossible to find any justification for them in law, precedent, or consistency. . . . The Reconstruction acts must consequently be condemned as unconstitutional, founded on

force, not law, and so tyrannical as to imperil the liberty of the entire nation should they be recognized as binding precedents" (pp. 265-267). Even less praiseworthy is Mr. Foster's treatment of the income-tax law of 1894 and the action of the courts in reference thereto. He admits that, "now that the dust has not yet gathered upon the papers, it seems impossible for a commentator to discuss the question without bias" (pp. 422, 423); yet he yields much to prejudice, and plays the part of advocate rather than expositor, when he says (p. 421) that "the representatives of the new States in the West against whose action Gouverneur Morris had warned the other members of the Convention, combined with those of the South to oppress the States upon the North Atlantic coast"; as also, though in somewhat less degree, when he mentions (p. 423), as one "salutary effect" of the final decision, that "it has defeated an odious scheme of class-legislation. If upheld, it will be a safeguard to property from any spoliation under the guise of Federal taxation, give encouragement to a new doctrine of State rights that may be of other assistance in the future, and afford a check to waste of the national treasury. Upon the other hand it has raised an obstacle against the further reduction of an oppressive tariff. It has shorn the United States of a power that might be essential to their preservation in case of war. And it has given a blow to settled principles of constitutional construction which makes no decision of the past seem any longer secure." We hardly know whether or not the attempt (p. 422) to frame a definition of direct taxes to be taken seriously: "In consequence of this decision the only definition of direct taxes that can be formulated with any assurance is as follows: Direct taxes are taxes on land, poll-taxes, and, as long as a majority of the Supreme Court are of the same mind, taxes on rents and general taxes upon personal property and incomes which are not confined to a special class, although with large classes of exemptions."

It remains to notice a few points on which we think there is likely to be dissent from Mr. Foster's statements. It is rather extreme to say (p. 631), in reference to impeachment, that "were the power absent, we should have no check to executive or judicial tyranny. The necessity for its existence and for caution in its exercise is one of the strongest arguments in favor of the perpetuation of the Senate." In opposition to Mr. Bryce, the author contends (p. 496, note 23) that respect for the Senate of the United States has not declined as much as has respect for the House and for State Legislatures; but thoughtful men will not be comforted by learning that he "attributes the decadence of all to the fact that of late years the country has been so fortunate as to have few political questions of sufficient gravity to withdraw the ablest minds from business enterprises and legal controversies." The statement on page 338, that "a large number of the States allow aliens to vote . . . as soon as they have declared their intention to become citizens, although they have not been naturalized," while strictly true, might better have taken account of the practice of those States which require a previous term of residence before extending the suffrage to aliens. Mr. Foster finds an illustration of the evils that result from restriction of the suffrage to a class "in the liquor and Sunday laws, with which the inhabitants of the country districts still oppress the poorer classes in New York city" (p. 345; we suspect

surprised, therefore, to find him arguing (p. 350) virtually in favor of some kind of suffrage for foreigners. A slip of rather more serious character occurs on page 163, where the text states that "it was the contention of the North that the clause in the Constitution which gave Congress power to make all needful rules and regulations respecting the Territories or other property belonging to the United States, included absolute power to regulate their domestic institutions." As Mr. Foster must know, the Constitution speaks of "Territory," not of "Territories"; and not a little of the slavery discussion in Congress from 1850 onward turned on the meaning of the word "Territory" in this particular section. Had the Constitution said "Territories," it is possible that the after history of the United States might have been somewhat different from what it was.

The list of errata is large. Among obvious misprints, we note the omission of part of a word in a title at p. 181, note 66; "Darrell" instead of Harrell, author of 'The Brooks and Baxter War' (p. 258, notes 167 and 168); a life of Clay, by Shurz (p. 357, note 6); *Cohen v. Virginia* (p. 370, note 6); Pollock v. Farmer's Loan and Trust Co. (p. 370, note 8, p. 276, notes 41 and 42, p. 419, note 19); *United States v. Rees* (p. 334, note 15); Elliot's *Debate's* (p. 359, note 12), also Elliott's (p. 599, note 40, p. 600, note 48); *Mills v. Green, reversed* (p. 329, note 27), instead of *reversed*; and on page 357 the repetition at the end of the paragraph of a sentence which occurs a few lines above. The reference to Hildreth's History at page 17, note 15, should be to vol. iii., p. 46; and McPherson's 'History of Reconstruction' (not of the Rebellion) is doubtless the work intended to be cited at page 328, note 16. Tyler's 'Letters and Times of the Tylers' is quoted as 'Life and Times' (p. 172, note 27); Furber's 'Precedents relating to Privileges of the Senate' is changed (p. 496, note 23) to 'Precedents of Privileges in the Senate'; and the title of Montesquieu's work appears (p. 512, note 25) as 'De l'Esprit des Loix.' The name of the Kansas State printer (p. 708, note 103) should be Baker, not Bowker. Throughout the volume the use of "ibid." is as often a hindrance as a help to the reader; in at least one case (p. 339, note 25) it is impossible to tell what authority is referred to.

Mr. Foster's work is dedicated to Chief Justice Fuller. We doubt if the Chief Justice will appreciate the compliment any more highly for having his name dragged into the text, as is the case on page 2. We are bound to think, also, that the references to the Supreme Court (p. 278), to the practice of law in New York (p. 559), and to the value of a well-known New York daily paper (p. 205, note 97), are inappropriate in a book of this character, and had better have been omitted.

THE SUDAN AFTER GORDON.

Fire and Sword in the Sudan: A Personal Narrative of Fighting and Serving the Derwishes. 1879-1895. By Rudolf C. Slatin Pasha, C.B. Translated by Major F. R. Wingate. Illustrated. Edward Arnold. 1896. Pp. xix, 636. 8vo.

THIS is the story of an extraordinary career which in romantic incident can hardly be excelled even in fiction. Slatin's adventures began early, for while still a boy in his teens he made an extensive and dangerous journey in the eastern Sudan. At the close of the Bosnian campaign of 1878, in which he served as a lieutenant in the Austrian army, he returned

to Africa at the invitation of Gen. Gordon, and was made Governor of western Darfur, and shortly after, at the age of twenty-five, Governor-General of the whole province. This post he held for nearly three years, during which he fought twenty-seven battles, and then he became the slave of an Arab who but the day before had been one of the meanest of his subjects. Eleven years he served this master, now in favor and running barefooted at his bridle-rein or sitting at his palace gate, now loaded with chains in prison, and subjected to every indignity and hardship. Then, a year ago, came the perilous flight across the desert, and to-day he is in Egypt, a pasha only forty years old, and destined perhaps again to be the ruler of these lost provinces. According to the latest accounts, he has joined the expedition for the reconquest of the Sudan.

He tells this strange story in a simple, modest way and with an apparent truthfulness which does not fail even when self-interest would prompt him to conceal the truth. His constant deception of his master and his pretended devotion to the Moslem religion are as faithfully pictured as are the Khalifa's treachery and rapacious cruelty. The value of the book, however, does not lie alone in the personal narrative, but in the fact that it is a history, as well, of the Egyptian Sudan west of the Nile from the rise of the Mahdi to the present time. Considering the multitude of details of individuals, tribes, and places, it is a remarkable account to have been written from memory, for during his captivity the author was unable to make any notes or keep any diaries.

The half-savage inhabitants of Darfur were already ripe for revolt, through the misrule and oppression of their Egyptian rulers, when Slatin became Governor of the province. All his energies, therefore, were devoted to attempts to systematize and purify the government, to remove and punish corrupt officials, and to put down incipient rebellions. The Austrian missionary, Father Ohrwalder, in his 'Ten Years' Captivity,' has described in the following passage the manner of man Slatin was and the life he led at this time:

"His powers of endurance were wonderful, and he would often be twenty four hours in the saddle, constantly fighting and with nothing to eat or drink. He slept on the bare floor or ground beside his native soldiers, and lived on dhurra soaked in water. He was just, never took bribes, generous, ever ready to assist the poor and needy, and never refused admittance to old and young who sought his help."

His devotion to his task was so entire that, on learning that he had lost the confidence of his soldiers because he was a Christian, he promptly turned Mohammedan. Had he been but a few years earlier, there can be little doubt that his rule would have been brilliantly successful, but the struggle against the Mahdi's fanatical hordes was hopeless from the outset. Tribe after tribe joined the rebels. His principal officers deserted him, and, at length, the annihilation of the Hicks Pasha expedition having destroyed the last hope of rescue, and, his ammunition being exhausted, in December, 1883, he surrendered.

The story of his captivity is a monotonous and gloomy record of suffering and misrule unrelieved by a single ray of light. The Mahdi, to whom he took an oath of allegiance, gave him to the Khalifa Abdullahi, in whose service he remained till his escape. During the siege of Khartum he was for a time the medium of communication with the garrison, but he saw nothing of the active operations. At early dawn on January 26, 1885, he was

"startled by the deafening discharge of thousands of rifles and guns; this lasted for a few minutes, then only occasional rifle-shots were heard, and now all was quiet again." Knowing that an assault had been planned for that night, he waited in intense anxiety for news. At length he saw three blacks coming towards him, one of whom

"carried in his hands a bloody cloth in which something was wrapped up, and behind him followed a crowd of people weeping. The slaves had now approached my tent, and stood before me with insulting gestures; Shatta undid the cloth and showed me the head of Gen. Gordon! The blood rushed to my head and my heart seemed to stop beating; but, with a tremendous effort of self-control, I gazed silently at this ghastly spectacle. His blue eyes were half-opened; the mouth was perfectly natural; the hair of his head and his short whiskers were almost quite white. 'Is not this the head of your uncle the unbeliever?' said Shatta, holding the head up before me. 'What of it?' said I quietly. 'A brave soldier who fell at his post; happy is he to have fallen; his sufferings are over.'"

Slatin reports the Mahdi as expressing regret at Gordon's death, as he had intended to convert him and then exchange him for Arabi Pasha, in the hope that "the latter would have been of assistance to him in helping him to conquer Egypt."

A striking account is given of the circumstances connected with the death of the Mahdi, which took place soon after the fall of Khartum, and the accession of the Khalifa. This man, like many Orientals who have been suddenly raised from an obscure position to great power, has shown considerable capacity as a ruler. He is not hampered, however, by obligations which bind other men. He is above all law, even of that of the Koran, as all of his actions are held to be directly inspired of God. No regard for life or considerations of justice move him. His rivals and enemies have been destroyed, and he has surrounded himself with people whose interests are identical with his own. The Arab tribe to which he belongs has been brought from Darfur to the Nile, and has either driven out or enslaved the riverine inhabitants. His rule is one of pure terrorism and his acts are those of an ignorant savage. The whole Nile fleet, for instance, consisting of some 900 vessels, small and great, was declared one day to be the property of the Government, and thousands were deprived of their means of subsistence. The coinage has become so debased that "the present dollar is merely a heavy copper coin covered over with a thin layer of silver," but the merchants are compelled to accept it as good money, under penalty, if they refuse, of the "confiscation of their property, accompanied by flogging and imprisonment." Commerce, naturally, has dwindled to comparatively nothing, and the slave-trade, especially in women, alone thrives. This, together with war, famine, and disease, is fast depopulating the country. The statement is made that 75 per cent. of the whole population of the Sudan has perished since the advent of the Mahdi, "while of the remainder the majority are little better than slaves." Nor is there any hope that this desolating rule will come to an end except through the reconquest of the Sudan by Egypt. This will not be an easy task, for the religious fervor aroused by the Mahdi has not wholly subsided, and the Khalifa strives to keep it alive by every means in his power. Five times a day the faithful are called to prayers, and, in imitation of the Mahdi, he frequently harangues them from the pulpit of the mosque, though he has but little of the eloquence or intelligence which characterized his master. At all these services, Sla-

tin and all suspected men were compelled to be present and to kneel in the front rank of worshippers, an easy and sure way of keeping watch over them. There are now in Omdurman, the dervish capital, about 100 Christians, men and women, Greeks, Syrians, Copts, an Italian Sister, and a German.

In no part of his book does Slatin show to better advantage than in the story of his escape. It is told with great simplicity and without the slightest straining for effect, but the scenes and incidents of the flight are brought very vividly to the imagination. The long night rides; the hiding by day in the rocks exposed to the pitiless sun; the harassing delays while awaiting guides; the four-days' march bare-footed and leading the camel of his disabled guide, all are described with peculiar force. He escaped on the night of February 20, 1895, and reached Assuan on March 16. On his arrival in Cairo, the Khedive conferred upon him the title of pasha, and appointed him, with the rank of colonel, to the Intelligence Department.

Major Wingate has translated Slatin's narrative into excellent idiomatic English, the conversations being especially well done. There are some interesting and striking illustrations, a plan of Khartum and Omdurman, and a map showing the present extent of the Mahdist influence. The work is so bulky, however, as to discourage the ordinary reader, and many of the details in regard to obscure tribes are uninteresting. An abridged edition, which should contain only the personal narrative, is therefore very desirable.

A Wandering Scholar in the Levant. By David G. Hogarth, M.A., Fellow of Magdalen College, sometime Craven Fellow in the University of Oxford, F.S.A. With illustrations. Charles Scribner's Sons. 1896.

"To be at once a Scholar and a Wanderer is to indulge the least congruous desires," so Mr. Hogarth tells us in his opening sentence; and a little later he writes: "If the Scholar wanders into inland Asia, he is fain to play the explorer first and the scholar second." We hear, most briefly, of the discovery of the skeleton of a dead city, the ancient Cilician pirate city Olba, of Roman camps and roads and milestones and boundary lines and ruins, of the finding of coins and seals and Hittite monuments, but no details are given; the interest lies in the discovery. Most characteristic of Turkish methods is the story of the discovery of a Hittite monument at the town of Bor in Asia Minor. Ramsay discovered it in 1882, but the owner would not sell. Finally, in 1890, she offered it to Mr. Hogarth for 500 liras, and he, being pressed for time and unable to bargain at great length, offered five for it, and finally on the second day secured it for twenty.

"We could not hope to carry off so well-known a treasure, under the very eyes of the local governor, unless prepared to pay as much in *bachshish* as in purchase. . . . Making, therefore, an ostentatious virtue of necessity, we conveyed it ten miles to Nigdeh, and lodged it there in trust for his Majesty the Sultan. . . . Strolling that night in the dark over the crowded roof of the *khan*, I heard that certain Franks had tried to escape with a stone worth 10,000 liras, but had been arrested by the police and forced to disgorged. The officials themselves deprecated such wasteful generosity; and a Government Secretary approached us next day with a kind suggestion that, if our difficulty related to the conveyance of the stone to the coast, he could arrange that we should be robbed of it outside the town, and for a slight consideration recover it at the port."

Mr. Hogarth's story may be supplemented by the statement, from the Sultan's end, so to speak, that his unusual conduct in purchasing an antique monument from its owner and presenting it to the Ottoman Government instead of smuggling it out of the country rendered him *persona gratissima* at Constantinople. At the same time it strained the powers of the Ottoman Government to obtain possession of the stone, so firmly did the provincial governor hold on to it in the belief that it was of fabulous value, and the hope that he might himself have a share in the money which he supposed some one in Constantinople or on the coast was receiving for it. There is a sequel equally characteristic. It turned out that another fragment of the same monument existed in the hands of another owner. The latter offered it to Mr. Hogarth on condition that he would himself carry it away and not give it to the Government, and when he refused, destroyed it rather than let the Government know of its existence, for fear of imprisonment and blackmail. Many valuable monuments of antiquity are destroyed in the same manner, because of the corrupt and oppressive way in which the law of antiquities is administered, at least in the provinces.

But the most interesting part of this little book is the description of land and people through the almost unknown parts of central Anatolia and along the upper Euphrates. Mr. Hogarth describes the Turk of this region as a "slow-moving, slow-thinking rustic, who limits his speech to three tenses out of the sixty-four in his language, and his interests to the price of barley. Aliens, Greek, Armenian, Circassian, thrust him on one side and take his little parcel of land by fraud or force—there is no real distinction in Anatolia. . . . In energy and intelligence he takes rank a grade below his dog, who shares his profound and not altogether causeless suspicion of strangers, but attacks more vivaciously and is reconciled more frankly." He adds, however: "One is bound to like him, if only for his courage, his simplicity, and his blind fidelity and his loyalty." The condition of the women among these Anatolian Turkish peasants is, according to his account, pitiable in the extreme; they are "mere chattels of the man, condemned to the hardest field-work and to walk while their lords ride." His ethnological observations on the origin of these Turks of Anatolia are worthy of remark. "Three parts," he says, "of the 'Turks' of Anatolia never came from Turkestan, but are children of aborigines, Carians, Galatians, Phrygians, what you will." The Turks of some regions he finds identical in type with the Armenians by and with whom they live, evidence of forced conversions in the older time such as are horrifying the world to-day. He identifies the true Turk by his inclination to wander, which displays itself, among the denizens of towns and cities, by "the practice of migrating to a *yaila* in summer." This, he says, "is the most infallible sign that a village of 'Turks' is not a village of converted aborigines."

In the old Seljukian regions, the Seljuks having been less fanatical than the Ottomans, Mr. Hogarth found more and more ancient Christian settlements. One curious Greek community he visited on an island in the Lake of Egerdir. There is "a remnant of fifty Christian families with two priests. Service is held only on the great festivals, and then in Turkish, because neither priest nor people understand any other language." "The priests told us that the families became fewer every year; the fathers could teach their children

nothing about their ancestral faith, for they knew nothing themselves; the Moslems were 'eating them up.' We had to force the church door, and brush dust and mould from a vellum service-book dated 1492." Both Turks and Christians are dying out in Anatolia, according to Mr. Hogarth. The country is fertile and rich in natural resources, and the climate is salubrious, but the Government is execrable, and constantly growing worse. The hope of the future is colonization from Europe. Not that Mr. Hogarth is hostile to the Turk, however. He is decidedly friendly to him, in the usual manner of the English Tory, and deprecates Exeter Hall agitation against Turkish atrocities. Mr. Hogarth travelled up the Euphrates on his last trip in 1894, shortly before the massacre of Sassun, passing on the way the unsubdued Kurdish strongholds of the Dersim. He did not observe a reign of terror among the Armenians at that time, although there was "repression." What is ordinarily called the "Armenian question" is to him the "Kurdish question."

The last two chapters of this little book of 206 pages are devoted to Egypt and Cyprus. The whole book from beginning to end is readable, entertaining, and instructive. There are a fair map and a baker's dozen of illustrations, mostly half-tones from photographs. The volume is dedicated to Prof. Ramsay, under whose training, one would judge, Mr. Hogarth became "a wandering scholar in the Levant."

The Life of Thomas Hutchinson, Royal Governor of the Province of Massachusetts Bay. By James K. Hosmer. Boston: Houghton, Mifflin & Co. 1896. 8vo, pp. 453.

In this volume Prof. Hosmer has performed a public service, inasmuch as he has turned away from recording the triumphs of a political "boss" like Samuel Adams, to do justice to a greater but unsuccessful public servant. Whoever reads the history of Massachusetts knows that the intelligence, the learning, the public and private virtues, were not monopolized by the side which won in the Revolution. In fact, as may happen in any such contest, the losing side contained by far the greater proportion of conscientious men who risked everything for a principle without a prospect of gain by victory. The loyalists of Massachusetts were not a faction overthrown for its own misdeeds, a dethroned oligarchy, but they were the quiet, substantial, conservative men, who were conscious of small restraints imposed by England on the colony and of great benefits received from her protection. Luckily, the Refugees were not men of action, and probably not one of the melancholy passengers in the fleet which left Boston for Halifax had a drop of blood upon his conscience. Hence, the Tories have been despised or pitied, but mainly forgotten, by the present generation. Of this party, Gov. Thomas Hutchinson was not only the leader but the most perfect example, and it was a wise, kindly, and patriotic task which Prof. Hosmer has brought to a satisfactory end.

As we have on various occasions discussed the life and character of Hutchinson, we shall attempt no summary at this time. The reader of this book will find a thorough narrative, written with the skill of a practised historian, master of his subject, pleased with his theme, and sympathetic in his treatment. It is not a eulogy, but a tribute paid to an honorable antagonist. As a type of the best class of New Englander at that period, Hutchinson challenges a sincere if languid admiration. As a

citizen, a public servant, even as a crown official, he is worthy of respect, and we must regret that his native country could not retain his services. If we may venture on the comparison, fortunately not carried to so painful an ending, Hutchinson stood at a crisis where the Ball-Everett party stood in 1860, or where many, less known, at the South, stood. The very virtues of one year may seem vices the next, when the rush of events carries us far from the old landmarks into the unknown currents of the future.

Mr. Hooper has given, on p. 306, an admirable résumé, from which we quote. After saying that Hutchinson hoped and argued for a compromise of the views of the Government and the colonists, he adds:

"These things being gained, the glorious empire of England might remain undivided, mother and daughter remaining in peace together, an affectionate headship dwelling in the one, a filial and loving concession of precedence in the other. To attain such a consummation seemed to the Governor a thing worth suffering and striving for. To bring this about, as shown by all his acts and all his words, he contended year after year, sacrificing to his aim his reputation, his fortune—at last, hardest of all, his citizenship—dying in exile, of a broken heart."

Certainly every one who wishes to obtain a true view of the beginnings of our nation will read this biography, and will learn from it that an honest devotion to principle is an honorable legacy to posterity. It by no means follows that we belittle the principles or the actions of our favorite heroes if we allow that what they did was revolutionary, and that the word implies the creation of a new standard of right and wrong. No admirer of Hutchinson will deny that the world was the gainer by his defeat, nor that our patriots discovered and utilized a new force. Looking back, we see that the revolutions of Cromwell, of William the Third, even the bloody French Revolution, were immense steps in the progress of mankind. But we cannot blind ourselves to their attendant cruelties, nor refrain from a sigh over the Cavaliers, the Jacobites, and the old noblesse. Our Tories are the corresponding examples in American history, and are at least as deserving of a little sympathy. It is to our national credit that not only was the separation effected with a minimum of personal injury, but that the conquerors are at last willing to concede the undeniable merits of their opponents.

Vacation Rambles. By Thomas Hughes, Q.C. ("Vacuus Viator"), Author of 'Tom Brown's School Days.' Macmillan & Co. 1895.

THESE letters cover a period of more than thirty years' duration. They are bright, cheery, full of animal spirits. The writer is observant, easily pleased, and can communicate to us the pleasures he himself enjoys. But time leaves nothing long the same, and its tooth is very sharp on letters of former generations unless they chance to deal with circumstances and events of special interest or to be written in a fascinating manner. There remains chiefly an element of interest in the comparison of things past and present, and in noting to what extent the writer's prophecies and anticipations have been justified by events.

The first series of letters take us to Constantinople and Athens by way of the Tyrol and the Danube and back to England by another route. Mr. Hughes's impressions in Constantinople were extremely favorable to the Turks, but even Freeman would have allowed all he claims for the Turk's personal morals, and still

have maintained that his official character is "unspeakable." That, too, has its variations, and Mr. Hughes's Sultan and Vizier are now turned to dust. Some of the pictures of the French coast in this section are most agreeable and entertaining. The next section following is made up of home letters written from America in 1870, all the others having been written to the *Spectator*. These home letters are more free and easy than the others, and they have the attraction which always inheres in books and letters that enable us to see ourselves as other see us. Mr. Hughes was as much impressed as Matthew Arnold with the kindness showered upon him, and describes himself as "a spoilt child," and very naturally, because in 1870 the recollection of his services to America in the civil war was still fresh. These letters are extremely personal, and the substitution of initials and dashes for the full names of people is the thinnest possible disguise. A good many readers will be much pleased with the fine things said about them, and few will be grieved by the injurious comments. Col. Higginson's share in this feast is mixed of fat and lean, whatever the exact meaning Mr. Hughes intended to convey: "He was very fascinating to my mind and the most refined man in manners and look I have yet met, but I should say decidedly a cracked fellow in the good sense." There is about the usual number of misspellings of American proper names that we find in English books. Field for Fields, Hoare for Hoar, and even "Jef Davies" for "Jeff Davis" in the John Brown song. Nauson Island, where Mr. Hughes enjoyed with uncommon zest his hospitable reception and the company assembled, is disguised as "Naahont." His comparative impressions of Philadelphia were as flattering as Arnold's. He is less critical than Arnold of our eating and drinking, and does not express the English preference for tepid over cold water on the table, if any such is his.

A very different kind of interest from that attaching to this series of letters belongs to the series "America—1890 to 1897." These are concerned mainly with the Rugby settlement in Tennessee, and are very graphic in their accounts of life and scenery in the Cumberland Mountains. Mr. Hughes's story of a placard over the piano at a favorite resort of Texas cowboys is a variant of a more piquant form—the scene, a Western church; the placard, "Don't shoot the organist," etc. Still another series is exceedingly diversified, with the emphasis on the coast towns of England and France. One of the longest letters here deals with Lourdes, describing the place pretty carefully, and treating the miracle-working of the spring described by Zola as "a soup of microbes" with as much sympathy as any Roman Catholic could desire. Nothing is more becoming to Mr. Hughes in this volume than his way of leaving off. He reserves for his last chapter his address in Boston, October 11, 1870, "John to Jonathan," as clear a statement of the relations of England to our civil war as we have ever seen. It is quite as good reading now as then. In another letter Mr. Hughes says of England: "I believe that on the whole there is not, nor ever was, a nation that kept a more active conscience, or tried more honestly to do the right thing according to its lights." This is particularly interesting at the present time as the opinion of as good a friend as America has ever had on English soil, who did more for us in the day of our distress than some of our inverted Anglo-maniacs could ever do if they should do their best—and whose death has just been announced.

Iranisches Namenbuch. Von Ferdinand Justi. Gedruckt mit Unterstützung der Königlichen Akademie der Wissenschaften. Marburg: N. G. Elwert'sche Verlagsbuchhandlung. 1895.

IN this book of 526 quarto pages, arranged in double columns, Prof. Justi has treated 4,490 Iranian proper names borne by 9,450 persons. Considering that each name and person is placed by references (sometimes by several), an idea may be formed of the amount of labor which the book has cost. The interesting Introduction discusses the origin of names, and also classifies them. Prof. Justi finds that they are derived for the most part from literature, being original only in a subordinate sense. As to the earliest of Iranian proper names, they lingered as the echoes of the 'Zend Avesta' long after their meaning as words had disappeared; but, after the Conquest, Arabian names ran both the Zoroastrian and the Persian ones hard. So, later New-Persian names, many of them, were the result of the great epic poem of the 'Shah Nameh.' The same thing has happened elsewhere in mediæval and even modern times. Since 1566 and 1614, Romish saints have supplanted older heroes in Germany, and in Italy the Knights of the Round Table found many namesakes. So in England, under Cromwell (Justi recalls Barebones with his compound "Christian" name), the Old Testament poured out its quaint titles, and within this last half-century Tennyson has been largely responsible for the readdoption of beautiful Old English words, while Wagner's operas have given us Elsas and the like.

We may mention, in passing, one curious device which is reported at least in poetry; it could, however, hardly be so extended as to be called a custom, says Firdusi. Prince Feridun (Avestic Thraetaona) kept his young children nameless. First he waited till their characters had developed, and then he thought they might be safer unchristened. An unnamed princeling avoids "insult" and "tattle." No one could "call" after a child without a name, and no one could malign it. The same principle is partly apparent in "throne-names," which often displaced originals. We know more, for instance, of Ochus and Codomannus than we do of either Darius the First or Darius the Second. The same practice had appeared in Egypt and Assyria.

To collect historical and mythical names from Iranian lore was imperative upon some one, but few are aware that in the proper names of human beings we have often preserved to us our only trace of words that have otherwise vanished, as of gods which are little remembered. As to the latter, we know only of an original polytheism among the ancestors of Israel from their first (?) name for God, which is the plural Elohim; and who would remember how lately the moon was worshipped if it were not for Monday, or that Tiv exists in Tuesday, Woden in Wednesday, etc.? As to lost words, or word-roots, we have, in Arian-bigna, "The Glory of the Aryans," and in Baga-bigna, "The Glory of God," the sole signs of the root *bhaigtv* in Iranian. *Sabiktas*, "Blessed with Glory," and *Dibiktas* (?) show the participle of the past. In *Frata-karâ*, "The Maker of Fire," the oldest name of the Kings of Persia, we have again a past participle, this time of an Iranian *fra*; so in *Frata-gune*, "Color of Fire," and *Frataphernes*, "Fire's Glory." In *Codomannus* we have an Iranian *mannus*—man, etc. Another feature in the character of names is the clear evidence which they afford as to national traits actually present or once existing in forgotten ancestors.

Take even the "horse-names" of Iran, they point beyond a question to the well-accredited opinion that Persia, whose cavalry was the terror of the Romans, was the cradle of horse-culture. Even a king could bear the personal or family name of Vishtasp, "Horse-owner." Pourushaspa (Zarathushtra's father) meant "Many Horses"; Aurvadaspa was "Fleet Horses" (cp. also early English Hengist and Horsa). So Ushtra shows camel-breeding; Frashaothra meant "Quick Camels"; Zarathushtra, "Sorel Camels." Again, of arms: Bezaryashti was "High Lances"; Frayadratha, "Swift Chariot"; Skarayadratha, "Leaping Chariots"; Zairivairi, "Yellow Armor" (polished bronze), Bastavairi, "Woven Mail," and Yukhtavairi, "Jointed Armor"; Azad-feroz, "Born for Victory" (or Prince of Victory); Harpates, "the All-shielder," and Satrabates, "Shield of Empire."

Coming to religious and moral conceptions, we have only to follow the list of the Amesha-spendas of the Gāthās to trace an interesting development. The name of God himself was used quite simply as a proper name. Ormizd is Ahura Mazda spoken as one; and in the inscriptions of Persepolis and Murghāb we see the actual process of this change; Aura and Mazda occur once (and once only), each separately inflected; everywhere else the names form one word inflected at the end. Ormizd is shown by Justi to have been used as a name by persons known in history no less than forty-seven times; it survives even in modern use. Is not this singularly exceptional if not unique? We have plenty of names with "God" in them, but here is "God" without relief. It was and is used in profoundest reverence. In compounds we have it, as in Ohrmazd-dat, "God's Creature," and Ormizdukht, "God-daughter," etc., more in the common line. Then Bahman is Vohu-manah, the "Good Mind," God's first or second attribute; Justi gives us twenty-two instances of the word in history as a proper name. In compounds we have Bahman-dukht, "The Good Mind's Daughter," and Bahmanyar, "The Good Mind's Friend," etc.

The next and not less prominent divine attribute is the Holy Order of the Law. This appears in Astvad-ereta, "The Embodied Righteousness," Ukhshyad-ereta, "Increasing Righteousness," Artavardiya, "Strong through Righteousness," Khshathra, "the kingly power," which was the third attribute, appears in Khshayārsha, which is Xerxes, "The Right Ruling," but more literally in Arta-Khshathra, which is Artaxerxes, "King of Righteousness." (Ardashir is the same word in a later form.) Spenta Aramaiti, "Holy Zeal," the fourth Amesha-spenda, occurs in Ispandarmad, while Ameretatāt, Immortality, the fifth, comes out in Vardanoys, "Increasing the Deathless," and Sahakanus, "Immortal Friend." A final optimism is familiar in the Avestic Haurvatāt (Sanskrit Sarvatātī), which is "Universal Weal"; it becomes Khurdād in the proper name. Azad-bakht, "Born for Fortune" (or "Prince of Fortune"), and Shiguffteh-bakht, "Wonderful Fortune," are hopeful in the selfsame key. In the matter of specific religious expression, ritual, the sacramental fire is a striking feature, and the name Anoshadar, "Unquenched Fire," may show at once the interesting belief that the altar-flame brought down from Heaven to Zoroaster has never failed. This belief still lingers; and Obaramazd-ature, "Fire of Ahura," shows that the element was sacrosanct indeed; while Artasher Atashe, "Holy Fire King," shows "Church and State" (the King as a priest). Buland-Akhtar, "Lofty Star," and Farkhun-

deh-akhtar, "Luck-Bringing Star," attest astrology. Mihradar, "Fire of Mithra," recalls the post-gāthīc sun-god.

Following upon this extensive collection of proper names come tables of descent (pp. 390-479), the most important mythical dynasties being treated as well as the historical. The iconography of the book is indexed in two pages, containing 296 names of kings, satraps, pretenders, officials, warriors, magicians, persons indefinable, and women, whose portraits appear on stones or in statues. In pages 484-520 we have a valuable analysis of etymologies, and pages 521-526 treat of the affixes. Immense labor has been saved in this work to all who wish to have their citations sound and serious. Several languages have been examined in the course of the formidable undertaking, and the result does honor to the Academy of Sciences, whose liberal subvention has placed the book within our reach.

The Right Hon. Joseph Chamberlain. By S. H. Jeyes. [Public Men of To-day.] Frederick Warne & Co.

MR. JEYES'S volume is a brief account of the public career of Mr. Chamberlain seen by a friendly eye. His hero, a man sixty years of age, has already played many parts, and played them all skilfully. A Radical, a Socialist, a Liberal, a Home-Ruler, a Dissident Liberal, a Liberal Unionist, and finally a Conservative, he has boxed the compass of opinion, and yet has maintained a steadily growing prestige, so that his hold on power seems with time to be increasing. As man of business, administrator, orator, and diplomat he has been equally successful. He has won his success, too, at times in the teeth of violent opposition. He has been dreaded as a "Red," denounced as a traitor, laughed at as a would-be courtier; but, through all, his weight and influence in public affairs have steadily grown, until he is to day one of the half-dozen foremost men in England. Mr. Jeyes's volume gives a brief and readable account of his career; but evidently the time has not yet come for a full explanation of it. Possibly there is no mystery; perhaps Mr. Chamberlain is nothing more nor less than appears on the surface—a versatile man of business, with the knack of foreseeing the drift of public opinion that marks the great opportunist.

His biographer thinks that the one dominating object of his life is "his desire to improve the daily lot of the poor, and to use legislation for the purpose of helping and protecting those who cannot help or protect themselves"; but the only proof of this is that he began life as a radical with all sorts of schemes for remedying the ills of life, which have been gradually more and more relegated to the background. When people talk about Socialism in England, they continually overlook the fact that many things elsewhere looked upon as natural functions of government, and in this country taken as a matter of course, were not long since in England regarded as doubtful novelties. Mr. Chamberlain, who is never slow to take advantage of any opening afforded him by his opponents, recognizes the opportunity for confusion in a word capable of such various definitions, and boldly declares that he is a Socialist because "the poor-law is Socialism; the education act is Socialism; the greater part of municipal work is Socialism; and every kindly act of legislation by which the community has sought to discharge its responsibilities and its obligations to the poor, is Socialism." This is quite a mistake. We support criminals in prison,

but no one calls it Socialism. Most cities in the United States have a municipal water supply, but nobody ever regarded the Croton water-works as having socialistic tendencies. Public schools are based on the necessity of diffusing knowledge among those who are to be citizens. Socialism means something very different from advancing a confessedly public object by taxation. It implies some attack on those customs and institutions on which our civilization rests—liberty, property, contract, and marriage. Does Mr. Chamberlain wish to subvert any of these? His question, "What ransom will property pay for the security it enjoys?" was distinctly socialistic; ransom paid by property for security is nothing more nor less than blackmail, to which there is no other limit than the pleasure of the person who fixes the sum demanded. If Mr. Chamberlain's opinions of to day were those which he seemed to represent in putting this question, he would be one of the most dangerous public men alive. But are they the same? This volume seems to make it highly improbable that they are.

The Growth of the Brain: A Study of the Nervous System in Relation to Education. By Henry Herbert Donaldson, Professor of Neurology in the University of Chicago. [The Contemporary Science Series.] Charles Scribner's Sons. 1895. 8vo, pp. 374.

WITHIN very moderate compass is here presented much important and interesting information from many sources as to the structure, development, and functions of the brain. There are seventy-seven illustrations, original or from standard works. The most notable feature of the volume is the number of tables embodying statistics respecting the weight, number, and condition of the brain and its visible or microscopic constituents at various ages and under different circumstances. The following topics are discussed with more or less fullness: the growth of the nervous system compared with that of the body; the interpretation of brain weight in terms of cell structure; the early limitation of the number of nerve cells; the peculiar relation in this system between increase in size and in organization; the large though variable number of cells which have but slight importance in the final structure; the dominance of nutritive conditions; the wide diffusion of nerve impulses; the incompleteness of repose; the reflex nature of all responses; the native character of mental powers; and the comparative insignificance of formal education.

These are serious matters, and Dr. Donaldson's systematic and thoughtful consideration of them is worthy of attention even when some of his views may not commend themselves to us. The following are a few of the passages worthy to be quoted:

"The aim at the moment, then, is to determine what limitations anatomy places to the educational powers, and thus to obtain a rational basis from which to attack many of the pedagogical problems" (p. 342).

"On neurological grounds, therefore, nurture is to be considered of much less importance than nature, and in that sense the capacities that we most admire in persons worthy of remark are certainly inborn rather than made" (p. 344).

"The demonstration here of the loss of energy in learning what needs only to be unlearned is very striking, and if one experience produces such an effect, it is not difficult to understand how habits early formed and long cultivated become so difficult of eradication" (p. 347).

"Knowledge comes, for the hindrances to knowledge are in a large measure from without; but wisdom, as heretofore, continues to linger,

and still to occupy its place as the rare performance of a balanced brain" (p. 365).

Professor Donaldson hopes that his work may be useful to parents, teachers, and physicians, and that, "as a result of their demands, there may be supplied an account far more extensive and luminous than his own." At present it is to be feared that any failure upon the part of many educated people to profit by the information he offers, must be ascribed less to any want of desirable clearness and completeness in this work than to the non-existence of an adequate basis of facts, names, and ideas in their own minds. If Prof. W. W. Goodwin was even approximately correct in declaring in these columns that "whatever study is to be pursued with effect must have its foundations laid before the age of fifteen," then it is not enough that (as in at least one large American university) all undergraduates outside the technical courses supplement the instruction upon the brain by actual dissection of the organ; work of this sort, even more thorough, must constitute an absolute prerequisite for admission to college.

Dr. Donaldson uses few technical terms, and the proportion of mononyms is notably large. On the other hand, since *brain* is a component of the title and distinctly preferred in the index, it is not easy to account for the frequency of the ponderous *encephalon*, especially in the plural. Why, also, the indiscriminate employment of *fissure* and *sulcus*, *gyrus* and *convolution*? Due recognition is given the achievements of Dana, Hodge, Lombard, and other American neurologists. The author's own valuable observations upon the brain of the blind deaf-mute Laura Bridgman might well have occupied more space. The index is not full enough, and a summary of each chapter would have been acceptable.

The Worship of the Romans Viewed in Relation to the Roman Temperament. By Frank Granger, D.Litt. London: Methuen & Co. 1895.

THE object of this book is, as Dr. Granger puts it, "to interpret some of those thoughts which lay nearer to the average Roman mind than the Greek elements in its [sic] literature." By these "thoughts" he means a set of beliefs or practices which were closely bound up with the religion of the Romans as we find it, and he wishes "to point out the manner in which they are related to each other, and to justify them as a necessary factor in the awakening of the religious sentiment." After an introductory chapter which is entitled "The Roman Spirit," but which turns out to be rather of the nature of a homily to the English on the subject how best to govern India, we are hurried, without any transition whatever, from Calcutta to the first of this group of beliefs—namely, that in dreams and apparitions. Hence we pass to the "Soul and its Companions" (a title suggestive of 'Sintram,' but we find no dread Little Master here, only the *genius*, deified ancestors and other spirits); next, to "The World Around," by which is meant the supernatural world. Then follow accounts of Nature- (including of course Trees) Worship, Primitive Thought, Roman Magic, Divination and Prophecy, Holy Places; and the book closes with chapters on the Divine Victim and the Sacred Drama. It will be evident to the elect that we have here an attempt to bring together into a small volume (of not much more than 300 pages) what may be called the folk-lore of religion, a subject which has of late years received learned consideration in many German works, and in

English by scholars like Fraser, Baring-Gould, Lang, and others.

Not much that is new to students of comparative religion will be found in the book. It is in general a mere account of the said beliefs (Dr. Granger is *not*, by the way, possessed by a corn-demon, for which we are grateful), strung together in a pleasantly discursive style—perhaps too discursive for some scholars, while we fear that the author's habit of taking much for granted may frighten off the uninitiated. He has a way of beginning a story, drifting off (Herodotus-like) into something else, too often into sermons of the sort indicated above, and then coming back to the main thread only to drop it (*not* like Herodotus) as being too trite for further handling. And yet, as we have just said, his style is pleasant, and the topics which he has chosen to treat have always been attractive to men. To this day all are fascinated by the supernatural and the unknown.

The Roman lived in a world peopled, as he fancied, with spirits—his *genius*, the wraiths of the dead, whether showing themselves as ghosts by night or as noonday demons in the light—and rendered fearful by the terrors of the evil eye in man or by the prodigies and portents of the gods. But in one point, at least, he had the advantage of us. His was an age when, no matter what the torturing doubt, there was always somebody at hand who knew how the thing really was and what must be done to solve the doubt or to avert the danger. Sound and withal amusing is Dr. Granger on the great principle of primitive philosophy, that each occurrence has one cause, and but one only. We may perhaps put it in this fashion: You have a mysterious ailment and don't know what the reason is; you are worried by a recurring dream; you have seen a ghost or the "astral body" of a living friend; Pan has met you in the woods. You, the modern, are helpless because you don't believe that there is anybody who knows what it all really means. But the Roman had somebody—or thought he had, which, after all, is having. He went to his medicine man of the appropriate variety and was by him made whole. Something had been left undone, or something done which ought not to have been done—it was always one thing (a great comfort!), easy to understand and simple (though sometimes expensive) to expiate. The finding out what this thing was, and the doing of it on the one hand, or paying the price of the past action on the other, formed the main business of the Roman religion.

Dr. Granger, in his last chapter, may have been upon the track of this great truth; but, having mentioned the hymns which were sung at festivals, and having committed himself to the somewhat surprising statement that Horace was one of the first Romans to write poetry for such occasions, he is naturally led away to descant upon the lyrics of the Augustan bard, and all of a sudden the book ends, in delightfully consistent fashion, with the suggestion that children of succeeding generations may have often sung these lyrics in their walks along the country lanes. No, not even here ends; for it is added that they were perhaps "set to plain and strenuous music like that of the Delphic hymn." Delphic indeed, and Delphic the utterance! Still, we love it, for "we too were born in Arcadia."

But it would be unfair to have treated this book altogether in a sprightly—we hope not in a too flippant—vein. It has in it much that is useful to know as well as interesting to read. And among other valuable suggestions of Dr. Granger's, he is to be congratulated upon his

idea that the masks of ancestors, the *imagines*, were a survival of an original practice of preserving the actual heads of the deceased. He cites as a parallel the preservation of the skulls of the dead, each in its own wooden case, in a certain church in Brittany. It seems strange that he should not also have recalled the very similar custom of the *laedones* described by Herodotus (iv. 26). The publishers, too, deserve thanks for the clear black ink upon its good white surface, and above all for the light body of the paper used, which makes the book a joy and not a burden to hold. But the index is wholly inadequate.

Mind and Motion, and Monism. By the late George John Romanes. Longmans. 1895. Pp. 170.

WHEN Mr. Romanes began this book entitled 'Monism' (to which a lecture on 'Mind and Motion' is prefixed) by saying that it is established to the satisfaction of every physiologist that there is an absolutely exact correspondence between every mental fact and some concomitant fact of the brain, he exaggerated. There are physiologists enough who regard the correspondence, whether absolutely exact or not, as limited to feeling and sensation corresponding to excitation of nerve-cells, and to volition corresponding to nervous discharges, while maintaining that there are in the mind general ideas which correspond only to potentialities in the brain, not to any actual facts. However, having put out of court all who do not pin their faith to the invariability and exactitude of the correspondence between mental and material events, Mr. Romanes proceeded at once to divide believers in that proposition into Spiritualists, Materialists, and Monists, thus furnishing the last word with one signification the more. Monism originally meant the doctrine that mental phenomena and material phenomena have one substratum; and monism was said to have three forms, Idealism, or the doctrine that material phenomena are but a species of ideas; Materialism, or the doctrine that mental phenomena are merely a special variety of those facts which lie at the bottom of material phenomena; and Neutral Monism, which was described as the doctrine that material phenomena and mental phenomena are equally universal, and merely different aspects of any facts. The monism of Mr. Romanes seems to be a variety either of materialism or of this neutral monism; for he says, in the introductory essay, that mind and motion are substantially identical. Thus, of the three elements which compose the physical universe, to wit, matter (or inertia and identity), motion, and energy, he holds that one is coextensive with mind. In the old triad, he has displaced Idealism to make way for Spiritualism, which was always held, and which he himself held, to be a dualistic and, therefore, not a monistic doctrine, though as monistic he classes it. But he does not mean spiritualism in general; for of spiritualists and others who do not accept his first axiom of the absolute perfection of the correspondence between mental and cerebral events, he takes no notice whatsoever. Upon this point he is explicit (p. 49).

What Mr. Romanes wishes to prove is, that the hypothesis that all material motion has a feeling, and *vice versa*, besides accounting for sufficient facts to render it reasonable, leads to the proposition that all "causality" (could not this antiquated notion have been replaced by something more scientific?) is, on its inside, volition, and gives room for, as he at first says,

but subsequently (for he never gave the work the revision necessary to make its doctrine quite consistent) that it "sanctions" and almost necessitates, the assumption of a universal mind of the world (which he calls Theism), and, finally, that it reinstates the freedom of the will, and, with that, moral responsibility. Many readers will seem to see in the book the phenomenon of a man setting out from materialistic assumptions, but led, under the influence of a broad study of nature, toward idealistic conclusions, and going, at last, so far as to say that the ultimate reality is "either mental or something greater." Others will say, with some justice, that it is the work of an invalid, so weak that pages are occupied with reasonings and logical diagrams to show that a universal affirmative proposition cannot be converted *simpliciter*, and with another diagram altogether worthy of Dr. Fludd (except that it is a rough woodcut, instead of a beautiful copper-plate), and full of the most puerile propositions. The style, however, is as strong and clear as anything Romanes ever wrote, if not more so. That, if he had recovered from his illness, he would, by this time, have been advocating an idealistic theory of the evolution of all things, including the laws of causation, there is hardly room to doubt. Such is the theory that the great advocate of Darwinian ideas would inevitably have adopted as the fittest survivor in the struggle of theories.

Professor Koch on the Bacteriological Diagnosis of Cholera, Water-Filtration, and Cholera, and the Cholera in Germany during the Winter of 1892-93. Translated by George Duncan, M.A., with Prefatory Note by W. T. Gairdner, M.D., LL.D., F.R.S. Edinburgh: David Douglas; New York: William R. Jenkins. 1895.

NOTWITHSTANDING the disappointment that the scientific world and the general public experienced in the failure of his promises for the relief of consumption by inoculation, Prof. Koch remains a great authority on all bacteriological subjects connected with the recognition and prevention of disease. The three essays of the title-page of this book give collectively his personal views on the spread and the restraint of that pestilence through which, by the discovery of the comma bacillus, he first acquired fame. The control of epidemics, like the management of any condition affecting large areas or many people, requires popular coöperation; and it is by the absorption of such teachings that the popular mind is prepared to assist in the work. Koch believes that the comma (or cholera) bacillus is the efficient cause of that disease. A few deny it that power, but nearly all recognize in its presence a clear indication of the epidemic variety, which, under certain aspects, cannot be distinguished clinically from cholera morbus or cholera infantum. At least to believe that it is pathognomonic is to be on the safe side.

It has long been recognized by epidemiologists that the study of any outbreak means the detection of the first case, either at or after its occurrence. But the recognition of undeveloped cholera is a clinical impossibility, although such undeveloped cases furnish the sparks that light the greater flame of general infection. It is here that the bacteriologist is at his best. When the tornado strikes the ship, every sailor realizes it. It is the master's province to foretell the storm while the disturbance is yet recognizable only by his barometer. Koch expresses the true principle of all this

work when he says: "The proper field of bacteriological work, however, is the beginning and the end of an epidemic, when all depends on the correct judging of each individual case and the swiftest possible prevention of danger to the neighborhood." Almost every cholera epidemic is like an extremely flattened ellipse whose vertices are the first and the last cases. Upon determining just where the lines that enclose the disease begin and cease may depend the safety of the immediate and of the proximate communities. Bacteriology will do this; and the moral for us is to have enough skilled bacteriologists and equipped laboratories to render an intelligent and immediate verdict. Early measures of control may thus be instituted without waiting for the epidemic to become epidemic in the one instance, and the unsuspected case, held as a precaution, may be restrained from ignorantly spreading the disease in the other. For it is well established now that a person may appear and may feel perfectly well, and yet be an actual disseminator of cholera germs. Certain and immediate recognition of the disease can be made in about 50 per cent. of the cases, when the excreta are examined by competent observers; and in every instance it can be determined in from six to ten hours by means of the peptone (supplemented by the gelatine) plate-cultivation. In relation to detecting the cause *en route* when water-borne, there is no pretence that cholera-infected streams will always yield bacteria to the investigator. The probable explanation of this is not that there are no bacteria in the water, but that their distribution has excluded them from the particular specimen examined.

The essays on water-filtration and on cholera in the winter of '92-'93 are excellent examples of clear description and logical reasoning. An underlying motive running through the whole book is antagonism toward, or defence against, the attacks of the Pettenkofer or Munich school, which teaches a theory of localism with special reference to ground-water and little regard to bacteria. The controversy is not always in good taste, and there is an expenditure of energy that appears more personal than scientific in motive. Nevertheless the book is a good contribution to the literature of public health, which those charged with its care as engineers and civil officers, as well as physicians, may well consult, and the translation is in idiomatic and most readable English.

A Japanese Marriage. By Douglas Sladen. London: Black; New York: Macmillan. Pp. 401.

MR. DOUGLAS SLADEN'S 'Japanese Marriage' would not need to be spoken of had not this writer, by a certain straightforwardness and naturalness of style, gained an attention not usually given to books which exhibit such full measure of ignorance and coarseness, not to add effrontery. There was no need of resorting to what the world knows as fiction, for his former books and articles on Japan illustrated to a sufficient extent the writer's power of producing pure and silly inventions. In this volume, as usual, the Japanese is invariably a "Jap" (no other respectable writer on Japan ever repaid the country's hospitality by this impertinence), and the foreigner is incapable of speaking except in copious slang; but we have also such passages as the following (p. 166), which the former volumes have hardly equalled:

"Bryn's newly formed passion for Philip

[she is his wife's sister, and lives in their household]—if one may use the word where the question of sexual feeling did not enter—would have carried her through a much more severe trial. She thought the grandest sight she had ever seen in her life was Philip, unarmed, and in his night clothes, first hurling one sworded assailant over the banisters . . . and then tearing the life out of the other's throat. . . . There was no more taint of jealousy than there was of sexualism in her passion for Philip. She did not desire his carcases, though they gave her a dog's pleasure."

The Nation.

NEW YORK, THURSDAY, APRIL 2, 1896.

The Week.

THE New York Republican State convention last week put the word gold in its platform, and thus declared, without qualification or subterfuge, what it meant by the phrase sound money. A declaration so far in advance of the usual platitudes of party conventions deserves to be quoted in full:

"The agitation for the free coinage of silver at the ratio of 16 to 1 seriously disturbs all industrial interests, and calls for a clear statement of the Republican party's attitude upon this question, to the end that the trade of this country, at home and abroad, may again be placed upon a sound and stable foundation. We recognize in the movement for the free coinage of silver an attempt to degrade the long-established standard of our monetary system, and hence a blow to public and private credit, at once costly to the national Government and harmful to our domestic and foreign commerce. Until there is a prospect of international agreement as to silver coinage, and while gold remains the standard of the United States and of the civilized world, the Republican party of New York declares itself in favor of the firm and honorable maintenance of that standard."

A more decided expression of sound and wholesome doctrine on the money question it would be hard to frame. It is to be welcomed all the more since it stands in such notable contrast to the McKinley deliverance, adopted by the Ohio convention two weeks ago, in favor of "gold, silver, and paper with which to measure our exchange," and demanding the use of both gold and silver as standard money either by international agreement or "under such restrictions and such provisions, to be determined by legislation, as will secure the maintenance of the parities of values of the two metals, so that the purchasing and debt-paying power of the dollar, whether of silver, gold, or paper, shall be at all times equal." Mr. Morton could hardly have gone into the convention as a candidate on any other platform, nor could his party have expected to carry this State on any other. No matter who is nominated at St. Louis, the business men of New York are a unit in demanding that sound money be defined and described so that no room shall be left for two interpretations of it.

The financial plank of the Massachusetts Republican platform follows closely upon the lines of that of the New York Republicans, and is sound and strong. It is not afraid to say gold when gold is meant, and, in addition to declaring entire opposition to the "free and unlimited coinage of silver," opposes "any change in the existing gold standard except by international agreement," and demands that "every promise must be rigidly kept, and every obligation redeemable in coin must be paid in gold." This declaration

puts the Republicans of Massachusetts squarely upon the ground which Congress has refused repeatedly to take, for it says that by "coin" we mean "gold." If Congress had made this declaration before our issues of bonds, the country would have been several million dollars better off, so far as interest on the bonds is concerned, and many hundred millions better off in the way of improved business and industry. If the Republican conventions in other Eastern and Middle States will follow the lead of New York and Massachusetts on this question, their party will be placed in a better position before the country at the opening of the Presidential campaign than it has occupied for years. It may be that even Speaker Reed will be encouraged to say something more definite on the subject than that the "day cometh with the Republican morning soon to dawn." As matters stand now, there is a ludicrous discrepancy between the frank and manly financial declaration of the Massachusetts platform and his comic-opera treatment of the same subject.

Sound as the platform is on the currency question, allowing Senator Lodge to draw it up and sit on it gives it a touch of drollery. There has been no more insidious friend of the silver movement than Lodge himself. He has not missed a single opportunity in the Senate to show his sympathy with it. Two years ago he introduced in the Senate a resolution to put discriminating duties on English goods, to punish England for not abandoning her gold standard, which the sorry wag now exalts in Massachusetts. Still later he wrote to Moreton Frewen that the cause of the American hatred of England, as revealed in his Jingo enterprise, was her treatment of silver—that is, her refusal to aid us in giving up the gold standard. There is no more melancholy sign in politics to-day than that such a man can make this open parade of his hypocrisy, and yet retain his influence undiminished in a party like the Republican party in a State like Massachusetts. He "steered" the late convention in everything.

The *Manufacturer* of Philadelphia furnishes an explanation of the recent meeting at Washington between certain Republican Senators from the silver-mining States and certain Pennsylvania manufacturers. It denies, in the first place, that the initial steps for the meeting were taken in Philadelphia. The movement began in some other place (Pottsville, perhaps). The Philadelphia men were invited by the Senators to come to Washington for consultation and an exchange of views. When they came together the Senators informed them that the Dingley bill could not pass, nor could any other

tariff bill pass now or in the next Congress, unless something were done at the same time for silver. "This statement," it says, "was challenged, and a demand was made for proof that the silver-men will have power to defeat tariff legislation." The Senators said that "however much they might desire to sustain a tariff bill, the sentiment of their constituents was too violently opposed to such a course, unless silver remonetization should be at the same time supported, to permit them to advocate protection alone." The manufacturers expressed regret, "and in some instances indignation," that silver and the tariff had been so coupled together, and they separated not at all convinced that they would not be able to carry their measures without silver legislation, "but probably with some anxiety to learn positively if such is the case."

That the Manufacturers' Club of Philadelphia is not in favor of the silver standard, or of bimetallism in any form, was made plain at its meeting on Monday. The official organ of the club, for two or three years past, has been advocating legislation in favor of silver in one way or another, and its editor has been delivering lectures in various parts of the country in favor of bimetallism of one sort or another. In short, the influence of the club has run in the same direction as the speeches of Stewart, Teller, Bland, and Bryan, and has probably done more mischief than those because it has been addressed to a Republican audience in the Eastern States. A full meeting of the club was held on Monday, at which the subject was well thrashed out, and resolutions were adopted declaring "that the question of bimetallism can be permanently settled only through an international agreement, and that the Manufacturers' Club declares its unalterable opposition to the free coinage of silver by the United States alone, firmly believing that such a policy will result in disaster at home and dishonor abroad, and would only operate to place this country upon the basis of silver monometallism." Various attempts made by a small band of silver-men to modify the resolutions were voted down. Even a recommendation that Congress take steps for another international conference was rejected.

The McKinley boom is in great force in the newspapers, and the editor who has not some figures of his own upon it is decidedly unenterprising. Less than one-half the convention has been chosen, the total of delegates elected up to Saturday evening being 388, while the full convention will contain 909. The *Tribune*, which does its claiming on Sundays for some inscrutable reason, gives McKinley 204.

Gen. Grosvenor, the Washington manager of the McKinley boom, says this is too small a number, and publishes a table by States giving the Major 255 delegates. In order to do this, Gen. Grosvenor includes thirty-four delegates not yet chosen, but he says that these "are pretty sure to be for McKinley, and might as well be counted now." Why not? If you are going into the "claiming" business, why not throw your whole soul into it? The *Herald* makes the *Tribune* "look sick" by publishing telegraphic estimates from various parts of the country which show that McKinley will have 393 votes on the first ballot, or only sixty-two short of enough to nominate. This is good claiming, but the *World* beat it two weeks ago by a similar convincing calculation which gave him 564 votes on the first ballot, nominating him with nine votes to spare. The *Philadelphia Press*, which is not a McKinley paper, gives him only 201 of the delegates thus far elected. Per contra, the *Tribune* has held an election in New Jersey, and has discovered such a spontaneous boom for McKinley there that it seems safe to give him that State's electoral vote now, for, whether he be nominated or not, New Jersey is bound to vote for him.

Joe Manley continues to put forth figures on this subject, and, in his latest calculation, makes a striking comparison between McKinley to-day and Blaine in 1876:

"The situation is precisely as it was twenty years ago. You will remember that three months before the convention met at Cincinnati, we were confident of Mr. Blaine's nomination. He stood then as the apostle of protection, but he had opposed to his nomination Senator Conkling of New York, Senator Morton of Indiana, Secretary Bristow of Kentucky, Gov. Hayes of Ohio, and Gov. Hartranft of Pennsylvania. We felt so sure of Mr. Blaine's nomination that we regarded it as settled, and yet he was defeated in the convention, and the Maine man went down before the Ohio Governor."

Another feature of the deadly parallel which Mr. Manley does not mention is the uproarious support of the *Tribune*. Mr. Blaine had that in 1876, as McKinley has it now, and it was given in the same way then as now, with calculations, and tables of delegates, and whoops and claims; but it was of no avail when the balloting began, mainly because it was begun too early and maintained with too much zeal. Of course Mr. Blaine's reputation had something to do with his failure, but the chilling influence of that could scarcely have been more disastrous than McKinley's unfortunate career as a business man will be now. For the first time in the history of the country a man who has failed in business and has had his debts paid for him, is proposed as a Presidential nominee by the very men who have paid his debts, and who would be the direct beneficiaries of the economic policy which would be put into operation were he to be elected. There are the elements of as great a political scandal in this situ-

ation as there was in Blaine's public record.

The Davis resolutions are now surely dead, because Davis himself is dead. He lost his own State on Tuesday week, and telegraphed that he would "loyally respect the wishes" of the people of Minnesota and quit trying for the Presidency. Thus vanishes the original occasion and continuing cause of the Davis resolutions, and we shall hear of them no more. For having accomplished this, as also for coming out squarely against free coinage, the Minnesota convention deserves all thanks. On the question of peace and war and a fighting navy, its utterances were of the usual incoherent order. It "believes thoroughly" in arbitration, but at the same time wants to see preparations made for this country to become "invincible in war." But it doesn't want ships and invincibility in order to fight with; oh no, only to "secure peace" without a struggle, by simply displaying them. But haven't we "secured peace" absolutely for eighty years with the great naval powers, without any navy ourselves? Has any country respected us the less, or attempted to ride over us or wrong us? Have not, in fact, the talk and threat and actual imminence of war increased *pari passu* with the increase of our navy? Everybody except the Jingoos and the platform-makers knows that this is so.

We must all be grateful to Mr. Phelps for the address on the Monroe Doctrine which he has just delivered in Brooklyn. It is a remarkable outburst of common sense on a topic which has apparently a remarkable affinity for folly and ignorance. We are the more grateful for it because one of the worst phenomena of our time (if this be not a bull) is the silence of our leading men, of the men who know, and can speak with authority, in times of popular excitement, about matters of national importance. Every "craze" and every folly which comes up and takes hold of the popular mind through the newspapers, has generally a good run of a month or two before any rational person of weight or distinction takes hold of it, and "calls a halt." Lodge, Morgan, Chandler, Livingston, and the Old Pensioner, and a score of others, one-third ignoramus, one-third fool, and one-third knave, were blathering away about the Monroe Doctrine for months before a policeman could be found to interfere with them. No nation can go on in this way. If its men of light and leading will not talk, it cannot last as a civilized and free state. It is mind, after all, that moves the mass. Mass without mind means brute force, and the moral decline to which brute force always tends. Speaking out entails no penalty of which the "vir justus et tenax propositi" has any reason to be afraid. A little newspaper vituperation is all he has to fear, and this to a good citizen ought to be as water is to a duck's back.

Mr. Ritchie, President of the British Board of Trade, and a member of the cabinet, said last week that overtures looking to the establishment of a permanent court of arbitration between this country and Great Britain had been laid before the United States Government by Lord Salisbury. This news will be received with the utmost satisfaction by the promoters of the conference which is to meet in Washington on the 22d and 23d of April. The conversion of Lord Salisbury to the doctrine has been looked upon as the difficult task in the whole proceeding. Now that it has been accomplished, there ought to be no difficulty in bringing about the desired result, except such as is inherent in the nature of the undertaking. The mode of constituting the court and of defining its procedure will be the subject of discussion after the principle has been agreed to. As our Government was committed to the principle by the unanimous vote of both houses of Congress in 1890, there ought to be no remaining obstacle on this side of the water.

The prolonged marching up hill and down on the Cuban resolutions has at least had one good effect. It has plainly notified the country that Congress has not one spark of honest conviction, and only the dullest gleams of intelligence, in the whole affair. The agreement of the conference committee, now on the House resolutions, then on the Senate, does not mean that a particle of rational discussion has been given to either set, but only that a desperate and shame-faced determination to have resolutions of some kind has controlled the conferees. To be dignified, to act on full information, to weigh the consequences of action, to inquire what our duty is under law and treaty—none of these things is dreamed of in congressional philosophy. The pretence that it is, has now been fortunately dispelled by the public display of insincerity and shuffling kept up for a month, and the President would be perfectly justified in paying no more attention to the resolutions than he would to the voting of a mock Congress in a grammar-school.

The London *Spectator* remarks upon the recent blather in our Senate on Cuban affairs, that the Americans imagine they are dealing only with Spain, but in reality they are risking an alteration in the relations of all Europe. It says that Spain has already applied to France for diplomatic assistance in the event of a war with the United States, and that she is able to offer terms which will make it worth while for France to assist her. One method by which assistance could be rendered to her without any breach of relations with us would be by making it easy for Spain to borrow money in Paris. Whatever aid France might supply would tend to detach Spain from the Triple Al-

liance, where her sympathies now lie, and place her on the side of France in the next European conflict. In short, the United States cannot attack the interests of Spain without producing grave consequences in Europe and causing a storm which they have no intention of producing. The *Spectator* writes without the intention of influencing opinion here, but merely to show that the American policy of non-intervention in the affairs of Europe cannot be maintained if an aggressive policy is pursued toward European governments. This is true, even though our Senators have no intention other than that of "holering" and proclaiming their readiness, like Senator Thurston, to spill the blood of their nearest relatives to vindicate the nation's honor. An American Congressman does not concern himself so much with the shifting of the balance of power in Europe as he does with the shifting of the balance of the delegates in the "deestrick." You may talk till all is blue about France and Spain and the rest of the world: you will never get his attention very far from the caucus that deals with his renomination.

Secretary Lamont's answer to the inquiries of the Senate committee on military affairs for information as to the reason why the War Department is opposed to the bestowal of a lieutenant-generalship on Gen. Miles, seems so complete that one cannot help regretting that it was not called for before the movement for Gen. Miles's promotion was set on foot. It is unpleasant to have such a movement, when once begun, fail for any reason whatever. Its failure seems to raise a question about the General's own merit, when there is and can be no such question. Mr. Lamont simply says that only six officers have held the grade of Lieutenant-General since the foundation of the Government; that in no case has it been bestowed on any officer who has not commanded an independent force in active service; that it was not bestowed, prior to 1870, on several officers, such as Halleck, Meade, and Hancock, who had fulfilled this condition; and that it was provided by positive enactment in 1870 that the offices then held by Sherman and Sheridan should not be filled after their death. In other words, the rank seems to be reserved, by a piece of commendable national policy, for officers who command the whole army, or an independent part of it, as a reward for successful active service. We ought in many ways to display a good deal more of this reserve than we do. It is extremely difficult to maintain any degrees in our rewards or eulogies, so prone are our Congressmen to get everything there is in the way of honor or prize for anybody whom they like. It is no fault of Gen. Miles that he has not fulfilled the conditions annexed by precedent or law to the bestowal of this rank. That he would fulfil them if the occasion of-

fered, no one who knows him doubts, but it is not kind of his friends in Congress to compel controversy in the matter. Glory is a thing which should never be haggled over.

The manner in which the Greater New York bill passed the Assembly on Thursday left no room for doubt as to the political influences which are behind it. The Platt and Tammany forces voted solidly for it, under the leadership of Hamilton Fish, who, only a few years ago, won the testimonial of a set of diamond shirt-studs from Tammany as a reward for his usefulness in leading a similar "combine" through a session of the Assembly which had a Democratic majority. Without Tammany support the bill would have failed. The strongest speeches against it were made by Republicans, although it is a Republican machine measure, and no less than thirty-eight Republicans voted with the opposition. Nearly all the Tammany contingent, twenty-two of them, voted with the Platt men, and without this support the bill would have fallen seven votes short of enough to pass it. Of the 103 Republican members, only 63 could be induced to support the bill, although the power of the Platt machine was exerted to whip them into line. The bill is now under consideration by the Mayors of the three cities affected, New York, Brooklyn, and Long Island City, and its merits will be discussed at public hearings. It is assumed that the Mayor of Brooklyn will refuse to approve it, and it is generally believed that Mayor Strong will do the same. Public sentiment in Brooklyn is strongly aroused against it, and the result of the hearings there is well known in advance. The people of this city have been strangely lethargic about the question, but we believe that they are beginning to awake to the grave considerations involved in it, and that before the hearings upon it are ended they will leave no doubt as to their position toward it.

It is so long since the Congregationalists have had the pleasant excitement of a trial for heresy that the recent case at Madison, Connecticut, was naturally regarded as an entertaining novelty. The findings of the council, moreover, acquitting the accused clergyman, have a humorous relish about them. At least they appear humorous to inexperienced outsiders, though how they struck the staid old church-members who brought the charges we cannot say. The council gently reminds them of "the differences in the training and environment of the pastor and the complaining members." The pastor, that is, had been studying and assimilating the results of modern scholarship, while the sleepy people in Madison had been foolishly trusting to the stability of the faith once delivered to

the saints, and had not awakened to the necessity of a new creed every twenty-five years. It evidently seemed laughable to the learned members of the council that any one should be so old-fashioned, at this time of day, as to insist upon a literal interpretation of the Incarnation, the Atonement, and Inspiration. With the honest zeal of politicians, they advised pastor and people to "get together," and it is gratifying to learn that "a general love feast" followed, as a result of which it is confidently hoped that all differences of training and environment will be hereafter amicably surmounted.

The declarations made in the Italian Parliament on March 25, to the effect that an alliance had been made between Italy and Great Britain, not in a formal way, but based upon common interests, are very important, but probably are not a surprise to the statesmen of Europe. The maritime power of the Mediterranean, said Baron Blanc, the ex-Minister of Foreign Affairs, was the effective bond between Great Britain and the Dreibund. The Mediterranean being the highway to India as well as to Egypt, England is bound to make the control of it her first consideration, and here she can look only to Italy as an ally. The Italian navy is next to that of France, and, when combined with that of Great Britain, so far outweighs everything else in those waters that little account need be taken of the remainder.

The protest of France and Russia against the use of the Egyptian Reserve Fund for the expedition against the Dervishes has but little consequence except as an expression of dislike of the English occupation of Egypt and of the virtual addition of England to the Triple Alliance. It could have importance only if it were likely to be followed up by war, and of this there is no prospect whatever. In fact, France may for the present be counted out of the military game in Europe. In case of a reverse, the Government would be overturned, and we should have a repetition of the Commune. In case of triumph, the victorious general would surely be carried into a dictatorship. Both the parties in France are fully aware of these contingencies, and shrink from facing them, so that the British will probably have nothing more serious to fear than energetic discontent. The Porte will do nothing more than make inquiries, and Italy with England behind her will probably be able to patch up a peace with Menelek that will at least seem honorable. One of the most curious results of the Italian disasters is a great revival of the hopes of the Blacks in Italy about the temporal power: Menelek, acting under divine guidance, has shaken the Italian throne, and prepared the way for the restoration of Rome to its lawful owner,

FATAL MAJORITIES.

AMID all the ups and downs of parties in State and nation for the past ten years, one fact stands out conspicuously—the increasingly fatal effect of a majority. To get a majority is the great end of party striving. Sea and land are compassed to secure it. When obtained it is welcomed with immense huzzaing, and loud-sounding talk is heard of an “assured lease of power for twenty-five years,” and so on; whereas the usual, the now almost invariable, result, is, that a party in a great majority at one election is in a humiliatingly small minority at the next. And the small minority appears to be the direct consequence of the big majority. It is as if all the straining and desperate labor to get a party majority were but so many elaborate preparations to commit party suicide.

Politicians themselves are dimly aware of this law of political self-destruction. It is generally considered, for example, a disadvantage to have control of the Congress just preceding a Presidential election. On the stump the wicked incapacity of the other fellows is a much more inviting theme than the wisdom and patriotism which you yourself have displayed, in ways too often past finding out. It is safe to say that the greatest menace to Republican success next fall is the present Republican Congress. We know, in fact, that Republican leaders, in Congress and throughout the country, are in distress and dismay over the performances at Washington. Some of the very Senators and Representatives who in public take on the loftiest tone, in private wring their hands and almost shed tears as they speak of the mad passion, the mulishness, the greed, the sheer stupidity put so disastrously on exhibition by the party in control of Congress. To be sure, they do nothing effective to check the madness. They appear to be themselves as mad as the rest. Though they groan and grieve over the reckless imbecility of their party following, they imitate the example of the French leader of a “section” who, standing in a doorway as his people rushed off to tear up the paving and make a barricade, was heard to mutter despairingly: “I must go along with them, for I am their chief” (“Il faut que je les suive, car je suis leur chef”).

Why is it that the triumph of parties so swiftly becomes their destruction? Why do Platt and Croker, Crisp and Reed, so surely turn a majority into a rope to hang the party with? What is the reason that a majority can no longer be used for the benefit of both country and party, and so retained or made larger? One answer is, the decline of political leadership. We have more shrewd and masterful captains of fifties and captains of hundreds than ever before, but political commanders of the higher ranks are growing fewer. The men who get supreme control cannot see beyond their noses. They have never been to school in higher politics. They have

never learned the first lesson of government by majority—moderation. We say a majority can do what it pleases, but it cannot. That prime minister or that boss is near his fall who says: “This measure is pretty bad; we must apply our majority to it.” Moderation is the last thing our party chiefs and bosses think of. What is a majority for if not to be used for all it is worth? Hence, one after the other, in dreary succession, they run the same old round. Swept into power by the popular disgust with the party last in the majority, they straightway proceed to execute the villany the other side has taught them, usually bettering the instruction, display wilder partisan fury, excite deeper disgust, and go down in completer wreck. Then they crawl out from under the ruins, and complain of the fickleness of the popular judgment.

Another deadly element in a party majority is the character of too many of the men who compose it. In every great political reaction strange bits of driftwood are borne to the surface. Adventurers who know that they are but the accidents of an hour, wretched political ephemera that buzz their little day and then fall into putrefaction, they make up a difficult audience to which to preach moderation. Are they to miss the only chance of a lifetime? Will the leaders who implore them to be considerate and far-sighted guarantee them a return to the next Congress or Legislature if they refrain from selling themselves to the devil in this? It is all very well to remind them of the interest of the party, but how about the interest of the party of the first part? That is what they have both eyes on, and that is what they pursue day and night, turning neither to the right hand nor to the left, and by log-rolling, by voting as they are paid, by “strikes,” and speculations, and legislative “good things,” they rush madly ahead to enrich themselves and ruin their party.

There is, moreover, something in the very methods and machinery by which a party majority is won that carries in it the seeds of death. The bosses are partly the cause, partly the creature, of the forces with which they work. They get a majority only by lavish promises right and left of patronage and largesse, and then they have to go to work to invent the patronage and to swell the corruption fund. The pack of snarling, snapping curs that is at the heels of every boss, threatening to bite unless a bone is thrown them, is enough to embitter the sweetest temper. No wonder that so many of our naturally amiable bosses grow melancholy and irritable. Doubtless many of their schemes of plunder are resorted to, not out of native wickedness, but only to still the clamor of the greedy underlings whose support has been won by promises and can be kept only by spoils. There is thus an accelerated motion in a party majority, as nowadays secured, which hurries it on ever faster and

more furiously along the path of corruption until it crashes into ruin. Imagine Phæton McKinley successful in getting a majority by the methods his boodling managers adopt; one can easily picture the terrific party smash that would be certain to follow from his reckless driving, and the thunderbolt of popular rage that would lay him low.

How not only to get a majority but to keep it, and make it decent, conservative, useful, is the study to which party leaders should give their midnight vigils. How not to do it is writ large enough for even their not too alert minds to perceive, in the political history of the past decade. Horrible examples, solemn warnings, they have in plenty—let them look in the mirror if they see none elsewhere. But shining exemplars, successful models, they also have, if they would look at them, in the history of Anglo-Saxon popular government. It is an old lesson, but one so forgotten that it seems new, that moderation in victory, putting the public good before partisan advantage, building a majority upon a political principle, not upon greed and pelf, are the only ways of making a party majority more deadly to your opponents than to yourself. How many more surgical operations will our politicians need to undergo at the hands of Doctor Civis Americanus before they get that idea into their heads?

THE POLICY OF RECIPROCITY.

CONGRESSMAN HOPKINS, a member of the ways and means committee and chairman of its sub-committee on reciprocity and commercial treaties, has sent out a circular to manufacturers and others asking whether the effect of the treaties negotiated under the authority of the McKinley tariff act was favorable or unfavorable to this country, and what was the effect of their repeal by the existing tariff act; also, what can be accomplished by diplomatic negotiations in extending the export trade of the United States.

Reciprocity, it should be remarked, was not a Republican doctrine, but rather the contrary, until the famous scene took place in a committee-room of the Senate, where the late James G. Blaine, Secretary of State, smashed his hat on the table and denounced the McKinley tariff in excited terms, declaring that it would not make a market in any part of the world for another bushel of wheat or barrel of pork for the American farmer. When this emphatic declaration became publicly known, Senator Aldrich offered a new clause as an addition to the McKinley bill, which was known as the reciprocity amendment. It provided that whenever the President should be satisfied that any country producing and exporting sugar, molasses, coffee, tea, and hides, or any of those articles, should impose duties on the products of the United States which he (the President) should deem unreasonable in view of our

admitting those articles free of duty, he should suspend the free admission of such articles from those countries for such time as he should deem just, and impose upon them certain specified rates of duty. Under this provision, treaties of reciprocity were negotiated with Central America (except Costa Rica), Brazil, British Guiana, the British West Indies, San Domingo, and Spain (for Cuba and Porto Rico). Venezuela declined to make a treaty with us, in consequence of which her coffee was subjected by President Harrison to a duty of three cents per pound, although it had been free of duty under our tariff for nearly twenty years. Colombia and Hayti also declined to make such treaties, and their coffee was subjected to duty in like manner.

In this way the principle of reciprocity, which has been called "free trade in spots," was lugged into the party creed and received the sanction of the Minneapolis convention. In the platform of 1892 it was referred to in these terms:

"We point to the success of the Republican policy of reciprocity, under which our export trade has vastly increased, and new and enlarged markets have been opened for the products of our farms and workshops. We remind the people of the bitter opposition of the Democratic party to this practical business measure, and claim that, executed by a Republican administration, our present laws will eventually give us control of the trade of the world."

A copy of the Hopkins circular having been sent to Mr. James M. Swank, general manager of the American Iron and Steel Association, he publishes a reply to it in his *Bulletin*, saying, however, that it is an expression of his individual views only. His answer is interesting as coming from a protectionist of the old school who has not been tainted with any new-fangled notions on the subject of foreign trade. It also contains statistics of our trade with the several countries, covering the period immediately before the treaties were negotiated, and during their continuance, and immediately after their repeal. These statistics, since they embrace only eight years, some of which were marked by financial panics, cannot be considered decisive, yet they have a negative value in the way of disproving the claims of the new-fledged advocates of reciprocity.

They show that our export trade to the above-named countries increased during the three years before reciprocity went into operation from about \$31,000,000 to nearly \$42,000,000, or 35 per cent.; that during the next three years, while reciprocity was in operation, it increased to \$53,500,000, or 28 per cent.; during the year 1894, while the treaties were still in operation, it declined to \$52,800,000, and that in the last year for which statistics are given, 1895, it declined to \$45,500,000, the decline being wholly in the trade with Cuba and being due to the rebellion in that island. Although the treaties were all repealed, the trade with the other countries taken together showed no diminution.

By way of comparison Mr. Swank introduces the statistics of our trade with Canada (with which we had no treaty) during the same years, and here the changes and percentages correspond closely with those of the treaty countries, showing that the treaties had slight effect if any, our export trade being controlled by forces of wider scope. On the other hand, Mr. Swank shows that our exports to Mexico, with which we had no treaty, increased more rapidly than to any of the countries where reciprocity existed. In the matter of iron and steel, with which Mr. Swank is more especially concerned, he says that our exports "increased over 66 per cent. in the four years from 1887 to 1890 without reciprocity; that from 1891 to 1894 there was an actual decrease under reciprocity; and that in 1895 there was an increase over 1894 of over 17 per cent. without reciprocity."

Having demolished reciprocity with statistics, Mr. Swank decries it on grounds of principle. He calls it "a fatal error," an abandonment of the policy of the fathers of the republic, and a substitution of "the British policy of commercial treaties." This new policy was adopted, he says, "not to protect and preserve the home market for home producers, which is the very essence of the protective policy of the fathers, but that foreign markets of less value than the trade of one of our great States might be captured." He thinks also that a deplorable mistake was made when sugar was put on the free list in the McKinley tariff and a bounty voted to our own sugar-planters. This feature of the bill he considers the parent of the reciprocity clause, since without free sugar there would have been no basis for reciprocity at all.

The statistics introduced by Mr. Swank may serve to refute the advocates of the treaties, in so far as they set up a claim that our exports were largely increased thereby, yet they cannot be considered conclusive. There were two disturbances of trade during the period covered by them, the Baring crisis in England in 1890 and our own panic of 1893, the effects of the latter being still felt. Moreover, a longer period than four years would be necessary for a test, even in normal times. Mr. Swank's letter is chiefly significant as a protest of the old school against the schism and heresy which crept into the party as a consequence of Mr. Blaine's hat-smashing episode in 1890.

THE DELAWARE SENATORSHIP CONTEST.

ARMS have been so much to the fore in the Senate during the past two months that the laws have been silent. Yet a highly important legal and constitutional question has been under discussion, off and on, for four weeks, to which the newspaper correspondents, and therefore the people in general, have given almost no attention. We refer to the contest

over the representation of Delaware in the United States Senate. It is now up as a question of the highest privilege, and has the right of way over all other business until it is settled. The debate is still going on, and will doubtless go on for some time to come, though all the essentials both of law and of fact have been pretty thoroughly displayed in the speeches already delivered.

The facts are agreed to by all concerned. The Delaware Legislature was in prolonged deadlock in its balloting for United States Senator. "Gas" Addicks had bought the State for the Republicans, and supposed that, of course, the senatorship went with it; but a few ridiculously squeamish members refused to vote for him, and an adjournment without election seemed probable. On the last day of the session, however, May 9, 1895, 28 ballots were taken; 30 members were present in joint assembly, 15 votes being cast for Henry A. Du Pont, and the other 15 being divided. No majority for any candidate appears upon the record, therefore, but Mr. Du Pont makes his contest, and the majority report of the committee on privileges and elections proposes to award him the seat, on the ground that one member present and voting in the joint assembly was illegally present and voting. With this vote expunged from the record, there would have been a total of but 29 votes, and Mr. Du Pont would have been elected.

This member, thus challenged, was William T. Watson, the Senator duly elected from the county of Kent, chosen Speaker of the Delaware Senate on its organization, and becoming, under the State Constitution, acting-Governor upon the death of Gov. Marvil on April 8, 1895. On May 9, the last day of the session, Mr. Watson entered the Senate chamber, took his seat as Speaker (the President *pro tempore* resigning it to him), and went with the Senate to the hall of the House of Representatives, where he joined, without protest, in the balloting for United States Senator. It is contended by Mr. Du Pont that the office of Senator from Kent had been vacated by Mr. Watson's accession to the acting-governorship, and that therefore the legal number of the joint assembly was 29, not 30.

The argument for the contestant, which was presented at length by Senator Mitchell, is based, first, upon the common-law doctrine of incompatibility—in other words, that the same person shall not simultaneously exercise incompatible offices, and that the offices of Governor and member of the Legislature are incompatible. It is also argued that the Constitution of Delaware expressly prohibits such duplication of office. The right of the United States Senate to go back of the record of a Legislature is maintained, not as to facts, but as to the law governing the organization. If the Legislature, or a branch of it, did not perceive that the law and Constitution of the State made a seat va-

cant, that does not estop the United States Senate, so Senator Mitchell contended, from revising the legislative record so as to make it conform to law. The record in question thus revised would show that Mr. Du Pont had received a majority of the votes legally cast for United States Senator, and is therefore entitled to his seat.

The argument for the minority of the committee, which was ably presented by Senator Turpie, sets forth, first, the absolutely binding nature of a legislative record upon the United States Senate. The Senate of Delaware is the sole judge of the qualifications of its own members. The uniform practice of the United States Senate was laid down in a report on a contested-election case in 1873:

"In the opinion of your committee it is not competent for the Senate to inquire as to the right of individual members to sit in a Legislature which is conceded to have a quorum in both houses of legally elected members. But, undoubtedly, the Senate must always inquire whether the body which pretended to elect the Senator was a Legislature of the State or not, because a Senator can only be elected by the Legislature of a State."

Judicial decisions point the same way. A Kansas Legislature once contained an unconvicted felon. Under the State Constitution his seat should have been declared vacant. But the Legislature refused to act, and when his case was brought before the Supreme Court of the State, Judge Brewer, now of the Supreme Court at Washington, decided that there could be no interference from the outside, holding that if either house of the Legislature "refuses to oust a member, his seat is beyond judicial challenge."

It is denied, further, that the Speaker of the Delaware Senate succeeds to the "office" of Governor. The Constitution says that he shall "exercise the office until a Governor elected by the people shall be duly qualified." As a practical construction of the clause it is averred that, historically, every one of the five persons who, under the present Constitution of Delaware, have succeeded to the governorship, as Speaker Watson did, "without a single exception, after the expiry of the time limited for the temporary exercise of executive authority, went into the Senate and completed his term as Senator without protest, without objection." At the time of Mr. Watson's participation in the joint assembly no protest was made against his action until after the last ballot was taken, when, apparently as an afterthought, a protest was presented as a ground for the contest before the United States Senate.

Without undertaking to affirm how the Senate ought to or will decide this question, we are bound to say that any attempt of the Senate to go back of the record of a State Legislature is certain to lead to great abuses. The qualifications of electors, as well as of legislators, may be inquired into on the same ground; the fairness of elections passed upon; and thus the constitutional right of all Legislatures

to be the sole judges of the qualifications and credentials of their own members insidiously undermined. For better or for worse, we must stand upon the right and duty of the States to manage their own affairs without federal interference; and the election of a United States Senator is a State affair.

GERMAN AND IRISH CRIME AND DISORDER.

THE recently issued census volume on Crime, Pauperism, and Benevolence shows how much more numerous on June 1, 1890, among the persons of Irish birth or parentage than among persons of German birth or parentage were the inmates of prisons, almshouses, juvenile reformatories, and benevolent institutions. At that time there were in the United States 4,142,199 persons both of whose parents were born in Ireland, and 5,776,186 both of whose parents were born in Germany. Thus there were 140 persons of pure German blood in the country for every 100 persons of pure Irish blood. On June 1, 1890, however, 13,490 of the latter class were confined in prison, as against only 4,869 of the former. Or, stating the same thing in another way, it appears that out of every million persons of Irish birth or parentage there were 3,257 confined in prison, and out of every million Germans there were only 782, or but little more than one-fourth as many.

The same disproportion, though in a somewhat slighter degree, exists among the juvenile offenders, 2,587 of whom had Irish parents, as against 1,060 of German parentage. Out of every million persons of Irish parentage there were 624 confined as juvenile offenders, while out of a like number of Germans there were only 183. Among the paupers in almshouses the difference was nearly though not quite so great: 15,933 of such paupers were of Irish parentage, 7,793 were of German parentage. That is, there were 3,844 paupers per million of the Irish inhabitants and 1,349 per million of the German. Substantially the same proportions are maintained among the inmates of benevolent institutions: 24,147 were Irish, 11,505 were German. Out of every million inhabitants both of whose parents were Irish, 5,824 were to be found in benevolent institutions; 1,991 out of every million of German parentage were in like places.

It thus appears that out of every 1,000,000 persons residing in this country in 1890, both of whose parents were Irish, 13,549 were, on the first day of June of that year, public charges, as against 4,305 in every 1,000,000 persons of pure German parentage. In other words, the Irish contribute to the dependent and delinquent classes, in proportion to their numbers, something more than three for every one furnished by the Germans.

Any complete explanation of this difference would be difficult if not impossible. But partial explanation is comparatively

easy. The Irish went so long without popular or technical education, or common social justice, that the national character was seriously affected by it. It bred a certain disinclination and incapacity for steady industry, which is the leading characteristic of low civilization. The absence of legal protection, in like manner, bred disrespect for law and a tendency to protective law-breaking. Moreover, the possession of a franchise during the last hundred years which had no influence whatever on the government of their country, begot skill in the use of electoral machinery, and in electoral tricks and intrigue, without developing any sense of political responsibility or of public duty. The love of drink in the Irish is probably temperamental—that is, compounded partly of love of excitement and partly of sociability. The disposition of the Irish who land here to go into the liquor business is due partly to ignorance of all other kinds of business, and partly to want of capital.

That the Catholic religion counts for something in their apparent want of political capacity must be admitted, without meaning to be disrespectful to the church, if we rely on historical experience, for no Catholic community can be said to have succeeded in modern politics. The histories of Spain, France, Italy, and the Spanish-American republics, contrasted with those of England, Germany, Holland, Sweden, Denmark, and Norway, strongly suggest, at all events, the belief that creed has much to do with the ability to carry on modern governments. The Catholic creed probably lessens individual initiative and self-dependence by the large part direction plays in it, and for similar reasons may possibly weaken the power of resisting the temptation to certain forms of crime and social disorder. The knowledge of the English language, too, has been in America a misfortune for the Irish, from which the Germans escape, because it brings them at once in intelligent contact with the worst American tendencies.

The Germans, on the other hand, besides the greater phlegm of their race, come here with a much better home education, with a much more widely diffused training in handicrafts, with a love of beer instead of whiskey, and with no training in the use of political machinery. Their relations to the law in their own country have always been normal, and their respect for official and other superiors has had a better basis than mere superiority of force. It has been historical in most cases, and maintained by superiority of knowledge and of function. Though last, not least, ignorance of the language keeps the German to himself and his own people for some time after his arrival in this country, and out of the way of the American temptations which foreigners are least fitted to bear. Foremost among these is the contempt for the government which

grows out of observation of the office-holders, and is very trying, especially to the more ignorant immigrants. In truth, America is the last country to which a wise despot, seeking to transplant people according to their defects and capacities, would have sent the Irish, while he would probably have sent a large proportion of the German population here in the beginning of the century.

Correspondence.

A SINGLE-TAX COMMUNITY.

TO THE EDITOR OF THE NATION:

SIR: On the eastern shore of Mobile Bay, and some fifteen miles distant from the metropolis of Alabama, there is a growing community of men, women, and children whose daily lives are, to a great extent, governed by the fiscal theories of Mr. Henry George. Fairhope is the name of this unique colony, and its members appear to be as happy and contented as one could expect to find a community of one year's experience. The fundamental principles of the community are thus set forth in the *Fairhope Courier*: "That which nature provides is the common property of all God's children; that which the individual creates belongs to the individual; that which the community creates belongs to the community."

These enthusiastic advocates of the common ownership of land have chosen for the site of their interesting social experiment one of the loveliest spots in the South. From the water-shed about two miles back in the country the ground slopes gently towards the bay, and ends in a steep bluff of some fifty feet in altitude, thus affording an excellent system of natural drainage, while along the entire water-front a thick growth of oak, cedar, yupon, holly, pine, and magnolia forms a beautiful screen of perpetual foliage between the water and the bluff. The entire water-front, for a depth of 150 feet, has been reserved as a public park. The main street of the community begins at the bay, and, climbing the bluff by easy stages, runs back for about half a mile, being lined on either side with the cottages of the settlers. These are neat, substantial frame buildings of yellow pine (which grows here in great abundance), and are constructed in a manner that speaks well for the taste and skill of the occupants, while their modern furniture and doorbells are striking innovations in Southern farm life. At the intersection of the two principal streets are the store, the post-office, and the public well. A school building is soon to be erected. Religious services are held in the private residences.

The community owns about 350 acres of unencumbered land, and is, so far, free from debt. It has also constructed a wharf and pier-head. The system of land tenure has already been mentioned; but while the title is vested in the community, the members may obtain parcels of land under leases voidable only at the option of the lessee. The rental of the land is fixed by annual appraisal, according to its natural advantages of fertility and location. The unearned increment is appropriated by the community.

The government of the community is a pure democracy, and the administration of public affairs is vested in an executive council composed of the superintendents of lands and highways, public services, industries, and public

health, together with the treasurer of the community. In order to render all officers directly responsible to the people, the Swiss expedient of the initiative and referendum is incorporated in the scheme of government. Hence any act of the council must be submitted to a communal vote, if ten per cent. of the voters petition it, while, on petition of twenty per cent. of the voters, the question of the dismissal of any officer must be submitted to popular vote.

No taxes other than the rent of land are paid by the members of the community, and all State and local taxes are paid by the community itself. Some revenue is derived from wharf tolls.

The members of the Fairhope Colony are mainly from the Northwest, the moving spirit in the experiment being Ernest B. Gaston, a graduate of Drake University, Iowa. Others whose names are associated with the venture are Alfred Wooster, a Western journalist, and J. Bellangee, sometime professor of mathematics in the University of Nebraska.

It was desired to found a community which should put into practice the principles held by its members, and a committee of two was sent out to find a favorable location. After a long search through Texas, Arkansas, Tennessee, Mississippi, and Alabama, the present spot was finally chosen for the home of the Association. The land was purchased, and on January 14, 1895, the first ground was broken. The succeeding summer was mainly taken up in clearing the ground, but a small crop was raised and sold. For the coming season the amount of land under cultivation will be much greater, and fruits, "truck," and grain will be grown. Of course the main source of revenue is the sale of these products, which are for the most part shipped North and West. A canning-factory is projected for next summer.

Curiously enough, very few of the colonists come from agricultural pursuits. Some of the callings represented are medicine, journalism, gardening, draying, woodworking, and cigar-making. A detective, a sailor, and a "new woman" are also to be found in the community. More of the settlers come from Iowa than from any other State. Some are from Missouri, Kansas, Louisiana, Minnesota, Indiana, Florida, Illinois, and Pennsylvania, while even British Columbia and England are represented.—Respectfully yours,

GARDINER L. TUCKER.

UNIVERSITY OF THE SOUTH,
SEWANEE, TENN., March 28, 1896.

CONCERNING ROCK FISHES.

TO THE EDITOR OF THE NATION:

SIR: In the *Nation* of March 12, in a notice of my paper on the Crania of *Sebastodes*, these words occur: "His [Cramer's] statement that these fishes [the group of Rock-Fishes] abruptly disappear to the southward of the United States to reappear in the temperate and cold waters of western South America, is somewhat incorrect; they retire to greater depths under the tropics—that is all."

This statement may be true, but it is only guesswork. The southernmost limit of *Sebastodes* on the North American Coast is found in the Gulf of California (*Sebastodes sinensis*). The northern limit in South America is found in the Mejillones Islands, off Southern Peru. In other words, not a specimen has been taken between the tropic of Cancer and a point near that of Capricorn. Until we have informa-

tion as to the habits of the tropical *Sebastodes*, we cannot say whether they retire. F. C.

[There are now in print illustrations of Pacific Rock-Fishes, taken at points less than ten degrees from the equator, which will before long enable Mr. Cramer to judge of the actual scientific value of the positive assertions he bases entirely on his lack of specimens or of knowledge.—ED. NATION.]

HIRED GIRL.

TO THE EDITOR OF THE NATION:

SIR: It is not necessary to go back to former generations to find out the origin and use of the term "hired girl," as, on Cape Cod, Massachusetts, it is used by the inhabitants at the present time. The hired girl is usually the daughter of a neighbor; she takes her meals with the family, and is treated in every respect as an equal—as she is.

There are many other terms used on "The Cape," which I have never heard elsewhere. When a person is ill, and confined to his bed, they speak of him as being "sick in his naked bed." A thunder-storm is always called a tempest, etc. In 'The Raiders,' by S. R. Crockett, I noticed the term "naked bed." Why called "naked"? P.

PAU, FRANCE, March 19, 1896.

Notes.

GINN & Co. will shortly bring out 'A Guide to the Study of American History,' by Prof. Edward Channing and Albert Bushnell Hart of Harvard University.

Mr. William Astor Chanler's 'Through Jungle and Desert,' in northeastern Africa, namely: the private correspondence of Ernest and Henrietta Renan, under the title, 'Brother and Sister'; and 'The Geographical Distribution of Mammals,' by R. Lydekker, are just forthcoming from Macmillan & Co.

Houghton, Mifflin & Co. are about to issue 'Four-Handed Folk,' by Olive Thorne Miller; 'Spring Notes from Tennessee,' by Bradford Torrey; the fourth, unfinished, volume of the late Prof. Herbert Tuttle's 'History of Prussia'; 'The Expansion of Religion,' by Dr. Donald, the successor of Phillips Brooks; and 'Pirate Gold,' by F. J. Stimson.

'Motion Songs for Public Schools,' by Miss Mabel L. Pray, photographically illustrated, will be issued immediately by D. C. Heath & Co., Boston.

A play which has had the rare distinction of being represented in this city within a few months in four languages, and by three of the most eminent living actresses, Sudermann's 'Heimath,' has just been admirably translated for the "Sack and Buskin Library" of Lamson, Wolfe & Co., Boston, by Mr. Charles E. A. Winslow. It has been beautifully printed at the University Press in Cambridge, and tastefully bound. The title, "Magda," is that under which this very modern drama is given by the incomparable Duse, whom no one should neglect to see in a rôle so well adapted to her power to move and to charm. The reading of Mr. Winslow's refined translation will be a most valuable preliminary.

Mr. William Kent, author of 'The Mechanical Engineer's Pocket Book' (John Wiley & Sons) is evidently well qualified by talent and

experience for his task, and his book, for industrial engineers at least, is well in advance of any of its predecessors, as Molesworth, Haswell, or Nystrom. In the thousand or more closely printed pages dealing with general or mechanical engineering matters there seems to be little or nothing either superfluous or criticisable. While the book deals to only a small extent with matters purely electrical, the main body of the matter contained in it is of nearly as great value to electrical engineers as to their mechanical brethren. It is unfortunate that the few pages (less than fifty) which relate distinctively to electricity do not contain a better selection; and while we cannot expect all knowledge to be contained in one book, we must regret the admission of doubtful matter in a province with which the author can scarcely be expected to have an intimate acquaintance. Reward awaits the man with the necessary ability, experience, and industry to compile an electrical engineer's book as satisfactory in its special field as is Kent's book in the mechanical field. The typography of this volume is remarkably good.

The appearance, in an eighth edition, of Legouvé's 'Histoire Morale des Femmes' (Paris: Hetzel) reminds us anew how unfailingly the charm of literary beauty may be relied upon to save from oblivion works otherwise mainly of temporary interest. It should be said, however, that only part of the claims advanced in this eloquent plea for justice to woman—first published nearly half a century ago—have since been realized. The gracious and high-minded author of the book, now the Nestor of French Academicians, may therefore hope to see its influence continue among the younger generations. As a chapter from the history of civilization in France the work may well be read with interest and profit.

That Georges Ohnet is not a literary artist has been repeated *ad nauseam* by every French critic who values his own reputation. That he cannot write like the author of 'Le Lys Rouge,' or the author of 'Les Demi-Vierges,' or the author of 'La Cendre,' has become a truism repeated in every *chronique littéraire*. He is sentimental, wishy-washy, flabby, namby-pamby, and all the rest of it. Nevertheless, his books sell nearly as well, if not quite as well, as those of Zola, and 'Le Maître de Forges' is a success on the English and on the American stage, and not a failure on the French. Ohnet has written poor work, it is true, but he has also done good work, and at least he knows how to write a novel which is interesting without being obscene or sensual, which contains well-drawn characters not analyzed to weariness, and can tell a story bright enough to be read from start to finish without a pause. Such a story, and forcible withal, is 'La Fille du Député' (Paris: Paul Ollendorf), somewhat romanesque, and introducing the now almost inevitable priest, though in modest fashion, a very charming figure of a young girl who does not put passion above duty, a young Frenchman wonderfully like a decent American or clean-run Englishman, and a capital Socialist Deputy, most faithfully depicted as to his convictions and inconsistencies.

'Le Roi Apépl,' by Victor Cherbuliez (Paris: Borel), is a brilliant little novel, with all its author's qualities in evidence. The subject is by no means new: the rescue of a fine young fellow from the hands of a designing woman. The rescuer is a delightful old diplomat, clever, cool, and witty, who circumvents intriguing mother and fascinating daughter, and brings about their total discomfiture. The novel is not one to be read be-

cause it is naughty, for it is not this, but simply because it is a capital story, very well told by a very clever writer.

The Comtesse de Martel, whom everybody knows as "Gyp," the audacious, the amusing "Gyp," has given us another book, 'Le Bonheur de Ginette' (Paris: Calmann Lévy), which, however, is not in any respect up to 'Le Mariage de Chiffon,' though the heroine recalls at times that very attractive young lady. It is a work which disappoints us when two-thirds read, for just there Gyp goes off into the tiresome old beaten track of illicit love, though Ginette has up to this point shown too much force of character and individuality to render intelligible her fall from grace, common sense, and womanliness.

'Aus meinem Leben: Erinnerungen und Rückblicke' (Stuttgart: Nägele) is the fragment of an autobiography by the eminent naturalist Carl Vogt, who died in Geneva, Switzerland, on May 5, 1895. He was born in Giessen, July 5, 1817, and was descended from a long line of rough-hewn and sturdy ancestors, who belonged for the most part to what he calls "the honorable guild of butchers." The first chapter, entitled "Die Stammfamilien," is a series of realistic sketches of these rude and robust forefathers, with anecdotes illustrative of their character. Then follow three chapters on his native town and its inhabitants, the gymnasium and university, and his own experiences as a lad and a student. His strictures on the methods of instruction are severe and doubtless well deserved. Modern European history and literature were utterly ignored, and there was never the slightest intimation given in the school that such persons as Lessing, Goethe, and Schiller had ever existed. Vogt joined Agassiz and Desor at Neuchâtel in August, 1839, immediately after having taken his doctor's degree at Berne, where his father was professor of clinical medicine. He speaks in the highest terms of Agassiz's ability as a zoölogist, declaring that he never met a man endowed with equal talent in this department of natural science. The volume ends with Agassiz's departure for America in 1846. It was Prof. Vogt's intention to complete this autobiography, giving an account of his sojourn in Paris and Italy, his political activity during the Revolution of 1848, his subsequent scientific studies at Nice, and his life at Geneva, where he was appointed in 1852 to the chair of geology in the university of that city; but his death occurred before he found time to execute his plan.

Debes's 'Neuer Handatlas' (Leipzig: Wagner & Debes), which for some time has been appearing in *Lieferung* fashion, is now complete and becomes a sharp competitor of the other excellent atlases in Germany. That country naturally receives the most attention. The lands of the Empire and those neighboring from Paris to Russia, and from Jutland to Genoa, are treated in surprising detail on eleven double-page maps. Each of the other European countries is represented by one double page map; and twenty-two such maps are devoted to countries outside of Europe, many of them being more complete and exact than are to be found in almost any other work, e. g., Palestine, Eastern Asia, and, more especially still, the German colonies. One map is devoted to North America, one to the United States, and one to the Eastern States of the Union. The climatological charts are worthy of special mention. The book is provided with an admirable index having over 150,000 geographical names. The mechanical preparation of the work is the very best in every particu-

lar. Like many other admirable German books, this atlas is sold at an astonishingly low price—thirty-two marks.

Pure science predominates in the *Geographical Journal* for March. In the opening article Prof. J. Milne treats of the movements of the earth's crust, with special reference to his observations of earthquakes during a twenty years' residence in Japan. These have had unexpectedly practical results in demonstrating the value of certain methods of building, by following which "the security of life and property is greater than it was in former years" in that country. The Government has established a bureau for earthquake investigation with 928 stations, and has endowed a chair of seismology at its university. Next follow an account of the researches of the Swedish oceanographers on the movements of the surface waters of the North Sea, and a description, by Mr. W. L. Sclater, of the geographical distribution of the mammals of the Ethiopian region. Each of these papers is illustrated with diagrams and charts. There is also a map of Siam showing the recent treaty boundaries as well as the French and English spheres of influence, and a communication from Prince Henry of Orleans, narrating his remarkable journey from China to India. His route was the shortest and most direct between the two countries, and has long been searched for by Englishmen without success, but it proves, unfortunately, not to be "practicable for trade."

The *Scottish Geographical Magazine* for March contains a vivacious account by Miss M. W. Kingsley of some incidents in her recent extraordinary journey in western equatorial Africa. She gives very graphic pictures of the abundant animal life on the Ogové River—hippos, elephants, and crocodiles—of the swamp through which she waded for two hours "up to our chins all the time, and came out with a sort of astrachan collar of leeches," and of her Fan companions, whose cannibalistic propensities she describes with a cynical humor. The most interesting incident was an encounter with five gorillas, two of whom were "well over six feet." "When they passed from one plantain-tree to another across the clear ground, they waddled along in a most inelegant style, dragging their long arms knuckle downwards on the ground." But when disturbed, they displayed an amazing celerity. "I have seen various wild animals one time and another in their native wilds, but I have never seen anything so grand as a gorilla going through the forest. It is a powerful, graceful, superbly perfect trapeze performance." Sir D. P. Chalmers, recently Chief Justice of British Guiana, contributes an interesting sketch of that colony. He believes that its value lies "rather in its resources than in their actual present development." Though the sugar industry has declined, yet the export of gold has increased from 250 ounces in 1884 to 122,935 ounces in 1895.

The first four parts of *Biographische Blätter* (Berlin: Ernst Hofmann & Co.; New York: Lemcke & Buechner) compose volume one, and prove a worthy conception to have been worthily carried out. The "portraits" or sketches are mostly of Germans, and in the table of contents we remark one Englishman (Browning), one American (Holmes), one Russian (Bakunin), two Italians (Cagliostro and Pio IX., queer bedfellows), and half-a-dozen Frenchmen. There is considerable diversity in the matter. In part II., for example, is a series of interesting letters from and to William von Humboldt, including one from Prof. G. F.

Welcker of Bonn, pointing out Rousseau's 'Héloïse' as the source of Schiller's song to Emma, and of the beautiful chapel scene with the corpse of Otilie in Goethe's 'Elective Affinities' (*Die Wahlverwandtschaften*). In part iv. we meet with two letters of the late Karl Hillebrand on reading as a means of culture, with a systematic outline, and five letters of E. M. Arndt's, written from 1844 to 1849. The *B. Blätter* is handsomely printed in the Roman letter.

In the last number of *Cosmopolis* there is a somewhat curious article by Herr E. Engel—an "appreciation" of the French Symbolist poets which lacks nothing in point of severity. Mr. Engel does not admit that the poets of the Symbolist group have any talent whatsoever. He makes, indeed, or half makes, an exception in the case of Verlaine, since he admires even profoundly the poem that begins:

"Il pleure dans mon cœur
Comme il pleut sur la ville."

But this he thinks is the only true lyric that Verlaine ever wrote. As to the rest, the younger men, like Maeterlinck, get but hard measure; they are nothing but so many "fumistes," and their vogue is due solely to the wilful obscurity of their work.

About a month ago the *Figaro* published an enlarged reproduction of the new model for French postage-stamps, for which a commission was given, under the ministry of M. André Lebou, to M. Grasset, the decorative artist. This showed a certain dryness in its design and execution which recalled the work of some of the old wood-engravers; but its archaism was too plainly a result of force of will and of main strength to be entirely pleasing. Since then both *L'Illustration* and the *Revue Encyclopédique* have given facsimiles of the new stamp unenlarged. In these the work of M. Grasset is seen to much better advantage: the figure of France in it losing its stiffness, and becoming much more youthful and graceful. But this amelioration came too late to save the stamp. M. Grasset's drawing has been rejected by the Ministry, and another trial is to be made.

Lilies and morning-glories and passion-flowers, with many spring flowers, furnish forth the customary Easter output of colored booklets and cards by L. Prang & Co. They are adapted to many tastes and purses.

The recent action of the Congregation at Oxford, and of the Senate at Cambridge, in regard to granting women students B.A. degrees, as a matter of fact leaves the whole question of degrees for women in *statu quo*. At Cambridge there was no opposition to the resolution providing for a syndicate to inquire into the whole subject, the opposition having gathered its forces to defeat the second "grace," nominating the syndicate, which was rejected by only 186 votes to 171, and this on the score that some of the members were too closely identified with Girton and Newnham Colleges. At Oxford a more reactionary spirit prevailed: the various resolutions about degrees, diplomas, and certificates were rejected one after another, and resolution No. 5 (framed by the opponents of any recognition of residence or the complete course of study for women), providing for a diploma for any and every examination, was lost by only the narrow majority of 4 (140 to 136). It is not difficult to read between the lines of resolutions, debates, and votes, and to see that both Oxford and Cambridge must, in the near future, grant their degrees to those women whom they have instructed, examined, and endorsed.

It is announced that the "Antigone" of

Sophocles will be represented at Athens this year, during the celebration of the Olympic Games. It will be performed in the theatre of Dionysos, at the foot of the Acropolis, where very likely it may have been heard centuries ago. A committee, composed of competent persons, is at present engaged in arranging for the music of the play and the *mise en scène*, as well as in putting the ruined stage and amphitheatre into the best condition possible for the representation. The tragedy will be played by amateurs, students and composers.

The *New England Historical and Genealogical Register*, published in Boston by the Society bearing a corresponding name, which was incorporated in 1845, has now entered upon its fiftieth volume. Its indispensableness to all who engage in genealogical research is known to the well informed, and a complete set is a desideratum for every public library. Its indexing began in a day when the art was ill understood and little appreciated, and only within the past half-dozen years has it been competent. It is now proposed to make a consolidated index to the whole series, "comprising subjects, places, and persons," the last arranged by Christian names as well as by surnames. The mere compilation will cost \$3,000, but the Society foresees no difficulty in raising the funds for printing if the preparation is secured. It accordingly invites contributions to the sum named in any amount, and will make a beginning when \$1,000 has been subscribed. Communications and contributions may be addressed to John Ward Dean, editor of the *Register*, at 18 Somerset Street, Boston.

—The fine edition of the Works of Edgar Allan Poe (Chicago: Stone & Kimball) is now complete in ten volumes, five of tales, four of literary criticism and miscellaneous writings, and one of poems. Mr. Woodberry's notes on the criticisms supply names of periodicals in which the articles appeared, dates, and in fact all the information that can be desired by the most curious. Longfellow's letter, exculpating himself from the charge of plagiarizing Motherwell's ballad, "Bonnie George Campbell," shows that Poe might have gathered from the New England poet some salutary ideas about his own specialty—taste in literary composition. With the notes on the poems a complete variorum is printed for the first time, the editors having thought this desirable, "partly because there is no such illustration in literature of the elaboration of poetry through long-continued and minute verbal processes, and partly because so large a portion of the verse written by Poe perished in those processes." Mr. Stedman's introductions to these two divisions of the Works are as interesting, thoughtful, and discriminating as is that to the Tales. For the preservation of Poe's critical writings apart from those which deal with what it is art's function to express and the technique of expression, he gives perhaps the only very good reason, saying that though they might not have been worth much if produced in any other period, "in consideration of the man and the time—as a part of our literary history—they have a very decided value." After considering the nature and quality of Poe's lyrical genius and the violently different opinions about it expressed by authoritative writers, Mr. Stedman concludes definitely that "a distinctive melody is the element in Poe's verse that first and last has told on every class of readers—a rhythmical effect which, be it of much or little worth, was its author's own; and to add even one constituent to the resources of an art is what few succeed

in doing." The bibliography of English and foreign editions is careful, and even the index has not been slighted. If a glimpse of the edition could be waited to the poet, "within the distant Aldenn," the perfection of its make-up might almost persuade him to forgive the unflattering justice of some of the comments on his life and works.

—In the latest Report (1892-93) of the Commissioner of Education, which has just been distributed, we notice some special features, besides the usual elaborate statistics and compilations. First of all, the whole of Part II., covering 800 pages, is devoted to "Education and the World's Columbian Exposition," under which general heading are given programmes, addresses, papers, and notes on educational matters as far as related to the Exposition; furthermore, reports and comments on the educational exhibits and topics suggested thereby, by several American and foreign authorities. Among the latter, Dr. Emil Hausknecht's article on the American System of Education, and Prof. A. Riedler's on American Technological Schools, are noteworthy as productions of thoroughly competent and strikingly impartial observers. Then, the large number of papers read by eminent librarians before the World's Library Congress are here gathered into a valuable set. Prof. Hinsdale of Ann Arbor contributes to the Report a series of documents relating to earlier American educational history, dealing mainly with legislative and constitutional provisions—a useful compilation, since many of the documents are drawn from sources not easily accessible to students. The Commissioner has also incorporated in his official volumes the now famous Report of the "Committee of Ten," with comments thereon by leading educators (vol. ii., chap. 2); and, considering the prominent place which this educational classic—for so it may well be termed—assigns to the study of geography, it seems appropriate that a special chapter (vol. i., chap. 7) has been devoted to recent developments in the teaching of that subject in the principal European countries. Finally, a complete subject-index to all the papers read before the National Educational Association since its first organization is to be mentioned as a valuable part of this Government publication.

—Gaston Boissier has suffered many things at the hands of a translator of his 'Promenades Archéologiques: Rome et Pompéi.' The original is a pleasant book enough, made up of articles contributed to the *Revue des Deux Mondes* between 1866 and 1876, and revised and corrected here and there in the course of the three or four editions through which it has passed in the French. In spite of the contradictions sure to attend upon such a plan (for example, the excavations of the temple and house of Vesta are described in the first part of the chapter on the Forum, while in the third we are told that the excavations have not yet progressed so far), yet the book has a charm of its own, and, without professing any great depth, it is still both useful and interesting to the general reader. In particular, the chapters on the Catacombs, on Hadrian's villa, and on Ostia contain matter which is not conveniently collected anywhere else in English. A good translation would therefore have been welcome. But Mr. D. H. Fisher's (under the title of 'Rome and Pompeii,' New York: Putnam), in its stiffness and dearth of idiom, reads almost like the effort of a schoolboy. "Tribune

of harangues" (*tribune aux harangues*), "an ingenious machine to shorten the work of plan-raising" (*une machine ingénieuse pour abréger le travail de la levée des plans*), and "the memory of Caligula is not less lively (*vivant*) on the Palatine"—such things are little more than transaliterations. Delphic oracles were nothing to such an utterance as "the right of the jolly fullers was privileged to amuse the people," while Dionysius and the Dioscuri, masquerading under their French names of Denys and Dioscures, awaken the suspicion that Mr. Foster is not over-familiar with ancient literature. This suspicion becomes a conviction when we find *Ancyrae* for *Ancyra*, *virginis* for *virginio*; and *oculos* in Ovid's famous verse—

"Inque oculis facinus barbara mater habet."

And Scylla for Sylla caps the climax—for we are willing to suppose that "parson" is a mere misprint for "person" in the description of the well-known caricature of the Crucifixion.

—From the records of the Roman Inquisition, preserved in Trinity College, Dublin, supplemented by documents in the Venetian archives, Count Ugo Balsani has put together, clearly and instructively, a very curious and interesting story regarding the remains of Fra Paolo, which is printed in the *Rendiconti della R. Accademia dei Lincei*. When Sarpi died, in 1622, the Signoria proposed to honor him with magnificent obsequies and a monument, but his Servite brethren preferred to bury him secretly, fearing, in view of some attempts to steal the body, that it might in future be exposed to indignities. Its place of interment was forgotten until, at the end of a hundred years, in 1722, it was discovered and identified in the course of some repairs to the altar of Our Lady of Sorrows in the Servite convent. Except in the portion of the head wounded in the attempted assassination of Sarpi, it manifested the attribute of sanctity in the absence of decay, and popular devotion was not slow in exhibiting itself; miracles speedily began to multiply as cures were sought through supplications for his suffrage, and votive tablets recording them were hung up. When the body was returned to its coffin it was accompanied with a parchment, signed by the prior and brethren of the convent, attesting its identity and lauding his merits.

—News of this untoward event was conveyed to Rome, where the Inquisition and the Servite General at once exerted themselves to neutralize its dangerous tendencies. The Papal Nuncio, the Inquisitor at Venice, and the Servite Provincial, Padre Bertolli, were ordered to use every influence with the Signoria to put a stop to these uncanonical proceedings, and more especially to have the body transferred to the common sepulture of the brethren, where its identity should be irrecoverably lost. Active correspondence and still more active intrigues were set on foot, which were partially successful. The Signoria gave the Servites to understand that the miraculous cures must cease; the parchment was replaced with a less laudatory inscription on paper, and the coffin was securely fastened with locks, of which the keys were retained by the authorities. A woman named Gabrielli, who had been cured by Sarpi's intercession, was induced, through her Carmelite confessor, to withdraw a votive tablet which she had suspended. Politic deference to Rome led the magistracy to yield thus far, but it steadfastly refused to undergo the humiliation of treating with indignity the

corpses of the great citizen who had incurred the undying hostility of the Curia by his defence of the sovereignty of the Republic. In this it was firm, and, when the Provincial Bertolli made himself too objectionable by his persistent intrigues to effect it, he received a peremptory order to leave Venice. In communicating this to his General, he sought to enhance the merits of his persecution by the unhappy device of forging a letter of condolence to himself from the secretary of the Supreme Tribunal. A rumor of this got out, the Government arrested him in Padua, and, on his confessing the forgery, condemned him to five years' imprisonment "in uno de' quattro cameroti all' oscuro." Venetian dungeons were not salubrious; he was released after three years, broken in health and fortune, to get scanty relief from the Holy See, which did not care at the moment to arouse the susceptibilities of the Republic.

DODGE'S 'GUSTAVUS ADOLPHUS.'

Gustavus Adolphus: A History of the Art of War from its revival after the Middle Ages to the end of the Spanish Succession War, with a detailed account of the Campaigns of the great Swede, and of the most famous Campaigns of Turenne, Condé, Eugene, and Marlborough. With 237 illustrations in charts, plans of battle, armor, etc. By Theodore Ayrault Dodge, Bt.-Lieut.-Col., U. S. A., retired, etc., etc. [Great Captains.] Boston: Houghton, Mifflin & Co. 1895. 8vo, pp. 864.

THE 'Gustavus Adolphus' is the fourth in the important series of military memoirs from Colonel Dodge's pen. Each has been a welcome contribution to military history in English dress. The last is not least in the series, for a satisfactory connected treatment of the period outlined in the title-page has not been easily within reach of the English reader. Half the volume is devoted to Gustavus; and after the death of the Swedish King in the battle of Lützen, there follows a briefer narrative of the remaining campaigns of the Thirty Years' War and of the latter half of the seventeenth and the first decade of the eighteenth century.

It is more or less an arbitrary selection which limits the number of great captains to six. Some of the forgotten names of all ages may be quite as worthy of the distinction as Gustavus, and among those of his own century who are made subordinate in rank to Gustavus, it is fairly debatable whether Turenne and Marlborough were not quite as great generals as the Swede. The passion for classification is a universal human trait, of every age and clime. The sacred numbers were known before Pythagoras. Trinities are found in every department of nature. We group things in sevens because there are seven days in the week, or in dozens or half-dozens on the pattern of the signs of the zodiac or the number of the holy apostles. There is something of sophism, or at least of question-begging, in every such selection of a group.

It is noticeable, also, that each of the selected half-dozen is a sovereign ruler, except Hannibal; and his distant separation from Carthage made his case very like that of an independent prince waging war on his own account. This means more than at first meets the eye. Turenne's greatness was in spite of being often thwarted by Mazarin and Louvois, as Marlborough's was often clipped by the vetoes of the Dutch Deputies. The King-General, like Gus-

tavus, or Frederick, or Napoleon, was "The State" in Louis the Fourteenth's sense, and his military plans ruled the State policy instead of being subordinated to it. To compare Turenne to Gustavus in any satisfactory way, we must make full allowance for this subordination to the civil power, and estimate his accomplishment with careful consideration of the limitations on his power and his means. Did he show as much resource and ability in view of these limitations? is the question. The problem is not easy to solve, but, as we study his action and his thought, his executive energy and courage, with his aims and ideas, we get to feeling that Turenne was a leader one would love to follow with an enthusiastic confidence to the full as great as could be felt for Gustavus; and it is very much so with Marlborough also.

Colonel Dodge is of the opinion that Prince Eugene has been belittled by English writers in his association with Marlborough. It may be so, and in that case a judicial criticism of the actual offenders would have historical value. To carry weight, however, the criticism must be really judicial. The Colonel says: "It is because we English-speaking peoples slur over the deeds of all but our own heroes that we are wont to make Marlborough the only General of his day" (p. 711), and while he says also that "all nations suffer from want of perspective in gauging their own military history," he adds, "but we Anglo-Saxons are almost the worst offenders." Our reading of military history does not bring us to the conclusion here stated, even in the case used as an illustration—that of Waterloo. It would seem, rather, that whoever reads the French, German, and English histories, although they will agree that there is a good deal of human nature in men of all nations, will also conclude that there is no specially bad eminence for the "Anglo-Saxon." But that discussion would take us too far afield. Colonel Dodge's remarks are apropos of his estimate of Marlborough's strategy in marching from the Low Countries to join Eugene on the Danube and fight the battle of Blenheim. He says:

"It is quite inaccurate to call Marlborough's unopposed march an unheard-of enterprise. . . . The bald fact is that Marlborough marched to the Danube because, as all the military world knew, he was needed there; but he does not even appear to have had any immediate strategic objective. He was only, like the true soldier he was, marching to the sound of the guns. In common with the others, he saw that the allied cause could be best helped on the Danube, because the French were most seriously threatening this section."

This extract bristles with evidence that, in his advocacy of Prince Eugene, the author strangely misjudges Marlborough's strategy, and "suffers from want of perspective." Historians of repute do not generally speak of Marlborough's march as "an unheard-of enterprise," but they call it a very brilliant piece of strategy, which proved him to be a general of the larger kind and not merely a "battle-captain." He could have had plenty of work nearer his camp. In the Palatinate and in Alsace he could have found enemies for the seeking; but he chose to give them the slip and make a flank march past them, half across Europe, to reach decisive results instead of partial ones.

But it was "unopposed"! So are all strategic marches proper. Was Napoleon opposed in his march from Boulogne to Ulm, or over the Alps to Marengo? The strategy in its very essence consists in the wise transfer of an

army "unopposed" to the decisive and advantageous terrain of battle which the general has chosen in advance. If he fought his way there, it would lose the name as well as the character of a strategic movement. As Jomini well states the principle: "Il est un principe essentiel dont il ne faut jamais s'écarter à la guerre: c'est de marcher au point stratégique décisif avant de combattre, et de n'engager l'affaire que quand on est parvenu à s'en rendre maître." (*Hist. des guerres de la Rév.*, L. III., ch. x.).

Again, Marlborough marched "because, as all the military world knew, he was needed there": he saw this "in common with the others." Then why did not the others meet him on the way, when the French had sixty thousand men along the Rhine to his thirty thousand? It is rare that the warmth of advocacy so blinds an author that he contradicts what he has said on the preceding page; but in his zeal to belittle Marlborough Col. Dodge has done this, unless the French were not in "the military world." He had just said:

"Becoming aware of his advance, the French seemed to lose their heads; they grew fearful for their Alsatian fortresses, particularly Landau, and quickly concentrated here from the Netherlands, the Moselle, and the Middle Rhine all the troops of Villerot, Coigny, and Tallard, nearly sixty thousand in the aggregate, to check Marlborough, whose intention they could not divine."

The words we have italicised tell the story. Marlborough's strategy was the splendid success "the military world" has always taken it to be, and he marched from Coblenz up the Rhine to the Neckar and thence over the watershed into the Danube valley "unopposed." That was no small part of his glory. The victory of Blenheim consummated it.

Col. Dodge knows all this as well as anybody, but he is suffering momentarily from the psychological effects of warm advocacy of Eugene, and these disturb his vision as to Marlborough. This becomes still more plain if we compare his treatment of the two generals in their respective campaigns of 1705. The outline of Eugene's campaign was this: He was ordered to Italy with 28,000 men, to co-operate with the Duke of Savoy, who was with difficulty holding the French, under Marshal Vendôme, at bay at Turin. The latter had a large army scattered in garrisons, so that he took the field against Eugene with inferior numbers, often with less than half. He blocked the way against Eugene on the west side of Lake Garda, between the mountains and the lake, and held him there for a month. Leaving a subordinate in command, Vendôme went about other business. Eugene turns the left of the forces in his front, and marches to Brescia and on to Romanengo. This brought Vendôme back, who stopped Eugene's progress. The latter did not offer battle, but resorted to manoeuvring. Vendôme out-maneuvred him, checking him at every turn. On the 10th of August Eugene stole away by a night march, hoping to cross the upper Adda and approach Turin that way. Vendôme overtook him and again barred the way with 9,000 men. Eugene stole back, hoping to crush a detachment Vendôme had left at Cassano, but the latter foiled him again and faced him in a position difficult of approach. Eugene attacked with more than double numbers, but was repulsed and himself wounded in a bloody combat. For two months now the armies remained face to face, when Eugene tried another flank march, was again checked, and Vendôme captured Soncino and its garrison under his nose. The

Prince now gave it up, and early in November started for winter quarters near Mantua. Vendôme again headed him, and forced him back to the west side of Lake Garda where he began in the spring.

Col. Dodge's comments on this are all apologetic. He concludes that "Eugene had done well for the Duke of Savoy. He had kept Vendôme so busy that he could not besiege Turin; and while he had not been able to join his ally, he had accomplished the spirit of his task if not the letter."

Let us turn now to Marlborough's campaign of the same season in the Netherlands. By the plan agreed upon among the allies, Marlborough and the Prince of Baden were to have operated together from the line of the Moselle and Saar. The forces, by the fault of the Governments, were not forthcoming by midsummer, and Marlborough was called back to meet a vigorous advance of the French army under Villeroi, who had brilliantly taken the initiative there, capturing Huy by assault and besieging the citadel of Liège. On his approach the French raised the siege and withdrew within the entrenched lines of the Méhaigne, which, according to the theories of those days, were regarded as nearly impregnable. Marlborough manoeuvred to mislead Villeroi as to his point of attack, succeeded, and carried the lines by a brilliant assault at Léau. The French fell back behind the River Dyle. Marlborough planned an attack there, and opened with preliminary success, when the Dutch commanders flatly refused to go on. He manoeuvred Villeroi back to Waterloo, and had issued his orders for attack when the Dutch Deputies interposed their veto.

Nothing can be plainer than that Marlborough was master of the situation, and performed beyond criticism everything devolving upon a general, but was thwarted by the civil authorities, who had a veto upon his operations. But how does his treatment by our author compare with that of Eugene? It must be said that it is studied depreciation. We are told:

"This campaign must be pronounced a failure. Though it is true that the Duke was not to blame for his lack of support, and had many things to contend against, yet these are the same conditions which neutralized the best efforts of many another general of his era. And though, as is so often asserted, it is true that Marlborough never lost a battle or failed to take a place he laid siege to, it is also true that, from one or another cause, he conducted as many barren campaigns as any of the other generals whom we place in the same rank with himself."

This is not judicial. Contrasted with the apologies for Eugene's campaign of the same year, the bias is too evident. It is intimated, but not asserted, that this was a "barren campaign" from some lack of generalship on Marlborough's part. Nothing could well be further from the fact. There is also a strong suggestion without assertion that the lack of support from the civil authorities was a more or less doubtful apology for deficiencies of his own. The detailed evidence in the English authorities would make it impossible for any intelligent critic to assert this openly. Every military student has a warm side for Prince Eugene, but it is doing him an ill service to seek to make him Marlborough's equal by pooh poohing the latter's generalship.

We have commented on what is almost the only blemish in a large book, full of most interesting and clear narrative of military campaigns. The task Col. Dodge has already accomplished in his four fine volumes might

well be a life-work for an industrious man. The present one is an advance upon earlier ones in the system of map illustration. A general chart of central Europe is folded at the back of the book, while outline sketch maps of each campaign are found in the text, with still more detailed plans of battles numerous interspersed. These are uniform in style and artistically neat, adding very greatly to the ease and comfort with which the reader follows the chain of events.

When so much valuable material is given, it is almost ungracious to criticise the composition, and yet there is an impression of haste, if not of occasional carelessness, which detracts a little from the weight the book should have. In these days of stenographers and type-writers revision is necessary to prevent the impression that rapid composition may mean ill-considered substance. It is a little startling to find an event located "way beyond the Isar." The use of the singular form "victual" instead of "victuals" is plainly intentional, but does not seem an improvement on the established usage. "To collect victual," "hard up for victual," "depôts of victual," are phrases that jar on the ear. For a general term, "food" is ready for use, with its half-dozen synonyms in single words or phrases.

GERMAN AND ENGLISH COMMERCE IN ELIZABETH'S TIME.

Hamburg und England im Zeitalter der Koenigin Elisabeth. Von Dr. Richard Ehrenberg. Jena: Gustav Fischer. 1896. 8vo, pp. viii, 362.

THIS learned monograph, while addressed to specialists, contains much to interest the general public. The body of it gives a detailed account of the devious methods by which the city of Hamburg, in the second half of the sixteenth century, endeavored to secure the benefits of trade with England while avoiding an open breach with the other cities of the Hanseatic League, which were, at the same time, engaged in a bitter struggle with the English Government. The introduction consists of a graphic recital of the various causes which enabled England to wrest the supremacy of commerce from Germany, the most important of these causes being the energy and boldness of English statesmen, combined with the lack of unity among the Germans.

The commercial ascendancy which England has enjoyed for now more than three centuries is so familiar a fact that most people will learn with surprise that at the beginning of the modern era Germany surpassed England not only in culture, but also in population, in wealth, and in commerce. The reports of the Venetian ambassadors—the principal authority for the period—are unanimous in stating that at the end of the sixteenth century the population of Germany was twice as dense as that of England. The population of England and Wales was estimated at two millions and a half, which would make its density about equal to that of European Russia of to-day, not including Poland and Finland. In the matter of cash capital Germany was in like manner superior. The richest English merchants were estimated to be worth from \$250,000 to \$300,000, while German firms possessing that amount were considered as being in the second rank. As far back as 1546 the great German house of the Fuggers possessed a fortune of more than four millions of dollars, as appears from their account-books, still in existence. Up to the outbreak of the troubles

in the Netherlands, the English Crown had to place its loans in Antwerp, there not being wealth enough in England. The German merchants, on the other hand, controlled so much surplus capital that for a long course of years they supplied the sinews of war not only to their own Emperor but to his enemies, the kings of France, as well as to most of the European potentates, including the rulers of England.

The standard of living was much higher in Germany than in England, and there was greater luxury in dress and more comfort in habitation. In agriculture, too, Germany was more advanced; the only agricultural industry in which England excelled was sheep-raising, and that was promoted by an extensive enclosure of commons accompanied by wholesale evictions of farmers. Still greater was the preponderance of Germany in mining. Henry VIII. made repeated attempts to induce German operators to come to England and develop its mineral wealth. It was not till the time of Elizabeth that these efforts resulted in the formation of a company of Augsburg merchants with whom were associated a number of English capitalists headed by two of Elizabeth's greatest statesmen, William Cecil and Lord Leicester. It was from the imported German mechanics that the English learned how to conduct the iron industry profitably. In 1528 a German merchant was appointed by the King as "principal surveyor and master of all mines in England and Ireland." In 1560 Thomas Gresham induced an association of German merchants to undertake the urgently needed reform of the English coinage.

Germany was, at that time, in as great a degree as England is to-day, the land of machines and inventions. John Owen, an English Latin poet, published epigrams in 1613 in which he satirized the Germans as being highly skilled in pursuits and inventions which required manual expertness rather than in such as called for acuteness of intellect. This calumny elicited a refutation from a German doctor, who extolled the power and wealth of Germany, and instanced as German inventions of a higher character the Roman Empire, gunpowder, the art of printing, the reform of religion, the medicines of Theophrastus Paracelsus, and the mysteries of the Rosicrucians.

Among the many branches of manufacture in which Germany surpassed England was the cotton industry, which did not exist at all in England down to the time of Elizabeth. What were known as cotton goods were really lightweight woollens. Cotton goods were largely exported from Germany to England, and it was at a later period that they were imitated at Bolton and Manchester and were long known under the name of fustians. It is true that England did a large export business in woollen goods; but English cloths and kerseys were only partly finished products, and had to be finished and dyed abroad, in spite of the great efforts made by the Government to foster the industry. From statistics prepared for Sir William Cecil it appears that in the year 1564-65 the total exports from England amounted to less than £1,100,000, of which more than four-fifths consisted of woollen cloths. German exports were much more varied. The most important class was that of metals and metal goods, especially copper, brass, and brass wire, iron and steel, together with a great variety of tools and implements. Without going too far into particulars, it will suffice to say that down to the middle of the sixteenth century Germany was far ahead of England along the whole line of economic develop-

ment. Further, such trade as England had was to a great extent in the hands of foreigners; that is to say, foreigners did forty-two per cent. of the cloth export, fifty-four per cent. of the export of skins, twenty-two per cent. of the importation of wines, etc. The only branch entirely in English hands was the export of wool.

That England succeeded in wresting the supremacy from Germany Dr. Ehrenberg considers principally due to three causes: (1) the energetic and skilful activity of the English Government; (2) the growing technical and commercial capacity of the English people; (3) the geographical situation of England; but by far the most potent of these was the first. Germany, on the other hand, owed everything (1) to its great natural advantages, and (2) to the industry and dexterity of the middle class of the population. During the middle ages the kings and princes of Europe sacrificed the material welfare of their subjects in their struggles for political power; the cities strove for greater liberties and became the refuge of industry and commerce. If the cities of Germany were more successful in this endeavor than those of England, it was because the German citizen had reached a higher stage of culture, and partly because the princes of Germany were even more incapable than the kings of England of pursuing a wise commercial policy. It is to the free German cities and their union in the Hanseatic League that the commercial preponderance of Germany must be ascribed.

The accession of the house of Tudor at the close of the long wars of the Roses marked the turning point. The Tudors did so much for England because their policy was dictated by the wishes and interests of the nation, which recognized them as its born leaders and revered them with sentiments which are but imperfectly expressed by the word "loyalty." The power of the Crown reached its highest point. Its financial position was strengthened by its confiscation of church property, and, later on, by the readiness of the city of London to guarantee the loans which the Government placed among capitalists abroad. In their foreign policy the Tudors did not aim, like their predecessors and the princes of the Continent, at increase of territory and population, but rather attempted to procure advantageous treaties for the trade and industry of their people. Through long-continued and bitterly waged struggles with the protectionists of the Netherlands, they secured for English cloths the world-market of Antwerp. While in the middle of the fifteenth century England exported mostly coarse cloths and imported the finer grades from the Netherlands, and shipped its surplus stock of wool there to be worked up, the situation was completely reversed by the end of the sixteenth century. England still got a few coarse cloths from the Continent, but exported immensely of the finer sorts, and required so much wool for its manufacturing that it had to import quantities of it from abroad.

It would lead us too far to follow the author in his exposition of the unflinching vigilance bestowed by the Tudor "citizen kings" on the commercial progress of their subjects. He points out, among many other things, as illustrating the influence of merchants in the government, that Thomas Cromwell, Prime Minister under Henry VIII., was in his youth a merchant, while Sir Thomas Gresham, Cecil's right hand, was a merchant all his life. Concerning the important Guild of the Merchant Adventurers there are many interesting details. Some of their regulations still survive

in commercial usages of the present day, in the constitutions of trades-unions, in the rules of the New York Stock Exchange. Readers interested in such inquiries will derive much profit from Dr. Ehrenberg's book; such as do not know German will find them treated in Professor Ashley's 'Introduction to English Economic History and Theory.'

THE KING'S PEACE.

The King's Peace: An Historical Sketch of the English Law Courts. By F. A. Inderwick. [Social England Series, edited by Kenelm D. Cotes.] Macmillan & Co. 1896.

THE history of the English law courts, beginning with the *Curia Regis* and ending with the Supreme Court of Judicature, covers a period of eight centuries. Notwithstanding all the researches of scholars, our notions of Anglo-Saxon procedure are mainly conjectural. As Mr. Inderwick says: "If A owed B fifty pence, a trustworthy account of the precise course of procedure to be adopted by B to recover his money cannot be given." Anglo-Saxon law was mainly unwritten and customary law, administered by ecclesiastics, and when we speak to day of the common law being unwritten, it is because there once was a period when the great body of it rested in oral tradition handed down from father to son. This fact may explain, in part at least, the divergence between what Mr. Inderwick calls the lawyers' view of the English courts and that of "the philosophers," or, in other words, of the modern students of the Anglo-Saxon period. The lawyers' view—that taken by Coke and the fathers of our system—is usually summed up in the phrase that the King is "the fountain of justice." The philosophers, on the other hand (or some of them), insist that he was merely an overlord, whose decrees might be overridden by the freemen of the county court. Now, whatever view may be held as to the position of the Anglo-Saxon kings, the important question for us is what was the position of the King after the Norman conquest; and that he then became the source from which justice flowed, is shown by the fact that the courts were established by him. Every single important court of original jurisdiction of which we have any accurate knowledge, from that of the chancellor to that of the justice of the peace, is of royal origin. The courts which became established throughout England after the Conquest were the King's courts. The peace which they established was the King's peace, and in process of time these courts supplanted the old gemotes of the Saxons.

On the other hand, justice is older even than the Conquest, and unquestionably the new courts introduced and developed by William and his successors took many of the principles of justice as established locally throughout England and administered them. In other words, the Norman King introduced a new judicial machinery, but not new principles of common right; the ancient common law of Alfred survived and was perpetuated by the very machinery which was destined to blot out that of the Saxon courts. That the King was in the habit of allowing his decrees to be overridden by the freemen of the county court seems very unlikely; but that the King, sitting as a judge at Westminster, might lay down a rule for the disposition of a matter of private right, while at the distance of a day's journey a local custom might prescribe the exact opposite, is not only highly probable, but entirely in accord with everything that we know about our early

jurisprudence. The very notion of uniform law over a wide extent of territory was a novelty, and it is in great measure to the Norman kings that we owe it. This view of the matter seems to be borne out by the recent researches of Messrs. Pollock and Maitland. Mr. Inderwick treats the point as still open, but says that, for himself, he holds to the view of the lawyers.

The discussion of this point suggests another which writers on the history of the law frequently overlook, and that is that at no time during the whole 800 years has the law been a reasoned body of jurisprudence. If we take the law of any century as a test—even that of our own—we shall find that, side by side with principles based on reason and utility, are rules which owe their origin to custom, to superstition, and to accident, to say nothing of others, imbedded in the law for centuries, the explanation of the meaning of which has been completely lost in the lapse of time. When we hear that one T., tried for and acquitted of the murder of Mary A., has an appeal of battle brought against him by the girl's brother in the King's Bench, and that all the judges order a battle to be fought in their presence, but that, the appellant crying *craven*, judgment is again given in favor of T., we are carried back to the days of Ashby de la Zouche and Richard I.; but all this actually happened in 1818, and it was when George III. was King that the aid of Parliament had to be invoked to change the law. Even to-day the imputation of unchastity to a woman will not, by the common law, sustain an action of slander, and judges are constrained to enforce the rule while deploring its existence, and confessing themselves unable to explain its introduction. Vice-versa, in the most primitive period we are continually coming across proof that our ancestors applied rational rules just as we do, though side by side with them we find practices and customs founded upon the grossest superstition. At p. 19 Mr. Inderwick gives some examples of ancient oaths in civil cases. In an action for what we should call breach of warranty of the soundness of a horse, the plaintiff swears, "In the name of Almighty God, thou didst engage to me sound and clean that which thou soldest to me, and full security against afterclaims on the witness of N., who was then with us two." N. then makes oath to the fact for which he is called to vouch. Nothing could be more modern or rational than this; it is exactly the kind of proof that we should ourselves resort to if the art of writing were suddenly lost. Yet with our ancestors and their judges this was merely one kind of proof. Another, equally good, in criminal cases, was the oath of the accused, supported by that of his friends that they believed his oath; another the ordeal by water, the probative effect of sinking being to establish innocence—of floating, guilt (p. 21). Facts like these perpetually warn us against assuming that logical analysis has ever explained or will ever finally explain the law as a whole.

Mr. Inderwick's volume brings out in an interesting way the continuity of judicial administration in England from the time of the Confessor, and the strictly professional character of the bar, historically. The serjeant, for instance, was the King's servant-at-law, as assistant of the Court in the administration of justice, owing duty at once to the client and to the judge. This fact, which is the key to many of the riddles of professional ethics, is a sufficient answer to Lord Brougham's remarkable rhodomontade on the subject of its being the first duty of a lawyer to forget every obligation in the world except that to his client.

The ancient professional character of the bar is at the bottom of the old and sound rule forbidding lawyers to take cases on contingent fees, and not to solicit employment—rules entirely broken down in this community, to its own great loss.

A history of the English courts brings up so many interesting points that it is impossible in a brief notice to do justice to a volume like Mr. Inderwick's. 'The King's Peace' is not literally an alternative title, because one or two ecclesiastical jurisdictions are included, while on the other hand the very important appellate jurisdiction of the House of Lords is not treated at all. A chapter on the obsolete Courts of the Forest possesses much curious interest, and the subject of judicial costume furnishes a topic for several pages, which, in view of the fact that we have begun to go back to costume, even at the corner of Eighteenth Street and Fifth Avenue, is worth the attention of attorneys and counsellors. How many people are aware, one wonders, that the professional costume of England to-day includes the "bands of the Commonwealth" and the head-dress of the Restoration, which have no more to do with the traditional legal costume than the ruffs of Elizabeth or the lace collars of Charles I. (p. 205)—or that, by a very perversity of conservatism, the head-dress now the characteristic of the advocate and the judge was in the seventeenth century worn alike by kings and courtiers, by clergymen and by soldiers, by Jeffreys on the bench and by Titus Oates in the dock? In conclusion it may afford some consolation to the professional reader to know that, bad as legal business is to-day, it was so far worse in the time of Edward VI. that Westminster Hall was in part converted into a market; while during the reign of Mary the Common Pleas had but one serjeant and the Queen's Bench but one counsellor—a desertion of the courts which is said to have been due to the same causes which led to the remarkable spectacle of learned gentlemen appearing in court to argue, it may be, some such matter as a demurrer or a plea in bar, in plate armor—a costume sternly indicative of the underlying principle that the King's peace must be preserved, even if it had to be fought for.

Greenland Icefields and Life in the North Atlantic; with a new discussion of the causes of the Ice Age. By G. Frederick Wright and Warren Upham. Appletons. 1896. 8vo, pp. xvi, 407. Illustrated.

Handbook of Arctic Discoveries. By A. W. Greely. [Columbian Knowledge Series No. 8.] Boston: Roberts Brothers. 1896. Small 8vo, pp. x, 267, 11 maps, 1 portrait.

THE larger of these two volumes, 'Greenland Icefields,' contains material of three kinds, which may be respectively summarised as a description, physical and geographic, of Greenland and its surroundings; an account of the Esquimaux; and contributions to the foundations and theory of glacial geology. To the first belong chapters i.-v. and vii.-ix.; chapter x. is devoted to the Greenland Esquimaux, who are curiously designated as of the "North Atlantic," an ocean few of them have ever set eyes upon; the remainder of the work is occupied with glacial theories and geology. The account of Greenland is of course far inferior to that which has been given by Rink, whose 'Greenland' is copiously drawn upon for data; yet, as a popular account, it is sufficiently full and accurate to convey a tolerably satisfactory idea of the country and its condi-

tions. This has been frequently done before, and the present account presents nothing novel in the way of treatment, but includes a number of good "process" pictures. The chapter on the natives is superficial regarded as ethnology, and seems to have been inserted from a sense of duty rather than for any other reason. It is proper, we suppose, that a book on Greenland should have a chapter on the natives. It is extremely difficult for a casual traveller to say anything new about them, and hardly possible for him to say old things as well as they have been said already. As every new book appeals to a somewhat different circle of readers, Prof. Wright's account of them may serve a useful purpose in spite of its mediocrity.

When he gets upon the ground of glacial geology, a subject to which his contributions are well known, there is an immediate change for the better both in interest and in grasp. This part of the book comprises an account of the exploration of the inland ice, a comparison of the present and Pleistocene ice sheets, a discussion of Pleistocene changes of level around the North Atlantic basin, and three chapters (in which we trace the coöperation of Mr. Upham) on the causes and stages of the ice age, with a concluding summary. We do not discover anything new in the way of fact or theory—quite the contrary—but the summary is excellent and readable, though the standpoint of its authors differs from that of other geologists, in matters principally of detail. In brief, the present writers regard the ice age as due to elevation of the boreal lands and coincident changes of ocean currents, boreal humidity and temperature. They consider the glacial period as continuous, with local or minor oscillations in the extent of the ice sheet. Other geologists differ chiefly, at present, in the extent and duration they ascribe to these oscillations and in their estimates of the elevation concerned. This is not the occasion for a critical review of the general topic, but we may call attention to one point in which more precision would have been advisable. The reader who is not a geologist would be likely to suppose, from what is said, that the period when the boreal lands were covered with forests of a warm, temperate flora immediately preceded the glacial period. As is well known, the Oligocene flora had been extinct for ages, and the whole period of the Miocene and Pliocene intervened between the time of the forests and that of the ice cap. There is no evidence of any Pliocene forests in the arctic region.

In all these discussions the painful iteration of such phrases as "it seems," "it would appear," "it is probable," sufficiently indicates the disproportion between the observed facts and the hypotheses erected upon them. In any condensation, such as is here presented, the hypothetical element is even more conspicuous than usual, for obvious reasons. Bearing this in mind, the reader may obtain from the present volume a very fair idea of the different solutions proposed and of the problems concerned. Many years must pass before the painstaking collection of facts can reach a point where certainty in more than the principal outlines shall be assured. There is good reason to hope that the difficulties will not prove insurmountable.

The latest addition to the Columbian series of handbooks, by Gen. A. W. Greely, condenses the history of arctic exploration into convenient compass for ready reference. More than 50,000 pages of original literature have been gleaned for facts, and the author believes

that no important addition to arctic geography is unreflected to. While the scope of the volume is not intended to include scientific research, yet the more important investigations are noted, and a bibliography at the end of each chapter indicates the sources whence may be had further information, in the form either of narratives of adventure or of original research. The chapters discuss the subject topically, not chronologically, beginning with early northwest voyages previous to 1570, and continuing with accounts of the exploration of Nova Zembla, the northeast passage, Spitzbergen, Bering Straits, the northwest passage by sea and land, Franklin's last voyage, the Franklin search expeditions by land and sea, North Polar voyages, the islands of the Siberian Sea, Smith Sound and Robeson Channel, Franz-Josef Land, the international circumpolar stations, and Greenland, concluding with a chapter on the literature and an excellent index.

In examining the book we have been surprised to find how completely Gen. Greely has succeeded in covering the field in so small a volume, and also, in spite of the extreme condensation, how well the ease and interest of the narrative have been maintained. Under the conditions laid down for the handbook it would have been not unnatural if the text had become dry in its epitomizing, and bibliographic rather than descriptive. This danger has been skillfully avoided, and the result is, what the title implies, a convenient handbook, suitable for reference by the busy man and not distasteful to the inquirer of greater leisure. In all such compilations the question constantly recurs what to retain or to omit, and probably no two authors would come to precisely the same conclusion. Bearing this in mind, we cordially congratulate the author on the success with which his task has been performed, and the editor on having added so creditable a volume to his series.

From the Black Sea through Persia and India.
By Edwin Lord Weeks. Harpers.

We have to thank Mr. Weeks for an interesting and entertaining work which has already seen the light in the form of magazine articles. In company with the late Theodore Child, he started on horseback from Trebizond to cross to India. Although Mr. Child died of cholera in Persia, his companion pushed on to Bushire on the Persian Gulf, from which he took the steamer to Kurrachee.

The first part of his book is made up of a connected account of his travels; but after his arrival in India, where he was on better known ground, the author wisely gives us merely disconnected chapters on a variety of subjects. Even if at times the structure of his sentences is not perfect, he writes decidedly well, for he can be vivid as well as amusing, and what he says not only is worth saying, but is said in such a way as to hold our attention. Here is a description of a landscape in Persia:

"Far beyond the plain, tufted with bunches of dry yellow herbage, gilded by the setting sun, this great plateau rises above us at a distance impossible to estimate in the clear atmosphere; its surface broken up into little hillocks, like the waves of a petrified sea, each crest tipped with scarlet from the glowing west, and each long shadow correspondingly violet; and beyond this again rises another and still higher country of purple mountains, and through the gaps of their serrated sky-lines other and more distant ranges may be discerned faint and far away. Looking into the west as the sun sinks, range after range becomes visible, each less purple and more enveloped in golden haze."

The illustrations, too, are excellent, reminding us that the author is first and foremost an artist—a fact we might otherwise overlook, though his appreciations are certainly artistic enough. This does not interfere with the soundness of his judgment or the keenness of his practical observation in various matters. Thus he shows himself remarkably unprejudiced in his treatment of social or political questions. Here are two instances: "Whatever arguments may be brought forward, justly or unjustly, against the utility of foreign missions in general, there can be no shadow of doubt as to the beneficent results of their work in Persia. During the recent epidemic at Tabreez, the medical department of the American mission (then under the direction of Miss Bradford) did noble work." And again: "Mr. Rabino, the active head of the Imperial Bank of Persia, says, in a letter from Teheran, 'I enclose you various letters and reports from the American Presbyterian missionaries, for whose courageous and devoted labors I, an Englishman and a Catholic, can find no words to express my admiration. Their hospital was positively the only organization for the help of this terribly visited city.' To supplement his statement it is hardly necessary to add that 'these modern Templars have had no incentive in the shape of pecuniary gain, no stimulus in the guise of social success, and not even the poor reward of publicity. Their names will never be inscribed in the Court Gazette of any local four hundred; and the press of their own country, occupied with the conduct and bearing of its social leaders, the presence of royalty, and other matters of vital importance, has no space to chronicle deeds which, if performed by another race and another age, would have been held worthy of undying fame.'"

Compare with the foregoing the following:

"Wherever a medical officer reported on the condition of his men just returned from active service in Burmah or elsewhere, it appeared that the best soldiers, morally and physically, those who were always exempt from such maladies as dysentery, fever, cholera, and rheumatism, were the opium-eaters; they were able to go longer without food or stimulants, and to do more work. The testimony of physicians, both European and native, was almost invariably in favor of the drug when used moderately in the simple form known to native consumers. Surgeon-General Sir William Moore said 'he had often smoked opium, and really did not see where the wickedness and immorality came in. As a matter of fact, one might see more wickedness and immorality in a London gin-shop in half an hour even on a Sunday night than in an opium-shop during a whole year.' It has been found that opium is cheaper than wine or spirits, less detrimental to the system, and just the right agent to stimulate the indolent Oriental nature, as well as to counteract the weakening effects of a vegetable diet and scarcity of food. Many a poor 'Ryot' who can hardly pull himself together for the want of proper nourishment, is enabled by its aid to do a good day's work, while at the same time it serves him as a specific against the maladies resulting from unhealthy surroundings. . . . While scientists, philosophers, and empirics in Europe have been experimenting for ages to find the Elixir of Life, these simple Orientals have contented themselves with producing, by homoeopathic doses of opium, effects analogous to those hoped for from the discovery of Dr. Brown-Séquard; and, if they have not succeeded in renewing their youth, have certainly managed to make it last longer."

We note finally, as prophetic of coming troubles, in Erzerum in July, 1892: "It seems that all Armenians are regarded with suspicion just now on account of a plot against the Turkish authority, recently discovered, in which many of their leading men were implicated."

The Ancestry of John Whitney, who, with his wife Elinor and sons John, Richard, Nathaniel, Thomas, and Jonathan, emigrated from London, England, in the year 1635, and settled in Watertown, Massachusetts; the first of the name in America, and the one from whom a great majority of the Whitneys now living in the United States are descended. By Henry Melville, A.M., LL.B., of the City of New York. New York: Printed at the De Vinne Press. 1896. Pp. 295.

Thomas Halsey of Hertfordshire, England, and Southampton, Long Island, 1591-1679, with his American Descendants to the Eighth and Ninth Generations. By Jacob Lafayette Halsey and Edmund Drake Halsey. With an Introduction by Francis Whiting Halsey. Morristown, N. J. 1895. Pp. 550.

THE Whitney genealogy is one of a class of which we have few specimens in American literature, as it is the history for centuries of a family in England, one of whose branches has taken root in this country. It will be of absorbing interest to the numerous descendants of the Watertown settler, but will find few other readers. We are all interested in the lives of prominent actors in public affairs, either at home or abroad, but the minor agents are too numerous. The first and most important question discussed in this book is the parentage of the emigrant John Whitney. From the lists of passengers for New England, first published by the late James Savage, and often reprinted, it appears that in April, 1635, in the *Elizabeth and Anne* of London, embarked John Whitney, aged thirty-five, Ellen Whitney, aged thirty; John, Richard, Nathaniel, Thomas, and Jonathan Whitney, aged respectively 11, 9, 8, 6, and 1. This list covers twenty-three names, all duly licensed, but without a note of their residences. In a subsequent list of three names by the same vessel the persons brought certificates from the minister at Westminster, England. It seems by this book that John Whitney, son of Thomas W. of Westminster, was apprenticed in 1607 to William Fring, merchant tailor, was made free in 1614; took an apprentice, Robert Whitney (probably his brother), in 1624, and made Robert free in 1632. Again, the record of Isleworth, near London, shows that John and Ellen Whitney had children, Mary, b. 1619; John, b. 1621; Richard, b. 1623. Moreover, in the parish of St. Mary, Aldermary, London, John Whitney had a child Mary, buried in 1626, and a son Thomas, baptized December, 1627. John Whitney also had his son John entered in 1631 in Merchant Taylors' School, the name standing on the catalogue until 1635.

These, we believe, are all the facts obtainable as to the emigrant—the identity of the names of the father, mother, two sons, John and Richard, and possibly a third, Thomas, and their order. The ages in the list of emigrants do not agree with the baptisms, but it is a well-known fact that such discrepancies are almost the rule, whether from carelessness or design. It may also be conceded that John Whitney's record in Watertown is entirely consistent with the theory that he was the John of London, a freeman of the Merchant Taylors' Company, but it is somewhat strange that no evidence is given that he was ever termed "tailor" in his new home. The identification is probable, but by no means conclusive; and the pedigree is, therefore, much less satisfactory than that of some of our emigrants.

The English pedigree is better sustained. It is clear that John Whitney, the apprentice of 1607, was a son of Thomas W. of Westminster.

(see p. 217), who married Mary Bray in 1583, and had nine children, including John, baptized in 1592, and Robert, baptized in 1605. In 1637 administration was granted on his estate, but John is not mentioned, though the younger sons—Francis and Robert—were. This is entirely natural if John was then in New England. The pedigree quoted on p. 209 shows that Thomas Whitney of Westminster was son of Robert, the third son of Sir Robert Whitney of Whitney. The main line of Whitney is traced clearly to A.D. 1242, taking its name from the parish of Whitney, Co. Hereford, on the banks of the river Wye. It was an old and noted county family, flourishing in the direct male line until 1670, when Sir Thomas W. died. He was first cousin, once removed, to Thomas W. of Westminster, but his estates, not being entailed, passed to his sisters. It appears (see p. 210) that John W. of Westminster, son of Robert, evidently the merchant tailor, claimed to be heir male to the whole family, a title of honor, but not necessarily an heir to the land. He may well have been ignorant of any cousins in New England.

The English pedigree is well prepared from sources easily accessible, some what overloaded with general quotations. It is evidently padded to make a book of a size to correspond with the elegance of the printing and the illustrations; but it is padding of good quality and is creditable to the compiler. Though, as already stated, the proofs of the affiliation are not of the first quality, they are plausible, even probable, and are far better than those given in many pedigrees unquestioned in England.

The second book on our list, the Halsey genealogy, is simply one on the familiar American pattern, giving the descendants of Thomas Halsey of Lynn, Mass., in 1637, and of Southampton, L. I., in 1640, who died about 1677. It is a substantial record, well prepared in respect to dates, but disfigured by a system of numbering, "devised by the Rev. John E. Todd, which he has kindly permitted to be used." We are not familiar with Mr. Todd's antiquarian work, but it is a pity that his ingenuity took this form. Why will genealogists abandon the old, tried, and approved methods for useless experiments? We have also a coat-of-arms and an attempt to identify the emigrant—both failures. It seems that there is a family of the name in Hertfordshire, Eng., the present head being Thomas F. Halsey, M.P. His ancestor, William Halsey, in 1633 received a grant of arms for him and his brother James Halsey and their descendants. They were sons of Robert Halsey of Great Gaddesdon Parsonage, and they had brothers Duncomb (who died before 1633) and Thomas, baptized January, 1591-2. This Thomas was living in Naples in 1631, as appears by a letter preserved in his English home. Without the slightest evidence that we can discover in this book, he is assumed to be the Thomas who was in Lynn, Mass., sixteen years later. In this book is a facsimile of the letter written by Thomas Halsey at Naples, 1621, and of the signatures of the Long Island man in 1647, 1648, and 1677. The last three are alike, and are totally dissimilar from the Naples one, except that both are of the style of the early part of the seventeenth century. It would take strong positive evidence to overcome this unintentional proof that the two men were not the same.

It is a pity to see so much creditable work, such a solid contribution to family history, disfigured by an ill-judged introduction and by such an unwarranted scheme of arrangement. It cannot be too often repeated that industry, zeal, and wealth combined may accumulate

the materials of a genealogy, but all may be rendered nearly worthless by a neglect of the established rules for arranging them.

The Structure and Development of Mosses and Ferns. By Douglas H. Campbell, Ph.D., Professor of Botany in the Leland Stanford Junior University. Macmillan & Co. 1895.

UNDER the term "moss," in popular nomenclature, are included a great many sorts of delicate plants which to botanists are not mosses at all. For example, the long gray or black tresses which hang from the trees at our Far South, and which are everywhere called "moss," are pathetically depauperate members of the pineapple family. Anybody who cares to do so, can convince himself of this by comparing, even superficially, the flowers of the Southern "gray moss" with the young blossoms of its nobler relative. Algae, or seaweeds, are generally called sea-mosses, and the lichens of our woods are seldom known as anything but mosses or tree-mosses.

What, then, is a true moss? In the first place, it shares with the plants which, in popular parlance, are improperly denominated mosses, a certain delicacy of structure and diminutive size. But from algae and lichens true mosses differ in the possession of leaves, although, in at least one well-known instance, these leaves are rudimentary. Mosses grow from a microscopic body, known as a spore, which on germination develops into a network of more or less complexity. By and by, at some point of the network, there is produced a bud which may bear a curious resemblance to the flower of the higher plants. In some instances the likeness is so close that bryologists, the specialists who devote their attention to mosses, are wont to speak of this open bud as a flower. Moreover, this "flower" contains reproductive organs which are analogous to but not strictly homologous with the reproductive organs in flowers; it has certain parts to be fertilized, and others which are to provide, at the proper time, the fertilizing agent. The result of such impregnation is the production of a capsule filled with spores, each and every one of which is capable of starting a new moss plant. In this too hasty outline we have not referred to the singular alternation of generations which constitutes one of the most marked features of the group. Such recondite matters are clearly explained in many works, but in few works any more clearly than in the excellent treatise by Prof. Campbell. The life history, as it is the fashion to call it, of mosses and their immediate allies, has been given by him in a very intelligible manner, adapted to the wants of the serious student. Moreover, everything has been brought well up to date; and although there are a few instances of what seems improper perspective, nothing in the whole section devoted to mosses is misleading.

There are two facts respecting the distribution of mosses which are of singular interest, namely, the wide dispersion of species and the caprice which determines their homes. The minuteness and lightness of the dry spores fit them to be the carriers of life over vast distances in the upper air; oceans presenting, in fact, but slight obstacles to their dissemination. Hence we find the same species distributed over immense areas and encroaching on widely separated continents. Perhaps one of these days, when more attention is given to very minute differences between different individuals of the same species, it may turn out that, after effecting a safe landing on a new continent, plants yield to slight but neverthe-

less decided climatal differences. But if these climatal differences have really begun to act on these hardy emigrants, and have really initiated natural selection, the work has been thus far exceedingly slight and practically unappreciable.

Few sorts of plants display as much determination mingled with capricious whimsicality in the choice of a home as these minute mosses. Some dwell only on the mortar between bricks of a wall, while others choose decomposing bones, and others still, clean clay soil. In a few cases the habitat may be safely used by the beginner as an aid in the determination of the species.

It is in the sections given to ferns and their kindred that the author appears to the best advantage. For a good many years he has made the development of ferns a special study, and with substantial results. It is known in a general way even to the general public that the story of a fern's life is peculiarly interesting. It is widely known, too, that the mystery of its reproduction has been fully cleared up. Even elementary students of botany know that the spore of the fern does not produce at first a fern plant, or anything that might be mistaken for a fern plant, but, rather, a transitory film-like structure, of minute size, on the earthward side of which are developed the reproductive organs. By the interaction of these there arises on the film a diminutive bud, which speedily unfolds in one way or another into what people call a fern. Meanwhile in most cases the transient film, on which this work of reproduction has taken place, perishes and disappears. Ferns have, therefore, from their earliest state, much to interest botanists and all who care to study living things.

The unfolding of the leaves, or, more properly, the fronds, of ferns, is one of the strangest developments in nature. For the most part they uncoil in graceful curves, keeping for a while the shape of a crozier, and then extending in curves of greater amplitude and more tender beauty. Even in the giant ferns of the tropics this gracefulness of outline is never wholly lost. From the tree ferns of the equatorial belt to the shrinking ferns of our colder climate is a long step, but in the structure of the one we can trace the other, and by parity of reasoning we can take the far longer step back to the first great coal period. The record of development of ferns and their kindred, although broken here and there almost beyond deciphering, shows us that the devious pathway from the lower to the higher forms of life has been presumably without interruption of catastrophe. This is perhaps as well shown in the elder and latter ferns as anywhere else. It is this hint of steady although uneven progress from lower to the higher, given by these plants, that has rendered them so highly interesting to the biologist. From start to finish they are full of interest. Prof. Campbell has gathered together all necessary information respecting this surprising history, and although not casting it in a form specially attractive to the general reader, but fitted rather for the student of ferns, presents the whole in its due proportions. Even the latest results obtained in respect to the higher allies of the ferns, namely, the clubmosses, are given in detail and correctly. The work is a credit to American science.

The Episcopate in America: Sketches, Biographical and Bibliographical, of the Bishops of the American Church, with a Preliminary Essay on the Historic Episcopate, and Docu-

mentary Annals of the Introduction of the Anglican Line of Succession into America. By William Stevens Perry, Bishop of Iowa, and Historiographer of the American Church. New York: The Christian Literature Co. 1895. Pp. lxviii, 878.

THE title of this handsome volume explains its character, but omits to mention that each sketch of a Bishop of the Protestant Episcopal Church in the United States of America (for that is what is meant by "the American Church") is preceded by his portrait, which adds greatly to the value of the volume. It is surprising that Bishop Perry was able to collect representations of all the Protestant Episcopal Bishops in this country, from Bishop Seabury to Bishop Millspaugh, and he is to be congratulated on the result of his efforts. He states that no other collection known is complete.

The introductory essay traces (1) the origin of "the historic episcopate" from the Apostles' times, chiefly after Lightfoot; (2) its introduction into this country after the Revolutionary War—with facsimiles of some valuable historical documents; (3) its introduction into British North America—with a list of bishops; (4) the rise of the Methodist superintendency or episcopacy (which, however, has no connection with "the historic episcopate"), together with a list of the "bishops" of the Methodist Episcopal Church North from Coke and Asbury on, but those of the Methodist Episcopal Church South are singularly omitted; (5) the episcopate of the Roman Catholic communion in the United States, from the non-canonical consecration of Archbishop Carroll on, with a list of the archdioceses and dioceses, archbishops and bishops, of that branch of the Catholic Church; and (6) a brief account of the foreign churches receiving the episcopate from the American Church—that is, the churches in Hayti and Mexico—with sketches of Bishops Holly and Riley, the latter of whom resigned his jurisdiction, at the request of the House of Bishops, in 1884.

As there are sketches of 176 American bishops, each one must necessarily be brief, but it gives succinctly the main particulars in the ecclesiastical life of its subject. In reading some of these we have noticed a few omissions, inaccuracies, and misprints, which can easily be corrected. Under Bishop Pinkney, his 'Life' of his uncle, William Pinkney, the celebrated lawyer (New York: D. Appleton & Co., 1859), is omitted; also his essay on 'Webster and Pinkney,' in reply to Harvey (privately printed, 1878); and his poems, such as his 'Songs for the Seasons' (1864), and others mentioned in Dr. Hutton's 'Life of Bishop Pinkney.' The portrait of the Bishop here given is not as good as the one prefixed to Dr. Hutton's 'Life.' Under Bishop Whittle, the division of the diocese of Virginia is given as 1893, and under Bishop Randolph, as 1894, both dates being incorrect; it was made in 1892. Bishop Nelson's name is "Kinloch," not "Kinlock." Under Bishop Newton, "Smith" should be "South." Mention of the service in the Confederate army of Bishops R. W. B. Elliott, Harris, and Galleher is omitted, although it is duly made in the case of Bishops Polk, Dudley, Penick, Peterkin, Johnston, Capers, and Newton. The term "bishop-coadjutor" is an anachronism as used by Bishop Perry. It was, as he well knows, first legally authorized by the last General Convention, which met in Minneapolis in October, 1895. The authorized term up to that date was "assistant bishop," and some would have preferred to see that term retained. To con-

clude our fault-finding, we object decidedly to the term "priested," which is no word.

Taken as a whole, the work will be welcomed by Episcopalians, to whom it is of special interest, and it adds one more to the long list of historical works for which the church is already indebted to the author.

Westminster. By Sir Walter Besant. With 130 illustrations by William Patten and others. Frederick A. Stokes Co.

THIS book has been made out of a number of papers in the *Pall Mall Magazine*; and it is an example of the sort of thing we are getting deluged with nowadays. The public likes pretty pictures, and modern mechanical processes have cheapened their production; and, as the public also likes to imagine it is being instructed, books about "historic cities" and the like are tolerably sure of a market if only they are handsomely bound, commended by a well-known name on the title-page, and plentifully "illustrated." The volume before us is certainly a charming picture-book; but about Sir Walter Besant's share in it it is impossible to feel much satisfaction. He undoubtedly knows a great deal about London and Westminster—few men are so intimately acquainted with the older portions of the metropolis; and the drawing-room reader will carry away some information from the pages of this book, especially if he reads only half-a-dozen at a time. But the style is intolerably diffuse, and the sentiment is that of Wardour Street.

Westminster, to begin with, is not so important as London, and the great theme of the Abbey Sir Walter does not undertake. Yet he wants to make a book as big, externally, as his much more solid work on London; and then there are all these pictures to be kept apart by letterpress! And so he pads with both hands. Sometimes he quotes a few pages—like the nine from Maitland describing the Evil May Day of 1517, which most of his readers will suppose to be a contemporary account. More usually he opens the floodgates of enumerative gush of the cheap picturesque variety. Thus, apropos of the "uproarious life" outside the Abbey: "There were taverns. . . . There was the clashing of weapons: there were the profane oaths of the soldiers"; there was this and there was that, for half a page. Or again: "Everywhere there were stately halls, lofty roofs, tourelles with rich carving," and then follow some forty other articles from the repertoire of the scene painter and costumier. The trick is played time after time. To one who knows his Scott (not to say G. P. R. James or Harrison Ainsworth), and has a Stow at hand, it is singularly easy. But even this is scarcely more irritating than the long conversations and monologues Sir Walter puts into the mouths of his real or imaginary characters. Perhaps they are thought to enliven the book: to those who know any one period at all well the happy-go-lucky archaisms of the modern man of letters are only distressing. Let us add that, though in a series of "pictures" it may not be unpardonable to jump about from century to century, to and fro, the result upon most readers will undoubtedly be to strengthen the deep-rooted belief that the men of the Middle Ages all lived at the same time. It is fortunate that in his historical novels Sir Walter Besant has to remain in one period.

If would hardly be worth while to criticise this book if it came from a less honored hand. It will do no positive harm—except perhaps that it may do something to lower the average

standard of literary performance. But we who in our college days chuckled over 'The Monks of Thelema,' and have been stirred in later years by 'All Sorts and Conditions of Men'; we who admire the authors' champion, and rejoiced when the English Government did honor to letters in his person—feel that a book like 'Westminster' is poor work. We cannot help hoping that Sir Walter himself is not so blinded by success and flattery as to escape the prick of conscience.

BOOKS OF THE WEEK.

Anderson, Prof. M. B. Some Representative Poets of the Nineteenth Century: A Syllabus of University Extension Lectures. San Francisco: William Doxey. Baisac, H. de. La Grande Bretèche, and Other Stories. London: Dent; New York: Macmillan. \$1.50.
Baring-Gould, S. The Broom-Squire. F. A. Stokes Co. \$1.25.
Bee, Arlo. Poems of John Keats. Boston: Gian & Co. \$1.10.
Bercy, Paul. Key to Short Selections for Translating English into French. W. R. Jenkins. 75c.

The Nation.

NEW YORK, THURSDAY, APRIL 9, 1896.

The Week.

THE quality of the statesmen who are attending to peace and war for us in Congress was well illustrated by Mr. Hitt's part in the debate on the Cuban resolutions on Friday. We believe Mr. Hitt is excused by some for his share in the follies of the House on foreign affairs, by alleging that, in joining the crazy men, his main object is to prevent their doing more serious mischief. We often head lunatics off, as every one knows, by pretending to share their more dangerous delusions. On Friday, however, he seems to have given up the rôle of a restraining influence and thrown in his lot with his patients. When the Senate concurrent resolutions on Cuban belligerency came down to the House on the 2d of March, the second was the following:

"Resolved, further. That the friendly offices of the United States should be offered by the President to the Spanish Government, for the recognition of the independence of Cuba."

Of this resolution Mr. Hitt said, in the debate which followed:

"Every gentleman, on hearing that suggestion made and that proposition presented to him, must think for a moment what would be the response if a proposition were made to our Government, for example, by a British Minister, presenting resolutions adopted by the British Parliament, asking or desiring us at once to recognize the independence of Texas, or Florida, or of Michigan. How long would he remain in Washington after presenting such a proposition as that, after the self-respect of our Government had been thus insulted?"

And more to the same effect. Here the chairman of the House committee on foreign relations is restraining the crazy men of the Senate, and reading them a lesson in international law and comity. He predicts war if any such resolution is passed, and is, to all appearances, absolutely *compos mentis*.

But the lucid interval is short. In one month almost to a day, without any known change in the situation, except news which he received from the correspondent of the *Mail and Express*, giving the exact numbers of the Cuban army, Mr. Hitt moved this very resolution himself, and supported it in a long speech arguing that the

"second resolution as adopted by the House was in more cautious form than that now proposed, and Spain, unless persistently seeking a quarrel, could not have resented such a proposition, while the resolution of the Senate proposing independence was more exposed to captious objection. But when a war between a parent government and a dependency had been going on for a considerable time, and when separation was the best solution of the war, the mediation or friendly counsel of another nation to solve an existing struggle by recognizing independence might be a truly friendly act; and this, in fact, has often been done."

That is, what was an insult on the 2d of

March becomes on the 3d of April "a truly friendly act." It is hardly necessary to comment on this beyond saying that it helps us to understand the great hesitation in Europe to invest in American securities. Investors feel as passengers in a train would feel if they heard the engineer had handed over the locomotive to a party of schoolboys going home for the holidays. As for Mr. Hitt, we advise him to get out a text-book of ethics at once. We would guarantee it a large sale among highwaymen, who would be delighted to find that a demand for a traveller's purse is a truly friendly act if no offence is intended, and that to be knocked down and put in jail for it would only argue a captious disposition to seek a quarrel. We hope that Mr. Hitt's A. P. A. friends will not fail to see how he adopts the Jesuit doctrine of "intention," as explained by Pascal.

Senator Chandler's astonishing letter has called out a reply from the chairman of the committee on resolutions of the New Hampshire convention, Mr. Putney, which rescues Bill from his own charge that he was a coward, and leaves him a simple falsifier. It was not true, says Mr. Putney, that Chandler had been informed of the McKinley endorsement only an hour before the convention; he was told of it the previous evening. At first he said he would fight it, but afterwards sent word that he "would not contend." "You were not a coward," writes Mr. Putney soothingly; "you simply accepted the inevitable." This is prudence, not cowardice. It is imprudent, however, to tell lies when you are sure to be found out. On one point, though, Mr. Putney confesses his indebtedness to Senator Chandler. "I am glad," he says, "to learn that Mr. Reed is a bimetallist, for Mr. Lodge, to whom you make report of your stewardship, and whom you seem to recognize as his manager, has put him on a gold-bug platform in Massachusetts."

Here at last is Speaker Reed's long-sought opportunity to declare his views on the money question. People generally have not understood what a hard struggle he has had with his own nice sense of propriety in this matter of making his opinions known. He has been fairly aching, even burning, to come out in his own bold, bluff way and let the country know what he thinks. But would it be delicate? Would it not shock refined sensibilities? Would it conform to the amenities of the campaign? Those are the anxious questions he puts his friends who urge him to speak out. No man is more eager to do so than he; but just consider his position, the delicacy of the situation, the fitness of things. People might think

he was a candidate for the Presidency. Would that be dignified? But the pinch of his difficulty has been the lack of fitting opportunity. He could not go out of his way to make an occasion. But he now has one made to his hand by Chandler. A grave question of veracity has arisen between Chandler and Lodge; one says Reed is a bimetallist, the other that he is a gold-bug. Now we affirm that it would be entirely proper for a public man, even a shrinking, sensitive public man like Mr. Reed, to come forward under such circumstances and say which was right. No one would accuse him of outraging the proprieties. We say nothing of the desirability of his coming out as Speaker, as a candidate, as a man who is asking the American people to give him the deciding power over the currency while refusing to let them know what kind of currency he favors; we put it wholly on the ground of his duty to settle the question of veracity between two eminent statesmen. That could be done, we maintain, without at all imperilling Mr. Reed's reputation as a retiring nature, which instinctively dreads publicity, and has chosen a political career only for its hermit-like attractions.

Each day's developments show more clearly the lack of sincerity in the support of Reed for the Presidential nomination by New England. District conventions in Massachusetts were held in two districts on Thursday. In each case the McKinley men insisted upon making themselves heard, and although in neither were they anywhere near a majority, they refused in one district to support a motion that the Reed resolution be made the unanimous expression of opinion, and in the other forced a change from "instructing" the delegates to support the Speaker to "recommending" such action. Joe Manley has had the New Hampshire delegates chosen on Tuesday week sign a statement that they were selected with the definite knowledge that they would unitedly and earnestly favor Reed's nomination, and that they will give him their cordial support, but they add that, "if forced to make a second choice, we shall try to represent faithfully the wishes of our constituents"; and one of them, in a dispatch to the *Boston Journal*, says that he thinks "Mr. Reed has a fighting chance for the nomination." This is not the way that victories are won. The most striking feature about the Reed canvass is the lack of heart in it. The Speaker has effaced himself during the past four months so thoroughly that he seems to stand for nothing, and his supporters find it hard to hold their ground against a rival who does represent something.

An interesting question of fact is raised by some comments of the *St. Louis Globe-*

Democrat on the recent financial deliverances of the New York and Massachusetts Republicans. The *Globe-Democrat*, which has always been an earnest supporter of sound money, pronounces these declarations in favor of the gold standard "as impregnable as the Ten Commandments," characterizes them as "the Apostles' Creed of the Republican party," and maintains that one or the other, preferably the Massachusetts resolution, should be adopted literally by the St. Louis convention. It says further:

"The Republican masses are as sincerely and courageously devoted to honest money in 1896 as they were in 1875, when their representatives in Congress passed the law which brought every dollar of the country's currency up to the gold level in 1879. They are as unalterably opposed to bogus dollars of silver as they were to depreciated dollars of paper."

If this be true, how does it happen that so few Republican conventions come out for the gold standard; that the New Hampshire convention, a week after the one in Massachusetts, rejected all but unanimously a proposition to make a similar deliverance, on the ground that the latter was, as the chairman of the committee on resolutions puts it, "a gold-bug platform"; that the chief candidate for the Presidential nomination refuses to commit himself on the question of the gold standard; and that even "glorious Tom Reed" is declared by his friends, without any protest from him, to be that mysterious thing, a "bimetallist"?

We contrast in another column the attitude of Messrs. Hayes and McKinley on the currency question in 1876 and in 1896 respectively. It is worth while to set the financial plank adopted by the convention which presented the former as "Ohio's favorite son" twenty years ago, over against the one adopted by the recent McKinley convention in that State:

1876.

We recognize gold as the true standard of value, and the only steady and safe basis for a circulating medium; and declare that that policy of finance should be steadily pursued which, without unnecessary injury to business or trade, will ultimately equalize the value of the coin and paper dollar.

1896.

We contend for honest money, for a currency of gold, silver, and paper with which to measure our exchanges, that shall be as sound as the Government and as untarnished as its honor; and to that end we favor bimetallism and demand the use of both gold and silver as standard money, either in accordance with a ratio to be fixed by an international agreement (if that can be obtained) or under such restrictions and such provisions, to be determined by legislation, as will secure the maintenance of the parities of values of the two metals, so that the purchasing and debt-paying power of the dollar, whether of silver, gold, or paper, shall be at all times equal.

The Republican Senators have found, much to their disgust, that their Populist

allies are going to vote against admitting Mr. Du Pont of Delaware. It is suspected that the constitutional arguments against admission have not so powerfully impressed the Populist mind as the gold-bug argument. With Senator Blackburn lost to the silver forces, it would never do to let in a gold Senator. Delaware can get along with one Senator as well as Kentucky. Besides, if the next Senate is to throttle protection unless something is done for silver, the throttlers cannot be too careful how they keep their opponents in a minority. As we have before said, the argument against admitting Mr. Du Pont seems to us a very strong one, and we presume that some of the strict-constructionists on the Republican side of the Senate will not be sorry not to be obliged to strain a point and make a dangerous precedent under party pressure.

The *Herald* published on Thursday extracts from the message of President Diaz to the Mexican Congress, sent to that body the day before, which show that Secretary Olney cannot too soon begin enlightening the Chief Executive of Mexico on the Monroe Doctrine. Gen. Diaz said he had steadfastly refused to express an opinion on the Venezuelan dispute, though having received "invitations of an international character" to do so, because he was "not in a position to presume that the claims of England constituted an attempt at usurpation." This looks bad. A man who wants to know what the facts are does not show proper reverence for the immortal Monroe. Besides, this pretence of ignorance on Diaz's part is evidently hollow, as a casual reading of the American press, or even a slight attention to the opinions of our school-children, would have convinced him that England was wickedly putting her hands on just where the immortal Monroe had cried, "Hands off!" Worse and worse, President Diaz affirms that England's refusal to submit a boundary line to arbitration did not necessarily make her out a bloody villain, inasmuch as "the Mexican Government itself had declared more than once that it would not admit arbitration for certain territorial questions which, in our opinion, involved the honor of the country." After this, a weak assertion that he is in favor of the Monroe Doctrine, "properly understood," will deceive nobody. The whole thing looks to us like a deliberate insult, but we refer it to the larger wisdom of Congress, in which the Constitution has rightly lodged the duty of resenting insults to this our nation.

Gov. Morton has thrown the whole Platt machine into spasms by requesting Mr. Lyman, the State Excise Commissioner, not to appoint inspectors or special agents under the new law until his legal adviser has investigated the question whether or not they are subject to civil-service regulations. The news of this request created

consternation among the army of applicants who had assembled at Albany to get the new "confidential" places. Instead of fighting for these places, they found themselves compelled to fight against the idea that the places could be obtained only after competitive examinations. Anything more absolutely disgusting than a competitive examination for a "place" is not conceivable to the mind of a practical politician. The mere sight of a room fitted up with desks, like a school-room, with pens and pencils and blank forms with printed questions to be answered in writing, gives him a sinking of the heart which in most cases produces nausea. He turns away with positive loathing, and declares that, rather than submit to such humiliation, he will leave politics for ever. This feeling was very strong at Albany on Thursday, according to the *Herald* correspondent, for that night "Senator Raines, John F. Parkhurst, and a host of other machine men were sitting up with Mr. Lyman, arguing that civil-service [*sic*] would be folly, and would be sure to fill his office with a lot of college graduates who don't know anything about life in great cities or practical politics."

The Boys feared that something of this kind might happen, but they thought the Legislature had "fixed it" by declaring the offices "confidential." Lieut.-Gov. Saxton says that the new amendment to the Constitution expresses the desire of the people to have the merit and fitness of all applicants for office ascertained by competitive examinations, and adds:

"The question is, Does the Legislature make an exception by merely declaring a position to be confidential which is not in reality confidential? If so, the Legislature can entirely nullify the civil-service provision of the Constitution by declaring that all places under the civil service shall be confidential. We cannot change the nature of the thing by giving it a certain name. The question is not what the place is called, but what it really is. I must say that I can see no real difference between the confidential agents provided for under the Raines law and hundreds of other places now on the competitive list."

That is the view which is certain to prevail in the end, for it is precisely the one which has been decreed by the Court of Appeals, and if the Governor's adviser were to take a different one, the matter would not rest there, but would be carried into the courts for final decision. There is no escape for the Boys. They must make up their minds to the examinations, with the awful prospect that college graduates will run away with the "places" in the end, and will execute the law in the cities in complete ignorance of the intricacies and obligations of practical politics.

There seems to be little doubt that the sons of Tom Platt and Senator Raines had a "straight tip," a considerable time in advance, to the effect that some snug business for a surety company could be found when the Raines liquor-tax law

should go into operation. Whether they did or not, they were lucky enough to have their company all ready for business when the law was passed, and were lucky enough to get the State Excise Commissioner to give notice that his appointees must get a surety company to furnish their bonds. The liquor-dealers must also have bonds, and, curiously enough, they are getting the idea that a surety company with Boss Platt's son as manager is undoubtedly the best source to go to for them. The rascals really think that in this way they may establish a "pull" not only on the Boss but on the Excise Department, which will be useful in enabling them to "beat the law" in various ways and escape the consequences. It is a wicked world, and our liquor-dealers have been educated to believe that a "pull" is the basis of our system of government. Their delusion is likely to prove of great business advantage to young Platt and young Raines, who, of course, suspected no such fortuitous aid when they set up their surety company. They would not mix politics and business for anything in the world; neither would their fathers permit them to do such a thing. But how surprised they must be at their wonderful luck!

We have examined with care the various arguments made in favor of consolidation, at the final hearing before Mayor Strong on Monday, to see if something really worth considering was advanced, but we have been able to discover nothing of the sort. Like all the arguments of the kind that have preceded them, the substance was mainly wind. Take, for instance, the speech of Mr. Parker, the Police Commissioner. According to the report in the *Times*, which is friendly to consolidation, this was in outline as follows:

"He said it was sublimated nonsense to say there was any danger of a satrapy—a government of legislative commission for New York. He said that it was folly to believe the people of New York would be so supine, so slavish, so dead, as to permit any odious legislation to be fastened on them at any stage of the proceedings pending the completion of the proposed charter and the formal establishment of the government of Greater New York. All measures, he said, would come before the Mayor, and any citizen, as well as the proposed Consolidation Commission, could send bills to the Legislature affecting the form of government of Greater New York. There would be, there could be, no chance of odious or oppressive or misrepresentative government at any stage—certainly no greater than now existed or had always existed, under the present order. He reminded the Mayor that it took only fourteen months to provide the new Constitution for the whole State of New York. 'The bill does not increase New York taxes,' said Mr. Parker, 'and any attempt to loot New York can be stopped in a moment unless New York has gone daft.'"

In addition to this convincing disposal of all objections to the proposition, Mr. Parker turned upon one of the opposition speakers and withered him with this question: "Are you afraid to let the people elect officials?" This dear old question, "What! are you afraid to trust the peo-

ple?" has been roared steadily during the last half-century or more by every practical politician who found himself at a loss for real arguments in defence of a shady political job. Mr. Parker got it from his old friend Jimmy O'Brien, who has thundered it hundreds of times, and has never failed to "shut up" his enemies with it. If that does not give us consolidation, nothing will.

The Mississippi Legislature has adjourned without advancing the scheme for an inequitable change in the distribution of the school funds. Early in the session it was proposed that only the school taxes paid by the negroes be devoted to the education of negro children. But the press of the State generally opposed the change, taking the position that it was the duty of the property-owning whites, and a measure of safety as well, to maintain the efficiency of the colored schools. Presumably because of this opposition, the measure lay upon the House table for weeks, and, when its friends had the temerity to call it up near the end of the session, it was rejected by a large majority. A companion measure, apparently conceived to accomplish much the same result in a less direct and less honest manner, also failed to pass. This provided that the poll taxes, now turned into the State Treasury, and thence distributed pro rata among the counties for school purposes, should be retained in the counties where collected. Payment of the poll tax is a franchise qualification, but very many of the negroes have not the concern about the franchise attributed to them by contested-election committees in Washington, and neglect to pay this tax. The result of the proposed change in distribution, therefore, would be to reduce the funds available for school purposes in the counties where the negroes predominate. The sentiment of the State, as represented by the vote in the Legislature, favors the change, on the ground that the present method is unjust to some of the counties. In the Senate the measure received the necessary two-thirds vote, but it failed of two-thirds in the House, although a majority voted for it. The newspapers of the State are in advance of the people on the subject of negro education, and it is likely that their growing influence will prevent any further attempts to weaken the support of the colored schools.

The National Liberal Federation of England voted at Huddersfield its "continued confidence in Lord Rosebery," but thereby hangs a tale which is unfolded by Mr. A. O. Hume, a Radical delegate from Dulwich. He declares that, before the convention, he wrote to the Secretary, asking whether he should be allowed to move a vote of no confidence in Lord Rosebery. In reply he was told that such an amend-

ment would not be in order, though of course he would be at liberty to vote against the resolutions as a whole. In other words, unless a delegate wished to vote against a reaffirmation of Liberal principles, he could not vote against continued confidence in Lord Rosebery. Against such gagging tactics Mr. Hume protests, in a letter to the *London Times*, and proceeds to give the reasons why, as he says, hundreds and thousands of Liberal electors have no confidence in Lord Rosebery as a leader. The first is that a Liberal leader should be a Commoner, in favor of which much may be said, though it is by no means a conclusive reason. The second is that Rosebery is unsound on the limitation of the veto of the House of Lords, to which the reply might be made, What possible leader is sound, in the Radical sense? Much more weighty is the third reason, which is that Rosebery is "wanting in that earnestness of purpose and enthusiasm essential in any leader of the popular party." Not without a certain justice does Mr. Hume say of Lord Rosebery that, "sandwiched in between literature and horse-racing, he holds to politics as a gentlemanly and creditable recreation," but that he is utterly devoid of a "burning love of justice" and a "holy enthusiasm in the cause of man," which alone can invest a man with the power of a true democratic leader. One has but to think of Mr. Gladstone's flaming indignation on Bulgaria in 1880, to see the point.

Some people have wondered how Mr. Balfour could have so confidently affirmed, in his speech on bimetalism the other day, that the American people are "absolutely unanimous" in favor of the bimetallic standard. A philosopher who knows all about the foundations of belief, should not be above knowing something about the facts. But we think we have the explanation. Mr. Balfour gets his views of American opinion from Moreton Frewen. On the other hand, our bimetallicists get their views of English opinion from Moreton Frewen. How do you know the American people are absolutely unanimous for bimetallicism? Moreton Frewen says so, and he has just been in Washington, and has letters every week from Senator Lodge. What makes you think that England will be on her knees to the bimetallicists in six months? Moreton Frewen told me so, and here's the last letter I had from him about it. Nothing like this expert international knowledge has ever been seen before. The funniest part of it is that, though an authority on two countries, Moreton Frewen is respected in neither. In England he is regarded as an amiable enthusiast. In the United States he is seen to know rather less about our politics than the Marquis of Castellane or Capt. Concas. But in either country there are some solemn persons who think him a perfect oracle about the other.

HAYES AND McKINLEY.

TWENTY years ago, as now, Ohio entered a "favorite son" in the contest for the Republican nomination. The candidate was successful in the convention, and the Electoral Commission awarded him the Presidency. The national convention of 1896 is still about two months away, but the present Ohio candidate is far ahead of all his rivals, and his success is confidently predicted. In one respect, however, and that the most important of all, McKinley in 1896 is as far removed from Hayes in 1876 as one pole from the other. The Ohio candidate twenty years ago was so sound on the financial issue that nobody in the country could question his position. The Ohio candidate now is so vague and enigmatical in his outgivings that nobody can tell what he means.

Mr. Hayes came into national prominence through his election as Governor of Ohio in 1875, after the most interesting, exciting, and important State canvass known in the country for many years. The nation was then suffering at once from the business depression that followed the panic of 1873, and from the demoralizing effects of a depreciated currency. The Democratic managers in Ohio, and indeed throughout the country generally, except in the extreme East, thought that inflation of the currency would prove the most popular policy on which to make a campaign. They therefore renominated the veteran William Allen for Governor, on a platform which declared that the contraction of the currency already made by the Republican party, and the further contraction proposed by it with a view to the resumption of specie payments, had brought disaster to the business of the country and threatened general bankruptcy; and demanded "that this policy be abandoned, and that the volume of currency be made and kept equal to the wants of trade, leaving the restoration of legal tenders to par, gold, to be brought about by promoting the industries of the people, and not by destroying them."

The Republican convention adopted a guarded declaration that "a policy of finance should be steadily pursued which, without unnecessary shock to business or trade, will ultimately equalize the purchasing capacity of the coin and paper dollar." This represented the cowardice of many Republican politicians, and, after the nomination of Mr. Hayes, he was appealed to by many of his party friends not to oppose an increase of the paper currency. But he refused to make any compromise, and sounded the real keynote of the canvass in his first deliverance, when he came out openly and boldly for honest money and against inflation. The campaign attracted the attention of the whole country for months, and the success of Mr. Hayes in what was then a doubtful State brought him immediately within the range of possible choice for the national convention the next summer.

Mr. Hayes continued as outspoken and emphatic on the financial issue after his election to the governorship as before. In March, 1876, he wrote Gen. Garfield that "the previous question will again be irredeemable paper as a permanent policy, or a policy which seeks a return to coin," and added that "my opinion is decidedly against yielding a hair's-breadth." The Republican national convention met the issue squarely. Its platform recalled the fact that, in the first act of Congress signed by President Grant, the national Government sought to remove any doubts of its purpose to discharge all just obligations to the public creditors by solemnly pledging its faith to make provision at the earliest practicable period for the redemption of the United States notes in coin, and declared that "commercial prosperity, public morals, and national credit demand that this promise be fulfilled by a continuous and steady progress to specie payments." Gov. Hayes warmly endorsed this plank in his letter of acceptance, speaking as follows:

"It is my conviction that the feeling of uncertainty inseparable from an irredeemable paper currency, with its fluctuations of value, is one of the great obstacles to a revival of confidence and business, and to a return of prosperity. That uncertainty can be ended in but one way—the resumption of specie payments. But the longer the instability of our money system is permitted to continue, the greater will be the injury inflicted upon our economical interests and all classes of society. If elected, I shall approve every appropriate measure to accomplish the desired end; and shall oppose any step backward."

President Hayes's financial views were put to the test within a few months after his inauguration. He convened Congress in extra session on the 15th of October, 1877. On the 5th of November, Mr. Bland of Missouri carried through the House, by a vote of 164 to 34, a motion to suspend the rules and pass "an act to authorize the free coinage of the standard silver dollar, and to restore its legal-tender character." During the following winter the Senate amended the bill so as to provide for the coinage of silver dollars to the amount of not less than \$2,000,000 nor more than \$4,000,000 a month. On the 28th of February, 1878, Mr. Hayes vetoed this bill in a most effective message, on the ground that, "if the country is to be benefited by a silver coinage, it can be done only by the issue of silver dollars of full value, which will defraud no man"; and he declared that "a currency worth less than it purports to be worth will in the end defraud not only creditors, but all who are engaged in legitimate business, and none more surely than those who are dependent on their daily labor for their daily bread."

Such was the financial record of the Ohio candidate of 1876—a record of which any man might be proud. By a curious coincidence the Ohio candidate of 1896 entered Congress at the same time that Mr. Hayes became President. The first test of Mr. McKinley's financial soundness came on the 5th of November, 1877,

and he responded by voting with Mr. Bland for the free coinage of silver. The second test came on the 28th of February, 1878, when the question was whether the Bland-Allison bill should be passed over the veto of the Republican President, and again Mr. McKinley followed the lead of Bland, helping to make up the more than two-thirds majority that overrode the representative of his own State in the White House. The McKinley of 1896 is consistent with the McKinley of 1877 and 1878, standing as he now does on a platform that favors an undefined "bimetallism," and the coinage of silver under restrictions and provisions "to be determined by legislation," which holds out the hope that the Ohio candidate of 1896 would not veto any currency act that should get through Congress.

Can the Republican party afford to go into the campaign of this year under a candidate who began public life as the advocate of free coinage, and whose position on the silver question, after twenty years of service, is calculated to win the support of the silver monometallists?

THE GREATER NEW YORK SCHEME.

PRESIDENT LOW, in arguing last week for consolidation, made much use of the union of the States, by the framing of the Constitution, as an illustration of the advantages which result from bringing adjacent communities possessing common interests under one government. He said:

"What did they do? They proposed a stronger union as to the matters in which the interests of the States were one, and they called a convention to prepare a constitution for the new Union. I ask you to notice that they did not in 1787 resolve that in 1789 the United States of America should be established, trusting to luck to be able, in the meanwhile, to frame a suitable constitution. They called together their wisest men, prepared the Constitution with the most careful deliberation, submitted it to the vote of the people in every State, and thus established the new Union upon a basis that was clearly understood, by the people to be affected, before the Union provided for became a living fact. I do not believe that it is possible to find a safer model to follow in bringing about the union that is aimed at in this measure for the creation of the Greater New York."

It is a pity that time and the occasion did not permit him to go more fully into the aptness of this analogy, because there are several points in it which need more clearing up. There has never been a more striking evidence of political capacity than the founding of this Government in the way described by President Low. On the other hand, neither New York nor Brooklyn has given any sign of political capacity, but they have been, Brooklyn through its whole history, and New York for at least forty years, gross and notorious examples of municipal disorder and corruption. Brooklyn is, and long has been, under the dominion of a corrupt and ignorant boss, three years out of five. New York has been for forty years under a corrupt boss with hardly any intermission. Total incapacity to found and carry on, not efficient, but even decent municipal gov-

ernment, has long been the distinguishing trait of both of them. So that the notion that by uniting them, giving them larger revenues to be administered, a larger constituency to persuade or hoodwink, more holes and corners for politicians to hide jobs in, more laws to construe and interpret, more places to distribute among workers and Boys, we shall produce an orderly, well-administered municipality, is, we will not say, an absurd proposition, but one that needs far more elucidation than President Low has been able to bestow on it. There is nothing in our experience of men or of cities to warrant us in expecting anything of the kind, and yet we will not assert positively that it might not happen.

Now let us come down to the *modus in quo*. The States in 1787 sent their wisest men to frame the new Constitution and gave them plenty of time. It was the practice of every State at that period to employ its wisest men in the transaction of all, or nearly all, public business. Its legislators, governors, mayors may not all have been very wise men, but they were the wisest men there were. In making up the national convention, the States simply followed the local tradition. The members of it became members because they were the leading men in their own States. They were men of character and education and long and successful experience in public business. Now is there a vestige, or more than a vestige, of this great tradition left among us to-day? It was by almost superhuman exertion that we put a respectable business man in the mayoral chair last year, as the successor of a Tammany bummer. Our legislators are, year after year, the creatures of a boss, who sells their legislation, like prison-made goods, to serve his own purposes. There are only three or four men, and there have not for years been more than three or four men, in the New York Legislature, who speak their own thoughts or obey their own convictions. They do not need time even for such a measure as consolidation, because they neither discuss nor deliberate on any measure small or great. They "jam it through." They do not know any other way of making laws or framing governments. We dare not have a city council with real power, like other great cities of the world, because it would, we fear, be filled with ragamuffins who would plunder us wholesale. We have, therefore, to content ourselves with a Board of Aldermen which does little but license peddlers and draw its salary. Is it possible that by bringing two such communities together the resultant will be something wise and good and pure? Is it in the least likely that we shall send our wisest men to frame the common government? Is it likely that if we did they would be allowed to put into execution a really wise measure, if one of its results were to be, as it would have to be in order to improve our condition, the destruction of the power of the Boss? Is

it not plain that before any union between the two cities can be properly effected, we need a far more thorough trial of the possibility of improving each city, through the instrumentalities furnished us by the constitutional amendments—that is, by more direct appeals to the intelligence and consciences of the citizens on city issues?

The truth is, and it is a truth which is visible all over the country, in Washington as well as in the States, that while our problems are increasing in gravity, we are making less and less use of our wisest men in their solution. No Congress we have ever had has had, or ever made for itself, more serious tasks than the present one, but no Congress has ever made such ludicrously ineffective attempts to perform them. Its efforts to provide causes of war, and to prepare for war, have been equally feeble and incompetent, and, as to domestic troubles, it has dismissed them with a smile. From our Albany Legislature we have got nothing good for years, except by a lucky accident or some extraordinary pressure, not revealable in debate. All over the country our official class is overwhelmed by the increasing complication of the work of government caused by our rapid growth, and although there are agencies at work—stern necessity is one of them—which must sooner or later furnish us with a better class of servants, we have not yet got them. The idea that Platt will furnish us with a commission capable of dealing with the consolidation question—one of the weightiest ever set before any community—with the care, the forethought, the constructive ingenuity, the sense of justice, the indifference to personal motives which its gravity calls for, is so novel, so startling, and receives so little support from experience, that the community may well hesitate for the moment to do anything about it.

The reorganization of the government of the City of London, a few years ago, was a much less difficult task than the consolidation of New York and Brooklyn, and it is a kind of task in which the British invariably employ men of the highest training and ripest experience—their wisest men, in short—and yet it took many years of consideration and discussion to bring it to a conclusion. The attempt to reorganize the London government began in 1860, and a succession of bills for the purpose were introduced in Parliament in subsequent years by such men as Sir George Cornewall Lewis, John Stuart Mill, Charles Buxton, Lord Elcho, J. B. Firth, and Sir William Harcourt in 1884 (we are quoting Mr. Albert Shaw). It was not till 1888 that the final bill was passed. In other words, the scheme was debated for twenty-eight years by the ablest men in England, before it took final shape and came into operation. We have set to do more difficult work—T. C. Platt of Owego and Clarence Lexow of Nyack, and given them one year!

A LITERARY CRISIS.

FINANCIAL and political crises have been pretty thoroughly studied; the crisis of a fever is a well-recognized phenomenon; but a literary crisis has not been carefully defined. Hence we should not wonder at the loose and often conflicting terms in which it is described. The important thing to know is that such a crisis exists. All the authorities now agree that it does. A publisher's letter last week in the *Evening Post* showed that there is an unmistakable literary crisis in the United States; Sir Walter Besant has been ready to prove any time these five years that one is blighting British letters; and here comes M. René Doumic in France giving lectures on "The Existing Literary Crisis." M. Doumic is no mathematician to be lecturing on imaginary quantities.

Agreed as to the fact, our authorities are wide apart as to causes, manifestations, remedies. Mr. Tait says the trouble with American literature is that it looks too much abroad; M. Doumic asserts that French literature must look more abroad, or expire of inanition; Sir Walter Besant says—well, he says a great many things, but they always lead up to the duty of joining his Authors' Society. Mr. Tait thinks we "strangle" domestic authors; M. Doumic affirms that domestic authors strangle us. He seems to agree with an English critic who asserts that if the French naturalistic novel cannot move our hearts, it can at least turn our stomachs. Mr. Tait says we read too much and too indiscriminately; M. Doumic complains that we do not read enough: France will soon number but "a handful of mandarins among an illiterate people." But it is unnecessary to pursue these differences. A literary crisis exists—that is plain, we hope, to the meanest intelligence. It is marked by deep dissatisfaction on the part of authors or publishers or the reading public, one or all. Now for the remedies.

The first one is, to suppress competition. It is not stated in this bald way, but that is what is meant. The phrases are: Emancipating ourselves from "the colonial attitude"; stopping "the adoration of the foreign writer"; getting the press to devote more space to "domestic literature." All this means that there is a literary crisis because literature cannot stand competition, and that protection of the native product will cure the crisis. But this remedy is really a confession of inferiority. It is like dread of the evils of competition in society. "What shall we do with our boys," ask alarmed parents, "in the face of the fierce competition in all businesses and professions?" This question really means, as Leelle Stephen has remarked, "What shall we do with our fools?" A bright, energetic boy has everything to gain from competition. And so, it may be said, only dullard books have anything to fear from literary competition. Anyhow, they cannot escape it. This remedy

is very like a prescription of a bottle of port and terrapin every day for a person on an income of \$3 a week. The thing cannot be done.

If it were possible to dispose of living competitors, what are you going to do with dead competitors? Short of another Omar to burn the British Museum and all its works, the "dead hand" of literature will continue to labor, even if all modern authors go on strike. This was rather brutally put by a London publisher in controversy with the Authors' Society. Pay our authors more, he was told, or you will get no books to publish and will starve. Not at all, replied the publisher; it is you who will do the starving, for the reprints I can make from the stores of the British Museum will last me long after every one of you has been driven to manual labor. Needless to say, the authors shrank from the unequal combat, and continued to take their beggarly 10 per cent. and be thankful.

The other remedy is more to the point. Make literature prosperous by getting great writers to produce it. From this no one can dissent; but the trouble is that when they say great writer they mean great reputation. "Scarcely a year passes," says Mr. Tait, "without London making three or four great literary reputations. How long is it since New York made one?" Alas, my masters, how obviously "made" such reputations are! Here we come upon a very curious phenomenon. The public were never so eager as now to have a literary genius to pet and flutter about. They run off impetuously on false scents and at every hasty cry of lo! here, and lo! there. And if they ever do find the first sign or glimmer of genius, they straightway do their best to extinguish it. They do this by the method of what is called "making a great literary reputation."

The process has often been witnessed. An author produces something unusual, something showing an original turn, giving promise of genius. Immediately the signal is given, and the whole pack of destroyers of genius is let loose upon him. The reporter runs him to earth. The photographer levels the deadly camera at him. A dinner is given in his honor at the Aldine Club. He is invited to write for the *Ladies' Home Journal*. Then the end is not far off. Only one step remains. It is to be "syndicated." Genius in the clutches of a syndicate is a melancholy spectacle. It soon becomes subdued to the medium in which it works, and appears as dull and ditch-watery as if the divine spark had never glowed at all. As long as we go so painstakingly about the work of putting every singer of native woodnotes wild in a gilded cage of publicity, of denying expanding talent the time to read or think or commune with its own heart, of making a great reputation by means of puffery and wind, it is certain that we shall not get ourselves out of perpetual literary crisis.

ITALY'S HUMILIATION AND PROWESS IN AFRICA.

ITALY, March 19, 1896.

ITALY for the Italians, Italy a pledge of peace in Europe, was the programme of Mazzini and Garibaldi; and after the consolidation of the country, with Rome for its capital, after stock had been taken of the moral, material, and social condition of the new kingdom, its wants, needs, and necessities were set forth—schools, the redemption of waste but fertile lands, attention to hygiene. Saffi, Bertani, Cairoli, and others of their stamp were from the first opposed to grandiose public buildings or useless railroads; above all, to the expenditure of increasing sums for the army and the navy. It was after the Congress of Berlin that the Jingoism began to murmur that "every nation of Europe had obtained something, Italy nothing." Then, when France took Tunis, a regular campaign set in for increased army and navy alliances in Europe, and a colony "somewhere." So Italy drifted into Africa, from Massowah to Saati; hence the massacre of the five hundred at Dogali, the shrieks for "revenge," the expedition sent out under San Marzano, the treaty of Uchialli, and the famous article which, in the Italian translation, gave Italy the protectorate over Abyssinia and bound the Emperor Menelik to treat with no European Power save through Italy's mediation. In return for this, Italy armed and equipped Abyssinia, so that it is absurd now to ask who gave Menelik his weapons. Italy at the Belgian conference secured him the right of obtaining them from Europe—*voilà tout!*

After the fall of Crispi's first ministry, the Rudini-Nicotera ministry, whose members had been opposed to any military occupation, still less extension, in Africa, affirmed that while they should not propose any withdrawal from what was now called the Eritrean colony, they should keep it well within the triangle Massowah, Keren, Asmara. They reduced the African budget from fifteen to eight millions, sent out Colonel Oreste Baratieri to make the colony self-supporting, and to organize it modestly and thoroughly, so that in the future it might serve as an outlet for the surplus peasant population, which is now compelled to seek a home in North or South America because the mother country cannot or will not find lands for them to cultivate. How absolutely he obeyed instructions, how completely he reorganized the colony, I showed in my last letter on Italy in Africa, a year ago, in your columns, and to-day, as I recall his last visit to me in Naples, his calm enthusiasm, his firm belief in the future of the colony, his full comprehension of the dangers and the difficulties of the undertaking—with hostile Dervishes, Abyssinians, warlike and jealous of any foreign usurpation, with France and Russia seeking to take advantage of any Italian blunder on the Dark Continent—which transformed the boy hero of the Volturno into a true heir of Garibaldi's military principles, I can do more understand the transformation of the last six months' action or inaction than I can subdue the bitter grief that, after the Adua disaster, fate should have chosen him for "the last of all his men that could not die."

All is clear as daylight until July, 1895. Kassala was occupied to prevent the Dervishes from invading the colony; and although all the anti-Africanists protested against this extension of its western frontier 500 kilometres from Massowah, yet inasmuch as England had given permission for this occupation, "with due respect for the territorial rights of Egypt,"

should such a step be deemed necessary for the security of the Italian possessions, on military grounds the occupation was intelligible. Further, when Baratieri found that the chiefs who had accepted service under him were betraying their trust, when he found that Ras Mangashà, in return for protection and assistance, was preparing to invade the colony, it was not only his right but his duty to repel the invasion and chastise the invader, which he did by his wonderful strategical marches and splendid victories of Coatit and Senafè. Yet that he was not intoxicated by these is proved by a letter after the victory to one of his most intimate friends in Italy, published in the *Illustrazione Italiana* by Ferdinand Martini, late Minister of Public Instruction, and a staunch believer in a commercial and agricultural colony in Africa. He knew that the chiefs, and especially Ras Mangashà, had not deserted the Italians without having previously made peace with Menelik; hence he wrote, and clearly with a keen remembrance of the detestation of the majority of his countrymen for African extension: "I have done my duty, but if I succumb, no one will compassionate my death or defend me if I survive." Then, if you take the documents, meagre as they are, from the Green Book published in July, 1896, every one of them depicts the strength of the Abyssinians and their resolution to attack the colony when the rainy season is over, and he repeats, "To insure peace we must be ready for war." The Government summoned him to Italy (July 7, '95), and he remained there till September, when he was recalled by despatches from Arimondi, warning him of the hostile attitude of the Abyssinians. One of two paths was open to him: either to insist on the total abandonment of the Tigre and of Agame, immense provinces of Abyssinia absolutely belonging to Menelik, or on sufficient money, arms, and men to attempt to hold them. If his alternative was rejected by the Ministry, then, for his own reputation and for the sake of his noble little army, for Italy's prestige, he should have resigned, and from his seat in the House given his reasons.

You must bear in mind the state of Italy during those months—the galleys, the prisons, full of political offenders; every day fresh suspects sent by the exceptional tribunal to *domicilio coatto* amid protests and menaces from their friends and champions; the banking scandals smothered, but resuscitating the most violent indignation and clamor throughout the country, and in the House a nominal majority for the Government of four-fifths of the Deputies. The financial difficulties, too, must not be forgotten, nor now nor hereafter would it be just to forget that, but for this African episode, Sonnino would have succeeded in laying the foundations for a budgetary equilibrium in a not far distant future. To have asked the House for supplies for extension in Africa would have been suicide for the Ministry when you consider the frightful state of taxation, the misery of the populations, the increasing emigration, the fact that there is a tax on wheat of 7 lire per quintal, that salt is 40 centimes per kilo, that commerce is stagnant and industry gagged at every point. During the last discussion of the African question, when grave were the cautions of the anti-Africanists, especially on account of the Russian "Mission," the Minister for Foreign Affairs answered: "As to reinforcements that might be needed in case of necessity for local defence, our warnings to the barbarians in Africa are, 'Before you from Shoa come to raid slaves and cattle in the

Tigre, and you repeat your aggressions on the colony, our swift war-ships and our ready battalions will have more than time to help General Baratieri inflict fresh chastisements on you." During the examination of the budget, though screamed down by the majority, several Deputies pleaded for prudence, and Campi, a supporter of agricultural colonies, said:

"As an Italian I am proud of our victories, but do not let them inebriate us or induce us to adopt a programme of expansion. One of the great benefits of victory is that it gives us complete liberty of action. Now if we stop, if we even retrace a few steps, no one can say that we are timid or pusillanimous: our flag cannot be humiliated by this course. Signori, oh profit by this moment in which it is vouchsafed to us to be wholly wise."

In the same spirit, Branca, now Minister of Finance in the new Rudini Ministry, hostile from the first to expansion, said: "Even if we are victorious, Abyssinia will return to the charge whenever we seem unprepared or complications recur in Europe." To several motions Rudini was opposed, saying, "We simply take cognizance that the Ministry is pledged to permit no expansion and hold it responsible for the future." "I accept," said Crispi, and the House dissolved.

Baratieri returned to Africa, with what instructions we know not yet. After once more defeating the rear of Ras Mangashà's column at Debra-Ailat, he declared the campaign at an end, and annexed the entire territory (i. e., all of Tigre and Agame occupied by his troops). Ergo, either these were his instructions or the home Government was bound to recall him, replace him with a more obedient general, and court-martial him at once. The House resumed its sittings on November 21, and many were the interpellations. Crispi's answers were curt and scornful. "We are on the defensive, and if, in defending ourselves, we conquer, is this a crime? Are we to leave the field open to the enemy to defeat us?" The Minister for Foreign Affairs made the only statement which throws any light on the subject:

"When General Baratieri was with us we were enabled to determine exactly the reasonable territorial limits which should circumscribe our occupation. . . . The Government, accepting these limits, ascertained that they could be reached without sacrifices exceeding the exigencies of the budget. . . . Thanks to the last victory [Debra-Ailat], Tigre is now incorporated in the colony. The legislation of Eritrea is applied to Tigre, to the entire satisfaction of the native clergy, who you know, gentlemen, have for their chief the only legitimate religious head in all Ethiopia."

(This was a blunder, but no matter.) There followed a long, glowing discourse on the glory, advantages, and benefits of this enormous annexation. San Giuliani and Franchetti, two of the greatest authorities on African policy, were "quite other" than satisfied. Brin made a most startling statement. Minister for Foreign Affairs and for the Navy several times, as he is again to-day, he spoke with authority. After delineating the African policy of the ministries in which he had taken part, he said: "This policy has been totally changed. I can affirm with assurance that the policy agreed upon with the Governor has been utterly altered, against the opinion of the Governor himself." To which Crispi replied: "If those petty princes of Shoa and of other localities keep quiet and do not attack us, we shall leave them in peace"; and the Ministry got 207 votes against 181 of the Opposition.

Six days later came the news of Amba-Alagi,

where a detached battalion was cut to pieces, and Major Toselli, after sending a remnant under his aide-de-camp to safety, faced the 20,000 foes till he fell dead at his post. Twenty millions of lire were reluctantly voted, even the ministerial majority putting a veto on "expansion"; and then throughout the country arose the cry, "Withdraw into our old colony; the Shoans are advancing with all their forces." No. Tigre was pompously announced in the Almanach de Gotha as forming part of the colony. Agame was occupied, and the fine fort of Adigrat constructed in its capital. Macalle, thirty kilometres south of this, was garrisoned with some 2,000 men, and the Shoans advanced. Of the disaster which followed, I need not speak. It is summed up in the report that the losses amount to between 7,000 and 10,000 soldiers, Italians and askars, and that more than 200 officers were killed. The news plunged Italy into convulsion. "No more soldiers for Africa," was the cry. Pavia tore up the rails. Milan was prepared for revolution, when word came that the King had accepted the resignation of the Crispi Ministry and that Rudini was to succeed him. This produced comparative calm, which was increased by the amnesty granted on the 14th for all those condemned by the military tribunals of January, 1894. The new Ministry is composed of the staunchest opponents of African extension. In his first speech Rudini quietly affirmed that an honorable peace was being negotiated, and that the seventeenth article of the Uchialli treaty would be abandoned in any case, as detrimental to Italian interests. The Crispinian newspapers howled. The *Riforma* cried, "Peace with dishonor"; the *Tribuna*, "Dishonor without peace." But Rudini quietly told the House that the Crispi Ministry, before going out, had themselves authorized Baratieri to treat for peace even to the abandonment of Adigrat and Kassala! This the Crispinians deny, and we must wait for the publication of the Green Book to get at the truth.

But for a cloud on the horizon, I should say for the time affairs may be tidied over. The House will grant the 140 millions demanded by the present government, as even Colaiani the Socialist, says that "we can't leave our troops defenceless in face of the Abyssinians"; and if Menelik allows, the colony will be reduced to its former limits, Asmara, Keren, Massowah. But now comes the British Jingoism to stir again the troubled waters. It was presumable that Italy would withdraw from Kassala, where it is with the greatest difficulty that Baldissera can send provisions; but if Anglo-Egyptian troops march on Dongola, she will scarcely be able to do so. Possibly before the English have time to start, the Dervishes may have compelled the garrison of Kassala to retire from the fort named by King Humbert "Baratieri!" This would be a blessing not in disguise. J. W. M.

ROME, March 25, 1896.

SOME recent remarks in the *Nation* respecting the Abyssinian disasters as bearing on the qualities of the Italian army seem to me clearly erroneous. As to the battles fought, that at Saati, in the early days of the colony, was a decisive victory, though in that of Dogali a single battalion, taken by surprise on the march to reinforce Saati, was surrounded and exterminated; but it was said by the reliefs who went out to bury the dead, that they lay in their ranks as they stood fighting, with not a fugitive, while the Abyssinian losses were such that Ras Alula, who commanded, withdrew to the

hills and left Saati unmolested. In the next battle, which took place at Agordat, the Italian force attacked and routed a Dervish army three times its strength in one of the most brilliant battles in the history of African enterprise; the Dervish loss exceeding the number of the Italian army. This was followed shortly after by the capture of Kassala, a fortified position taken from the Egyptians by the Dervishes several years before, and stormed by the army of Gen. Baratieri, who has now been defeated at Adua.

The present war opened with a revolt of a minor chief of the ceded province, and a battle at Halai in which the rebels were defeated and dispersed, with the loss of their chief. Closely following this came the attack of Mangashà, one of the pretenders to the throne, and son, by a concubine, of Johannes, the defeated and dead rival of Menelik, at the head of 14,000 Abyssinians armed with rifles and 4,000 spearmen. The battle, in which less than 4,000 Italian troops, mostly African battalions under Italian officers and organization, were attacked at Coatit, with all the well-known courage of the Abyssinians, ended in the total defeat of Mangashà, pursued till the night made it impossible to carry pursuit further, and the remnant of the fugitives escaped to Shoa. But Menelik, who had furnished and organized the invasion of Mangashà, now set to work on the preparation of an expedition in which all the strength of the empire should be called out, and gathered an army of 80,000 riflemen, furnished with arms of the latest patterns, and abundant ammunition, by the French agents through Obock and Gibuti. Baratieri had grown careless, and, though warned by the Government, from information received by its agents at Zella, of the extent of the preparations, left his outpost at Amba-Alagi unsupported, and delayed the recall until too late. This force was attacked by the leading division of the Abyssinian army, numbering 40,000, in a strong but unfortified position; and, after a hard-fought battle lasting all the morning, and in which the Abyssinian losses were greater than the Italian force, a retreat was ordered. In the course of it about 700 men escaped from the field, over 1,000 of them having died in their places, the "fighting edge" there shown calling out the admiration of military critics of most European nations, and even including French.

It was now evident that Baratieri had become either physically, mentally, or militarily so demoralized that he was unfit for command, and the Ministry desired to recall him, substituting Baldissera; but political influences prevailed, Baratieri being an influential Deputy on whom future hopes were based by the group of Piedmontese politicians who opposed the Ministry, and who had influence enough in the higher regions to prevent the change. Baratieri was advised to remain on the defensive and be prudent, while the Abyssinians took position at Adua, in a very strong position, recognized, indeed, by the General as impregnable, in a dispatch of the morning of the very day before the battle. The Italian positions were equally formidable, a wide valley separating the two armies. Here the time passed in the slow demoralization of the Italian army; the General seeming, according to the evidence of correspondents present and of several officers, to be attacked by softening of the brain. He himself in his report says that he was hardly conscious of what he was doing or why he gave the order to attack. The result we all know—the most disastrous defeat ever

known in African wars. But the "fighting edge" is to be seen in the losses, nearly half the army, and in fighting, for the pursuit of the retreating remnant was very brief. I take from the report just printed, drawn up from the evidence of the survivors, a portion, that relating to the Da Bormida division:

"Cut off, the enemy having broken through the centre, the Da Bormida brigade remained alone on the battlefield, fighting till night, bravely, heroically. Towards seven A. M., Da Bormida had sent up on a height on the left, perhaps to sustain Gen. Albertone, the battalion of irregulars [mobilized militia, Africans under their own chiefs], which fought for a half-hour against overwhelming forces, and then was obliged to retire with heavy loss; two battalions sent in support could not fire efficiently without hitting our own men. Then Da Bormida, seeing that great masses of the enemy were moving on him from the right, attacked them, deployed, repulsed them, and advanced nearly to the camps of Macconnen and Mangashà Atikin. For the moment, our men believed that they had won the victory; but, the enemy always increasing, Da Bormida ordered a retreat in a direction diverging from the centre, and effected it in échelon with counter attacks at the point of the bayonet. The artillery had fired all its ammunition and the infantry exhausted nearly all its cartridges. In this retreat Da Bormida fell riddled with balls."

But this was at seven P. M.; the men had been marching all night, and went into the battle fasting. The officers who last saw the General say that, when the retreat was begun, he said to them, "Go on, my lads; I will stay here," and, lighting a cigar, faced the enemy and was shot down. The force of the Abyssinian army was six times that of the Italian, which had marched by moonlight twenty miles over a country cut up by ravines, mostly unrecognised, and so difficult that in places it was necessary to take the guns from the mules' backs and carry them by hand; and as the General had, three days before, decided to fall back from the positions, the provision reserves had been sent on, and the whole army was on short allowance for the three days before the fight, into which it entered without resting. The enormous superiority in number of the Abyssinians enabled them to flank the Italians and attack the reserve before it had formed or extricated itself from the ravines, and threw it into confusion all the greater that, from the nature of the attack, they supposed that the main body in front had been annihilated; in confusion it retreated, being the only division that moved from its positions without the order of retreat, in spite of losses in the others, in actual fighting, quite unprecedented in modern warfare, except at Amba-Alagi. Several battalions were practically annihilated without moving from their positions; three-fourths of the officers falling out of the total number in the battle. The Abyssinian dead were so numerous that the *parlementaire* sent to Menelik to arrange for the burial of the Italian dead, reported that the Abyssinians had not been able to bury their own from the number.

Troops without any fighting edge don't fight in that way, and there were offers, during the few days succeeding the battle, of thousands of volunteers from all parts of the kingdom to go to Africa. The battle of Adua was, in fact, the repetition on an immense scale of the famous charge of the six hundred at Balaklava, the blunder as much more horrible as the disaster was greater. It has merely shown that Italian troops will go where they are sent, asking no questions, and the opinion of competent critics is that their fighting edge is of the finest temper. I have omitted the affair of Macalle,

where a thousand Italian troops, white and African, resisted, in a hastily improvised fortification, the attacks of the Abyssinian army for a month, and finally surrendered with the honors of war on the proposition of Menelik, the commander having decided to blow up the fort, with all in it, rather than surrender.

The Italian soldier is as fine as he can be, and the officers, as a class, the truest gentlemen and the most modest I have ever met; discipline is of the severest, and yet the soldiers as a rule adore their officers, and will go where they will lead them. The proof of their high morale is that the army in Africa is as ready to fight now as it was before the battle of Adua, and better prepared. The Massowah expedition was a blunder from the beginning, as Crispi declared it, in his opinion, when the first disaster in it called him to power; but, after the defeat of Dogali, military honor forbade retreat, and the same motive will probably not permit withdrawal at present. There are positions in which the honor of a country is worth more than its cost, and in the Italian mind this is one of them. X.

THE CARLYLE HOUSE IN CHELSEA.

LONDON, March, 1896.

THE house in Cheyne Row, Chelsea, where Carlyle lived has long been a place of pilgrimage. While it was still the dirtiest and shabbiest in all the neighborhood, hero-worshippers came to look upon it and shed a sentimental tear. It needed no medallion on the wall, no statue on the Embankment Garden beyond, to remind them of the tragedy of which the little old eighteenth-century street was the scene not so many years since. Into the domestic drama of the Carlyle household it is now impossible to intrude, that drama having been made public property, once and for all, when the 'Reminiscences' and 'Letters' were published. It is this which really has reconciled one to the recent transformation of the house into a public museum. Otherwise, one might shrink from what would seem the violation of a great man's privacy. It is different with Milton's cottage at Chalfont, for instance, with Dürer's house in Nuremberg; Milton and Dürer being among the remote heroes of dead centuries. But only yesterday the Carlyles were still at No. 5, now No. 24, there struggling in that "tearing whirlpool of miseries, anxieties, and sorrows" which life, alas! always was for them both.

However, since museum the house has now become, the more interesting and complete it is made, the better, so that most people will hear with pleasure that the loan exhibition, opened in December for a month, the time being then extended to three, is to be continued indefinitely. It is true that many of the things on view at the present moment—the greater number the property of Mr. Alexander Carlyle—may eventually be claimed by their owners. But it is hoped that others will be sent to take their place, and, at any rate, the collection will remain as it is until the summer—a fortunate arrangement for touring Americans apt to seek headquarters in London during May, June, and July.

The house, as by this time is well known, has been put in repair and given the thorough cleaning it so sorely needed after its temporary rôle as cheap hotel for cats. Every effort has been made to restore it to the condition in which it was left by the Carlyles, their wall-papers even having been reproduced—for in their day, in many of the rooms, wall-paper

there was, well hung over the beautiful paneling which, with the daintily decorated stairway, was one of the chief charms of their home, had they but realized it. When possible, the old furniture has been arranged in its old place, where they were accustomed to see it; and in every room and on the stairway pencil sketches by Mrs. Allingham show the exact position of engravings and pictures, these in some cases actually hanging where originally they belonged. What little there is down stairs is found in the back dining-room; Carlyle's bookcase, designed by himself, standing in the recess by the chimney-place which he meant it to fill. There you may see the complete library edition of his works, in the familiar red bindings, published by Chapman & Hall. And there, too, to your greater pleasure, you may see many of Carlyle's own books; really a motley collection, for your chance upon now a 'Danish Grammar' or a 'Handbook for Ireland,' now the works of John Knox or the plays of Schiller, or, again, a copy of the 'Earthly Paradise,' opened to show the inscription, "Thomas Carlyle, with his Scholar John Ruskin's love. 1st January, 1870." Ah, me! ah, me! as Carlyle might have sighed. One shelf is reserved for a pretty, old-fashioned cup and saucer and a couple of plates in white and gilt—"part of breakfast set," the catalogue explains; and memory forthwith singles from out the long procession of maid-servants, Mr. Carlyle's special abhorrence, "that horse," "that cow," "that mooncalf," and looks upon the grim comedy played one dull November morning—"a whole washing-tub full of broken things" in the kitchen, all the china breakfast service gone irretrievably, save a mere remnant left for the idle gaze of the sightseer. Do we not know those maid-servants of No. 5 even better than Cromwell's Ironsides, than Frederick's Grenadiers? Will they not, too, be remembered as long as Carlyle's name is honored, as long as the most human letters ever written are read by a sympathetic or prying public?

On the wall opposite are engravings of Frederick, of Maria Theresa, and of others who had a part to play in that weariest of all books in the making; and, in a case, are fragments of MSS., some full of the blue pencil corrections that were the printer's despair; medals commemorating Carlyle's birthday, a horseshoe with screw-cogs for frost, invented by him—a horseshoe all too sorely needed, too seldom used, in London's slippery streets—and other such odds and ends.

But the more intimate relics are above in the drawing-room. It is impossible here to give a full list of them: of the portraits, the pieces of furniture—most notable the desk upon which all Carlyle's books, except only the Schiller, were written—the miscellaneous contents of the glass case, with its testimonials from home and abroad, its photographs, card-cases, pencils, flasks, seals, and the several trifles once the most immediate personal property of either Carlyle or Mrs. Carlyle. But perhaps among them all is nothing so pathetic, so genuinely touching, as the three little birthday and Christmas notes. "The prophecy of a wash-stand," one says, "to the neatest of all women. Blessings on her bonny face, and be it ever blithe to me as it is dear, blithe or not. 25th Dec., 1850." And this from the man who hated all such nonsense as presents, and shrank from the bother of going into a shop to buy anything. Of his tenderness, in so trivial a matter, to his wife after her mother's death, one likes to have the reminder in the room where, for all its distinguished associations, one re-

members best the long, bitter days of her loneliness and jealousy, the long, sad evenings when he sat solitary over his dreary Prussian books.

On the same floor is Mrs. Carlyle's bedroom, all but empty. But its emptiness cannot help one to forget her terrible sleepless nights; her headaches; her waiting in the darkness, with revolver and rattle by her bedside, during the household cleaning, to her ever a horror; her agony in the early morning, when, awakened by the crowing of "infernal cocks" or barking of dogs, she listened for the mad stamping and titanic cursing in the room above. "If we could only sleep, dear," she wrote to him once, "and what you call *digest*, wouldn't it be nice?"—and, so writing, gave perhaps, the true clue to the tragedy of their life together. The bed has been brought back to Carlyle's room—a great gloomy bedstead, with heavy red hangings, well calculated to murder sleep. How often it figured in Mrs. Carlyle's letters, where no domestic detail, however squalid or lurid, was ever glossed over—tales, these, which the squeamish do not venture to repeat. But perhaps interest culminates when still another flight of stairs is climbed, and one finds one's self in the garret study, with its double walls and its top-light, the most disastrous of their many failures, where for the most part of those endless thirteen years Carlyle was "smothered" under his 'Frederick.' Was there ever, since the world began, an author whose work was done in such anguish and bitterness of spirit? The chair presented to him by John Forster has a prominent place. On the walls, the faces of Voltaire and Frederick look out from quaint little old cheap prints. There are portraits innumerable of the master himself: most conspicuous a photograph of Mr. Whistler's picture, a painting by Linnell (very early this, of course), a sketch by Count D'Orsay. And there are, above all, in convenient cases, manuscripts and letters, far more than can be now enumerated; none, however, of greater value, I think, none that does him more honor, than the brave, manly, fine letter written by him to his publishers after the MS. of the first volume of his 'French Revolution,' lent to Mill, had been burnt. Real trouble Carlyle met with a dignity and courage and strength that almost make one wish his way through life had been less smooth and easy. For, rugged as it seemed to him, assuredly most of his trials and tribulations were of his own imagining.

So entirely is the domestic economy of the little house laid bare to the curious that the basement kitchen may be visited, where odd pieces of the Carlyle dinner service are set out upon the dresser, and a cat sits purring in front of the fire, for all the world as if Pen were still alive. Glimpses there are, also, into the tiny garden, where, during the hot summers when he stayed in town, Carlyle had his tent study. At the back rises a bit of the old brick wall, all that is left of Henry VIII.'s Chelsea manor-house. To one side is a small green-china garden seat, one of the "noblemen," it may be, on which Carlyle sat for his midnight smoke, "looking up into the empyrean and the stars." And, later, grass-plots, and paths, and bushes are, as well as the thing can be done, to be put in precisely that order in which Mrs. Carlyle kept them. Altogether, the place has a homely yet solemn pathos, not spoiled by indiscreet or blatant touting for the tourist. The directors have shown admirable judgment and sympathy in the arrangement of the rooms and cases. There is nothing to

offend the most sensitive; much more than I have had space to mention, to delight the student. Indeed, No. 24 Cheyne Row, like the Soane Museum in Lincoln's Inn Fields, will, to many, seem far worthier a special visit than the large, better advertised galleries and museums. Because I believe that no one who has read Carlyle with pleasure or profit can fail to be interested, I am eager to call attention to the fact that it is proposed to make this exhibition of Carlyle's relics permanent.

Correspondence.

THE SILVER PROPAGANDA.

TO THE EDITOR OF THE NATION:

SIR: In a business letter to-day received from a merchant in Denver, Col., I find the enclosed printed slip, which sets forth a lot of the usual quality of so called silver arguments. This is an evidence of the activity of silverites. On the other hand, I have personal knowledge of the refusal of a large wholesale house in Georgia, whose partners believe in sound money, to circulate in their mails anything referring to the currency question in any way whatever.

I do not mean to say that it is the duty of any business concern to take up politics. Business men must decide this question for themselves. But if the sound-money men really believe that the 16-to-1 practice would bring about a worse condition of panic than we have ever experienced, it would seem that self-interest would dictate their injecting politics into their businesses to the same extent at least as the silverites are doing.—Very respectfully,

A. T. H. BROWER.

CHICAGO, April 8, 1896.

A COLLEGE FOR TEACHERS.

TO THE EDITOR OF THE NATION:

SIR: Readers of President Schurman's article in the April *Forum* on "Teaching—A Trade or a Profession?" will rejoice that an old cause has received a new advocate. To those, however, who, during the past decade, have been speaking and writing and bringing things to pass in this field, it will be a matter of surprise that the familiar proposition to establish a university professional school for teachers should have been advanced as something quite novel and, in a way, original. Novel it doubtless is to the writer in question, for his article shows that he is ignorant of—I will not say chooses to ignore—some of the ideals and tendencies that have entered into American educational history during recent years. In the interest of simple justice, as well as of truth, it seems proper to call attention to the facts which have been slurred over.

In doing this it is chiefly important to note that while President Schurman has been working out a scheme, others have acted, and have brought about the very thing that he presents as an ideal yet unrealized. It is, in fact, several years now since it became possible in President Schurman's own state for students of college and university grade to pursue, in a university, courses in education leading to the degrees of A.B., A.M., and Ph.D. These courses include theoretical studies of the kind he has described, and they also include practical work in a school organized for the express purpose of giving students of education an opportunity to observe, practice, experiment, and apply. They pro-

vide not only for the training of superintendents and of teachers for secondary schools, but also—a point which is a distinct advantage—for the training of kindergarten and teachers in elementary schools, both public and private. Further, these courses have already been sought by students as candidates for the above-mentioned degrees, and each of the three degrees referred to has been given to such students.

Aside from the particular instance just cited, it is pretty generally known that there have existed for some time, and that there are now springing up each year, other agencies for the higher training of teachers that include, or aim to include, some or all of the characteristics just enumerated. I submit that there is no essential difference between these schemes already in operation and that set forth in the *Forum* article. That President Schurman may be able to develop something superior to anything that now exists, can easily be believed and should be devoutly hoped; but the points wherein his scheme claims to be peculiar are minor matters, relating chiefly to name. To claim or to imply that such things are essential is to quibble.

It may even be said that, in the points wherein the scheme in question differs from other plans, it is inferior as a practical measure. Its peculiarity lies wholly in its limitations. In the first place, it is proposed to limit the membership to college graduates or persons of equal scholastic standing. It is significant that at Cornell the standard set for this ideal professional school is higher than the standard of that professional school which is already in existence there, although the movement for raising the standards of professional schools is elsewhere well under way. The second limitation would confine the work of the proposed school to the preparation of superintendents and of teachers for secondary schools. The rapidly enlarging fields now opening to college graduates as specialists in the kindergarten and in the elementary school—in manual training, art education, domestic science, natural science, English, and other branches—are ignored or dismissed with a wave of the hand. It is said in effect, "Normal schools are good enough to prepare teachers for the masses. The college has no interest except in the secondary school or in the superintendent's office." To such a way of thinking it is sufficient to reply that there are many people in this country to-day who know that such a position is narrow and unworthy.

In writing this letter I have had in mind to give credit to whom credit belongs for what has already been done, and to make clear the fact that college men and women bent on learning how to teach need not wait until a new pedagogic school shall be established before seeking professional training, and need not confine themselves within the narrow limits set for them in the article in question. But I have especially aimed to correct the false impression that would naturally be created by this article: for while it purports to be written in the interest of the higher training of teachers, in reality it tends to hinder the movement at large, because it ignores and discredits the results of progress already achieved.

WALTER L. HERVEY.

TEACHERS COLLEGE, NEW YORK, April 1, 1896.

MR. TUCKER AND DR. HALL.

TO THE EDITOR OF THE NATION:

SIR: In your issue No. 1608, Dr. Fitzedward Hall accuses me of garbling one of his sen-

tences containing a statement which I disputed, both in a *North American Review* article some years ago and in my little book 'Our Common Speech,' recently published. I admit, of course, that the omission of certain words should have been indicated; and, more, I think I should have been wiser to give the whole sentence exactly as he wrote it, for one cannot be too careful, in repeating any statement for the purpose of criticising it, to avoid even the slightest appearance of misrepresenting what was actually said.

This admitted, let me state exactly what the omission was, since Dr. Hall did not think it worth while to do so. The Doctor wrote, in his *Nineteenth Century* article, in severe criticism of the English of the late William Cullen Bryant: "Living as he did, among a people among whom, in the case of all but a very few writers and speakers, our language is daily becoming more and more depraved," etc. I left out the words, "in the case of all but a very few writers and speakers," which words were absolutely immaterial for my argument that followed, to the effect that our language is much more depraved in Great Britain than in this country, inasmuch as that argument is based entirely on common, every-day usage, and contains no claim for the beauty of distinctly American English as exemplified by our exceptionally careful writers and speakers. In other words, whatever force the argument may have would not be in the smallest degree affected by the insertion of the omitted words. Under these circumstances, I leave it to the candid reader to judge whether my critic is justified in charging me with "practices akin to the use of loaded dice," or with quoting his sentence "so transformed, by the elision, unindicated, of part of it, as to vitiate its purport materially." I might as well accuse Dr. Hall of misquoting Mr. Bryant by representing him to have written "honour," which Dr. Hall did, in a "letter" to you, Mr. Editor, published by him as a pamphlet in London in 1881, page 22. Whatever other linguistic crimes Mr. Bryant may have been guilty of, he certainly did not disfigure "honour" by the excrescent *u*.

Permit me to notice one other criticism which Dr. Hall makes of my little book. He says my phrase "of the Carroll Gansvoort stripe" is "slang of the slums and the gutter." I wish he would inform your readers in what respect it is worse than his expression, on page 15 of the pamphlet just referred to: "The items . . . are, mostly, quite of a piece with the particulars which the *Evening Post* retains." In each case the figure is evidently that of samples of the same cloth. I speak of them as having the same stripe; my critic says they are "quite of a piece." To approve the latter phrase and call the former the "slang of the slums and the gutter" seems to me just about as consistent as to spell "favor" with a *u*, and "editor" without it, as Dr. Hall does in consecutive paragraphs of his pamphlet. I find him also, on pages 20-21, characterizing certain opinions with which he does not agree as "old mumpsimus." There is a pretty word for a writer who is so shocked by hearing two men spoken of as being of the same stripe.—Respectfully yours, GILBERT M. TUCKER.

ALBANY, N. Y., April 6, 1896.

"NAKED BED."

TO THE EDITOR OF THE NATION:

SIR: If your correspondent from Pau will "—back to former generations," he will find

the origin of the figure "naked bed." It is in common use in Elizabethan literature, and refers simply to the custom in earlier times of going naked to bed.

At this moment, I recall the expression in a quaint poem, written in old-fashioned fourteen-syllable verse, that is to be found in 'The Paradise of Dainty Devices,' edited by Richard Edwards, in 1576. The subject, a weary mother singing her baby to sleep in the night-watches, is an exquisitely simple and graceful rendering of Terence's epigram, *Amantium ira amoris redintegratio est*. I quote the first stanza, with the note for the lovers of good poetry that there is more of it where this came from:

"In going to my naked bed, as one that would have slept,
I heard a wife sing to her child, that long before had wept;
She sighed sore and sang full sore, to bring the babe to rest,
That would not cease, but cried still in sucking at her breast;
She was full weary of her watch, and grieved with her child,
She rocked it and rated it, until on her it smiled:
Then did she say now have I found the proverb true
to prove,
The falling out of faithful friends renewing is of love."

M. A. S.

BALTIMORE, April 8, 1896.

TO THE EDITOR OF THE NATION:

SIR: The "naked bed" is the bed to which we go naked—literally naked in the olden time, when nightgowns were unknown. Compare "idle bed" in "Julius Caesar" (ii. 1, 117), "lasy bed" in "Troilus and Cressida" (i. 3, 147), and the familiar "sick bed." W. J. R.

CAMBRIDGE, MASS., April 8.

Notes.

MR. LECCKY'S 'Democracy and Liberty' is just being published by the Longmans.

'A History of Christian Doctrine,' by Dr. George P. Fisher of Yale, and 'Shakspeare and his Predecessors in the English Drama,' by Prof. F. L. Boas of Oxford, are among the latest announcements of Charles Scribner's Sons.

A volume of original poems by Caroline and Alice Duer, and 'Songs from the Greek,' translated by Jane Minot Sedgwick, will bear the imprint of Geo. H. Richmond & Co.

D. Appleton & Co. announce 'What is Electricity?' by Prof. John Trowbridge of Harvard.

Macmillan will handle for the Clarendon Press the 'Revenue Laws of Ptolemy Philadelphus,' edited by B. P. Grenfell from a papyrus in the Bodleian, the largest and oldest known in Greek, with a portfolio of thirteen facsimiles; and for the Cambridge University Press a fresh translation of part of the Sinai Gospels brought from Mt. Sinai last year by Mrs. S. S. Lewis, with a new and complete edition of her translation. This firm will begin immediately the publication of a new edition of Byron's Works, in verse and in prose, edited by W. E. Henley; the prose consisting of all the letters and the diaries, and the poems being arranged chronologically. Soon to appear also, is volume vi. of 'Periods of European History,' 1789-1815.

J. B. Lippincott Co. have in press 'The Making of Pennsylvania,' by Sidney George Fisher.

Roberts Bros. promise 'The Puritan in England and New England,' by Dr. Ezra Hoyt Byington, and 'Old Colony Days,' by May Alden Ward.

'Stereo-Chemistry' is the subject of a volume by Prof. Charlotte E. Roberts of Welles-

ley College which D. C. Heath & Co. will issue.

Way & Williams, Chicago, have nearly ready 'The Lamp of Gold,' a sequence of forty-nine sonnets, by Miss Florence L. Snow, with decorations by Edmund H. Garrett.

G. P. Putnam's Sons make the gratifying announcement that they will follow up their editions of Hamilton, Franklin, Washington, Jay, Mason, Paine, Jefferson, and King with 'The Works of James Monroe,' edited by S. M. Hamilton, whose experience in the archives of the State Department peculiarly qualifies him for his task. This reprint will occupy four volumes, and will be begun in 1897. The same firm will undertake 'The Constitutional Decisions of John Marshall,' edited with an historical introduction and analytical notes by Simon Sterne of the New York bar.

Letters of Monroe, Jefferson, Madison, and Richard Rush will compose Part I. of the Hamilton Facsimiles of MSS. from the national archives projected by the *Public Opinion Co.*, and will make a volume of which the edition will be limited to 500 copies. The series has no determinate bounds. Communications respecting it should be addressed to D. T. Pierce, No. 18 Astor Place, New York.

The Prussian Academy of Sciences intends to publish a complete and critical edition of the works of Immanuel Kant, and solicits communications from persons who may have in their possession any writings of the Königsberg philosopher which have not yet been printed. Letters, notes taken of his lectures or found on the margins and fly-leaves of books that once belonged to his library, as well as biographical items and similar records, will be gladly received and duly acknowledged.

A new wrinkle in the 'Annual Literary Index' for 1895 (New York: *Publishers' Weekly*), following the Necrology of deceased writers, is an Index to Dates of Principal Events, in which many more obituaries occur. Abyssinia, Armenia, Australia, Austria, Chicago, Cuba, Gold, Great Britain, Lynching, Madagascar, Manitoba, Silver, Strikes, Whiskey Trust, Yacht Race, are typical rubrics. We have marked some errors and discrepancies in names, both in the index to periodicals and in the accompanying author-index; but such defects are almost unavoidable. The five departments of this yearly key to the best literary production are now: Index to periodicals; Index to general literature (or, guide to the contents of books of essays, studies, and the like); author-index; bibliographies; necrology; and dates of principal events.

Externally and intrinsically, few reprints nowadays compete for prior mention with North's Plutarch in the "Tudor Translations" of David Nutt, London. This series has just been brought to a close with volumes v. and vi., and fortunate must the possessor of them count himself. The letter employed in this edition seems to us one of the most successful of the compromises between the heavy face of the early printers and the styles now in vogue, and shows that the hair-line can be abrogated without resorting to a repulsive compactness. The red binding is in accord with the generous scheme of the typography.

The Dent-Macmillan issues are a good second to the foregoing, and in the Batsch translations we have 'The Atheist's Mass,' 'Old Goriot,' and 'La Grande Breteche,' in their green livery, and the first volume of Carleton's classic 'Traits and Stories of the Irish Peasantry,' with an introduction by D. J. O'Donoghue preliminary to the subject.

own, with a portrait of Carleton, and reproductions of four designs by Phis. This, too, is in green covers, of a lighter shade, as befits the Emerald Isle. Macmillans' name is linked with George Bell & Sons' in the seventh volume of Mr. Wheatley's edition of Pepys's Diary—definitive, one would say, but that some Capt. Burton may itch and contrive to fill up the disreputable lacunae; the rather dull period here embraced being from July 1, 1667, to April 30, 1668. From Macmillans' own press we have two more volumes in their Standard Tales of the present century, Peacock's 'Gryll Grange' and Borrow's spirited 'Lavengro'; and Charles Kingsley's 'Heroes,' in the uniform pocket edition, in blue.

The Harpers are advancing rapidly with their handsome uniform edition of Thomas Hardy's novels. 'A Leodicean,' just brought out, succeeds 'The Trumpet Major,' 'The Hand of Ethelberta,' and 'The Woodlanders,' to name only the more recent.

Scribners' handy "Ivory Series" is newly augmented by Cable's 'Madame Delphine' and Mrs. Spofford's 'A Master Spirit.'

W. R. Jenkins has added to his well-known French reprints Victor Hugo's 'Quatrevingt-treize,' with an introduction and notes by Benjamin D. Woodward. The print is commendably large and open.

Fifty numbers of the Old South Leaflets (Boston) result in two volumes which claim a place in libraries and in intelligent households. The documents thus conveniently bound together range from the U. S. Constitution to Columbus's letter to Gabriel Sanchez describing his first voyage and discovery; from Magna Charta to George Rogers Clarke's account of the capture of Vincennes; from Franklin's Plan of Union to Cromwell's first speech to his Parliament; from Washington's Farewell Address to Jefferson's Life of Capt. Meriwether Lewis; from the Swiss Constitution to Strabo's Introduction to Geography; from Lincoln's Inaugurals and Emancipation Proclamation to Marco Polo's account of Japan and Java—and we have not half done. These volumes should go on the same shelf with Preston's useful 'Documents Illustrative of American History, 1606-1893.'

Those patriots who are anxious that we should, in Cuba and in Hawaii, extend our points of contact (and so of belligerency) with the outer world, would do well to ponder the significance of the four maps which stand like sentries at the front of 'The Statesman's Year-Book for 1896' (Macmillan). They are entitled "The Frontier Question on the Pamirs" (Russian sore spot); "The Indo Chinese Frontier Question" (French sore spot); "Venezuela-Guiana Boundary Question" (South and North American sore spot); and "Map to Illustrate Recent Arrangements with respect to Bechuanaland" (Dutch and German sore spot). Never was the innovation of inserting maps in this standard year-book better justified than in the current issue, in which also, with the customary changes in every part, there has been a special furbishing of the naval statistics. It may be doubted if Abyssinia will continue next year to be reckoned under Italy's foreign dependencies.

The Cassell Publishing Co. renew as in former years their convenient little 'Cassell's Complete Pocket Guide to Europe,' familiar to tourists for more than a decade; but editorial provision has not catered to visitors to the Olympian Games at Athens and increasingly to Greece by adding a section on that country, which is accordingly not in "Europe." That Turkey is equally counted out is perhaps

indicative of the pious wish that fathers the thought.

Students of mediæval history who have been bewildered by the all too rapidly accumulating "literature" of the last five or six years dealing with the origin of the German town constitution will be relieved to find in Dr. F. Keutgen's 'Untersuchungen über den Ursprung der deutschen Stadtverfassung' (Leipzig: Duncker & Humblot) a brief, sober, and scholarly review of the whole discussion. Dr. Keutgen neither follows the keen-witted though virulent Von Below in his Village Commune theory, nor does he accept the Market theory of Sobm, in spite of that scholar's well-nigh overwhelming authority in the early constitutional field. He perceives that there are several elements to be taken into account, not one of which can offer a complete solution of the problem; and, in particular, that the question of the sources of the town population is distinct from, though closely connected with, that of the town government. If any fault is to be found with his treatment, it lies in his unquestioning acceptance of the general principles of early constitutional development which have been current in Germany for a couple of generations past. The inquiry will probably have to go a good deal deeper than the municipal historians commonly suppose.

The three stories by the late John Heard which have been collected in 'Esquisses Mexicaines' (Paris: Paul Ollendorff), are rather gruesome, as stories, though they undeniably convey a distinct and truthful impression of typical nature and man in Mexico.

An important work on physical geography has lately been completed by A. de Lapparent, an author eminent among French geographers and geologists ('Leçons de Géographie Physique,' Paris: Masson). It is notable in two respects: it presents much more fully than any other European work the principles of geomorphology, as developed by various investigators in this country; and it applies these principles to the description and explanation of the geography of Europe, and more briefly to the rest of the world. Although even the well-known countries of Europe must again be explored with these modern principles in mind before they can be fully described, the summary statements here given of the facts and explanations already acquired is a very welcome contribution to modern geographical literature. For American geographers studying Europe at home, or contemplating a trip abroad, De Lapparent's work will prove a very serviceable companion.

Zola's new story, 'Rome,' is printed as a *feuilleton* in two Roman papers, the *Tribuna* and another, and has been received by their readers with loud cries of dissatisfaction. They complain that the book is partly worthless gossip and partly a heavy compilation of religion and politics. With even less patience do they bear Zola's cruel insistence upon the poverty and squalor of Rome, and his descriptions of the new quarter of the Prati del Castello, with its immense unfinished palaces with windows boarded up, the haunt of beggars and thieves. The *Tribuna* has been obliged to print a note denying all "solidarity" with the French author; and the *Riforma*, which speaks of the new novel in the most contemptuous terms, declares that "the insults and calumnies of M. Zola do not merit even a refutation."

The late Georges Delesalle was for years engaged on the compilation of a dictionary of French slang, and the result of his labors appears under the title 'Dictionnaire Argot-

Français et Français-Argot' (Paris: Ollendorff), in which, by means of the second part, the student is enabled to find readily the slang equivalents of the polite or recognized word. Prefixed to the dictionary proper is not only a preface by Jean Richepin—himself a master of slang—who lauds, as it deserves, Delesalle's work, but an interesting though too short study of slang from its origin to the present day. All the words in Villon's "jargon" which have any affinity with modern French slang have been carefully listed; they are followed by a glossary of similar terms in the 'Vis Gênerouse' of 1506, and by examples of slang verse of the eighteenth and nineteenth centuries. Delesalle's object was not merely to collect a greater or less number of slang words; he wished to work in the same field as Timmermans, and to accumulate additional material for the philological study of argot, and in this he has certainly succeeded. The epigraph, it may be noted, is from Zola's preface to 'L'Assommoir.'

The first volume of Livet's 'Lexique de la Langue de Molière' (Paris: H. Welter) is out, and a welcome book it is. The work was crowned by the French Academy and the author awarded one of its important prizes; the book itself is published by the Government and printed at the Imprimerie Nationale. Livet's great erudition and his intimate acquaintance with the works, not of Molière alone, but of seventeenth-century writers, have enabled him to carry out in rich abundance his comparison of Molière's tongue with that of his contemporaries, and to add invaluable notes and commentaries to almost every word and expression. This first volume, of 583 pages, takes us but to the word *curiosités*.

The fifth volume of the "Théâtre Complet" of Edmond Gondinet has just been published by Calmann Lévy. It contains two of his vivacious comedies, "Un Voyage d'agrément" and "Tapageurs," and a drama "Libres!" which is not as good reading as the amusing though often absurd lighter pieces.

Prof. Furtwängler, the successor of Brunn in the University of Munich, is delivering a course of public lectures on archeology, the proceeds of which are to be devoted to the "Mädchen-Gymnasium" about to be established in that city. The lectures are rendered additionally attractive and instructive by the use of the stereopticon, and are largely attended, so that the endowment fund will be considerably increased from this source. They also show the deep interest felt in the movement for the higher education of women by many of the most distinguished scholars of Germany.

On March 4 the faculty of the University of Heidelberg conferred the degree of Doctor of Philosophy *magna cum laude* on Fräulein Anna Gebeer, who presented an historical thesis on "The Importance of Queen Cunigunde to the Reign of Henry II." On March 6 the same university conferred the same academic distinction on Miss Alice Luce, who, after graduating at an American university, devoted herself to philology at Leipzig and Heidelberg. Several other women, mostly foreigners, have also announced themselves as candidates for examination and promotion. Quite recently the diploma of Countess Marie von Linden, the first woman who ever took a degree at Tübingen, was affixed to the official "black-board" of that university. This young lady, the daughter of the Württemberg Chamberlain, Count Eduard von Linden, made a specialty of natural science and was "promoted" *cum laude*. Her thesis was on the structural evolution and characteristics of marine snails.

An interesting contribution, 'Zur Beurteilung der Frauenbewegung in England und Deutschland,' by Lily von Gizycki, has just been published by Heymann in Berlin. The authoress is the widow of the well-known writer on ethics, Prof. Georg von Gizycki, who died about a year ago, and of whom an appreciative sketch was given in a late number of *Biographische Blätter*. She is also one of the editors of the semi-monthly sheet *Die Frauenbewegung*, issued by Dümmler in Berlin.

The first female professor in Russia is Mme. Kerschbaumer, who has been appointed to the chair of ophthalmology in a medical college for women at St. Petersburg. She is a Russian by birth, but married to an Austrian physician, with whom she founded an eye-infirmary at Salzburg in 1875 and since then has been engaged in conducting this institute. She pursued her studies chiefly in Switzerland.

A correspondent writes to us: "An ingenuous student of political history who should seek in the Century or Standard Dictionary for a definition of Boy, would fail to find it. Presumably the editors of these works supposed the word in its political sense to be only ephemeral slang; but a word which has held its own for half-a-century may fairly claim to have established its title. In the New York *Mirror* of Oct. 25, 1845, we read as follows: 'It [*The Globe*] is a very handsome and gentlemanly-looking paper, considering that it represents the "unwashed Democracy," and is the acknowledged organ of the class of politicians known as "the boys."'" Even the Oxford Dictionary has missed this definition.

—The April *Atlantic* contains numerous papers of permanently attractive quality, adapted to the class of readers who bestow more than waste moments upon their magazines. The opening story, by Henry James, has more to gain than to lose by deferred reading, since its continuation is to follow next month. The Scotch element in American life, of which Prof. Shaler writes, may fortunately be regarded, not in the light of a threatening problem, but of a field where fruitful observation may be pursued with a cheerfulness of spirit not often possible when immigration is a theme. By an effective device of grouping, three articles, not especially noticeable if considered singly, are made to produce compositely a vivid impression of the range and diversity of American country life and scenery—from the woods of New England, whose old-time maple-sugar industry is sympathetically described by Rowland E. Robinson, to the Western farm, some financial as well as natural aspects of which are treated of in a short story by Octave Thanet, and to the Okefinokee swamp, a Southern paradise for the thorough-going camper-out. In the last paper, however, the naturalist's remorselessness in shooting rare specimens strikes a note discordant to the bird-lover and to the humane reader alike. A paper in which a large issue is comprehensively discussed is "China and the Western World," by Lafcadio Hearn. The ultimate event to which this paper points is the loss of supremacy by the Aryan to a non-Christian Oriental race; but the practical consideration is that Chinese industrial and commercial competition will have to be faced very much sooner than has been expected. Evidence is drawn from all quarters of the globe to prove the formidable capacities of this race as competitors in industry and commerce. The conservatism blindly relied on as a check to Chinese advancement does not extend to business, while tenacity in clinging to the ancestral simplicity,

in matters domestic and personal, is a source of strength in the other direction. In arguing and illustrating his points, Mr. Hearn shows his usual subtlety of sympathy with an Eastern people "disciplined for thousands of years to the most untiring industry," and "content to strive to the uttermost in exchange for the simple privilege of life."

—Scribner's for April is smartly up to date, with the titles of most of its articles pointing directly to current events or to topics of current interest. A fashionable fad supplies the network of Richard Hardig Davis's brightly touched-off story, "Cinderella," in which Van Bibber, somewhat obscured of late, reappears as a social power. Prof. Trowbridge describes briefly "The New Photography by Cathode Rays," and Henry Norman takes the side of solidarity and right reason in the "Quarrel of the English-Speaking Peoples." Aline Gorren, using as a starting-point M. Brunetiere's remarks to the effect that literature and journalism are fundamentally incompatible conceptions, makes an interesting attempt towards a philosophy of the vulgarity of the American newspaper, and of its approved violation of the sanctities of private life. In writing of Lord Leighton, Cosmo Monkhouse owns to a schoolboy panegyric on a work of the artist exhibited in 1855, and his praise at the present date still leaves something to be desired in the nice balancing of artistic less and more; but his paper is genial and entertaining, and the illustrations are the best of their kind. Another article, profusely accompanied by pictures, describes a day at the classic games at Olympia. In spite of its elaborate attempt at an imaginative reproduction of time and personalities contemporary with Pindar, this article may safely be passed over in favor of Rufus B. Richardson's plain account of the restoration, in preparation for the games now in progress, of the stadion at Athens, where Mr. Richardson is director of the American School of Classical Studies.

—Prof. Marquand's account, in the *Century*, of the Olympic games and their history is of an unrelieved seriousness and solidity worthy of the 'Britannica,' and has at least this advantage over the encyclopedia article, that it seeks the reader and relieves him of the trouble of seeking it. Besides painful reminiscences, there may be found, under the head of "Four Lincoln Conspiracies," something new to most readers concerning the details of the three abortive plots which preceded the tragedy, and the flight and capture after it. In a literal rehearsal of events such as this, the meanness of the incidents of the assassin's hiding, his disappointed expectations of recognition as a hero, the petty character of his uncertainties and deceptions, strip him of even the dramatic interest that might have attached to him if he had not outlived his deed by a fortnight. In a third paper W. D. Howells dwells both humorously and eloquently on the inconsistencies and inconveniences of the fraternal relationship, as at present perforce recognized, and explains the essential difference between the involuntary or natural brotherhood and the brotherhood that is voluntary and human, or, as he finally prefers to call it, the supernatural brotherhood, with its superior opportunities of liberty, congeniality, and universality. That society, which has hitherto shirked its duty in this respect, shall take upon itself the obligations now unjustly attached to the ties of consanguinity, and shall thus relieve the individual from burdens often onerous and even

odious, and which cause him to shrink in dismay at the thought of any more brothers, is the view this paper insists on and the end it would hasten. Second only to the pleasure of following Mr. Howells's ingenious essay is that of picking holes in his logic—a feat which will put no especial strain upon the reader's powers of mind.

—If this month's *Harper's* obtains more than the briefest lease of attention, it will be altogether owing to G. W. Smalley's interesting observations on James Russell Lowell, and the new phases of his character revealed to himself and others during his residence, as minister, in England. It is flattering to one's sense of the capacities of life for development to learn that after he had passed the limit of three score, Mr. Lowell underwent transformation from the reserved student to the man of the world in the best sense of the term, becoming after sixty the brilliant social personage and after-dinner speaker known to his later, and especially his English, admirers. The typical quality of Mr. Lowell's Americanism is a second theme of these recollections, through which there runs an element of defence of him in this particular. It was the pronounced national character of his individuality that won him a large part of his popularity in England, and it is not likely that the genuineness of his Americanism has ever been seriously doubted in any competent quarter, unless by patriots of the school of Theodore Roosevelt, who takes occasion in this same magazine, in an article on Gen. Anthony Wayne, to insist on such of his familiar doctrines as that "Americans need to keep in mind the fact that, as a nation, they have erred far more often in not being willing enough to fight than in being too willing." That, united, the future of the world belongs to the United States and Great Britain, divided, to neither, is the principle for which Mr. Lowell is remembered to have stood unwaveringly, at home and abroad. Measured by the statesmanship of the author of the essay on Democracy, the propaganda of the article on General Wayne amounts to no more than a harmless expression of personal idiosyncrasy, or an example of the difference between culture and anarchy in ideas.

—The seventh volume of Paul Leicester Ford's edition of the writings of Jefferson (Putnam's) ends with his farewell to the Senate, as its presiding officer, on the eve of becoming the head of the Executive. In the six preceding years we see him retiring into his cheese, banishing the thought of politics, viewing his approaching end; rejoicing at escaping the Presidency when Adams was successful, knowing well "that no man will ever bring out of that office the reputation which carries him to it," but cheerfully accepting the Vice-Presidency, and entering at last with alacrity upon the higher office. The "feds" and Alexandrians, with "Ham," their chief, cause him endless concern; the Mazzei letter completes his breach with Washington; the "infidelities of the post-office" make him generally refrain from signing his private letters. His secret authorship of the Kentucky Resolves is displayed in his correspondence, and these landmarks of secession are admirably given by Mr. Ford in facsimile print, in rough draft, and in fair copy. Notable, again, are Jefferson's political creed on pp. 327, 328, with its many bearings on our present situation, and the memorandum of his services in answer to the *Call for Papers*

"whether my country is the better for my having lived at all." The fear of a bloody termination of slavery crops up everywhere; but on occasion of a negro rising in Virginia in 1800, he deprecates excessive hangings, writing to Monroe: "The other states & the world at large will forever condemn us if we indulge a principle of revenge, or go one step beyond absolute necessity. They cannot lose sight of the rights of the two parties, & the object of the unsuccessful one." Other aspects of Jefferson in this typical volume are the philosopher interested in fossils and in Indian languages; the manufacturer of nails; the inventor of a mouldboard. Mr. Ford's scrupulousness, in the matter of an insert respecting a disputed phrase in the letter of June 1, 1798, to John Taylor, was, to our mind, wholly uncalled for by the context.

—The incidents connected with the Presidential election of 1800 are admirably told in the letters contained in the third volume of 'The Life and Correspondence of Rufus King' (Putnam). The mistakes of John Adams in carrying through his "unadvised" measures, and the political blunder of the Federalists under the lead of Alexander Hamilton, brought that party to a crushing defeat. Hamilton's letter on Adams destroyed his followers' belief in his discretion, and did much to lead to the triumph of the other party. It is curious to see how erroneous were some of the judgments expressed of leading men. Marshall was thought to be too much guided by the refinements of theory; to be temporizing, and even feeble. His indolence and attachment to convivial habits were dwelt upon, and some years elapsed before his reasoning powers and weight of character were recognized. So Troup wrote of Gallatin's appointment to the Treasury: "An appointment by all virtuous and enlightened men amongst us considered as a violent outrage on the virtue and respectability of our country." The death of Washington naturally received attention, and the whole nation was described as exhibiting "all the symbols and badges of grief. Our churches are all hung with black cloth and our bells have long been muffled. The tongue of envy and malice is dumb—and not a word and not a whisper is heard from any mouth but in the General's praise. . . . Jefferson has just arrived in Philadelphia. He has taken care to avoid all ceremonies of respect to the memory of Gen. Washington." Turning to affairs abroad, King describes the want of attention paid to Washington's death by the English court. The death was announced in the newspapers, but not in the *Gazette*.

"I attended the next Levee in full mourning; my colleagues made me the customary compliments of condolence, but the King, tho' he spoke to me as usual on other topics, took no notice of the occasion of my being in mourning, & was silent respecting America. The next day, being the Queen's drawing room, I was at court & in mourning, as on the preceding day; both the King & Queen observed the same reserve, as the King had before done. I went again to the Levee, still in mourning, & the King still maintained his former silence. The Ministers are not regular in their attendance & commonly come late; some of them were, however, present on each day, but none of them said a word to me concerning the death of this great man; so I conclude, & the President, who well knows the character of this court, will think I had sufficient reason to do so, that this disrespectful omission &, as I consider it, want of magnanimity was a concerted neglect."

—The failure of the commission on damages under the sixth article of Jay's treaty, and the

standing grievances on impressment, convoys, and rights of neutrals, formed the subjects which monopolized King's activity; and so judiciously did he do what was expected of him that Jefferson saw no reason to remove him when the Federalists had ceased to be in power. The editor has performed his task with discretion, and adds value to the record by making good some omissions in former volumes. The extracts from King's memoranda are interesting, although it is sometimes difficult to accept as historical the anecdotes he records. The proof-reading shows carelessness: Hopson's choice (p. 298); the names of Stoddert (p. 380) and Truxtun (382) are misspelled; while the letter in cipher on p. 398 could have been deciphered from the copy in the Department of State. The letter of Adams to Tench Coxe is accessible in the 'Life of Pinckney.' The word *brimberion* is described by Troup as having been coined by John Adams, although the word *brimborion* was a word in good usage in the last century and had been borrowed from the French.

—The inhabitants of Neuchâtel have been extremely proud of certain fragments of local chronicles, which were held to be of the fifteenth century, and to have been written by the canons Purry de Rive and Hugues de Pierre. They related the story of the battles of Morat and of Granson and other high ancestral deeds. A great scandal, therefore, came to pass when M. Piolet, a young archivist who had studied the chronicles more closely than others, put forth the opinion that they could not possibly be authentic. Much noise was raised around him, by which, happily, he was not at all intimidated, but only went on to a still closer examination of the old texts. He finds in them a great number of words and of turns of expression which were not in use till a century after the death of the pretended chroniclers. Some statements of fact also are singularly inexact, such as an allusion to the University of Bale some twenty-five years before its foundation. Besides demonstrating the apocryphal character of the chronicle, M. Piolet has been able to indicate the manuscript sources from which it was drawn, and almost, if not quite, to unveil the fraudulent author of it. He must have belonged to the entourage of the Chancellor de Montmollin, if it were not Montmollin himself, who lived at the beginning of the eighteenth century. The most earnest partisans of the authenticity of the chronicles have been obliged to yield to the abundance of M. Piolet's proofs, but they do it with rather a bad grace. Indeed, many of the Neuchâtelois appear to find the new discovery disconcerting.

PATER'S LAST ESSAYS.

Miscellaneous Studies: A Series of Essays by Walter Pater, late Fellow of Brasenose College. Prepared for the press by Charles L. Shadwell, Fellow of Oriel College. Macmillan & Co. 1895.

THESE final gleanings of Mr. Pater's work lack, in some instances, the latest touch of his hand; but in none except the essay on Pascal can they be called incomplete. All that they want is unity; they are so many codicils to his studies in art or in literature. The most precious and significant are in the nature of autobiography. Mr. Pater's reader will find them all characteristic and worthy of preservation; his admirers will consider one, at least, unique and indispensable.

The chapters on Raphael, on Romanino and Moretto of Brescia, on the Cathedral of Vézelay and Notre Dame d'Amiens, are the continuation, by a skilled and matured hand, of those eloquent essays on Botticelli and Luca della Robbia and Leonardo da Vinci which appeared more than twenty years ago. It is not for a mere layman to criticise these, but simply to express the opinion that fortunate indeed is the student who shall make his first acquaintance with these less-known painters, and with these cathedrals, under the guidance of such a cicerone. Mr. Pater here writes in the plain and direct manner of one who has much to tell and has complete mastery of his subject, one who has eyes to see what many cannot see by themselves, and who has all the historical equipment, the acquaintance with the life and thought of a period, without which even the artist's eye cannot see straight and intelligently. A far safer and less whimsical guide than Mr. Ruskin, a guide more poetically sensitive than Mr. Hamerton, we always feel that he is most inspiring, most felicitously occupied, when his theme is art. We are not now speaking as a connoisseur, but as a learner who has found in him his Virgilio, in some sort—his gracious and illuminating conductor in strange regions to whose atmosphere he was not born. To the literary critic, at any rate, it is quite clear that Mr. Pater moves most easily and most winningly, with fewer temptations and snares for his footsteps, when, as we have said, his theme is Art. When he is not treating of Art directly, he strays into it inevitably. His 'Marius' is a series of brilliant and imaginative pictures; his philosophy is the philosophy of an artistic spirit, of the Platonic lover of beauty.

The fundamental endowment of his nature is most strikingly revealed in the sketch entitled "The Child in the House," here first published in the collected works. It was called originally, when it appeared in *Macmillan's Magazine*, "an imaginary portrait"; but it is undoubtedly a portrait of Mr. Pater's own childhood. It has a singular interest and value because it sums up all the peculiarities of his style and manner, as well as of his temperament. It is a picture of an extremely sensitive artistic temperament, taken with all the shades, the nuances, of some peculiarly delicate process. This hyperæsthesia, which verges upon disease, which one sees distinctly reaching disease in many pages of Maupassant's 'La Vie Errante,' remained with Mr. Pater simply an exquisite organ, a superfine sense with which he took in the world so vividly that his impressions became far more real to him than any thoughts or processes of reason. He began "to assign," as he himself says, "very little to the abstract thought, and much to its visible vehicle or occasion. He came more and more to be unable to care for or think of soul but as in an actual body, or of any world but that wherein are water and trees, and men and women look so or so, and press actual hands." One can understand from this how Marius proceeded in his conversion. He accepted, in the house of Cecilia, an ocular demonstration of the Christian religion. He saw there a family living lives of sweetness and charity, peace and contentment; he saw this life moving in an atmosphere of decorum and ritual that appealed to his taste and his sense of fitness: he looked upon the beauty of holiness, and he surrendered at discretion. It is not an intellectual process at all. There is no inquiry for credentials, no inquiry as to whether this belief be true or false. The intellect has no part in his choice any more than it has in the decision whether a

woman is beautiful. We look and we make up our mind without hesitation. From the same natural bent proceeds his fondness for the ritual and symbolism of religion; his "love for the comely order of the sanctuary, the secrets of its white linen and holy vessels and fonts of pure water, its hieratic purity and simplicity, became the type of something he desired always to have about him in actual life." It is this same feeling that gives us the wonderfully sympathetic and vivid picture of the rites of Aesculapius, and of the Christian worship and ceremonial at the house of Cecilia—a scene which shows us what sort of familiar appeal may have won the minds of the early Christians at a time when their religion, "hardly less than the religion of ancient Greeks, translated so much of its spiritual verity into things that may be seen." As a final touch we have the confession that this passion for the visible emblems and consolations of religion was fed in the child's soul by his early fear of death, "a fear of death intensified by the desire of beauty."

The essay on Pascal is a further revelation of our author's temperament and of his necessary point of view. It would have received some additions if he had lived, but its general outline and drift would not have been altered. He describes the 'Pensées' as evincing a malady of genius, a typical malady of soul, which, he observes, anticipates certain modern conditions of thought—the ailing helplessness of Obermann, for example. Pascal's malady, he goes on to say, "reassures sympathetically, by a sense of good company, that large class of persons who are *malades* in the same way." "La maladie est l'état naturel des Chrétiens," he quotes with a sort of acceptance, and adds, "We are all ailing more or less with this disease," not perceiving the irony of his own admission nor the profound irony of Pascal's attitude in such an utterance. For the 'Pensées' present chiefly the spectacle of a powerful and penetrating intellect which has stultified itself by the acceptance of certain irrational dogmas, and which bears the consequence in an agonized endeavor to make this attitude square with the rational scheme of things. To achieve this impossibility, he wrests and twists his own powerful logic, he vilifies man, he vilifies the Deity whom he professes not to know. To his credit be it said that his yoke is too heavy for him to bear, and it causes him unutterable misery. With lesser spirits the penalty of such a surrender is a growing indifference to truth, a decay of conscience that ends in dishonesty; no sight is more pitiable to the student of human nature than the certainty with which this degeneracy affects certain classes of men, even the best of men. But, for Pascal, sincerity and power of intellect were a supreme endowment. He could not quench it without groaning and travail of spirit; he had made *il gran rifiuto*, the abdication of his own reason, and so he necessarily belonged to the class he so pathetically describes as the band of those "qui cherchent en gémissant." It is the tragedy of a Samson who has put out his own eyes. Yet it is a Samson who has not wholly succeeded in blinding himself; the light still glimmers, and the light gives pain, the mortal pain of a great intelligence at war with itself, an intelligence made to apprehend life and the world, not (like Mr. Pater's Marius) chiefly by the senses, but with the inward eye. To his serious apprehension, the æsthetic charms, the ritual of the Catholic Church were, indeed, as Mr. Pater himself admits, often weary and unprofitable, "an extra trial of faith." The vision of things must

come to him not by their beauty, but by their reality, by their truth. And hence, with this fundamental sincerity, there is a horror of compromise, a tendency to paradoxes and contradictions, a readiness "to push all things to extremes." He is ready to push even his scepticism to an extreme.

Mr. Pater notes the influence of Montaigne on some of the "Thoughts," the *sceptical influence of Montaigne*, as he calls it. It is quite true that in those later years of illness described by his sister with a naïve fidelity of diagnosis, Pascal has lost the self-poise, the wit of the 'Lettres Provinciales'; he has parted company with the large and sane spirit, the transcendent good sense, of Montaigne, which looked so far and so serenely beyond the mists and prejudices and conventions of his time. But Mr. Pater fails to see that Pascal is never so thoroughgoing, so absolute a sceptic as when, in the 'Thoughts,' he denies altogether the validity of his own reason in favor of a mystical scheme inspired by an ecclesiastical authority. "Nous ne connaissons ni l'existence ni la nature de Dieu." "Il n'y a rien de si conforme à la raison que ce désaveu de la raison." Such phrases go far beyond the Pyrrhonism of Montaigne. We can hardly conceive them as uttered before that last period of shock and hallucinations and ascetic pietism which his sister so vividly portrays. They anticipate, it is true, the language of some theologians of the present century; yet they are the *ne plus ultra* of agnosticism, for they affirm not merely that we do not know, but that we cannot know, the realities of the Universe.

"Apollo in Picardy" is the realization of a conception which had haunted Mr. Pater's mind for many years, the earliest hints of it appearing in the series of papers on the Renaissance. It is a delicate fantasy played about a theme which Heine suggests. The ex-deity Apollo, a wanderer to northern climes, brings to the chill seasons of Picardy an alien supernatural brightness, and plays strange pranks with the monastic brethren among whom he is a sojourner. Masquerading as Brother Apollyon, he still retains his lyre, and helps by its magic notes to raise the rhythmical and classic lines of some monastic edifice; he still keeps his bow, and his ancient dominion over the creatures of the forest; and, by the spell of his weird and baneful beauty, he ensnares, as of old, young Brother Hyacinth to wrestle and play quoits with him. It is a fatal game played on some late autumn evening, when the scene dissolves before the earliest blast of winter, and the vagabond god at last flees with the whirling leaves, tricky and conscienceless, leaving the stain and suspicion of murder on the innocent mad Prior St. Jean. The antics of the exiled deity, wavering between monk and wizard and daemon, and retaining in his fallen estate the relics and reminiscences of his ancient dignities, are traced with the fine and dexterous strokes of learning and imagination which painted the Amazon in the "Hippolytus Veiled." It is a pretty bit of moonshine, lighting up the fretwork of some old ruin—a fancy which few writers would have dared to intrust to the matter-of-fact vehicle of prose.

But Mr. Pater likes to demonstrate that prose is not necessarily prosaic, that it is an instrument of many stops, from which a varied music may be drawn. The proof of this is easy enough, if you know how—*solvitur ambulando*; and Mr. Pater does offer us a rather convincing solution. Yet we like his work best when he is not pursuing these wire-drawn fancies

and clothing them in a web of elaborate and ingenious spinning. We like him best when he is so charged with his subject that he has no time left to think of embroidery. Nothing that he has since done moves with a flow so free and impassioned as those early essays on the Renaissance. Nothing, for example, quite equals his description of Leonardo's "La Gioconda," as a spontaneous flight of sustained imagination and eloquence. There is many a paragraph in his later works that moves with curious artifice, on the wings of Icarus. But the flight makes us uneasy. There is something in the movement, tortuous, baffling, ineffectual; it affects us like some of the nocturnes of Chopin. These periods are intended to imitate with cunning carelessness the freedoms of conversation, its digressions and parentheses; but the art is too evident, it reminds us of Mr. Pater's favorite *askesis*. There is indeed too much *askesis* for the reader; and readers, with proper justice, object to any athletics of the understanding which are not demanded by the intrinsic weight and difficulty of the theme. Mr. Pater speaks somewhere of the "long victorious period"; some of his periods are long and not victorious—not victorious as Plato's longest periods, or like Mr. Ruskin's, both of which bear the reader without fatigue triumphantly on the wings of a passionate and powerful eloquence. Therefore it is that we most admire Mr. Pater when he lets himself go, when he forgets his artifice and yields to the current of thought and emotion of the moment. He did this oftenest, as was natural, in the ardor and abandon of youth.

But the word *abandon* can never be rightly used of any period of Mr. Pater's work. It was always under the control of an artistic conscience that tended to austerity. For, mingled with this pathetic precocity of the "Child in the House," that susceptible spirit nurtured on delicate and dainty sights and sounds, it is a singular trait to discover an admiration for the Spartan training of youth, whether in English schools or in Lacedæmon. The foundation for this admiration is, we suppose, the feeling for restraint and measure in art, for an *askesis* which may emerge in asceticism; and the theory that masculine beauty is developed by such training. This feeling is embodied in the imaginary portrait of Emerald Uthwart, which is the counterpart of the sketch of the Laconian "noble slavery," one of the most brilliant chapters on the Platonic system and ideas. Uthwart is a young Englishman with the ideal temperament of a soldier, the tastes of a scholar, and the susceptibilities of Mr. Pater's own childhood. He leaves Oxford after the training of an English school, and serves in a brief campaign in Flanders, where he receives an honorable wound. He is finally dismissed in disgrace because of some irregular exploit, which, though punished by a court-martial of martinets, won, after later investigation, the applause of his countrymen and the reversal of the military decision. The reversal comes too late, and he dies of the double wound at his heart. Uthwart is the embodiment of that *askesis* which Mr. Pater so much admires, of the monastic discipline and obedience, the vigorous rule in play and study, of a Rugby or a Winchester, "a sort of hardness natural to English youths," crowned by the subtler influences of Oxford, "the memory of which made almost everything he saw after it seem vulgar." This last sentence evidently comes from Mr. Pater's heart. No one can blame him for loving that one ideal abiding in the world of *σχολή*, of scholarly leisure and quiet,

where wisdom may be worshipped and pursued in ideal temples, amid habitations which Plato himself might have found no less fitting than his own Academy.

SHAW'S MUNICIPAL GOVERNMENT.

Municipal Government in Continental Europe.
By Albert Shaw. The Century Co. 1895.

THE interest now so generally felt in the improvement of municipal government in the United States is a natural development of civilization. Americans have been for many years occupied in subduing a new continent, and during this century the work has been pushed at a tremendous pace. Much remains to be done, but the task is no longer on the great scale of the past, and our present command of the resources of nature is so complete as to give us leisure to pay attention to our conquests. Like men who, having accumulated a comfortable property, begin to think of improving their houses and adorning their grounds, our cities are awakening to the possibilities of better sanitation, smoother pavements, handsomer buildings, and more beautiful parks. As is usually the case, governing bodies lag behind public opinion, and we are therefore at present engaged in stimulating our rulers to more enlightened and honorable activity.

The popularity of Mr. Shaw's books is evidence of the growth of the municipal spirit in this country. The details of the administration of government, especially of the government of subordinate communities, are not intrinsically of an interesting character. But when the Anglo-Saxon conscience is aroused, as it is now aroused concerning municipal improvement, the natural aversion to details is overcome, and even statistical tables lose their terrors. Moreover, it is only fair to say, Mr. Shaw has the knack of coating his pills of information with a pleasant style, and he quickly leads his readers away from the analysis of tedious particulars to the contemplation of splendid results. Whatever criticism may be passed on his methods, it is undeniable that he succeeds in attaining what is probably his main purpose—the presentation to Americans of such magnificent ideals of civic progress as shall stimulate them to vigorous effort towards their realization.

Perhaps the most striking fact, to the ordinary American reader, of all that Mr. Shaw presents, is that European cities have recently been increasing their population at a more rapid rate than those of this country. We are so much in the habit of expatiating upon our wonderful progress as to make it startling to be told that since 1870 Berlin has overtaken and passed New York; that in thirty years Philadelphia has gained a half-million souls, while Berlin has gained a million; that in 1875 Hamburg and Boston had nearly the same number of inhabitants, while in 1890 Hamburg had almost 570,000 to 448,000 in Boston; and that during this period Hamburg's population has increased at twice the rate of that of Baltimore. Leipzig has distanced St. Louis and San Francisco; Cologne has in the last decade surpassed Cleveland, Buffalo, and Pittsburgh. So if we compare Munich and Breslau and Dresden and Magdeburg with American towns of corresponding size—Detroit, Milwaukee, Louisville, Albany, Rochester, and even Minneapolis—we find that the foreign cities have grown almost without exception faster than our own. Even Nuremberg, which we associate with the Middle Ages, increased its population between 1860-'90 from less than 100,000 to 142,000, while

Providence grew only from 105,000 to 132,000. In some cases, Mr. Shaw observes, the annexation of territory affects these comparisons, but these cases probably offset each other. Moreover, if we take in the smaller towns, the general result is the same, and if we were to bring the comparison down to 1895, it would be even more favorable to the German towns.

It is quite evident that the plea of infancy, which we have perhaps been taught to make too much of by the protectionists, is no longer available to our cities. As a matter of fact, with the exception of an ancient core, the ordinary German city is newer than the American. If the foreign towns have surpassed our own in the quality of their development, we cannot longer excuse ourselves on the ground of youth, nor can we escape the conclusion that our own backwardness is due, not to any parsimony in public expenditure, but to lack of intelligence and honesty in our governments. Doubtless Mr. Shaw is somewhat carried away by his subject, and almost all foreign administration seems to him admirable. We shall presently take exception to some of his statements; but, making due allowance for the *coulour de rose*, we must admit that in the art of municipal government we have been fairly distanced by countries which our popular orators generally speak of as "effete."

As we have pointed out in commenting on Mr. Shaw's book about the English cities, there appears to be only one explanation of this. In all matters directed by private enterprise we need confess no shameful deficiency; it is in the administration of public affairs that we fail. At the same time, we are the only people whose municipal affairs are regulated by universal suffrage. The argument is conclusive that our form of government is one of the causes, if not the sole cause, of our backwardness. As we cannot expect to do away with universal suffrage, we must somehow manage to improve its results. Nothing can be cruder than to suggest that we have only to introduce foreign methods of administration in order to solve our problems. The matter is far more difficult than this. It is hard to account for the slackened rate at which our population increases unless it is explained by the burden of misgovernment. If we are to improve our cities, it must be done not by increasing the rate of taxation, but by economical and business-like expenditure. We have sufficient intelligence to keep up with the march of progress; but we cannot do so without adopting the methods employed in successful private enterprises.

For these reasons Mr. Shaw's book is disappointing. He lavishes praise on foreign methods and is ecstatic over foreign results, but he gives us comparatively little in the way of precise and definite statement that is useful for purposes of comparison. We find it quite impossible from his data to determine whether the administration of the government of Paris is economical or ruinously extravagant. He expatiates on the lighting system of that city—which is behind the times in its use of electricity—but he does not tell us how much it costs to produce gas, or how much the consumer has to pay for it. But unless we have these data we cannot tell whether the revenue derived from taxing the gas company is desirable revenue or not. This revenue is now 20,000,000 francs; but it is questionable if a tax upon light is, on the whole, advantageous, no matter how productive it may be. Mr. Shaw thinks it indisputable that if the city were to provide gas, the poor people of Paris would get

it cheaper than now. Perhaps they would apparently have it furnished for nothing, like some other things; but what would become of the 20,000,000 of revenue, and who would finally pay the piper?

Again, if we wish to compare the results attained at Paris with those at Berlin, we must go elsewhere than to Mr. Shaw's book. The nearest approach to definite information may be found in the appendixes, where some scanty tables are presented as the budgets of these cities. On the face of these figures it would seem that the Police Department of Berlin cost 3,831,000 marks, while that of Paris cost 29,520,000 francs; that the care and management of the streets and parks of Berlin cost less than 4,000,000 marks, while in Paris the corresponding expense was not far from ten times as many francs; and that the salary account in Berlin was a little over 7,000,000 marks, against nothing under that head in Paris. In fact, wherever we have attempted to obtain exact results from Mr. Shaw's statements, we have failed so completely as to lead us to the opinion that he has depended mainly on what he has been told, and has seldom made any thorough investigation for himself.

Perhaps the most remarkable exhibition of Mr. Shaw's methods is to be found in his study of Paris, which occupies one-third of his book. We are there told that "all countries are under permanent obligations to the clear political philosophy that furnished the French Revolution with its principles," and it is intimated that this philosophy would require that the administration of Parisian affairs should be turned over to the Municipal Council. Concerning this body Mr. Shaw writes with less comprehension than can be obtained by any one from a file of Paris newspapers. He says that public exactions in Paris have not tended to exhaust the sources of private wealth, and then shows how rapidly the number of school children who cannot afford to pay for their own dinners has increased, how from 15,000 to 20,000 families annually have their rent paid by the City Council, how "thousands of honest men in temporary need" are boarded by the city in the free lodging-houses, and brings much other evidence tending to prove that the number of people unable to earn a living in Paris must be very great. Considering that the ordinary expenditures of the government of the city are 290,000,000 francs, of which about 111,000,000 francs is on account of its indebtedness; that the extraordinary expenses are nearly 50,000,000 francs more; that the debt is now 2,000,000,000 francs, practically all of which has been incurred within forty years; and that in addition to this the national charges are of a staggering magnitude, it seems a hasty conclusion that the sources of private wealth have not been affected. Undoubtedly there is much to show in Paris for all this expenditure, and Mr. Shaw is quite confident that very little money has been wasted, although he mildly cautions the authorities to resist the temptation to increase the bonded debt. But in what way the French people are to meet the charges of the war for which they have been so long waiting, when it at last comes, it is not easy to say; or rather it is clear that solvency can be maintained only by the preservation of peace.

Mr. Shaw is so resolutely optimistic that we are not surprised to find no allusion to the disposition of the Paris Council to subsidize strikers; a disposition formerly curbed by the general Government, but which in a recent case has been permitted to display itself outside of Paris. Of the Bourse du Travail he has only

commendation to offer, being apparently ignorant of the capture of that institution by the communists, whose conduct became so scandalous as to compel the authorities to close its doors. We could multiply instances of this kind, which prove that for really scientific uses Mr. Shaw's book has slight value; but, as we have indicated, it has merits of another kind. It will at least arouse interest in matters of the highest importance, and will direct attention to the quarters from which the information that we need may be derived. It is a stimulating and suggestive essay, or collection of essays, and the way is now broken for some cool and clear-headed observer to lay before the American public the results of really scientific comparison of the methods of municipal government.

The Relief of Chitral. By Capt. G. J. Younghusband and Capt. F. E. Younghusband. Macmillan & Co. 1895. Pp. 188.

With Kelly to Chitral. By Lieut. W. G. L. Beynon. Edward Arnold. 1896. Pp. 160.

HARDLY a year passes without some little war being undertaken upon some part of the extensive frontier of the British Empire in India. None of these little wars has attracted such general interest in recent times as the operations conducted last spring for the relief of Chitral. The ordinary Indian frontier expedition is undertaken for the punishment of some rebellious tribe, or the subjection of some petty independent chieftain who has neglected to obey the orders of the Government of India. The Chitral expeditions had a more dramatic interest. A British agent was besieged by an overwhelming force of native tribesmen in a small hill-fort among the mountains of the Hindu-Kush, several hundred miles from the nearest military post; it was known that he had with him only a small force of Sikh and Kashmir troops. The season was the most unpropitious for mountain warfare; the enemy was brave and experienced, and the country through which alone relief operations could be conducted well-nigh impassable by reason of natural difficulties; and, to compare small things with great, the situation was similar to that in the Sudan in 1885, when the civilized world was marvelling at Gordon's heroic defence of Khartum, and wondering whether the relieving force hurrying up the Nile could arrive in time to save him.

It would take too long to narrate the events which brought about the dangerous situation of Dr. Robertson, the British agent. It is enough to say that Chitral is a small, mountainous state, 300 miles beyond the borders of British India, not far from the Pamir region, and nominally dependent on Kashmir. It is exceedingly doubtful whether the British Government in India was justified in interfering with such a distant and inaccessible country as Chitral, but, for good or for evil, it had interfered, and as a consequence its agent found himself in the month of March, 1895, besieged in a ruinous hill-fort, eighty yards square, with a garrison of 99 Sikh and 301 Kashmir infantry, by several thousand Pathans and Chitralis led by Umra Khan, a neighboring Pathan chief, and Sher Afzul, a pretender to the Chitral throne. It was necessary for the maintenance of British prestige that Dr. Robertson should be rescued at once, and, as soon as his desperate situation was known, two expeditions were sent to his relief, and the siege of Chitral was raised after a gallant resistance in

which the garrison lost more than one-third of its numbers.

The volume written by the two brothers, Capt. G. J. Younghusband and Capt. F. E. Younghusband, gives an excellent account of the defence and the relief of Chitral. The siege lasted from the 4th of March to the 19th of April, and during the latter part of this period the garrison had to subsist on a scanty allowance of horse flesh. Umra Khan was an expert in mountain siege operations, and tried every method of attack; several attempts were made to set fire to the fortifications; a nearly successful effort was made to run a mine under the fort, which was frustrated only by a gallant sortie; and the walls were so weak that they had to be strengthened with empty boxes, and so full of gaps that carpets had to be hung across to prevent the enemy from picking off the defenders. Unceasing vigilance was necessary to prevent a surprise, and there were only three British officers available for duty. To add to the dismay of the garrison, information was received during the early part of the siege that two reinforcements, the one escorting a much-needed supply of ammunition, had been cut off, and that the British officer commanding one party had been killed with two-thirds of his men, while the British officers commanding the other party had been captured by Umra Khan.

The news of the siege, followed by the news of these disasters, caused the Government of India to direct a powerful force to be mobilized on the Punjab frontier, which was ordered to march due north through the valleys that formed the territory ruled by Umra Khan to the relief of Chitral. At the same time instructions were sent to Col. Kelly, who commanded a Sikh regiment which was making roads upon the northern frontier of Kashmir, to make an effort, if an effort were possible, to reach Chitral by advancing through the mountains first west and then south for some 300 miles. The larger expedition, which marched northwards from the northwestern corner of India, consisted of about 15,000 men, including six British regiments, and was commanded by Gen. Sir Robert Low. It crossed two lofty passes in spite of determined opposition, and fought several successful actions. Its operations caused Umra Khan to give up the command of the army besieging Chitral, and to return to the defence of his own villages, but it had not the honor of relieving the besieged garrison. This feat was accomplished by Col. Kelly, despite the smallness of his force (which consisted of only 400 Sikhs and some untrained native levies) and the exceptional difficulties of the country through which he had to pass. The operations of both Low and Kelly are described at length by the Younghusbands, who acknowledge in no grudging terms that the military honors of the campaign were earned by the gallant garrison of Chitral and the indefatigable officers and men of Col. Kelly's column.

Col. Kelly's operations form the subject of Lieut. Beynon's narrative, which is a naïve and simple record of the daily occurrences of an arduous march. Readers of Mr. Kipling's Indian stories will remember the tale told by "The Infant" in "The Conference of the Powers." Lieut. Beynon is simply "The Infant" in real life. The style, the language, the allusions, the narrative as a whole bear the unmistakable imprint of a Kipling story. Now it can be taken for granted that Lieut. Beynon is not imitating Kipling—his narrative is far too artless and natural for such a suspicion—and it is a further proof of Kipling's singular

genius in assimilating the manner of thought and speech of the British subaltern on service in India that the words of Lieut. Beynon, relating real events, should read like the words of Mr. Kipling in one of his most characteristic stories. No higher praise can be given to Lieut. Beynon's personal reminiscences than this, and all who have enjoyed Kipling's tales of military life should make a point of reading them. They will find not only a narrative of sustained interest, giving an insight into the character of the young British officers of the present day, but also an account of natural difficulties heroically surmounted, of the crossing of a pass 12,400 feet high, covered by fresh fallen snow several feet deep, of two fights in which positions of the greatest strength were successfully stormed by a handful of native troops led by a few young Englishmen, and of perils and trials cheerfully faced by both officers and men. Both as a record of a gallant feat of arms and as a human document, few more fascinating volumes dealing with military action have been published in recent years than Lieut. Beynon's "With Kelly to Chitral."

The Gurneys of Earliham. By Augustus J. C. Hare, author of "Memorials of a Quiet Life," etc., etc. In two volumes. London: George Allen; New York: Dodd, Mead & Co.

In these beautiful volumes, enriched with a remarkable series of "Goupil-tint" reproductions of portrait paintings and engravings, and also with many woodcuts and silhouettes, the editor comes to his task with an experienced hand, and if his success is less conspicuous than heretofore, the fault is less his own than that of the materials with which he had to work. To be virtuous and noble it is not necessary to write a good epistolary style, but to write such a style is necessary to the prosperity of a book made up largely of personal letters. And then, too, much that, in its day, may be quite admirable, passing from friend to friend, and very comforting and consoling under life's various sorrows, may suffer from the fierce light of general publicity, and from the changes that the expression of religious thought and feeling undergoes with the lapse of years. Sometimes, indeed, the flavor of antiquity is good. There is something quaint and racy in the religious phraseology of the earlier time that commends it to our appreciation. But as orthodox Quakers, profoundly affected by the Evangelical Revival, interlarding their letters with its phrases to the exclusion of the most characteristic forms of genuine Quaker speech, while retaining many of the most conventional and mechanical, the Gurneys often degenerate into a jargon that is wearisome to heart and mind.

In one way and another much that is printed here has been put within the reach of the reading public. Samuel Gurney and Joseph John, their sister Elizabeth Fry, and their brother-in-law, Thomas Fowell Buxton, have all had their biographies written, and incidentally something has been made known of their family connections. But Mr. Hare's predilection is preëminently for family biography, and what he has attempted here is to give a picture of the Gurney family, a record of their united experiences of domestic joy and sorrow, public service and reform, and religious development and change. It is certainly not strange that such a family attracted him to the attempt. If anything deterred him, it must have been the size of the family, for it numbered, the children of John Gurney and Catharine

rine Bell (a great granddaughter of Barclay of Ury), twelve, born from 1776 to 1791. We cannot be too grateful for the tabulation of their names and those of their wives and husbands, with the dates of their births, marriages, and deaths. Without this help the labyrinth would be utterly bewildering, especially as there are uncles, cousins, and aunts, some of whom play a prominent part upon the crowded stage. Only one of the children died in infancy. Three of the sisters did not marry, but Joseph John married three times, his third wife acquiring no less than 119 nephews and nieces by her marriage, eleven of whom were the children of Elizabeth Fry, whose public cares imposed no check on the prolific habit of her house.

Earlham, the big, comfortable, beautifully situated house a few miles from Norwich, in which the children all passed their youth, and several of them their childhood, was rented from a family which had owned it for centuries, in 1786, and the Gurneys occupy it still. With its spacious rooms and grounds and its innumerable cupboards, it was a perfectly ideal house for eleven children to grow up in, and draw their lovers to, and get married from, and come back to, always thankfully, from time to time. Much the pleasantest part of Mr. Hare's book is that which reflects the happiness of the household during the years while the children were still young. The Quakerism of the father was much less strict than that of his children who continued in the faith, and we read of dances and gayeties and pomps and vanities that in after years Elizabeth Fry could not remember without pain. She was herself one of the gayest of them all until, in 1798, going to meeting profoundly conscious of a pair of purple boots with scarlet lacing, Friend William Savory from America excited in her a violent revulsion from her innocent happiness, and made her a Quaker of the plainest kind. None of the girls had taken kindly to the Quaker Meeting before this. It was in Goat's Lane, and to write in their journals that the meeting was disgusting was so inevitable that they were obliged to invent a formula, "Goat's was *dis*," to avoid laborious repetition.

They were a family of diarists, and the diaries of the children throw much light on their development. If not all "over-early solemnized," soon or late they all made large atonement for the brightness of their early years. Even their marriages were undertaken in a portentous and oppressive manner. Elizabeth's brought with it many anxieties. Her husband had not the Midas touch of the Gurneys, which turned everything to gold. But Samuel, the richest and most genial of them all, could always be trusted in an extremity. The defection of her children from her Quaker strictness was a sore grief to her, and, when they went over to the Established Church, she knew the bitterness of death. Two or three of her sisters went the same way, but with little or no abatement of their Quaker simplicity and severity. The evangelicalism of the Macaulays, Fenns, and Wilberforces engrafted on a Quaker stock brought forth much fruit of morbid self-depreciation and distrust of natural humanity. This effect was more positive and less agreeable in the case of Joseph John Gurney than with the others. All that was least simple and natural in Quakerism and the Clapham Sect seemed to coalesce in his theology and piety. He took himself with awful seriousness, sometimes mistaking his fondness for public speech for a leading of the spirit, and writing letters to his brothers and sisters

in their affliction so devoid of natural sympathy that their elaborate consolation must have been hard to bear. There is only the briefest mention of his long visit to America, in the course of which he devoted himself more earnestly to smashing the Hicksites and the unorthodox abolitionists than to the anti-slavery testimony to which he had felt himself called. There was really very little of the Quaker left in him, although he accounted himself one of the strictest of the strict, and was so in the ordering of his speech and action. But his thinking was that of the Clapham Sect, his bibliolatry narrow and intense, with an insistence upon dogmas of which Fox knew but little and for which he cared even less. Now and then Mr. Hare is bold enough to "hint a fault or hesitate dislike" of his rigid dogmatism and formalism, but his best criticisms upon them are the contrasting qualities of Samuel Gurney.

All that relates to Mrs. Fry's endeavors to alleviate the miseries of prison discipline is interesting, but gives no new impression. In her "journeyings often" in furtherance of these endeavors, the simplicity of her nature must have been in frequent danger from the adulation of nobility and royalty—a tribute in part, we are compelled to think, to the commercial standing of her brothers. She was not unconscious of this danger, though when she wrote of herself as "undetermined with excessive love," it was her love for others that she was thinking of. But the danger which she most feared, and with best reason, was from the adulation of her sectarian friends. "I have," she wrote, "passed through many and great dangers, many ways; I have been tried with the applause of the world, and none know how great a trial that has been and the deep humiliation of it; and yet I fully believe it is not nearly so dangerous as being made much of in religious society. There is a snare even in religious unity if we are not on the watch." The italics are presumably Mr. Hare's. They do not exaggerate the importance of the warning words.

Everywhere in these volumes we breathe an atmosphere of social sympathy and reform. Sir Thomas Fowell Buxton, who married Hannah Gurney, was Wilberforce's first lieutenant, and carried through the West India Emancipation to its conclusion after Wilberforce's death (like that of Moses) in full vision of the promised land. But this great business is not dwelt upon, much self-denial being necessary to an editor who has taken so large a contract as the Gurney family on his hands. To so large a family, death must be a frequent visitor, and the details of sickness and death obscure many pages with their clouds and mournful light. There are other pages that can be less safely skipped than these. The combination of plain thinking with high living which was characteristic of a family at once so pious and so rich, affords perhaps the most characteristic feature of the book. There is much to admire, and, even where our admiration halts, our interest is sustained by the exhibition of instructive traits of character, which, failing to attract us, warn us of something to avoid.

From Blomidon to Smoky, and Other Papers. By Frank Bolles. Boston: Houghton, Mifflin & Co. 1895. 8vo, pp. 278.

AMONG these essays are several which are merely accounts of excursions; these are delightful and well worth preservation in book form. It is not from them, however, that the volume derives its greatest value; the title furnishes no hint of what is most important in

the contents. Ten of the thirteen chapters are filled with notes on birds in freedom and on birds in captivity. In these there is much that was new, much that was necessary before the life histories could be written, and this gives the work a place and permanence that could not have been secured without it. Mr. Bolles was an excellent field naturalist, and he resorted to the haunts of nature's children, alert in every sense, to learn of them, not to close his eyes and dream. He gathered a great deal, all of which was open to everybody, yet much of which was new to literature, and some of which was at first received with question. When he first announced that the sapsucker in chosen groups of trees, "orchards," drilled the trunks for sap, "bird men" somewhat generally smiled in a knowing way, for they knew the bird to be an insectivore, and certain of their number had shown beyond doubt that the little woodpecker was seeking the insect in the tree, and certain others had proved conclusively that the holes were bored to start the sap to attract the insects, that the bird might catch them. "Oh, yes; very likely the bird was laughing at him!" But the observer knew the scientist was doing all the laughing, and, to satisfy him, the drills were watched for weeks, observations were taken betimes from morning till night, and besides all this some of the birds were taken and kept for months, feeding almost entirely upon diluted syrup. Then it was admitted as not at all improbable that the birds in pursuit of the insects might acquire a taste for sap, and it was also conceded that our author himself might be an ornithologist.

An enthusiastic sympathy with nature pervades the text, and Mr. Bolles's style is so earnest and convincing that, after perusal of his pages, one feels as if he could never meet those birds without memories of "Puffy," "Fluffy," and the others, or of how they told the author of their habits and peculiarities as he called them about him in the woods. We like the book; we can only regret that death has denied us more from the same pen.

Beautiful Houses: A Study in House-Building. By Louis H. Gibson, Architect. Thomas Y. Crowell & Co. 1895. Pp. xi, 346.

THAT house-building is an art, and that its best developments have arisen from the needs of the future occupants and their instinctive sense of what would suit them best, are the safe propositions to the proving of which one-half of this book is devoted. The domestic architecture of the past is discussed in 130 pages with an abundant supply of illustrations, and many of the pictures in the second and larger division of the book also are available as illustration of earlier chapters. The discussion of English domestic architecture, pages 91 to 107, is appreciative and judicious, the illustrations are well chosen, and the reader wishes for more of it, and for the omission of the not very appropriate or very well managed discussion of the transition from Gothic to Classic which is interpolated. The discussion of American "Old Colonial" buildings, which follows on page 127, seems very oddly separated from the English chapter above. It is true that the English domestic architecture of the Georgian epoch is not mentioned in the discussion of English examples, but the American Colonial architecture is a variant of the architecture of George II. and George III., and the mention of that fact at page 127 would have steadied the mind of the inquirer. The very curious conception of Continental domestic architec-

ture—namely, that it is fine in its larger and statelier manifestations, but inferior in its simpler forms—which is to be found put into words on page 91, page 103, and elsewhere, naturally sends the author to England and America for examples which may be useful to modern builders. It is in no way surprising that the actual and the possible connection between ancient and modern design is imperfectly made out, for to have done this thoroughly would have involved much serious work; but perhaps the reader has a right to expect some suggestions of the reason why the modern houses, however well adapted to their owners' wants, are without artistic merit, while the ancient buildings have always character and frequently beauty. In this respect there is no connection between the first and the second halves of this book. In the one we are told of the spirited and interesting buildings of the past, and in the other we are shown how modern houses are made comfortable, convenient, pleasant to live in, hygienic, and ugly. Each of these is a good essay in its way, and perhaps it is hypercriticism to complain that they are not connected by any comparison of the social influences which made for good art in the one case, and which make for unbeautiful confusion in the other; but we had been encouraged to hope for it by the generally wise suggestions of the first part.

The numerous illustrations, taken from many different books as well as directly from the buildings, contain a great deal of valuable material, but the appearance of the book is marred by their extremely diverse character.

BOOKS OF THE WEEK.

FOR RENT—PROUT'S NECK, MAINE.

Furnished Cottage near bathing beach. Address F. MOSE, 1827 Jefferson Place, Washington, D. C.

Books of To-day and 'Belinda' Suppt.

The Best Monthly Review of English Books for American Readers.

Annual Subscription 3s. 6d., post free.

HATCHARDS,

Booksellers to the Queen,

187 PICCADILLY, LONDON.

NONQUIT, MASS.

To Let—A cottage; fully furnished; well situated near the water; five large chambers; open fireplace. Fine bathing, boating, fishing. \$250.
FRANCIS C. WILLIAMS, Brookline, Mass.

Real Estate.

COTUIT, MASS.

FURNISHED HOUSE FOR RENT OR RENT.—One of the choicest places on the South Shore. The house, exceptionally well built, is in a grove of pine and oak trees. All the rooms (14 besides the kitchen, etc.) command fine ocean views. There are open fireplaces and furnace. The climate is unsurpassed for salubrity and equable temperature. Excellent and safe bathing close to the house. Apply to
R. S. HUBBARD
Tradersmen's Bank, Philadelphia.

TO RENT.

Seal Harbor, Mt. Desert, Maine.

Close to sea. COTTAGE, Eleven Rooms, furnished. Hardwood Floors, modern improvements. Address
Rev. A. S. H. WINBOR, Wisconsin, Me.

Northeast Harbor, Mt. Desert, Me.

TO RENT.—House of fifteen rooms, completely furnished. Modern conveniences. For terms and particulars, apply to
Mrs. KATE J. WHITMORE
Northeast Harbor, Me.

FOR RENT—FURNISHED COTTAGE
ON LAKE GEORGE. On Lake Front, 1/4 mile from Crosby Side. On first floor, parlor, dining room, servant's room, and kitchen; on second floor, 6 bedrooms. Rent \$300. Address
Lucy B. Moss
39 Gladstone Hotel, Philadelphia.

Dresden-A. Pension Donath, Lüttichau Str.
Homelike, sunny, central, with modern conveniences; best American references; 4 to 6 marks a day.

AT ISLESFORD, near Northeast and Seal Harbor, Mt. Desert, Me. TO LET—A new cottage; 8 rooms, all furnished; rent low. AMOS MANN, Islesford, Me.

MT. DESERT (P. O., SEAL HARBOR).
Furnished houses \$175, \$250, \$350, \$500. Hot-water baths, open fires. W. M. GRISWOLD, Cambridge, Mass.

YALE MIXTURE.

The choicest tobacco made, and pre-eminently
a gentleman's smoke.

The Nation.

NEW YORK, THURSDAY, APRIL 10, 1896.

The Week.

THE platform of the Rhode Island Republicans is the most outspoken yet of all party utterances on the money question, going farther even than the excellent deliverances of the Republicans of New York and Massachusetts. It declares inflexible opposition to the free and unlimited coinage of silver, pronounces the continued agitation of the silver question "unpatriotic and destructive of all the interests of industry and commerce," and adds:

"The existing gold standard is the measure of value adopted by the nations with whom the United States have the most important commercial relations, and the very suggestion of a departure from it inflicts injury to the credit of a nation whose honor should never be questioned at home or abroad. To those who toil for their daily bread, a currency redeemable in and of equal value with gold is essential. While the capitalist may protect himself against the fluctuations even of silver, the laborer and the artisan, the salaried official and the widow, are powerless to guard against the changing values of a currency which a great and beneficent government should make absolutely secure and unchanging in its purchasing power."

It is refreshing and encouraging to find such straightforward talk as that in a party platform on the eve of a Presidential campaign. If we had a few Presidential candidates who were capable of like frankness and courage, the outlook would be much better than it is. The Rhode Island convention did not declare for any candidate, but its delegates are said to be in favor of Speaker Reed. McKinley's name was not mentioned in the convention, but the *Tribune's* correspondent says this was carefully avoided because to have mentioned it "would have been just the same as hollering 'Fire.'" This may be true, since the naming of McKinley on that platform would have been a performance so incongruous that the convention would have been justified, had such a thing occurred, in running as from a burning building.

The Maryland Bankers' Association has followed the example of the New York State Bankers and of the executive council of the American Bankers' Association, by adopting a resolution in favor of "a rigid adherence to the gold standard of value." There is nothing more encouraging than this attitude of the bankers on the great question of the day, for although they have been right all the time in their own minds, they have not heretofore deemed it prudent to take a bold stand and make an aggressive fight for the views they hold. The fact that they do so now indicates that they find public opinion backing them pretty strongly. Comptroller Eckels made a capital speech to the Maryland bankers, in which he said that

the American people would never elect a President who would give his official sanction to a bill for the free coinage of silver. Mr. Eckels is right, and what he says had best be heeded by both political parties when they nominate their candidates and make their platforms this year. The tide is now running strong against all free-silver candidates and all straddlers, both Republicans and Democrats.

The news from Washington about the Cuban question confirms the report that the Administration does not purpose doing anything at present in the way of recognition, for reasons which must commend themselves to every rational person. The Senate ought to be the helper of the State Department in maintaining the rules of international morality, but aid from that quarter is not to be expected at present. There does not seem to be any reason, however, why a courteous attempt at mediation should not be made. This is, of course, never out of order. A civil proposal to both parties to mediate, with the consent of both parties, would be a perfectly reasonable proceeding, now that the armed conflict has lasted over a year and is threatening civilization itself on the island. The ravages of the insurgents seem likely to leave the island a howling waste, and we are as much interested as any one in preventing this result. In fact, nobody will suffer as much as we shall through the loss of the island by Spain, for a proposal to annex it, and make of it about three States, will certainly follow. Cuban independence we can stand, but the conversion of the Cuban population into American citizens would be a great calamity.

It is comforting to know that there are limits to the readiness of the United States Senate to interfere with the affairs of the universe while it neglects the demands of the nation for which it is supposed to legislate. Mr. Call of Florida introduced a most absurd resolution last week concerning the imprisonment of Mrs. Maybrick. This extraordinary resolution recited that the people of the United States "sympathize with Florence E. Maybrick, formerly of Mobile, Ala., in her sufferings under a sentence of life imprisonment at hard labor in England"; that they "almost universally believe her to be innocent"; that "it would be an act of gracious respect to the public opinion of this people, speaking the English language, in large part of English descent, governed by the same laws, inheriting the same love of law and order, the same abhorrence of crime, the same love of liberty and the protection of the weak and helpless against arbitrary power, for the Government of Great Britain to pardon Mrs.

Maybrick and restore her to her country and her family"; and requesting the President to communicate this resolution to the Government of Great Britain. Senator Sherman had sufficient sense of the proprieties to move to lay the resolution on the table, explaining that whatever difference of opinion might exist as to Mrs. Maybrick's guilt or innocence, "certainly it is a subject over which the Senate of the United States has no jurisdiction." Mr. Sherman finally consented to have the resolution referred to the judiciary committee, and that committee reported it back adversely on Monday on the ground that the Senate has no jurisdiction over the subject. It is not to be wondered at, in view of previous performances by his colleagues, that Mr. Call should have supposed that the Senate would humor him in this matter, but it was perhaps necessary that absurdity should be carried to this extreme before the upper branch of Congress should recover its senses.

"Presidential politics" reaches a very low level when the admission as States of two Territories notoriously unfit for statehood is threatened in order to secure delegates for or against one or another candidate in the Republican national convention next June. That is what is explicitly charged by the Washington correspondents of Republican newspapers like the *Philadelphia Press* in explaining the action of the House committee on Territories last Thursday, when it voted to report favorably the bill for the admission of New Mexico. There is absolutely not a single sound argument in favor of the proposition. The population of the Territory is below the number required for a member of Congress under the present apportionment, and the number of inhabitants is growing very slowly, although the region was long ago provided with good railroad facilities. Moreover, the ratio of illiteracy among the people is far greater than in any other Territory ever brought into the Union. At the beginning of the session the Republican members of the House committee were generally opposed to admission, but all save one voted for it last week, the controlling reason with the Pennsylvania, New York, and Iowa members being the desire to secure the New Mexico delegates to the St. Louis convention for Quay, Morton, or Allison. Similar motives have since operated the same way in the case of Arizona. Of course, if the Republicans allow these bills to pass the House, the free-coinage majority in the Senate will jump at the chance to strengthen their forces by four votes.

The Democratic national convention will not be held until nearly a month

after the Republican, and public attention hitherto has been almost monopolized by the canvass for delegates to the first of these great gatherings. The holding of conventions for the choice of delegates to the second assembly has now begun, however, and, from this time on, both parties will be declaring their position in various States every week. The first Democratic convention has just met in Oregon, and the result was favorable to that element which insists upon a free-coinage deliverance at Chicago next July. The friends of sound money asked nothing more than a reaffirmation of the currency plank on which Cleveland ran in 1892, but the silverites insisted upon an out-and-out declaration for "16 to 1," and carried the day by a vote of 152 to 91. The next Democratic State convention will be held in Missouri next week, and the free-coinage men have been carrying everything before them, almost every county convention having adopted strong resolutions favoring free coinage, while the sound-money men secured only 10 out of the 68 delegates from the city of St. Louis.

Gen. Harrison's friend Mr. Michener explains the circumstances under which it may be necessary to make the ex-President a candidate again. It is like calling in the best doctor in an emergency. Ordinary practitioners may do as long as the disease runs on smoothly, but when heroic measures are necessary, the best man must be had at all hazards. Now the Republican party, Mr. Michener finds, is suffering from a serious complication of disorders. Its brain is threatened with gold congestion; its stomach appears to be invaded by silver cancer; one foot has low-tariff gout, the other is afflicted with McKinleyism in its worst form; and various peccant humors, in the form of a combination of silver and tariff, cause darting pains throughout the body. It is a clear case for calling in Dr. Harrison, thinks friend Michener. But we must observe that the greater the emergency the greater the need of knowing the standing, the "school," of the last-resort physician. The trouble with Dr. Harrison is that his record shows him to have practised all kinds of medicine. A mixture of diseases does not require a mixture of cures. The Harrison remedies have been those of the "regular" schools, metaphysical "healers," Christian scientists, and faith-curists successively. The patient will not know which one to expect from him, and, unless he makes up his mind to say what treatment he is in favor of, we fear that Quack McKinley will continue in charge of the case, with the undertaker in easy reach by telephone.

There is general agreement as to the facts of the business situation. The fair promise of prosperity seen in nearly all branches of trade last fall has been blight-

ed. "Business started out splendidly last fall," says President Roberts of the Pennsylvania Railroad. "Everywhere I learned that there had been a general revival of business in the fall," says President Depew of the New York Central Railroad, referring to his trip through the West. Against the background of those flattering hopes of six months ago, the record of failures for the first quarter of 1896 looks black enough. Both in number of failures and in total amount of liabilities, Bradstreet's tables show that the past three months surpassed any corresponding period of our commercial history. Those are the facts, and there is no getting away from them. What is the theory to account for them? How does it happen that we are not sharing in the prosperity which English trade is now enjoying?

We know what the partisan, the McKinley, theory is. Last fall's prosperity was due solely to anticipation of the blessings of a Republican Congress. People were only impatiently taking their profits in advance. The Wilson tariff was ruinous, a Democratic President in charge of the finances was a calamity, but still money could be made on the strength of the tariff that was to come in three years' time. That was the orthodox Republican theory six months ago. Now it has been amended. No man is willing to invest a dollar or hire a laborer until McKinley is nominated. All the dollars, in fact, are being expended to buy his nomination, and none are left for trade. If prosperity comes quickly, it will be due to hope which radiates from his noble face; if not, it will show in what desperate need of him the country stands. This theory we all know. We might argue against it, but we will not. Neither will we argue with children under four, or with people who live in padded rooms. But it is well, in the intervals of the insane chorus, to allow the voices of unprejudiced business men to be heard. Says President Roberts: "Congress convened, and that was the first blow to the business world. Next came the silver craze with its calamitous career in the Senate. And lastly, as if to cap the climax, came the everlasting agitation of our foreign relations. The Venezuelan message started the ball rolling, and since then we've had the Monroe Doctrine, Armenia, England, Spain, and Cuba." President Depew testifies that "all business was paralyzed by the war scares." These are but typical instances of the way the clatter of the politicians falls on cynical ears among business men. They are cynical not only about partisan theories, but about partisan remedies. What they do count upon and pin their faith to is, as President Roberts says, a declaration by both parties in favor of the gold standard.

The *Engineering and Mining Journal* has made a special examination of

two recent transactions in the iron market which have attracted attention. One of these is a shipment of Alabama pig iron to England, the other a contract for 10,000 tons of steel rails for Japan, taken by the Carnegie Steel Company. The first of these it finds was a trial order for 1,000 tons, to be followed by larger ones if the quality were found satisfactory. The price is supposed to be about \$8 for No. 1 foundry and \$6.50 for gray forge, or perhaps a trifle less than those figures, which are the advertised prices for domestic deliveries. The contract price for the steel rails has not been made public, but the *Journal* conjectures that it is about \$20 per ton at the mill. The price charged by the steel-rail combination to domestic consumers is \$28. Another fact of some importance is that the Grand Trunk Railway of Canada has placed an order for 15,000 tons of steel rails with the Illinois Steel Company of Chicago, at prices lower than those at which English steel can be afforded at Montreal or Quebec. "The important point proved in the cases under consideration," says the *Journal*, "is that our works are able at the present time to turn out iron and steel at costs which enable them to compete with the English and other European mills on ground which they have always considered their own." Not only is this the fact, but it is equally true, and even more important, that the power of production has so far exceeded the consumption of the country that a foreign market for the surplus is indispensable. These facts furnish a rather discordant note to the McKinley braying chorus which now fills all ears, but they will not stop the braying. More protection will be demanded just the same, and it will not be surprising to be told that it is an advantage to us to pay \$8 per ton more for Mr. Carnegie's rails than the Japanese get them for.

An attempt was made a few days ago in Congress to introduce the metric system of weights and measures in the United States, and it very nearly succeeded in the House, but, after a small majority had been recorded in favor of it, the vote was reconsidered, and the bill was sent back to the committee which had reported it. The metric system was adopted permissively by an act of Congress passed in 1866. The bill proposed by the committee on coinage, weights and measures provided that all the transactions of the Government and of all departments thereof involving weights and measures, except the surveys of the public lands, should thereafter be effected by the metric system, an exception being made of the surveys of public lands so that they might continue to be uniform. A question was raised in the debate on the bill whether the metric system would be compulsory on individuals in their private business, the chairman of the committee, Mr. Stone, contending that the old weights and measures would still be lawful, while Mr.

Parker of New Jersey maintained that they would not be so after January 1, 1901. The language of the second section of the bill seemed to sustain Mr. Parker's view, and the clause was fatal to the measure, and seems likely to be so in any future attempt to introduce the metric system.

The spoilsmen in Congress have won a victory by placing obstacles in the way of the rapid extension of the movement for improving the postal service by the consolidation of offices tributary to large cities. For some time the Postmaster-General has been making the offices in suburban town-stations of the adjacent city, and their heads subordinates of the city postmaster, instead of independent officials. The advantages of this system in raising the standard of service have been made manifest wherever it has been tried, and the patrons of offices in the smaller places near Boston, Brooklyn, and Baltimore are more than satisfied with the results of the change. But Senator Gorman has found that this system in Maryland threatened his control of the village postmasters, and he rallied the spoilsmen of both parties in successful support of a provision prohibiting the further consolidation of post-offices beyond the corporate limits of the city in which the central station is located. The Republicans who believe in boss methods were easily persuaded to cooperate with the Maryland Senator by the argument that extensions of the reform might prevent their control of the small offices after the expected victory of their party in the Presidential election next fall; while men who have always professed to favor reform, yielded to Gen. Hawley's plea that the old-fashioned village postmaster stood as the preserver of our liberties.

The decision of the State Civil-Service Commission to put Commissioner Lyman's special agents in the non-competitive schedule was what was expected, but our belief is that everybody engaged in the enterprise will live to regret it. The Raines act is a serious matter for the Republican party in this State. No matter how it is administered, it will put the domination of the party, in both city and State, in great peril. All, or nearly all, that class of voters who turn the scale at elections in the State are now persuaded that the bill was concocted and passed for the deliberate purpose, not so much of regulating the liquor traffic, as of establishing a Platt machine. Both in the interest of Gov. Morton and of the party, everything possible should have been done to allay this suspicion. The most effective if not the only way of allaying it was to make plainly non-partisan appointments of the officers who were to execute the law. This would have done much, or, at all events, something, to make people believe that the law is really a liquor law. On the contrary, everything that has taken

place in connection with the bill, ever since it was introduced, tends to confirm the popular suspicion about it. It now appears pretty clear that the removal of McKinstry and the appointment of Lord on the State Civil-Service Commission, in January, was a preparation for what was done last week, as it put Col. Burt, the only civil-service reformer on the commission, in a minority, and enabled Lord and Cobb to vote him down. Gov. Morton would have done well, both for his own fame and for his political prosperity, to keep his skirts clean of all complicity with this plot. If the band who concocted it think they can transfer their juggling apparatus to Washington, they are mistaken. Neither they nor their kind have won an election in this State for many a day. The fortunes of politics in this State are in the hands of a different class, who have at least the remnants of a moral sense and some sparks of patriotism.

The statement of Ballington Booth published on Monday shows that the split in the Salvation Army is the consequence of Gen. Booth's bad conduct when in this country. "He objected to the display of the national flag upon our badges and in our halls and homes. He said the time had arrived to cease carrying the stars and stripes at the head of our parades." He is evidently a bad old man. Moreover, the books, etc., were all revised in London, and all rules and regulations were made in England, and were enforced by orders received from London. The organization was directed from abroad. Ballington makes a long statement in support of the above, but judiciously remarks, "There will be denials and counter-statements." Doubtless there will, but he, in our opinion, does not go far enough. We do not think the new American organization ought to save a single man or woman who has not been naturalized. Carrying the flag is all very well, but the "Volunteers" and those saved by them ought to be bona-fide American citizens in order to make this body a really American organization. Unfortunately for Ballington, Booth-Tucker and his wife have arrived from England, and are going to be naturalized immediately, and, so far as spoken words go, are as devoted to the flag as he is, while adhering to the old organization. Indeed, their love of the country seems to surpass Ballington's. The conflict of the two movements will at least bring us a great increase of patriotism.

All the English magazines for April have articles, from the hands of experts, on the Egyptian complications. They all agree that the decision to send an expedition towards Dongola was as surprising to the public, both in England and in Egypt, as it was and remains inexplicable in its real motives. Lord Farrer left Cairo on

March 8, Major Griffiths on March 9, and neither of them had heard in official circles a whisper of the need or of the purpose of making such a movement. The contention that the expedition is really intended as a demonstration in favor of the Italians at Kassala, is thoroughly riddled by Major Griffiths's article in the *Fortnightly*. He shows that, from a military point of view, it is impossible to get to Dongola in force before next August. So the first glib talk of a "dash on Dongola" means nothing. This is apparently the conclusion of the Government itself. Mr. Curzon first announced an expedition to Dongola, later corrected himself to an advance "in the direction of Dongola," and finally located the terminus for the present at Akasheh—not one-third of the way to Dongola. If there is, therefore, any maturely considered and far-reaching plan back of the movement, it would seem to look, as the best authorities think it does look, to the reconquest and holding of the Sudan. This can be undertaken on the plea that it is necessary to the safety of Egypt, since her present frontier is, as Major Griffiths shows, an entirely uncertain line across which Dervish raids are constantly pushing.

The result of the elections to the new Cortes will surprise no one familiar with Spanish political methods. The Government always wins in such elections. If it did not, the order of nature would seem, to the Spanish mind, to be miraculously violated. The only question is of the majority. Sometimes, as in the present case, the thing is overdone and the majority made so outrageously large as to excite protests. The Opposition will stand being put in a minority of one to two without whining, but to be left with only one Deputy to three is going a little too far. However, there is not much vigor even in the cries of rage over Conservative greed and cheating that are now going up from the Liberals. Sagasta knows that he has only to wait a little while for his turn to come. The very dispatches giving the news of the sweeping Conservative successes add that "it is conceded on all sides that the new Cortes will be short-lived." That is to say, Cánovas will soon be thrown over by his own majority, Sagasta will be called in, he will then have a chance to dissolve and get his infallible majority, and so the whirligig will spin on. Nothing can better illustrate the present unfitness of Spaniards for parliamentary government than the wearisome repetition of this electoral farce. The Cuban trouble appears to have cut no figure in the campaign, except so far as the Deputies from the island itself are concerned. It cannot be denied, however, that this demonstration of Spanish political feebleness comes most inopportunistly for a country insisting upon its right and ability to govern a distant colony.

"IN CLOSE TOUCH WITH THE PEOPLE."

In his first term as a member of Congress McKinley voted for the free coinage of silver at the ratio of 16 to 1 in 1877, and to override President Hayes's veto of the Bland-Allison act in 1878. As leader of the House a dozen years later he earnestly advocated the passage of the silver-purchase act in 1890, on the ground that "we cannot have free coinage now except in the manner provided in the bill." The advocates of McKinley's nomination for the Presidency have only one way of meeting the disclosure of these ugly facts. They excuse the course of their favorite in each instance by the plea that he was no worse than his party or than public sentiment. As the *Chicago Inter Ocean* puts it:

"McKinley's record in Congress on the silver question really shows that he was in happy accord with a great majority of the Republican party on that as well as on other great questions. He was not only with the vast majority of the Republican party, but he showed himself to be moving in close contact with the general public sentiment of the country—showed himself to be in close touch with the people."

In this argument the supporters of McKinley have reached the lowest level that can be reached in urging the claims of an aspirant for the Presidency. They maintain, and seem glad to maintain, that their favorite is a man without a spark of the statesmanlike foresight which enables its possessor to discern the dangers of a popular craze that for the moment sweeps everything before it. They boast that the first aim of their candidate, while he was a member of Congress, was to learn what the prevailing sentiment of the public at the moment of voting was, and then to array himself on that side. Their argument logically leads to the conclusion that, if he were elected President, he would not interpose the executive veto against the enactment of the most dangerous bill passed by Congress, because, if he took such an attitude, he would no longer be "in close touch with the people."

The framers of the Constitution would have been amazed to hear such a plea, that the President of the United States should be nothing more than the mere echo of fleeting public sentiment. One chief reason for vesting him with the veto power was that he might stand as a bulwark against this danger. Hamilton says in the 'Federalist' of this prerogative:

"The power in question not only serves as a shield to the executive [from encroachments upon his power by the legislative department], but it furnishes an additional security against the enactment of improper laws. It establishes a salutary check upon the legislative body, calculated to guard the community against the effects of faction, precipitancy, or of any impulse unfriendly to the public good, which may happen to influence a majority of that body. The propriety of the thing does not turn upon the supposition of superior wisdom or virtue in the executive, but upon the supposition that the Legislature will not be infallible; that impressions of the moment may sometimes hurry it into measures which itself, on maturer reflection, would condemn. The primary inducement to conferring the power

in question upon the executive is to enable him to defend himself; the secondary one is to increase the chances in favor of the community against the passing of bad laws, through haste, inadvertence, or design. The oftener the measure is brought under examination, the greater the diversity in the situations of those who are to examine it, the less must be the danger of those errors which flow from want of due deliberation, or of those missteps which proceed from the contagion of some common passion or interest."

The theory of the veto power is that the President may save the nation from disaster in a crisis by refusing to keep "in close touch with the people," by opposing what seems to be the prevailing public sentiment. As a rule, our Presidents have lived up to the theory of the Constitution in this respect, and in every such case history has justified their action. When they have fallen to the lower level of not opposing any popular craze, the nation has always suffered.

When Congress passed the inflation act in 1874, public sentiment appeared to favor it, and a majority of the Republican Senators earnestly supported it, among them such powerful leaders as Cameron of Pennsylvania, Morton of Indiana, and Logan of Illinois. A President whose prime object was to keep "in close touch with the people" would have signed the bill without the slightest hesitation. What saved the nation from a frightful disaster was the fact that Gen. Grant recognized "true principles of finance, national interest, national obligation to creditors" as superior to what might prove, and did prove, an "impulse unfriendly to the public good," such as the framers of the Constitution had foreseen.

When another of these dangerous impulses was felt in Congress sixteen years later, the incumbent of the White House was apparently a man who lacked Gen. Grant's courage. In 1890 the passage of a free-coinage act was threatened, and Senator Sherman and other Republicans who opposed that policy were made apprehensive, by Mr. Harrison's silence, that he would not feel at liberty to veto such a bill if it should pass. "Some action," says Mr. Sherman, "had to be taken to prevent a return to free silver coinage, and the measure evolved was the best obtainable." The silver-purchase act, the operation of which within three years compelled the calling of a special session of Congress to secure its repeal, was thus due to the weakness of a President who could not be depended upon to resist the passion of the hour.

McKinley's record on the currency question is bad enough. But the defence of that record on the ground that he was in line with his party, and the advocacy of his election to the Presidency because he will always try to be in close contact with public sentiment, uncover fresh perils to the country from his successful candidacy. An executive whose highest aim is always to be "in close touch with the people" is to be dreaded, as a constant menace to the safety of the nation.

THE DEMOCRATS NOT ALL DEAD.

THE news which has come to hand during the past week concerning the results of city and town elections in various States must be a genuine shock to the readers of Republican newspapers. They have been assured that the Democratic party was so nearly extinct that it was not to be regarded seriously as an element in the next elections. It might make a pretence of running candidates, but would put them forward in a purely perfunctory manner, and with no expectation of electing them. The Republicans had so "sure a thing" that they might run any one they pleased for the Presidency, on any kind of platform, and elect him in a walk-over. Even Mr. McKinley, with an unbroken silver record and on a straddling platform, could be elected without a struggle. The local election news does not harmonize with this view. It shows not only that the Democrats are alive, but that the rascals are voting in such numbers as to greatly cut down Republican majorities in some places and actually carry the elections in others.

Several weeks ago the town elections in New York State showed a marked reaction in favor of the Democrats because of the Raines liquor-tax bill. That measure had not then been made a law, and the popular disapproval expressed towards it was not so strong as it is now. Many other elections were held on April 7, and in these the Democratic gains were more pronounced and general than they were in those held earlier. The general result is much the same as it was in 1893, when the people of the State improved their first opportunity of passing judgment upon the Democratic party's course under Hill, Sheehan, Maynard, and Flower. The winter and spring elections for supervisors in many counties of the State in that year showed almost uniform gains for the Republicans. The Democrats made light of their loss, but when the November election was held they discovered that the loss had foreshadowed a Republican majority of 100,000 in the State. The Republican losses now are fully as large and uniform as were the Democratic three years ago, and they come from localities which are capable of doing the party the greatest amount of harm. They are largest in the cities, nearly all of which, so far as heard from, give Democratic gains. This was inevitable, for it is in the cities, with their large and mixed populations, that the Raines law will excite the greatest opposition. The country districts will not be much affected by it, as the liquor question plays a small part in their affairs, yet even in these sections there are distinct signs of a Republican reaction, for the Democrats have made a slight net gain in the supervisors thus far elected.

In other States the same signs of Democratic life and energy are perceptible. City and town elections were held throughout Michigan on the above date, and, according to the *Tribune's* dispatches,

"unusual interest was manifested" and a "large vote was polled"; and "while the issues, as a rule, were purely local ones, the Democrats generally developed unlooked-for strength, and in many cities which for years have returned Republican officials their ticket has been elected in whole or in part." Similar reports come from Ohio, in which elections were held on April 6. The Democrats cut down the Republican majorities in many places, and carried others for the first time in several years. So too in Connecticut. They made a vigorous contest in all quarters, and scored gains in many. In Wisconsin they are also alive, for in the Milwaukee election of April 7 "large Democratic gains were recorded in all wards of the city." New Jersey bore a like testimony on Tuesday last.

We do not cite these facts as convincing proof that the Democratic party is bound to carry the next Presidential election, or that it has an equal chance with the Republican party in that election; but we do think that they give unmistakable evidence that the Republicans cannot afford to run unnecessary risks. The Democrats of the country are not dead. They have been greatly disheartened by the failures of their party in Congress, and thousands of them have stayed away from the polls in recent elections on that account. But the conduct of the present Republican Congress has cheered them up a bit on this point, by showing them that one party is no worse than the other in this respect, and they are beginning to vote again. They have not gone over to the Republican party, and the excitement of a Presidential campaign will bring them in practically solid mass into active politics again. The town elections foreshadow this unmistakably, and the Republicans will be wise to recognize the fact and conduct themselves accordingly. New York is a doubtful State for them to-day; it would be a sure Democratic State with McKinley on one side and a sound-money Democrat on a gold-standard platform on the other side. On this point there is no room for doubt. The warnings from other States are scarcely less plain. Great and sudden changes in popular sentiment are very familiar phenomena in our politics, and a blunder by the Republicans now would be quite certain to produce one. The business interests of the country, which control all elections, will not consent to the election of a man whose record on financial questions is notoriously unsound, and whose political and private business record is no better.

"INTENTION" IN INTERNATIONAL RELATIONS.

CONGRESSMAN HITT's defence of the Senate Cuban resolutions, which he had before declared to be indefensible, was based on the ground that international action of that kind can be offensive only when "it is on its face manifestly intended to of-

fend." We remarked last week that this is to import into international law the Jesuit doctrine that bad actions are virtuous if done with good intentions. One of Pascal's most delightful Provincial Letters unfolds the beauties of this doctrine, and some of them are worth recurring to for the purpose of showing Mr. Hitt and his kind on what a firm foundation of ethics they are building. There is a family likeness discernible in those who "cheat with holiness and zeal," whether in religion or politics, and Pascal's exposure of insincerity and hypocrisy in one sphere applies finely to the other also.

After Pascal's Jesuit Father had explained many of the little tricks of the casuists in favor of the clergy, the suspicion arose that the rest of the world might not come off so well. Not at all, said the Father; we provide similar indulgences for all. Take servants, for example, and see what excellent maxims we have for them. They may steal from their masters if they find their wages too low, and if they do it solely and firmly for their own good, without malice. There is not the slightest occasion for them to shrink from the most questionable services, provided they are well paid for the same. For what say our Twenty-four Fathers? "To carry letters and presents; to open doors and windows; to aid their master to climb in at the window, and to hold the ladder while he climbs—all this is allowable and not immoral." But this, of course, as our good Father Bauny has pointed out, means that such actions are made innocent by resolutely fixing the intention, not at all upon the evil deeds in which servants make themselves accomplices, but solely upon the reward which they are to receive.

This "marvellous principle" of directing the intention is capable of the widest expansion and application. It covers the whole range of dubious actions from simony to stabbing a man in the back. By making sure that you have excellent intentions, you may do anything you please with a good conscience. Of course it is, abstractly, wrong to kill a man; but if you do it, not to injure him, but to maintain your own honor, that is quite another affair. So of duelling. That, of course, is forbidden by the Church; but our great Hurtado de Mendoza has shown how easy it is for a good Catholic to fight a duel. Is there any possible sin, he says, in going out to the fields to take a walk, while you are waiting for a man, and to defend yourself if he attacks you? That is a very different thing from accepting a challenge, since your intention is directed to other circumstances of the affair altogether. In fact, by being extremely careful about your intention, you may yourself challenge to a duel; you may kill a man from ambush, unless a very firm friendship (*arctior amicitia*) exists between you and him; you may kill a man for an insulting word or even gesture, may,

according to our great and incomparable Molina, kill a man for six or seven ducats. These are but examples of the way in which the method of fixing the intention takes all the awkwardness out of the common principles of morality, and makes life tolerable and agreeable to perfect gentlemen.

All this makes clear the source of the Hitt doctrine of "intention" in international relations. It is simply carrying the Jesuit casuistry into public life. Congress passes resolutions which, if they mean anything, mean an affront to a friendly nation, with the threat of war in the background. But Father Hitt steps in with his mild protest that this is all a mistake; that our intention is fixed, not on insults or war, but on the most harmless and peaceable things in the world. Unless Spain is determined to fasten a quarrel upon us, she has no right to look at our words or our acts, which are public, but only at our intentions, which are hidden away in our own pure bosoms. What Mr. Hitt's intention really was, he did not say. We hazard a shrewd guess that it was the same that justified the valet in helping his infamous master—i. e., a fixed contemplation, not of the wickedness in hand, but of his own personal gain. Congressmen use insulting words; they intend only personal popularity with the baser sort. They bluster about war; they mean only a renomination. They swell and explode with patriotic rage; their intention is but to be first in the war of words, and to distance dangerous competitors. This is really to out-Jesuit the Jesuits. They had the grace to guard their doctrine with the limitation: "Care must be taken lest the use of this maxim result in danger to the state." Father Hitt forgot that, but we do not greatly blame him in these days when the old phrase, "that the republic take no harm," sounds so silly and obsolete.

The question remains, What will foreigners think of this new doctrine of "intention" in international relations? That they will like it, or assent to it for an instant, is conceivable only on the ground that Johnson was right when he confided to Boswell his opinion: "Foreigners, so far as I can see, are fools." They surely must be if they think it possible to regulate their treatment of us, not by our public acts, our official language, our menacing attitude and gesture, but by our secret intentions. They will quote to our Jingo-Jesuit diplomats the obvious comment of Pascal, "*L'intention de celui qui blesse ne soulage point celui qui est blessé.*"

THE EDUCATION QUESTION IN ENGLAND.

ALTHOUGH the bill introduced into the House of Commons by Sir John Gorst, the President of the committee of council for education, radically changes the organization of the elementary education system in England as it has existed since 1870, the various changes are compara-

tively easy to follow. While the principal object of the bill is to afford further financial help to the schools of the Church of England and the Roman Catholics, and to bolster up a system which had its beginnings long before Parliament turned its attention to education, several of the changes are undeniably in the interest of education, and have been shown to be necessary by twenty-five years' experience. The dual plan of board schools and schools ostensibly maintained by the churches is continued. There now seems no getting away from it. But, in strengthening the church schools, at least something is to be done for the poorer grade of board schools. These poorer schools under the boards are in rural communities. They have been established where the church schools have broken down; and scores of them, especially where the boards are small and in the hands of farmers and village merchants, are as understaffed and as inadequate as any of the church schools in similar localities, the management of which is entirely in the hands of the Church of England rector or vicar of the parish.

If the bill now before the House of Commons is passed, the county council will become the supreme local authority for elementary, secondary, and technical education, and the Education Department in London will be relieved of some of its duties with regard to the inspection of schools and the distribution of grants from the imperial Treasury. Each county council will elect, or elect and appoint, as it may determine, its statutory education committee, much as it now elects its police committee. It will be at the discretion of the council whether all the members of the committee are chosen from the council, or whether the council will go outside its own membership and appoint men or women eminent in the local education world. It will also be possible for counties to group themselves together, and elect joint committees to exercise powers and distribute grants under the various education acts.

The county councils will employ corps of school inspectors who will do most of the work now done by inspectors from the Education Department; and it will be from the shire house at the county town, instead of from London, that the schools, board and voluntary, will receive their annual grants from imperial funds. School boards will continue to raise their local funds as heretofore, and in the case of school-board districts in which the local tax plus the grant per scholar from the Treasury does not meet expenses, the difference will come, not, as now, from London, but through the county council. The grant to meet this deficiency is limited by the bill to four shillings per scholar. In the past this doling out of extra funds from the Treasury has been restricted to boards whose incomes from local taxes, when the maximum tax allowed by the law had been levied, was not sufficient, with the

ordinary Government grant per scholar, to meet expenses. Under the Gorst bill, this extra poor-district grant will be paid to Church of England, Roman Catholic, and other voluntary schools.

The difficulty of granting additional public money to the church schools without throwing their control into the hands of popularly elected boards, has been adroitly got over by giving the education committee of the county councils the right to delegate some of their local authority to local managers. The London School Board has long delegated some of its authority in this way to managers of groups of schools, and the Salisbury Government has made the London plan general with the county councils in order to save the fullest measure of local control of the voluntary schools to the clergymen of the Church of England and the priests of the Roman Catholic Church. The London School Board appoints hundreds of these local managers of schools under its jurisdiction. They receive no pay; and, under close supervision from the School Board, these managers practically appoint and promote the teachers, and are responsible for many other details connected with the organization and working of the schools.

Nor is the four-shilling grant all that the church schools gain financially. As the law now stands, the annual grant per scholar from the Treasury to church schools is regulated in amount by the subscriptions raised by the school managers. This restriction has hampered clerical managers of schools to which private subscriptions were small, and, rather than give up the schools and resort to a school board, various devices and tricks in bookkeeping have been invented to get over the restriction. Every now and again some really disreputable dodge on the part of clergymen has been exposed. Now, however, there will be an end to all these schemes, as the annual grants per scholar, apart from the extra grant of four shillings a year, will be paid without any inquiries as to the amount of private subscriptions to the school. This is a great triumph for the clerical party, second only in importance to the ingenious arrangement under which, while drawing nearly all their funds from the Treasury, the clergymen are to give up little or none of their control of the schools.

Another remarkable concession has also been made to the Church of England party. This time it is in connection with the board schools. Under the act of 1870, no instruction can be given in a board school which involves the teaching of the formularies or catechisms of any particular church or denomination. The existence of this provision has long been a source of disquiet with the more aggressive school of English churchmen. It has been assailed several times in Parliament, more than once in the House of Lords at the instance of the Bishop of Salisbury, and with the sympathy and

help of the present Premier. At last the churchmen have succeeded in their onslaught on the unsectarian character of the schools maintained wholly out of local and imperial taxes. If the Gorst bill passes, it will be possible for "a reasonable number of the parents" of the children to go before the managers of a board school, and to insist that the children shall be taught in religion according to the creed or denomination of the persons making the claim. Nominally it will be possible for Roman Catholic, Wesleyan, or Unitarian parents to make these demands. The Catholics, however, will not do so, for the priests do not allow their children to attend any but Catholic schools, and to teach Catholic children in this way in board schools would involve additions to the school furnishings which will never be allowed in English board schools. Non-conformists have never asked for the teaching of the tenets of their faith in the elementary schools, and are not likely to avail themselves of the clause. It is therefore solely in the interest of the sacerdotal wing of the Church of England, and, if it should become law as it now stands, clergymen will be able to go among their parishioners, and, in connection with almost any board school, get together a sufficiently large number of parents to demand Church of England teaching.

THE AMERICAN ORIENTAL SOCIETY'S MEETING.

ANDOVER HILL, April 11, 1896.

At the recent Congress of Orientalists in London, Prof. Cowell of Cambridge, the President of the Aryan Section, opened its sessions with some graceful verses, first in Sanskrit, and then in English, as follows:

"Calm in calm woods the ancient Rishis sate,
Soothing their souls with friendship's converse
high—
While we, my honoured friends, by evil fate,
Meet where the city's ceaseless din rolls by."

And he consoled us with the thought that "contrast brings new harmonies to light." Well, here we were as little disturbed by the din of the traffic that surges through Piccadilly as were the calm Hindu hermits, and we needed no such consolation. Andover is an ideal place of meeting for a learned society, and especially for our Oriental Society, whose earliest history is closely associated with "The Hill." For Andover may justly be called the cradle of Oriental learning in America. The names of Moses Stuart and Edward Robinson—famous Andover names, famed, withal, far beyond Andover—stand beside that of our founder, John Pickering, on the first list of our officers of considerably more than half a century ago. Indeed, the temper of cheerful reminiscence was quite pervading. It was to the house of Moses Stuart that its present occupant, Prof. Harris, welcomed us on Thursday; and it was the old home of Austin Phelps in which Prof. Moore received us on Friday. The charming inn in which—sociable and unscattered—we lodged, just opposite the Campus, was once the home of Harriet Beecher Stowe, and was fitted up for her occupancy with the first seven hundred dollars of the proceeds of 'Uncle Tom's Cabin.' But let no one think from all this that the afore-

cradle has been consigned to the dusty attic of reminiscence. Whoever examined Prof. Moore's masterly piece of work, his Commentary on the Book of Judges, just issued, and heard the papers of his friend and assistant, Dr. Torrey, will doubtless admit that that piece of furniture is still rocking in a very lively manner, and that there is no present fear of the nursery's lapsing into unwholesome quiet.

President Gilman, who had given the Society much faithful service from the fifties to the seventies, is now our presiding officer; and it is pleasant to record the faithfulness with which—in spite of his duties on the Venezuelan Commission—he took the long journey from Baltimore in order to be present. Some societies suffer under the régime of the merely "ornamental" or "figure-head" type of president; but we are fortunate in having a man to preside who can efficiently help us to the smooth and ready dispatch of the business in hand. The attendance was good. The members number between three and four hundred, including many residing in distant parts of this country and many abroad. About one-tenth of these were present, besides many intelligently interested auditors from the Seminary and the town. The Johns Hopkins was represented by its President and by Haupt; Columbia by Gotthell and Jackson; Yale by Hopkins, the successor of Prof. Whitney; Harvard by Toy, Lyon, and Lanman; and so on.

This was our one hundred and seventh meeting. The sessions began on Thursday, and continued without drag, and yet without hurry, until Saturday noon. The purpose of this arrangement is to give opportunity for two informal evening sessions. This present arrangement of annual meetings extending over three days is a most palpable improvement over the old plan of two extremely brief semi-annual meetings, where the need of "hustling" and "catching trains" quite overcrowded the scholar's spirit. President Gilman set the business session for Friday morning. This began with the presentation of correspondence by the corresponding secretary, Prof. Lanman. Notable among these letters was one from a distant corner of Assam in India, from Sibesar on the Brahmaputra. It was written by Mr. Peal of the Royal Geographical Society, who is at work on the languages of that region, and contained a request for a certain publication of the society upon those tongues by one of our earliest members, Rev. Nathan Brown, a missionary of the Baptist Union. "Its [the book's] value to us here," says Mr. Peal, "is much greater than you might suppose. Dr. Brown was a real *genius*." A recent letter, bearing the signature, still clear and firm, of Otto Boettlingk of the Russian Imperial Academy, the Nestor of all Sanskritists and the oldest honorary member of our society (he was elected in 1844), combines with frequent brochures from his pen to attest the unexhausted vitality of this distinguished octogenarian. Prof. Buehler of Vienna sends a stately publication of the Austrian Academy dedicated to the memory of our Whitney, and tells of the progress of his *Encyclopedia of Indic Philology*, to be issued by Trubner of Strassburg, the publisher of Paul's Germanic, Groeber's Romance, and Geiger's Iranian Philology, and to be executed on the same plan with those works. It is of interest to us because two of our members, Bloomfield and Lanman, have a hand in it. Dr. Johnston of Ballykilbeg, County Down, formerly of the Bengal Civil Service, makes the welcome announcement that he has translated Deussen's '*System des Vedanta*,' and that it is to run through the *Calcutta Review* and then

appear in book form. Dr. Burgess of Edinburgh, formerly Director-General of the Archaeological Survey of India, gives an encouraging account of the progress of his great work (already noticed in these columns), soon to be issued by Griggs of London. The first portfolio of 150 or more colotype plates of the most important archaeological remains in India may soon be expected. They are made from the best of some three or four thousand negatives at Whitehall and the Calcutta Museum, and the negatives are selected by an unexcelled expert. Of interest to serious students of Buddhism is a letter from the well-known Subhuti, a Buddhist high-priest of Ceylon, stating his readiness to comply with a request for a transcript of certain Pali texts of the Sacred Canon. Finally, Lal Chandra Vidya Bhaskara of Jodhpur, Rajputana, sends us, in superb calligraphy, a most elaborate Life of Prof. Whitney, done into Sanskrit verses from the obituary notice of that scholar which appeared in the *Nation* of June 14, 1894.

The necrology of the year included some very notable names. Among them is that of Prof. Roth of Tuebingen, the life-long friend and fellow-laborer of Whitney in the field of Vedic research. Another is Rost, the Librarian of the India Office in London, whom scores of grateful scholars have risen up to call blessed for his learning and for the kindness with which he put that learning at their disposal. Of our illustrious countryman, Dr. Van Dyck, the great Arabist, we need not speak, unless for the pride and joy that we have in calling his noble life and life-work to remembrance. Two men long distinguished in other walks of life, the late Hon. Charles Theodore Russell of Cambridge and the Rev. Talbot W. Chambers of New York, were for very many years faithful and interested members of the Society.

The treasurer, Mr. Warren of Cambridge, showed a satisfactory balance-sheet; and the Committee of Publication announced that a new half-volume had been issued a few days before. New blood was infused into the society by the election of a goodly number of new members. The old administrative officers were reelected, with one exception: the secretary, Prof. Lanman, after nearly twenty years of such labor, desired to be relieved, and in his stead was elected Prof. Hopkins. On the other hand, the healthy growth of the Society has greatly increased the amount of editorial labor to be done, and this labor had come, by prescription, to attach to the post of secretary. To effect a much-needed redistribution of burdens, accordingly, the directors appointed Professors Lanman and Moore to serve as responsible editors of the *Journal*.

Of the miscellaneous business only two items need be mentioned. One was an invitation from the Society of Biblical Literature and Exegesis to coöperate with them in the effort to establish a School of Oriental Study and Research in Bible Lands, somewhat after the manner of the American Schools at Athens and Rome. Prof. Thayer of Harvard submitted the draft of a plan. The other was a scheme for promoting the Historical Study of Religions, and emanated from Prof. Jastrow of Philadelphia.

The papers presented were about thirty in number. They were, of course, largely technical. One of the most striking things about them was the largeness of the number that attempted a *rapprochement* of wholly diverse phases of ancient civilization. Thus, Dr. Cassanowicz discussed the Alexander legends in Talmud and Midrash with reference to Greek and

Assyrian parallels. Prof. Macdonald's paper on the place of al-Ghazali in the theology of Islam adverted to the influence exerted by Buddhism upon one of the forms of Sufism. Prof. Jackson's paper upon Persian names in the Book of Esther, as well as that of his colleague, Prof. Gotthell, upon references to Zoroaster in the Syriac literature, brought out still other interlacings of Aryan and Semitic life. And again, Mr. Edmunds's essay on the compilation of the Pali Canon was the fruit of studies which were suggested to him by his study of the history of the New Testament Canon under Prof. Rendel Harris. Dr. Scott's paper upon Malayan words in English was a brief account of a most elaborate investigation. In the course of it he used the expression, "If there is any longer any such work as an English Dictionary." If, indeed! Our vocabulary is already fairly flooded with words of the cosmopolitan jargon. His essay showed, perhaps more clearly than any of those just mentioned, how infinite is the interplay between races and nations, how impossible to study any of them in isolation. And yet how short is the time since scholars began to realize that they could not understand the origin of Greek civilization from the Grecian monuments of that civilization alone!

Appropos of a technical discussion of a passage in Ezra, Prof. Haupt expressed a view long held by him that Assyrian is only an older local variety of Aramaic. In his paper on Genesis ii. 6, "There went up a mist (*edh*) from the earth," etc., he assumed on the part of the Palestinian narrator a misunderstanding of the old Babylonian material worked over by him, in which material the loan-word *edh* had reference to the system of irrigation practised in Babylonia. Prof. Haupt's pupil, Dr. Johnston, sent a valuable paper on the epistolary literature of the Assyro-Babylonians. These letters are original, contemporaneous, and authentic documents for the history of their times. Noteworthy among them are the letters between Bel-ibni, the general of Ashurbanipal, and his royal master. They are pervaded by cordial good feeling and soldier-like frankness, and are rich in historical allusions and details. How wonderful that we should now possess the letters—still clear in tone and fresh in coloring—to and from a king who only a little while ago was to us the half-mythical Sardanapalus!

Prof. Bloomfield sent an advance report of the results of his '*Atharva-Veda*' studies now publishing in Max Mueller's '*Sacred Books of the East*.' And a printed specimen of the late Prof. Whitney's translation of the same Veda was laid before the Society by Prof. Lanman, who is now bringing out that work in his '*Harvard Oriental Series*.' The latter's studies of the relative age of different parts of the '*Rig-Veda*' have been continued by Prof. Arnold of the University College of North Wales, Bangor, who sent us an elaborate treatise on that subject. And a critical investigation of the eighth book of the '*Rig-Veda*,' conducted with a similar purpose, was presented by Prof. Hopkins. It is interesting to see at such a meeting as this how like in method is the criticism of the Vedas to that of the Bible, differ as they may in details. For this reason, if for no other, it would be a pity to divide the Society into two sections, a Semitic and an Aryan. The meeting was a thoroughly harmonious one—no *odium philologicum*. It was altogether happy and profitable, and full of promise for the future of the Society. The next meeting is appointed to be held at Baltimore, in Easter week, April 23-24, 1897.

PERSIGNY'S MEMOIRS.

PARIS, March 26, 1896.

THE increase of interest which is felt just now in all that relates to the Napoleonic period does not extend as yet to the genesis and the development of the Second Empire. The events of that period are so near to us that we seem to have little to learn about it; the consequences of the Second Empire are still too acutely felt. To be sure, the First Empire ended at Waterloo, as the Second Empire ended at Sedan, but it is not natural for the present generation to view with the same feelings two catastrophes separated by such a long interval.

It was perhaps imprudent to draw public attention to one of the men who were the most ardent supporters of Napoleon, and who powerfully contributed to the establishment of the Second Empire—I mean M. de Persigny; but all memoirs seem to be unwilling now to remain in the shade. There is a great demand for them, and the economists are wont to say that where there is a demand, there is a supply. This 'Mémoires du Duc de Persigny' (Paris: Plon; New York: Dyssen & Pfeiffer), edited by M. H. de Laire, Comte d'Espagny, who was the private secretary of the Duke, are not memoirs in the usual sense of the word; they are rather a succession of political essays and notes. The notes were written at different times. Persigny was afraid that, after his death, the Government would seize them, in virtue of the law that allows a search for and seizure of the papers of men who have occupied high functions in the state. He therefore made three copies of his Memoirs, A, B, and C. M. d'Espagny gives us one of these. He thinks himself entitled to do so inasmuch as twenty-four years have elapsed since the death of M. de Persigny (January 12, 1872), and as the persons mentioned in the memoirs are all dead, with the exception of the Empress Eugénie.

The name of the Duc de Persigny was Fialin; his family belonged to the province of Forez, and he always made great efforts to prove that it was of noble origin. While he was ambassador in London I know that he induced his colleague, the Italian Minister, to have researches made in the archives of Turin, as he had a notion that his family had connections with some noble families of the north of Italy. Nothing was ever discovered about the Fialins at Turin, but Persigny was always persuaded that his family had emigrated from Dauphiné to the Lyonnais. Persigny was a small fief in the Forez, which had belonged to one of his ancestors. Fialin entered as a private a regiment of hussars. Little is known about his life after he left the regiment; he tried without success to enter the administration of the crown forests; he took some part in the intrigues of the Duchesse de Berry when she prepared an expedition in Vendée. We see him, however, abandon the Legitimist for the Napoleonic cause, in a review which he founded under the title of *Revue de l'Occident Français*. The Duke of Reichstadt was dead; Louis Napoleon was known only by the part which he had taken in a rising in Romagna; King Joseph was living in quiet retirement in London. It seemed almost madness to speak of a restoration of the Napoleons. In his review Persigny makes a real manifesto: he prophesies a complete renovation of Europe, he announces the arrival of a new Messiah.

"In the imperial idea resides the true law of the modern world. . . . The time has come for announcing in Europe the imperial

gospel which as yet has had no apostles. The time has come to seize the old flag of the Emperor—not only the flag of Marengo and Austerlitz, the flag also of Burgos and of Moscow. The Emperor! the whole Emperor!"

What Persigny admires is not only the military genius of the Emperor, but his political genius, the ideas and institutions which paved the way for the new régime in France; he finds a Napoleon better than parliamentarism and all possible constitutional formulas. To do him justice, he always remained what he was in this Review, of which only one number was issued, and which provoked no echo. King Joseph, however, wished to see the author, and received him at Denham Place, near London.

Persigny entered into relations with Prince Louis Napoleon, the nephew and heir of Napoleon, and met in him a response to his own ideas. With him he arranged at Arenenberg the Strasbourg expedition, after having travelled for several months in the department of the East of France, and chiefly in Alsace and Lorraine. The expedition failed almost ignominiously. Napoleon was arrested in the barracks of a regiment of artillery; Persigny fled to the Grand Duchy of Baden, concealed himself in the Black Forest, and afterwards went to Arenenberg and to England, by way of Germany. Persigny was again with the Prince when he made his second attempt at Boulogne. This time he was arrested and tried before the House of Peers. He was condemned to twenty years' imprisonment and sent to the citadel of Doullens. After the Revolution of 1848, Persigny worked openly for Prince Napoleon. He was imprisoned again for some time by order of the Provisionary Government, and was at the Conciergerie during the bloody insurrection of June. The reaction which followed ended in the nomination of Prince Louis Napoleon as President. Persigny was not among his first Ministers, who were to be chosen from the Chamber, but he was one of his secret and intimate advisers. In 1849 he was elected a Deputy in two departments, the Loire and the Nord; from that moment his public career belongs to history. He advised the President, before the 2d of December, to choose M. de Morny as Home Minister, and contented himself with a subordinate task in the execution of the Coup d'État; but there is no doubt that he was one of its chief inspirers.

His Memoirs begin with two chapters, one on the establishment of Louis Napoleon's Presidency, the other on the committee which took its name from the Rue de Poitiers, where it had its meeting, and which was composed of the most important members of Parliament, all more or less hostile to Prince Napoleon, whom they justly suspected of meditating a coup d'État and the reestablishment of the Empire. The constituent work of the Parliamentarians had come to an end; they had committed the mistake of submitting the choice of President to universal suffrage. Universal suffrage fixed itself not on Gen. Cavaignac, though he had saved Paris in the June insurrection, but on Prince Napoleon, notwithstanding his two attempts at Strasbourg and Boulogne. The name of Napoleon had still a place in the people's imagination, and nations as well as individuals are often led by the forces of imagination. The leaders of the Parliamentarians, Thiers, Barrot, Molé, etc., were unpopular; the country attributed the Revolution of 1848, which had taken it by surprise, to their miserable rivalries. There can be no doubt that the country was tired of the permanent agitation which had followed the

establishment of the Republic. The coalition of Parliamentarians—the Duke de Broglie, Count Molé, Thiers, Berryer, Montalembert, Rémusat, etc.—which met at the Rue de Poitiers, really desired the reestablishment of a monarchy; on the other side was Prince Napoleon, silent, enigmatical, but the nominee of the people, who thought that his mission was to renew an imperialist era. Persigny was for a time a sort of deputy of the Prince in the Parliamentary committee. He tells us how he tried to convince his colleagues of the impossibility of establishing a monarchy; he spoke boldly for his own solution, the Empire; of course he did not convert anybody. The Gordian knot was to be severed by the sword.

Persigny was several times minister and ambassador; he was of an uneasy nature, and never remained long in the same place. In 1850, he knew Bismarck at Berlin; Bismarck was at that time one of the influential members of the feudal party, which hated the Empire, Napoleon, and France. Among the members of this party, Bismarck maintained an exceptional attitude towards the members of the French Embassy; he was not afraid to compromise himself by showing himself polite and amiable to them, and talked freely with them on all subjects. Persigny says that Bismarck came one day to see him, and, taking on a serious and almost solemn tone, asked his advice on the affairs of Prussia: the Liberal party was entirely the master in the lower chamber; this party threatened to disorganize everything, even the army. Persigny answered without hesitation.

"If you were used, as they are in England, to struggles for liberty—if all classes in Prussia were accustomed to make mutual concessions to each other—I should advise your King to bow to public opinion and to enter without fear on the path of a constitutional régime. But in the present state of things it would be madness. . . . If Louis Philippe had not allowed a parliamentary quarrel to explode in public, if he had placed himself at the head of his troops to keep order in the streets, the Revolution of 1848 would not have taken place, and his dynasty would still reign. It is true that Charles X. undertook to resist the Revolution and was beaten; but his example is also a lesson, for when he signed his Ordinances he did not foresee that they might provoke an insurrection, and nothing was ready to suppress it. The garrison of Paris, much weakened by the departure of a great part of the Royal Guard for the camp at Lunéville, had no food, no munitions of any sort, and, surprised by an unforeseen struggle, it was vanquished in a moment.

"Well! apply the lessons of history to the circumstances in which you are placed. You have this piece of luck, that the Liberal party invites a struggle on the question of the army, and consequently, in defending the army, you have it with you. You have also this advantage, that the vote of the budget is not necessary for carrying on the government, as, in case of a conflict, the budget of the preceding year can legally suffice. . . . Consider yourself in a civil war; resist the Chamber, adjourn it once, twice, three times; but have your army always ready for a conflict."

A few days afterwards Bismarck accepted the presidency of the Council in Berlin, and began the contest with the Parliament. Persigny never saw him again till 1867, when he met him at the Tuilleries at a dinner which Napoleon gave to the King of Prussia during the Universal Exposition. After dinner Bismarck came to him: "'Well,' said he, 'have I not well followed your instruction?' 'Yea,' said I, 'but I must admit that the pupil has singularly surpassed the master.'" Two days afterwards Bismarck paid him a visit, and they had a long conversation on the subject of Luxemburg, and the difficulties which arose from the relations between the Duchy of Luxemburg

and Germany. They spoke also of Sadowa and of possible changes in Germany, of the Rhine provinces. Persigny did not think it possible that France would long establish her authority over the German-speaking provinces of the Rhine, but he objected to Prussia taking these provinces for herself; he wished her to aggrandize herself in the north of Germany, on condition that she would indemnify on the left bank of the Rhine the princes dispossessed on the right bank; he wished to avoid any direct contact between France and Prussia, and to create all along the Rhine a succession of neutralized buffer states. Bismarck took great interest in the development of these plans; he would have liked to know what the Emperor Napoleon thought of them. Persigny was candid enough to tell him that he really did not know, and to add that his personal influence in the Council was not very great in such matters. We see in the Memoirs that the influence which was most hostile to him was that of the Emperor; as for the Emperor, he always treated Persigny with much kindness, but he had become more and more silent, he saw Persigny less and less, and Persigny does not disguise the fact that, towards the end of the Empire, his influence had become very small.

On the whole, these Memoirs, though there is no thread to tie together their disconnected parts, though they are very artless and incomplete, will afford a valuable document to the historian of the Second Empire.

Correspondence.

THE DEBASING OF NORMAL SCHOOLS.

TO THE EDITOR OF THE NATION:

SIR: President Schurman's article on "Teaching—a Trade or a Profession?" in the April *Forum*, contains in categorical form certain statements which, to say the least, are plainly debatable, and therefore should not be allowed to pass uncontested.

Like other writers before him, President Schurman holds that the simultaneous pursuit of academical and professional instruction in normal schools is "pernicious," on the ground that studies otherwise yielding a liberal education lose their educational or culture value when pursued with a view to technical, practical ends. But can it for a moment be maintained that the case of a student pursuing certain lines of study with the ultimate view of teaching the same is at all parallel to that of a boy learning arithmetic, let us say, for use in the store, or of a university student working in order to pass his examination? In the one case purely practical or outward results are aimed at; the theoretical, the ideal side of the work is neglected as far as it is possible to do so. In the other case the subject is studied not merely with a view to the acquisition of facts, but also with regard to its adaptability to psychological laws and with a view to its moral and ethical aspects; the earnest student observing the attitude of his own mind toward the subject he is pursuing in order to know the better how to reach the avenues of another mind in imparting knowledge. The latter mode of learning, therefore, is exactly that which may be expected to yield the greatest intellectual enjoyment and benefit; for the student's interest in the subject is genuine and intrinsic—the very opposite of that of a student working for examination.

The plan of making normal schools purely professional has been often urged; it has been

tried in a few cases and soon abandoned. The plan is not practicable, and, if it were, its disadvantages would condemn it. It must be admitted that the discontinuance for two years of all those branches of study in which the students might have become interested in the course of their academical training, previous to entering upon such a professional course, would be a lamentable mistake. Much to my regret, I cannot dwell upon this point, as I should have to claim too much of your valuable space.

President Schurman would limit the function of normal schools to the preparation of elementary teachers exclusively. Of several serious objections to such a course, I will mention but one. The inspiration and advantages of culture which members of the lower and shorter courses in normal schools receive through their contact with more advanced and ambitious students is of inestimable value to them and, indirectly, to their future pupils. It would not be possible to attract any considerable number of able and ambitious young persons to a school of such limited range as President Schurman contemplates; the elementary schools would therefore suffer through the inferiority of those willing to take charge of them, while now many of the brightest and most advanced students, both graduate and undergraduate, going out from normal schools of a higher order, take positions in the lower grades, either from preference or because they fail to secure positions in the higher grades. The present system, therefore, leads to an improvement of the teaching force in the lower grades and to a higher estimation of that work in the public mind—a matter of the utmost importance since there may ultimately result from it a more general recognition of the need of highly cultivated teachers for young children.

To reduce all normal schools—i. e., that whole class of institutions exclusively devoted to the training of teachers—to one level, and that a low one, would hardly be conducive to raising the teacher's profession. If it were possible in this country to carry such a plan into effect—which, I firmly believe, it is not—it would lead here to a state of things similar to that found in Germany. The German seminaries turn out teachers admirably trained, professionally, for their special work in the common schools; but they are, as a class, lacking in general culture. Why advocate a policy which would permanently reduce the vast majority of American teachers in the future to the same condition? A. LODGMAN.

MICHIGAN STATE NORMAL SCHOOL,
YPSILANTI, April 17, 1896.

OF BOOK-WORMS.

TO THE EDITOR OF THE NATION:

SIR: The account in the New York *Evening Post* of recent date of the finding of book-worms in the library of Cornell University has caused more or less comment which has not always been trustworthy. For the purpose of correcting the many misstatements and recording the facts in the case, I am moved to make the following statement:

On the 7th day of May, 1896, while working in the catalogue department of the University library, there came to hand a copy of Dante's "Divine Comedy" printed at Venice in the year 1586. It had been received through the mails a short time before direct from Italy, and bore on the title-page a stamped device consisting of a crown and, underneath, the words ARCELLI M.-CANINO. The old leather

cover was perforated with many holes about the size of a pin head, which is not an uncommon sight to those accustomed to handle old books. Many volumes come to hand during a year bearing such scars, but almost never is the insect found which does the boring. Examining the leaves of the volume, it was found that the worms had not done much damage. The title-page was pierced in eight places, but the holes extended through only a few leaves. Twenty-two holes were found through the back leaves, and they went somewhat deeper than those in the front of the book. Close down in the hinge of the book cover were found several little fat grubs, resembling those sometimes found in a hazel nut. These were taken to the entomological laboratory, where they were found to be alive and sufficiently interesting to be worth studying. From these larvæ were developed small brown beetles, and further investigation proved them to belong to the genus known in this country as *Sitodrepa panicea*, and in Europe as *Anobium paniceum*. This species belongs to the family *Ptintidae*, or Death-watch, and the order *Coleoptera*. It was first described by Frisch in 1791. There are two other species of this genus, *Anobium pertinax* and *Anobium eruditum*, and in the larva state all three are so much alike as to be scarcely distinguishable one from another.

The often-quoted account of the finding by M. Peignot of twenty-seven folios perforated by one insect is mentioned by Blades as an instance of the work of this insect, but it is not quite clear whether the boring was done by *Anobium pertinax* or *Sitodrepa panicea*. The *Library Journal* (vol. x., p. 181) mentions the finding of "real book-worms" by Richard Savage, librarian of Stratford-on-Avon, in April, 1885. These were the *Sitodrepa panicea*. F. J. Havergal, librarian of Hereford Cathedral, reported the finding of at least a dozen "genuine book-worms" during his eighteen years' experience, from 1853–1871. In the year 1858, William Blades found in the Bodleian Library a book-worm which he showed to the librarian, who at once killed it with his thumb-nail. As none of the insects in the above cases were scientifically studied, it is impossible to say to what species they belonged, but from the general description given they undoubtedly belonged to the genus *Anobium*.

In this country one or two instances of the finding of book-worms have been recorded. In 1888 H. S. Kephart, at that time cataloguer in the Yale University Library, found some worms. After keeping them for about six months, he sent all that were left to Prof. Comstock at Cornell. Only one was found to be alive when they reached here, and so nothing could be done towards determining to what species they belonged. Recently, Mr. B. C. Steiner reported the finding of a book-worm about two years ago in the Enoch Pratt Free Library of Baltimore, but again not enough came to hand to enable any one to determine where in the book-worm family it belonged.

Fully fifteen different kinds of insects which infest books are mentioned by entomologists and other writers on the subject. The larger part of these, however, do not eat the book. Some eat the paste used in binding the books; others, like the *Hypothenemus eruditus*, fasten themselves upon a book, "and, spinning a robe, which it covers with its own excrement, do the book little or no harm." So far as I have been able to learn, the insects which actually bore the books through, and therefore do the greatest injury, belong to the *Sitodrepa*

panicea or some species of the genus known in Europe as *Anobium*. WILLARD AUSTIN.

CORNELL UNIVERSITY LIBRARY, April 6, 1896.

"HIRED MAN."

TO THE EDITOR OF THE NATION:

SIR: Originating from the substantive *hír* there is, in Anglo-Saxon, the verb *hírian*, after which came *huren*, a forerunner of our *hire*; and the participle *hired* is known to have been long current. But another *hired* is the Anglo-Saxon for "family," "household," and likewise for "retinue" and "court." To modernize the ancient spellings, Old English had *hired-swain*, "domestic," *hired-knave*, "attendant," *hired knight*, "courtier," *hired-play*, "court-play," etc. And it had, moreover, in common use, *hired-man*, "retainer,"—that is, to say, "man dependent on the family," with its feminine, *hired-woman*. So long, therefore, as these expressions continued in vogue, the risk of ambiguity stood in the way of the employment of *hired man*, "man serving for hire," and of the allied *hired woman*.

Among the various kinds of fairs held in England there is one, now fast falling into desuetude, styled, as by other names (for instance, *statute-fair*, *Michaelmas-fair*, *sessions*, and *hiring*), *hiring-fair*. To such a fair, resort persons of both sexes, young and adult, who wish to engage themselves as servants, with others who wish to engage servants; and a bargain for service, usually for the period of a twelvemonth, if concluded, is clenched by the tender and acceptance of a shilling, or a half-crown, as earnest. Servants secured under these circumstances were formerly spoken of, at all events here in Suffolk, as *hired men*, *hired women*, etc.; and the terms were applied to no others. With the disappearance of hiring-fairs hereabouts, some seventy years ago, those terms, also, except historically, disappeared, or nearly so; since they are now heard used, very singularly, solely of domestics who comport themselves with unbecoming importance. "She is only a *hired girl*" expresses scornful censure, whereas "she is only a *servant*" expresses no censure at all.

In a former letter I have shown that the expression *hired men* was employed in America in 1751; and I hardly doubt that your researchful correspondent Mr. Albert Matthews can bring forward proof that *hired women*, *hired boys*, etc., also were somewhat as rife in the language of our colonial forefathers as they are in the language of their descendants. How such locutions found their way into our phraseology is a question which awaits solution.

By "servant" the authorized version of the New Testament represents, for the most part, δούλος, "slave," to be taken literally—as it is where, in Rev., xviii., 13, it Englishes σῶμα—or else figuratively. But παῖς, δακνός, οἰκέτης, and ὑπηρέτης, as well as there represented by "servant." In the four places where it is qualified by "hired," a free servant, in discrimination from a bond, is clearly intended, the originals being μισθωτός and μισθός, the former of which is, in two cases, translated by "hireling." Consulting brevity, I do not refer to the Old Testament.

Hired man I have not traced beyond Wyclif, who, in Jer., xli., 21, and again in St. Luke, xv., 17, 19, renders *mercenarii*—for he followed the Vulgate—by "hirid men," "hyrid men." The same Latin word, in the singular, he renders, in St. John, x., 12, 13, by "marchaunt"—glossed by "hyred hyne"—

strangely giving it, on etymological grounds readily conjectured, a sense quite at variance with that of "marchantis," by which, in Rev., xviii., 3, etc., he naturally renders *mercatores* and *negotiatores*. In King James's version of the Bible, *hired men* occurs in Jer., xli., 21, and nowhere else. Wyclif has "his *hirid* place" in Acts, xxviii., 30.

On the three occasions where Wyclif qualifies "men" by "hirid," "hyrid," he would, grammatically, have put the plural forms, *hiride*, *hyride*, as every tiro in Old English is aware. Can he, then, have designed, by his spelling, a reminder of *hired-men*, "retainers," which, in all probability, still had some currency in his time? That he was capable of eccentricity is plain from his perversion of "marchaunt," noted above. And may not the Wyclif MSS. exhibit *hirid men*, *hyrid-men*?

Very significantly, unparalleled as are, alike for quantity and for variety, the materials they possess in illustration of our language, both Dr. Murray, editor-in-chief of the Oxford English Dictionary, and Professor Wright, editor of the Dialect Dictionary now in preparation, are unable to lend me any assistance, as regards quotations, in connexion with the terms I am considering.

Was the expression *hired man* brought over from East Anglia, or elsewhere, by Englishmen who colonized America in the seventeenth and eighteenth centuries? Whether it was, or was not, we who have sprung from them, in making it, uncontrasted with *slave* or with *unpaid helper*, synonymous, pleonastically, with *servant-man* or *man-servant*, have distinctly deflected its sense from any which, so far as appears, has, in any age, belonged to it in the old country. The fact is certainly noteworthy.

Whether Dr. Holmes's restriction, in *Elsie Venner*, of the term *hired men* to servants of American birth has obtained only of late years, or otherwise than locally, could be ascertained without difficulty. F. H.

MARLESPOND, ENGLAND, March 29, 1896.

Notes.

DODD, MEAD & CO. have in press 'Historical Briefs,' by James Schouler, the historian of the United States. Polk's Diary, of which he has already given a foretaste that whets the appetite, with essays on Lafayette in America, Our Diplomacy during the Rebellion, and Historical Industry, Style, Grouping, Researches, Testimony, etc., will figure in the contents.

D. Appleton & Co.'s spring announcements include 'With the Fathers,' studies in American history by Prof. John B. McMaster; 'Wages and Capital,' by Prof. F. W. Taussig; 'Genius and Degeneration,' by Dr. William Hirsch; 'The Intellectual and Moral Development of the Child,' by Gabriel Compayré; 'Our Juvenile Offenders,' by W. Douglas Morrison; 'A B C of Sense-Perception,' by William J. Eckoff; 'Familiar Trees,' by F. Schuyler Mathews; 'Ice Work, Present and Past,' by T. G. Bonney; 'The Reds of the Midi,' translated from the French of Félix Gras by Mrs. Catharine A. Janvier; 'The Seats of the Mighty,' a romance of Old Quebec, by Gilbert Parker; and 'His Honor, and a Lady,' by Mrs. Everard Cotes.

A complete edition of the works of Robert Browning, in two volumes, with fresh historical and biographical notes; an annotated edition, under Canon Ainger's care, of Hood's Poems; a translation (in connection with J. M. Dent & Co.) of the works of Alphonse Daudet,

illustrated, in monthly volumes beginning with 'Tartarin of Tarascon'; and Comenius's 'Great Didactic,' are to be undertaken by Macmillan & Co. Mr. John La Farge will be the subject of the next *Portfolio* monograph, from the pen of Miss Cecilia Waern.

A Scotch novel, 'Robert Urquhart,' by Gabriel Setoun, will be published directly by Frederick Warne & Co.

Lee & Shepard, Boston, will bring out 'What They Say in New England: A Book of Signs, Sayings, and Superstitions,' by Clifton Johnson; 'Studies in the Thought-World of Practical Mind Art,' by Henry Wood; 'The Mystery of Handwriting,' by J. Harrington Keene ('Grapho'); 'Patmos, or the Unveiling,' by the Rev. Charles Beecher; 'Public Speaking and Reading,' by E. N. Kirby; 'Boston Charades,' by Herbert Ingalls; 'Gymnastics,' by W. A. Stecher; 'Maria Mitchell: Life and Correspondence,' by her sister, Phoebe M. Kendall; and 'The History of the Hutchinson Family,' by John Wallace Hutchinson, with an introduction by the late Frederick Douglass.

Houghton, Mifflin & Co. have nearly ready 'Tom Grogan,' by F. Hopkinson Smith, with illustrations by C. S. Reinhart.

D. C. Heath & Co. will soon issue 'The School Manual of Classical Music,' compiled by H. W. Hart, with biographical sketches.

Lemcke & Buechner have in preparation an exhaustive Hebrew and Chaldee Concordance of the Books of the Old Testament ('Veteris Testamenti Concordantiæ Hebraicæ atque Chaldaicæ'), by Salomon Mandelkern; an English edition of Hugo Winckler's 'Tel-Amarna Letters,' with a glossary; a critical edition of the Septuagint; 'Der Babylonische Talmud,' complete text with variant readings, translation and notes; and (in connection with the Bibliographisches Institut of Leipzig) a 'Geschichte der Englischen Litteratur,' from the earliest times to the present day, by Prof. Dr. Richard Wülker, illustrated with 150 cuts, 25 colored tables, 11 facsimile inserts, etc., to be published in fourteen instalments. A welcome resort to wood-engraving is noticed in the excellent cuts of the prospectus and of Part I.

The Muses' Library (London: Lawrence & Bullen; New York: Scribners) now includes a complete two-volume edition of the poems of Keats, prepared by Mr. G. Thorn Drury. The "feature" of the edition is the "Critical Introduction" by Mr. Robert Bridges. This is the most original and suggestive essay on Keats that has been written for a long time, and will repay careful reading and even some study. It is admirably frank, not hesitating to speak out in blame as well as in praise, and it shows abundant power of discrimination. The sections on allegory are perhaps too fine-spun, however, and the discussion of Keats's philosophy of beauty would in all probability astonish the poet himself. The style of the essay is surprisingly shapeless.

Mr. H. Buxton Forman's new edition of 'The Letters of Keats' (London: Reeves & Turner; New York: Scribners) is, on some accounts, the best that has yet appeared. It is absolutely complete, so far as materials are known to exist, and therefore includes all the correspondence that has come to light since Mr. Colvin's edition was published in 1891. The letters to Fanny Brawne are not put by themselves, but are inserted, so far as possible, in their appropriate places, chronologically. The advantages of this arrangement are obvious, and not the least of them is that the reader is not forced to read these letters (which

ought to have been burned) *seriatim*. For the carefulness of the editing, Mr. Forman's name is a sufficient warrant. The type is notably clear and of good size, and the value and interest of the volume are enhanced by a portrait and by "twenty-four contemporary views of places visited by Keats."

Turgeneff's 'Smoke' has been added to the series of the Russian master translated by Mrs. Garnett (Macmillan). Comparison with the version for some time familiar to our public with Holt's imprint shows no great difference in substance; in evenness and fineness of quality one may, perhaps, prefer the latter.

That Cuba has a strong case against Spain, on the charge of misgovernment, cannot easily be denied, whatever one may say of causes, responsibility, or remedies. Much of the evidence on which the Autonomists rest their case may be found in Raimundo Cabrera's 'Cuba and the Cubans' (Philadelphia: Levytype Co.), albeit set forth with the characteristic vice of Spanish writing—a fatal turn for rhetoric; *lirismo* is the Spanish word for it. This is a useful and timely book, though stiffly translated and carelessly printed. A more telling work in the same line is Rafael M. Merchan's 'Cuba: Justificación de su Guerra de Independencia' (Bogotá: La Luz). We know no other volume which puts the matter so temperately and, therefore, so powerfully.

The contents of the third and fourth numbers of Karl Strecker's 'Das Bismarck-Museum' (Berlin: Pauli) do not differ in kind from those of the preceding ones. There are nineteen plates (Nos. 23-42), consisting chiefly of diplomas of honorary citizenship of various German towns, addresses presented by clubs and other societies, and similar testimonials of esteem. The most original design is perhaps the "humoristic fan," representing a "European concert" of the great Powers, at which Bismarck directs the orchestra of statesmen, and wields the baton with remarkable *verve* and vigor before an audience composed of the sovereigns of Europe. It was the gift of Herr Zographo of Baden-Baden.

André Theuriot's 'Années de Printemps' forms the ninth volume of the daintily printed "Collection Ollendorff illustrée" (Paris: Ollendorff). It is a partial bibliography, covering the early years of the poet, novelist, and dramatist—few writers nowadays confining themselves to one branch of literature—and in many of its pages has the captivating charm of Theuriot's best work. But it carries us on merely to the time when 'In Memoriam' was accepted by the *Revue des Deux Mondes*—that is, when the author's literary career began.

'Contes d'Hiver,' by Alphonse Daudet, forms one of the numbers of the beautifully printed and illustrated "Nouvelle Collection Guillaume" (Paris: Guillaume).

'Il Duomo di Modena: Notizie Storiche ed Artistiche,' by Cav. Antonio Dondi (Modena), contains a collection of documents, alphabetically arranged, which, though in the first place dealing with the cathedral of Modena (one of the most venerable and fascinating in Italy, by the way), will be found invaluable by all students of mediæval and Renaissance art in Italy.

'Gli Affreschi della Libreria del Duomo di Siena' (Siena) is a neat pamphlet containing a reprint of old descriptions and heliotype reproductions of the famous frescoes by Pinturicchio, wherein are recounted the deeds of that captivating adventurer, diplomat, and prelate, Pope Pius II.

Another pamphlet deserving attention is an

admirable *catalogue raisonné* of the various works by Ambrogio Borgognone—after Foppa, the greatest and in every way the most delightful of Milanese painters. We owe this compilation to Signor Luca Beltrami (Milan: Hoepli), and it is the first of a series that will include all the Lombard masters.

The last number for 1896 of the *Archivio Storico dell'Arte* contains its usual quantity of valuable contributions. Signor Frizzoni writes about the recently dispersed Scarpa Collection, a pilgrimage to which, at the charming Venetian village of Motta on the green Livenza, used to be one of the pleasantest tasks that fell to the students' lot. Of the two most famous pictures of this collection, Mantegna's "St. Sebastian" remains, it appears, with Baron Franchetti in Venice, while the portrait of Raphael by Sebastiano del Piombo has gone to join the many masterpieces at Buda-Pesth. Signor Anselmi gives an account of the various glazed terracottas by the Della Robbia in the province of Pesaro-Urbino. Signor Carotti calls attention to the gorgeous polyptych which Cardinal della Rovere, afterwards Pope Julius II., ordered of the great Lombard painter Vincenzo Foppa, for his own native town of Savona, where, as a child, he roamed the streets little better than a beggar. All these papers are copiously illustrated. Finally, Signor Fabrizio wins our gratitude by extracting for us the few pearls—and even these are not of great price—from the heap piled up by German criticism during 1894.

Pan goes a great way to justify its hitherto rather futile existence by an article in its March number from the pen of Dr. Bode, in which we are made acquainted for the first time with a young decorative artist of the highest genius, Hermann Obrist. Obrist's talent has thus far most clearly revealed itself in his embroideries. Even the reproductions, excellent in their way, but yet inadequate, surprise us with the wonderful possibilities they open out for this exquisite but usually petty art. Dr. Bode ends his paper with a eulogy on our own industrial art, and on homes such as Mr. Tiffany's and Mr. Havemeyer's, more than flattering to our national vanity; but in all that differentiates decoration from furnishing, a great from a minor art, we have as yet produced little of such quality as is manifested in Hermann Obrist's best embroideries.

We have received the large and elaborately illustrated catalogue of the Schoenlank Collection, which is to be sold at Cologne during the present month, and we confess that it is not inspiring. The bulk of the collection is the work of third and fifth-rate Dutch and Flemish painters, and of the seventy-odd illustrations hardly half-a-dozen give the idea of an original interesting in any other than an archaeological way. Of most of the pictures one is tempted to say that it is of no importance whether they are or are not genuine, while of the authenticity of the few that are attributed to really great names one has grave doubts. Of course one cannot definitely judge them without careful study of the originals, but we risk little in saying that few of these pictures would have created a reputation for the painters to whom they are assigned, while the so-called Titian not only is a very bad picture, but is bad in a way and to an extent that render its attribution fantastic.

Members of the psychological departments in some of our universities, and others, engaged upon the subject of "child-study," will find matter of interest in an article in the *Pædagogium* for January (Leipzig), by Dr. Al-

fred Spitzner, reporting on behalf of the executive committee of a "congress for hygiene and demography." Under the title "Geistige Überanstrengung in den Schulen: Nervosität," the writer treats of mental and physical defects of pupils in the public schools, their relation, causes, etc. The question to what extent the school can be held responsible for the existing evil is discussed with frankness and good judgment, and the hasty conclusions and sweeping assertions concerning this difficult problem on the part of many physicians meet with just condemnation. The writer also discusses several methods of experimental school hygiene which, though perhaps of uncertain value, deserve the attention of specialists in this important field who are not already familiar with them.

The distribution of the Armenians in Asia Minor and Transcaucasia is the subject of the principal article in *Petermann's Mitteilungen* for January. The facts are mostly derived from a remarkable work recently published in Paris, 'La Turquie d'Asie,' which gives a geographical, administrative, and statistical account of each Asiatic province of the empire. The author, Vital Cuinet, a general secretary of the Ottoman Bank, has devoted his leisure and means for the past twelve years to the collection of information through correspondents in every important place. The services of these persons he cordially recognizes in his preface, but adds that to name them would be a poor return, as it would inevitably injure them with the Turkish officials. In the nine Armenian provinces, according to the figures given by Cuinet, the total population in 1890 was almost exactly 6,000,000, of whom 4,453,250 were Mohammedans, 913,875 Armenians, and 632,750 Greeks, Nestorians, Chaldeans, Jacobites, and Syrians. In the five provinces in which the Armenians are most numerous, they had only 24 per cent., while the Mohammedans had 69 per cent. of the population. They were in a majority in only nine *kasas* of the two provinces of Van and Bitlis. In Transcaucasia they form a fifth part of the total population, numbering 953,371, or slightly more than in Asia Minor. They live mostly in the governments of Tiflis, Erivan, and Elisabethpol. An interesting and valuable map, by the editor, Dr. Supan, accompanies the article, and shows by shading and coloring not only the distribution of the Armenians in the region, but that of the other Christians. To this number, also, Dr. Franz Boas contributes a colored map showing the distribution of the different Indian languages and dialects in British Columbia.

In the February number of the same periodical Mr. A. Lindenkohl gives some of the results of observations of the temperature and density of the waters of the Gulf Stream and the Gulf of Mexico. There is also a sketch of the Hinterland of the German colony of Togo in West Africa, with some useful suggestions as to the best method of developing its great resources. A detailed account of recent Russian explorations in northwestern China is interesting mainly as an indication of the activity displayed both by the Government and by scientific men and merchants in opening up this region to Russian influences. A table of the population of the principal towns in the German Empire on December 2, 1895, exhibits in a striking way the popular movement towards the cities. There are now 103 towns with more than 30,000 inhabitants, and 28 with more than 100,000. Since 1890, Hamburg and Munich have gained 55,000 each in round numbers, Berlin 100,000, and the remaining 25 large

cities have each increased in similar proportions. The editor, in referring to the reported arrival of Nansen in Eastern Siberia, calls attention to the fact that the first news of Nordenfjöld's reaching Bering Straits in 1878 came, not from the voyager himself nor from the Russian officials, but from the Siberian merchant Sibirakoff. In this case the *Vega* reached the straits and went into winter-quarters on September 28, but the news was not received in Europe till May 16, 1879.

From April 27 to May 2 will be held the spring session of the Chicago Commons School of Social Economics.

—Volume sixteen of the Transactions of the American Society of Mechanical Engineers contains, in addition to the usual papers on engine-testing and on the strength of materials, a description, by Mr. Fred. W. Taylor, of his piece-rate system of paying wages which has been in satisfactory operation for ten years in the works of a Philadelphia steel company where a thousand men are employed. Mr. Taylor speaks from abundant experience in declaring that the ordinary piece-work system of payment is no improvement upon the demoralizing day-work plan of paying men according to the positions they fill, and not according to their individual efficiencies. The introduction of piece-payment does at first quicken the pace of the better men, and thus increases output. But, "after the job has been repeated a number of times at the more rapid rate, the manufacturer thinks that he also should begin to share in the gain, and therefore reduces the price of the job to a figure at which the workman, although working harder, earns, perhaps, but little more than he originally did when on day work." The workman soon learns to foresee the cut and to guard against it. Thus "the ordinary piece-work system involves a permanent antagonism between employers and men, and a certainty of punishment for each workman who reaches a high rate of efficiency. . . . Even the best workmen are forced continually to act the part of hypocrites to hold their own in the struggle against the encroachments of their employers." This is the testimony not of a walking delegate, but of a responsible employer.

—The remedy consists of two parts. First, each job now performed is analyzed into its elementary operations, and the rate of payment for the whole is found by adding the rates which have, as a result of experience, been assigned to the constituent elements. It is thus made possible at once to fix, by similar analysis, a proportionate piece-rate for any novel job about to be undertaken. This counteracts the tendency of men to "mark time" on each new job in hope of securing a high piece-rate for it and subsequently nursing their "soft snap." The second essential feature of Mr. Taylor's plan is a system of "differential rates" of payment, designed to afford high wages for maximum efficiency, and to reduce wages more than proportionately for any falling off from the maximum. For example, suppose a good man can turn out ten pieces per day, wages are then fixed at thirty-five cents each for ten pieces and twenty-five cents each for any less number. Under this system, quantity of work has been increased and quality improved; the men, conscious that they are treated as individuals, have become more cheerful and more truthful; and although the company has never forbidden its men to join labor organizations, its business has not been

interrupted by any of the strikes that, during the past ten years, have embarrassed the steel industry generally. The best men see that the success of a labor organization must mean the lowering of their wages to the amount that inferior men can earn, and they refuse to join. Such, epitomized, is Mr. Taylor's account of his "step toward partial solution of the labor problem." It deserves to be noted that, from the establishment of the system in 1884 to the summer of 1893, no cut was ever made in piece-rates. The men found that "it was the intention of the firm to allow them to earn permanently at the rate of \$3.50," and they did it.

—In the latest number of the *Historische Zeitschrift*, founded and formerly conducted by the late Prof. von Sybel, the present editor, Heinrich von Treitschke, calls upon the Prussian Government to publish the *Testaments Politiques* of Frederick the Great of 1753 and 1768, which are now preserved in the secret cabinet of the state archives, and thus rendered inaccessible to scholars. After the historiographer of the House of Brandenburg, Prof. Preuss, had finished his 'Biography of Frederick the Great,' and other minor contributions to the life of this monarch, he was authorized to prepare, under the auspices of the Berlin Academy of Sciences, a new and complete edition of the 'Oeuvres de Frédéric le Grand,' which appeared in 1846-'57 in thirty stately and sumptuous volumes. But, although this work was nominally complete, it was actually far from being so, since it did not include the political correspondence and many official documents, which it was deemed undesirable to publish. Among the most important omissions were the two "Political Testaments" above mentioned. In 1843 Frederick William IV. referred the question of their publication to the ministers Eichhorn, Savigny, and Heinrich von Bülow, who decided unanimously against it. The papers were also submitted to Alexander von Humboldt and the historian Ranke, both of whom feared lest they should give offence, not so much to France as to Austria, and especially to Russia, and thus create foreign complications. Ranke expressed the opinion that they should be printed entirely or not at all. More than half a century has elapsed since these decisions were given, and it is now believed that the documents in question might be published without causing the slightest international irritation. They would, doubtless, throw new light upon the origin and conduct of the Seven Years' War and other historical events, as well as upon important questions of economical, financial, and military administration and diplomacy.

—The many expressions of disappointment at the policy of the new Tsar that have been heard of late give a peculiar interest to an article in a recent number of the Russian Liberal weekly, *Nedelya*, on political and economic life in Russia during 1895. While admitting that few actual public reforms have been accomplished, the writer takes a very hopeful view of the future. He points to the Emperor's expressed statements of the necessity of the development of national enlightenment and to the actual steps already taken in that direction. Among these he mentions the establishment of a medical institute for women and the stipendiums offered to authors and scientists by the Academy of Science. Important changes have been made in the administration of justice, leading to far greater equality before the law. The comparative lack of

advance in communal matters is explained as being due to unfortunate economic conditions, the consideration of which absorbed public attention. It is natural that the writer, being a Russian, should dwell with satisfaction on the triumphs of Russia in the diplomatic field, especially in the East. The closer relations with France, too, which he takes more seriously than many outside of France are inclined to do, are regarded as promising much for the influence of his country in European politics. After mentioning the friendly feelings of Russia towards the United States, he closes by prophesying that in the not distant future Russia will reach a great, leading international position, the main object of which will be the preservation of the peace of the world.

—The *Berlingske Tidende* of Copenhagen contained recently an interesting account, by Prof. Otto Jespersen, of a visit to the school for deaf-mutes at Nyborg, Fünen. This institution occupies a peculiar position among Danish institutions of its kind, from the fact that it is wholly a day school, its pupils being surrounded out of class hours by persons of normal speech, which, as the author states, is an important condition in their preparation for active life. Moreover, no children congenitally deaf are accepted. It includes both those who have become totally deaf as a result of sickness and those who have only partially lost their hearing. The articles, of which there are two, do not attempt a detailed account of the establishment, but confine themselves wholly to a description of the phonetic side of the subject, on which no one in Denmark is better fitted to speak than the author. Prof. Jespersen discusses some of the peculiar difficulties connected with the teaching of phonetics to deaf-mutes. The most interesting of these to a foreign reader is that of the so-called glottal catch, as this sound is not found in any other language than Danish, where it plays a very important part. So difficult is the sound that foreigners learn to produce it only after long practice, and frequently not even then. Prof. Jespersen found the results in this direction truly remarkable, the method, which is not described, being original with the director, Mr. Forchhammer. Another difficulty noted, which is not peculiar to Danish, is to teach the accentuation of words. Formerly no attempt was made in Denmark to distinguish between accented and unaccented syllables in teaching deaf-mutes, nor is the new method used in the higher classes, as the attempt to explain it to those who had already learned to speak would, it was feared, lead to confusion. The author found that the speech of the younger pupils was very much more intelligible than that of the older ones, who not only gave either the wrong accent or none at all, but also frequently changed the sound altogether. In order to teach tone and pitch, the absence of which is generally felt to be a disagreeable feature in the speech of deaf-mutes, Mr. Forchhammer has constructed an instrument which he calls the phonoscope. It can be used by seven persons at a time, who of course do not disturb one another, as they cannot hear.

—M. Edmond de Goncourt's book on Hokusai, the great Japanese painter, has just appeared in Paris (Charpentier). Some forecasts of its quality had already been offered, in the *Revue des Revues*, and were sufficient to show that there is no lack in it of the brilliant characteristics of its author, and of his passionate love of art and of things Japanese. A curious story is connected with the book.

Among the students of Japanese art no one, perhaps, has been more laborious, or is more competent as a critic and more erudite, than M. S. Bing. Although Hokusai (or, as M. Bing transliterates the name, Hok'sai) died but a little more than fifty years ago, few traces of his life remained. Little remained of him except his pictures. His grave, even, was unknown, until its discovery through M. Bing's researches. Many of the artist's letters have by the same means been brought to light. In prosecuting his work, M. Bing had recourse to the services of a learned Japanese who undertook the task of verifying upon the spot uncertain facts, and of "unravelling the tangled skein of contradictory informations." This confidential agent was a certain "Jijima Hanjuro," a clever fellow, who conceived the idea of adding to the liberal wages which he received from M. Bing the emoluments of an author. As the facts cleared up, and the results of his researches grew to the bulk of a substantial collection, Jijima published them in Japan as a 'Life of Hok'sai'; and while M. Bing was busily occupied in coördinating the reports that were sent him, and spending much patient labor over Hokusai's life and works, a copy of this book was sent across the ocean to Paris, where a translation of it was made for the benefit of M. de Goncourt. This translation Goncourt bought, and used quite innocently, so far as appears, since he was ignorant of its origin. M. Bing has published the preface of his own forthcoming volume, 'La Vie et l'Oeuvre de Hok'sai,' in the *Revue Blanche*, together with a note which tells the story given above. He lays no blame on M. de Goncourt, though he cannot refrain from saying, perhaps with a little irony mingled with the wit: "Je m'estime trop heureux d'être en posture tout spécialement propice pour attester l'origine authentique de l'histoire relatée dans le volume Goncourt, auquel je souhaite de plein cœur la fortune éclatante qui couronna les plus brillants ouvrages du maître écrivain." M. Bing's own book on Hokusai, which may be expected to be much more learned and more thorough than that of M. de Goncourt, will soon appear.

THE BEGINNINGS OF THE UNIVERSITIES.—I.

The Universities of Europe in the Middle Ages.
By Hastings Rashdall, M.A., Fellow and Lecturer of Hertford College, Oxford. Oxford: Clarendon Press; New York: Macmillan. 1895. 3 vols., 8vo, 560, 832 pp.

EVER since the great expansion of activity at Göttingen a century and a half ago, and more particularly since Wilhelm von Humboldt started the University of Berlin on its remarkable career, the universities have played an increasingly important part in modern civilization. Both in Europe and in America, as factors in institutional life they are constantly in the public eye, and, whether for weal or for woe, they influence powerfully the convictions and the conduct of a large proportion of the leaders of each generation. This condition has come about very gradually—so gradually, indeed, that we have no adequate history of it, and no widespread knowledge of the origin and causes of the institution itself, the university.

The really authoritative literature on the origin and development of the universities is very recent and very incomplete. Scholarly and accurate surveys, though necessarily much compressed, are those contributed by Mullinger

to the 'Encyclopædia Britannica,' and by Perry to the 'International Encyclopedia.' So far as the universities of Germany alone are concerned, we have an ideal sketch by Paulsen; but there is no treatment equally good of the whole field. Prof. Laurie's 'Rise and Constitution of the Universities' is very uncritical and inaccurate. Compayré's 'Abelard and the Origin of the Universities' is much the best and most authoritative book of its kind, but its scope is somewhat restricted. The older works of Meiners, Malden, and others were written before the wealth of material now at hand was accessible, and are of antiquarian interest only. It is to Father Denifle, the first volume of whose 'Die Entstehung der Universitäten des Mittelalters' appeared in 1885, and to Kaufmann, who began the publication of his 'Geschichte der deutschen Universitäten' in 1888, that we must look for scientific weighing of all the evidence, and careful presentation of all the facts relating to the origin and early history of the university movement. Unfortunately the work of both Denifle and Kaufmann has been interrupted, and it is impossible to predict when their remaining volumes will appear.

The publication of Mr. Rashdall's history has been eagerly awaited, especially since Mr. Gladstone's enthusiastic reference to it in his Romanes Lecture of 1892. It has grown out of an Oxford prize essay written in 1883, and is entitled by its scope, its vast research, and its scientific method to take rank with the works of Denifle and Kaufmann, to both of whom, indeed, but particularly the former, Mr. Rashdall owes much. He has also availed himself of the immense mass of official and historical matter relating to particular universities that has seen the light during the past twenty-five years. Indeed, Mr. Rashdall's bibliographical notes alone are of the greatest value, and would amply justify publication. No important omission of any kind, save of Compayré's excellent volume, mentioned above, has been noted in them.

The educational beginnings of the universities are readily traceable to the *schola exterior* of the monasteries; their institutional origin goes back to the mediæval guilds. Cassian, St. Benedict, Alcuin, and Hrabanus builded more wisely than they knew. Their cloister schools were resorted to by numbers of students who had no intention of becoming monks, and for them a special class or department, *schola exterior*, was organized. These schools developed with somewhat more freedom than the *schola interior*, which prepared pupils specifically for a monastic life. As a result, there began to appear in the tenth and eleventh centuries—first in Italy, then in France and England—a class of men, well trained and well educated according to the standards of the time, who were not restricted to the monasteries, and who were able and not unwilling to make teaching their life-work. These *magistri* or *scholastici* migrated from place to place, giving lectures and presiding at disputations. As their reputations spread, and groups of scholars followed them about, these masters and their followers were invited hither and yon by bishops, abbots, and princes. Their learning and influence became international. The leading teachers of the time gradually gravitated to certain centres, and in the course of a century or two several of them, often many, were to be found teaching in one town or near one monastery. Bologna, Paris, and Montpellier were such centres, and at each one of these places there appear to have been a number of masters and scholars without any

relation to each other. It is doubtless with this development in mind that Cardinal Newman claimed for Charlemagne the glory and honor of commencing the university movement, and wrote that "whether his school at Paris be called a university or not, he laid down principles of which a university is the result, in that he aimed at educating all classes and undertook all subjects of teaching."

The theory of Savigny that a university came into existence whenever a distinguished teacher attracted to himself a large number of scholars, is suggestive and partly true; but, as Denifle has shown, it is insufficient to account for all the facts. Mr. Rashdall's treatment proceeds upon the same assumption. A method of instruction different from that practised in the lower schools, and the possession by the students and masters of certain privileges, were the marks of the developed university. The method, so far at least as Paris and its imitators are concerned, is due largely to Abelard, who, as Mr. Rashdall says, inaugurated the intellectual movement out of which the universities eventually sprang, although even in their most rudimentary form they did not exist until a generation after his time. This fact has been so persistently ignored by popular writers on the subject, despite the verdict of Cousin, Newman, Denifle, and Compayré, that it is gratifying to find that Mr. Rashdall's independent studies have led him to lay great emphasis upon the influence of Abelard in the university movement. We can readily understand how the elaborate and forceful argumentations of William of Champeaux and his more famous pupil, Abelard, encouraged freedom of opinion and discussion and attracted hundreds of mature students to Paris. Abelard's "attempt to appeal from recent tradition to the ancient Fathers, and from the ancient Fathers to Scripture and to Reason," is the mediæval equivalent of what the modern university teacher knows as the study of the "sources." It would be a mistake to suppose, however, that the liberal and intelligent method of Abelard was universally followed and adhered to or that it uniformly led to good results. Many of the "disputations" based upon it were unquestionably stimulating, but too often they degenerated into mere formal logic-chopping and the routine of the "dictation."

The mode in which the universities acquired special privileges and immunities is somewhat more difficult to explain. By the beginning of the thirteenth century *Studia Generalia* had become common. Three were prominent—Paris for theology and arts, Bologna for law, and Salerno for medicine. Apparently any town that chose might, at that time, claim to be a *Studium Generale*, and, as Mr. Rashdall says, if Arezzo or Vercelli desired to intimate that it offered as good an education as Paris or Bologna, it did so by assuming the title of *Studium Generale*. It could do this with some grace if it simply provided more than one Magister, invited students from all countries, and maintained at least one of the so-called higher faculties—theology, law, or medicine. There was no authority to determine whether or not a given school was a *Studium Generale*; it was wholly a matter of usage. But it is natural to follow Mr. Rashdall in supposing that a Magister who had taught at so celebrated a centre as Paris, Bologna, or Salerno was pretty sure to receive recognition elsewhere. Doubtless the less well-known *Studia* gladly welcomed such a man as a teacher, while subjecting masters from smaller schools to severe and technical tests. It is Mr. Rashdall's inference

that "to the original conception of a *Studium Generale* there was thus gradually added a vague notion of a certain oecumenical validity for the Mastership which it conferred" (I., 9). This "oecumenical validity" became in time the *jus ubique docendi*.

The next step is the one by which Emperor and Pope were brought to lend a helping hand to the now vigorous university movement. As this is but dimly understood and has been hotly debated, it will be well to quote Mr. Rashdall's own carefully supported words:

"In the latter half of the thirteenth century this unrestricted liberty of founding *Studia Generalia* gradually ceased; and the cessation brought with it an important change in the meaning of the term. It so happened that at about the same time the two great 'world Powers' of Europe [anticipating the modern American millionaire] conceived the idea of erecting a school which was to be placed by an exercise of authority on a level with the great European centres of education. In 1224 the Emperor Frederick II. founded a *Studium Generale* at Naples; in 1229 Gregory IX. did the same at Toulouse; while in 1244 or 1245 Innocent IV. established a *Studium Generale* in the Pontifical Court itself. These foundations would appear to have suggested the idea that the erection of new *Studia Generalia* was one of the Papal and Imperial prerogatives, like the power of creating notaries public. Moreover, in order to give the graduates of Toulouse (in so far as parchment and wax could secure it) the same prestige and recognition which were enjoyed by the graduates of Paris and Bologna, a Bull was issued (in 1233) which declared that any one admitted to the mastership in that University should be freely allowed to teach in all the *Studia* without any further examination. In the course of the century other cities anxious to place their schools on a level with those privileged Universities applied for and obtained from Pope or Emperor Bulls constituting them *Studia Generalia*. The earlier of these Bulls simply confer the position of *Studium Generale* without further definition, or confer the privileges of some specified University such as Paris or Bologna.

"The most prominent practical purposes of such Bulls seems at first to have been to give beneficed ecclesiastics the right of studying in them while contriving to receive the fruits of their benefices—a privilege limited by canonical law or custom to *Studia* reputed 'general.' But gradually the special privilege of the *jus ubique docendi* came to be regarded as the principal object of Papal or Imperial creation. It was usually, but not quite invariably, conferred in express terms by the original foundation-bulls; and was apparently understood to be involved in the mere act of erection even in the rare cases where it is not expressly conceded. In 1292 even the old archetypal universities themselves—Bologna and Paris—were formally invested with the same privilege by Bulls of Nicholas IV. From this time the notion gradually gained ground that the *jus ubique docendi* was of the essence of a *Studium Generale*, and that no school which did not possess the privilege could obtain it without a Bull from Emperor or Pope" (I., 10-12).

This passage is a concise and doubtless correct summary of the facts concerning what has seemed a very difficult matter. Denifle and Mr. Rashdall are probably right in their conclusions from the admitted facts, and Kaufmann, despite his great learning and acumen, is probably wrong. While the Emperor and Pope had nothing to do with originating the university movement, after 1300 they became a most important factor in creating universities, and Mr. Rashdall is conservative rather than radical in excluding from the category of universities, from the beginning of the fourteenth century, all bodies that were not founded by Pope or Emperor. The essential point to bear in mind, however, is that the earliest universities were not founded, but grew.

SCARTAZZINI'S DANTE COMMENTARY.

La Divina Commedia di Dante Alighieri, riveduta nel testo e commentata da G. A. Scartazzini. 2ª edizione, riveduta, corretta, e notevolmente arricchita, coll'aggiunta del Rimario Perfezionato del Dott. Luigi Polacco. Milan: Ulrico Hoepli.

THAT indefatigable Dantist, Dr. Scartazzini, must have taken for his motto, No year without its book. Amid his almost kaleidoscopic publications for the illustration of his chosen poet, his readers bid fair to find themselves before long in some bewilderment. We now have his Introduction to Dante (to give this name to a work with various titles) in no less than five forms, three in Italian and two in German. We already had from him two commentaries upon the 'Divine Comedy,' a larger, in three volumes, published at Leipzig, and a smaller, in a single volume, issued at Milan; and now comes this second edition of the latter, so increased in bulk that it must be regarded as a distinct work. His voluminous 'Dante in Germania' surveyed what German scholars have done for the great Florentine; and he announces as already in the press an 'Enciclopedia Dantesca' in two large volumes. Several others of his books there are, but we will not mention them here.

In spite of this amazing rapidity of production, the work of Dr. Scartazzini is always valuable. The larger edition of the 'Divine Comedy' at once established itself among students of Dante as in important particulars the most useful modern commentary on the great poem. The one-volume edition, issued two years since, had already generally superseded for beginners and for class-room use the editions of Fraticelli, Bianchi, Andreoli, and others of less diffusion; and there can be little doubt that in its new form this edition is destined to be for some time to come the most useful and the most generally adopted of all the briefer commentaries on the poem. It seems, therefore, worth while to give our readers some notion of its merits and demerits.

The writing of an adequate commentary upon a poem like the 'Divine Comedy' is hardly less a work of art than was the production of the poem itself. It is, to be sure, art of a lower, though perhaps not more common kind; yet clearly showing itself art in that pedestrian industry, however laborious and faithful, invariably makes a failure of it. Only by the constant exercise of the imagination can the difficult three-fold task be accomplished of comprehending the poet, of understanding his words, and of interpreting both poet and words justly and surely to the commentator's own generation. For success here grammar does not suffice, nor the vanity of that erudition which D'Alembert so well described—"qui croit voir tous les jours augmenter sa substance par les acquisitions qu'il fait sans peine." The really successful exegete must manage to place before us the poet himself, as he uttered himself in his poem; stroke upon stroke he must depict for us that living personality as it drew from the stores of nature the materials for a new and rare fabric, selecting and shaping them to its needs. Mere explanation of verbal difficulty or of allusion is therefore but the beginning of a commentator's duty, though naturally, in dealing with a work like the 'Divine Comedy,' there are many and serious problems to be faced even here. The main matter is to induct us, more swiftly and truly than our limited personal studies can do it, into that manner of seeing and judging men and things which is

peculiar to the poet. What were his imaginative prepossessions, and how came he by them? In what shapes did truth and beauty present themselves to his inward eye? From what conjunction of personal experience and contemporary convention did his moral estimates proceed? What course of speculation did he run? Who were his intellectual masters? What did they teach him? And what were the determinations of his independent thought? These are the essential questions; and the really adequate commentary, flowing beside the poem, will answer them, not all at once, but little by little, so that at the end we shall have come not only to understand and admire, but also to comprehend and sympathize. All the great poets of the past need this treatment, but none among them more than Dante.

There is much in the 'Divine Comedy' to lead the commentator away from what should be his main purpose. First of all, the style abounds in lexicographical and grammatical difficulties, due in part to the uncertainties of the text, in part to the accumulated obscurity of six hundred years—difficulties whose solution may fairly tax the abilities and learning of any modern man. Then, Dante has chosen to give a firm vesture of flesh and blood to his thought by constant allusions to contemporary men and events. The elucidation of these has already given rise to a huge literature, the production of which shows no sign of abating. In this vast morass it is but too easy to become lost, and few that enter it ever emerge. But in our judgment the greatest danger of all for the commentator is a misconception of the poem as a whole, into which no less a person than Dante himself seems to lead us. Throughout the Middle Ages there reigned supreme and undoubted a peculiar theory as to the purpose and function of poetry, namely, that in so far as it is serious it is in its innermost essence allegory. This theory was held without reserve by Dante. In his 'Convito' (Tratt. II., cap. i.) he outlines it at length, and assumes to interpret in accordance with it the *canzoni* used as the texts of that work. Furthermore, in the dedicatory letter sent with the "Paradiso" to Can Grande della Scala (accepting this as genuine), the poet reaffirms the doctrine and asserts its application to his own poem, saying that the subject of his work, taken literally, is "the condition of souls after death, pure and simple"; while, taken allegorically, it is "man, in so far as, having through the freedom of his will merit or demerit, he receives from Justice reward or punishment."

Thus we have Dante's own assurance that the 'Divine Comedy' contains at once a literal and an allegorical meaning—an assurance that seems to find confirmation from the very aspect and first impression of the poem. Furthermore, we have his definition of allegory as threefold in its character. After this there could seem to be no doubt that the first business of the commentator is to disentangle this threefold mystic sense, and to show it running side by side with the literal meaning through the work. Such, indeed, has been the conception of their task that the majority of the commentators from the fourteenth century down have had; and in our own time many and severe have been the criticisms upon those who have seemed to be indifferent or careless in this matter. What was the excellent Giuliani's tractate, 'Dante spiegato con Dante,' but an arraignment of such as have dared to neglect Dante's own guidance in the interpretation of his poem? And yet, we venture to say, he who completely and absolutely accepts this guidance will certainly fail

of success in his efforts to produce a satisfactory exposition of the 'Divine Comedy.' For the truth is, it is, in the nature of things, an impossibility that there should be four meanings expressed at one and the same time throughout this or any other work of literature. This was long ago recognized in dealing with the classic poets; it is at last almost universally accepted in dealing with the Bible. And the time has come to admit that even a man who wrote his poem in the firm conviction that it ought to contain these meanings, if it was to be a serious work, and who at the end flattered himself that he had succeeded in making it do so, though he were Dante himself, could not by any possibility so transcend all human capability as to accomplish such an undertaking. Of symbolism in details, of allegory in dealing with particular matters, there certainly is an abundance in the 'Divine Comedy,' and these the commentator must explain as well as he can. But towards that vast and all-embracing four-fold meaning supposed to run through the whole poem, the only safe plan is to adopt an attitude of wise indifference. If any one doubts this, let him turn to Gabriele Rossetti's exposition of the 'Divine Comedy' and be convinced.

It is a much more important matter that should engage the chief energies of the modern commentator on Dante. It cannot be too often repeated that no man's ideas, not even the greatest poet's, are of his own peculiar coinage and issue. However rare and personal they may seem at first sight, they will be found upon examination to be in reality products of a slow accretion, in which many generations of minds have left traces of themselves. And something of this process we must be shown if we are to arrive at any adequate understanding and appreciation of what the poet tells us. It can hardly be said that Dr. Scartazzini has undertaken any one of his editions of the 'Divine Comedy' with this obligation clearly in mind. In all of them his effort seems chiefly to have been laboriously to gather what everybody has said on each particular point, and to select from the mass what appears to him most reasonable and probable. In doing this he has given many evidences of good sense and just discrimination in his preferences. He has avoided, for example, an undue zeal in the pursuit of Dante's possible allegorical intentions. He has in general refused to follow the *ignes fatui* of incidental interpretation. His judgment in questions of the text is, in the present state of our knowledge, not often to be quarrelled with, and he is undoubtedly superior in this respect to most of his predecessors. In lexicographical questions he is less sure, and, indeed, at times displays a decided lack of original and first-hand scholarship. He is too apt to fall back upon the interpretations of the fourteenth-century commentators, who are, after all, as any one who makes a comparative study of them must see, so uncritical in their methods and so divergent in their opinions as to afford us hardly more than valuable bodies of collateral linguistic and illustrative material, requiring in use the same treatment as the work of Dante himself. Still, the free even though unscientific employment of this material will guard any judicious commentator from many hasty and fantastic renderings. And this is the case with Dr. Scartazzini. We must add, however, that in the important and in many ways difficult matter of Dante's grammar he has done next to nothing of value.

But the greatest weakness of this edition, as we have already implied, is to be found in what we may call its comparative literary as-

pects. Evidences abound in it that Dr. Scartazzini has a decidedly superficial acquaintance with mediæval literature outside of Italy, and indeed with the course of ideas in the Middle Ages in general. Though expounding a poet whose imaginative life began with the almost unlimited acceptance of social and moral ideals first formulated by the poets of Provence and France, and who to the end retained his respect and admiration for these poets, Dr. Scartazzini shows so little knowledge of them that he is able to characterize even the most famous among them, like Arnaut Daniel and Giraut de Bornell, only at second hand and most inadequately. Of the real character of their poetry and of the sources of its interest for Dante he gives no account at all. And the same lack of sure and original knowledge makes itself felt in his treatment of those intellectual additions which Dante in his maturer years made to his earlier imaginative prepossessions. The passage from the amorous service of Beatrice Portinari to that practice of love which brings the desire and the will into harmonious motion with the divine "love that moves the sun and the other stars," is no such easy and obvious process that we may safely be left to follow it for ourselves. An adequate and final comment upon the 'Divine Comedy,' if we ever get it, will show us the kind of help Dante derived from all the great spirits he enshrines in his poem in attaining this ultimate adjustment of his thought to the world and to God.

Robert Burns in Other Tongues: A Critical Review of the Translations of the Songs and Poems of Robert Burns. By William Jacks. Glasgow: MacLehose; New York: Macmillan.

THIS book, if it serves no other end, ought to be a treasure to the Scotch perorator. One delights to imagine the flow of eloquence at Burns anniversaries and St. Andrew's Day dinners which will follow from a judicious use of its contents. The most resourceful speaker can hardly hope to produce a more electric effect than by reminding his hearers that the oppressed Czech, in his struggle against the Austrian tyrant, nourishes his courage on the martial pabulum of "Scots wha hae"; that the Dutch of the Orange Free State have a President who can do the "Cotter's Saturday Night" into their South African dialect; and that the Swiss Germans confirm their democratic independence with "A man's a man for a' that," while the Germans of the Fatherland wallow knee-deep in the wild-romantic sentiment of "O my luve's like a red, red rose." Some dexterous Scot might even get his tongue around

"Feledjuk e régi jót,
S no emlegetek öté,"

which is the Hungarian beginning of "Auld Lang Syne." If these sentiments do not bring down the house, all patriotism must be dead to the north of the Tweed.

Mr. Jacks's collection of translations is brought together from many quarters, and no one who lacks Mezzofanti's attainments can be trusted to pronounce with authority upon the merit of the versions. Alas that it should be a case of "No man but Lancelot, and he is dead." In the absence of Mezzofanti, Mr. Jacks has resorted to the only possible expedient. The tongues represented are German, Swiss-German, Danish, Norwegian, Swedish, Dutch, Flemish, African-Dutch, Frisian, Bohemian, Hungarian, Russian, French, Italian, Scottish-Gaelic, Irish-Gaelic, Welsh, and—not to be outdone by upstart tongues—Latin. Mr. Jacks does not pretend to be a master of all these,

yet to each translation a critical comment is prefixed. The preface explains how this is managed:

"It would be hypocritical pedantry to leave it to be assumed that I knew all the various languages which appear here sufficiently well to enable me to criticise these translations as I have done; indeed, some of them I do not know at all. In such cases I had each retranslated literally into a language which I did understand, and the retranslation was sent to a native of the particular country for confirmation and comment, and in this way I was able to make my remarks."

Such a process means no end of pains, as does the whole compilation. The volume is a labor of love and has been done thoroughly. The claims which it has to attention, apart from excellence of printing and paper, its incense to Scotch pride in Burns, and the portraits of the translators, are more considerable than one at first thought might suppose. Mr. Jacks's own observations are very interesting. The Burns devotee who wishes to take up languages will, from his knowledge of the originals, find the translations easy reading, and new light may be thrown on Burns in his own tongue by attention to Burns in French or German. Mr. Jacks gives a decisive instance of this last advantage anent the line "Courts for cowards are erected":

"Four out of every five readers of Burns to whom I put the question, 'Does this mean Royal Courts or Courts of Law?' replied 'Royal Courts of course.' An eminent German translator uses the word Gericht, not Hof. This suggested the question to me; and I discovered he was right, as the context shows. 'A fig for those by Law protected. . . Courts for cowards were erected.' When I pointed this out, my friends admitted that they had not thought of it so closely."

Mr. Jacks has not thrown in his translations miscellaneous, but has used method. As it is, the book runs into 550 pages, and only the leading translations in each language are printed. A selection is made of certain pieces, and these, wherever possible, are followed through the various tongues so that the reader may form standards of comparison. Out of the 47 songs and poems chosen for illustration, only 9 are given in but one language, and the majority of the rest are given in half-a-dozen. The pieces which English critics have recognized to be the best are those which have been most diligently translated. "The Cotter's Saturday Night," "Duncan Gray," "Flow gently, sweet Afton," "John Anderson, my Jo," "The Jolly Beggars," "A Man's a Man for a' that," "O wert thou in the cauld Blast," "O My Luve's like a red, red Rose," "Scots wha hae," "Tam o' Shanter," "To a Daisy," "To a Mouse," "To Mary in Heaven," "Ye Banks and Braes o' bonnie Doon" are the favorites of the Continent as of Great Britain and the United States.

In coming to the translations themselves, it seems to us that, as one would suppose *a priori*, the Teutonic translations are better than those in the Romance languages. Burns in French or Italian sounds very strange, though we must not forget that the most learned and sympathetic study of Burns which has been made by any foreigner is to the credit of a Frenchman, M. Auguste Angellier of Lille. Competent Celtic scholars say that the difficulty of translating Burns into Gaelic equals that of translating him into Greek or Latin. "Burns in Gaelic is a David in armor. His movements lack freedom, grace, and vivacity." But in German, especially in Swiss-German, a good deal of the original afflatus is preserved by a skillful translator like Laun, Rueta, or Corrodi. We insist upon Corrodi's translation into Swiss-German

because his contention that no other tongue serves so well for the reproduction of Burns as the Zurich dialect is supported by some excellent proofs. Corrodi has not tried the poems, but has translated thirty-four of the songs. Mr. Jacks says of his version of "A Man's a Man": "This translation is almost perfect; the first line is rather stilted, and two lines seem weak. . . . These are but two very small defects in what is perhaps the best translation into any language of this magnificent ode; and it is fair to point out some lines where the language seems even more expressive than in the original, which is a bold thing to say of any of Burns's masterpieces." The most distinguished European who has tried his hand at the translation of Burns is Van Lennep, the Scott of Holland. Perfect command of the English tongue is an inheritance of the Van Lenneps of Haarlem to the present day. The Latin translations are at least amusing, notably Mr. Leighton's into mediæval Latin verse. Mr. Whamond is less ridiculous, but Burns and Latin are oil and water.

We wish to leave the impression that this book will be valuable to the student of Burns and to the student of translations in general. Not least among its strong points is the merit of Mr. Jacks's criticism of each separate translation, and the light incidentally thrown upon European interest in English literature.

A Manual of Greek Antiquities. By Percy Gardner and Frank B. Jevons. Scribners. 1895.

AN introduction, in a single volume, to Greek antiquities in their chief branches—social, religious, and political—has long been needed, and the want is supplied, and well supplied, by the present work. The editors have divided the labor of composition. Prof. Gardner is responsible for the first five books, entitled respectively *The Surroundings of Greek Life*, *Religion and Mythology*, *Cultus*, *The Course of Life*, and *Commerce*; Dr. Jevons has written the other four, on *Constitutional and Legal Antiquities*, *Slavery*, *War*, and *The Theatre*.

Manuals are generally pretty dry reading, but this one is a pleasing exception to the rule. It is written in an easy, almost conversational style; it is no mere cataloguing of the facts, for in most cases the endeavor is made to trace the manners and customs described back to their origins, and indeed the success in this particular is remarkable. Take, for instance, the subject of Sacrifice. It was hardly to be believed that in a mere manual Prof. Gardner should have been able to go so deeply into a topic like this; and yet even the origins of the sacrifice meet with satisfactory discussion. And the subject of religion in general is treated by him with a fulness which is all the more welcome because Hermann-Strack's handbook has been long out of print, while the volume on Greek religion in Müller's great series is far too bald an outline for general readers. A little study of the pages here devoted to totem and fetish, ancestor worship, and orgiastic cults will be a genuine surprise to the reader unfamiliar with what has been doing of late years on the lines of comparative religion. The account of the Eleusinian Mysteries is interesting and yet sober—wholly without that overstraining of the imagination with which English writers have been too apt to portray the surroundings of the secret that was better kept than any other in antiquity. The contrast between the ritual of ancient temples and that of modern churches is excellently drawn. And, descending to particulars, we have noted no important omission

in details of religion save that of the Athenian *katharmata*. For all these pages on religion, by far the most valuable in the book, we are indebted to Prof. Gardner, and we must thank him too for his clear account of Greek houses and of social life in the open air.

To Dr. Jevons we are especially grateful for his chapters on the laws. In fact, we know of no other English book which gives so full a selection from the Attic Code in the original Greek, accompanied by such a clear commentary. The code of Gortyn also finds a place. His treatment of legal procedure before the courts is also excellent, though we note here a slight contradiction. On page 588 it is stated that "witnesses themselves did not appear" in court, while on page 590 we find the proper explanation, that they appeared, indeed, but merely to acknowledge their evidence as given at the *andaporia*. On the subject of theatrical antiquities Dr. Jevons is not so much at home. On the still burning question of stage or no stage, while we agree with him that the case of the no-stagers is not yet fully proved, yet his attack upon their position by no means blunts all their weapons. In fact, he seems not to be aware how many and various shafts will soon be directed at his devoted head. For instance, the careful examinations made by both Americans and Germans of the internal evidence from the plays themselves, appear to be all but unknown to him. And, to take up one of his own arguments, the passage in Plato's "Symposium" on which he lays much stress is now generally admitted to refer to the *proagon* of Agathon's play, and not to the performance itself. It took place, therefore, in the odeum, not in the theatre. And nobody has yet arisen to tear away the raised stage from the Greek music-hall.

It is to be regretted that the plan of this book did not include at least simple bibliographies of the most important subjects treated in it. The footnotes are few for such a work (750 pages of text), and they are chiefly references to ancient authors. The book contains some pictures, not very well executed; but, as the editors remark in their preface, English-speaking students have now at their command a fairly complete and well-arranged series of illustrations for all the important branches of Greek antiquities in Anderson's edition of Schreiber's 'Atlas,' which has already been reviewed in these columns. These two books ought to be in the library of every classical school, and they will usually be sufficient for all except advanced students of old Greek life.

Goethe's Faust. By Kuno Fischer. Translated and published by Harry Riggs Wolcott. Vol. I. Faust Literature before Goethe. Manchester, Iowa. 1895.

PROF. FISCHER'S lectures on "Faust," which were delivered about twenty years ago in Goethe's native city, were first published in 1878. In 1887 they were republished with extensive additions, and five years later a third edition brought the work up to date. The present translation, which is, we believe, the first into English, has been made from the text of the last edition. It comprises only the first ten chapters, which deal with the Faust literature prior to Goethe; the second and more important volume, on 'The Origin, Idea, and Composition of Goethe's Faust,' is promised for the end of the year. To English students it will be an invaluable aid.

In the first volume the Christian magus legends of the early centuries are discussed,

chiefly in the interest of scholarly completeness, under the representative names of Simon the Sorcerer, Cyprian of Antioch, and Theophilus. The various Faust traditions of Germany are treated with illuminating fulness, although, of course, the discovery at Carlsruhe of the Nuremberg "Faustgeschichten" of Roemshirt, which antedate even the oldest Faust book, is too recent to have received notice here. A chapter is devoted to Marlowe's "Faustus," the influence of which upon the dramatic treatment of the legend in Germany was of great poetic importance; it fixed the character of the opening scene. The volume closes with a discussion of Lessing's famous *Litteratur-brief*, No. xvii., and his fragment of "Faust." The peculiar aptitude of the German mind for this mediæval legend is everywhere apparent. Those who are impressed by numbers will be interested to learn that "Faust" has been dramatized 118 times, and that 41 of these dramas preceded Goethe's. It seems to have been the predestined form in which the soul of Germany was to find its highest poetic expression.

Sanity and moderation characterize Prof. Fischer's critical methods. He is of that small but cherished minority of Faust interpreters who preserve beneath the *talar* of scholarship their reasonableness and humanity. But he has been unable wholly to exclude controversial matter. He has given much patient or impatient study to Faust interpretations, and derives from them the same kind of entertainment that Goethe would have found, had he lived to read all the strange things which have been uttered in his name; but the pages devoted to an attack on Herman Grimm lead to nothing and are to be regretted. Nor do we think that Prof. Fischer has made out his case that the Faust book was in the nature of a Lutheran tract. Ridicule of the Pope was a coarse form of wit, common enough long before the Reformation; and Calderon, who cannot be accused of anti-clerical sentiments, puts disrespectful words into the mouth of one of Cyprian's lackeys in "El Mágico Prodigioso." Certainly it was not the purpose of the chap-book to laud the deeds of Dr. Faust even at the Vatican.

The translation is worthy of all praise. It is easy and idiomatic, and particularly felicitous in the rendering of catchwords and phrases into which the author has put a special significance. On page 116, "converted" is doubtless an intentional perversion of the playful impropriety of the original. On page 120, Faust is made to remove his entire leg, which in the chap-book is only a foot. The Hochschule at Erfurt is called a university, p. 126. The words of the prince at the Diet of Augsburg, page 144, are not accurately rendered. On page 152, by a slip of translation, the Faust fable is said to be founded on the puppet play, whereas, two pages below, Prof. Fischer's opinion is correctly stated: "The drama grew out of the chap-book." Finally, on page 161, the word "duel" unduly dignifies the tavern brawl in which Marlowe lost his life. That these should be the only slips which a careful reading has revealed, is a sufficient tribute to the excellence and accuracy of the translation. The second volume will not complete this admirable work unless it is furnished with a full index.

The Pianoforte Sonata: Its Origin and Development. By J. S. Shedlock. London: Methuen & Co.

THE earliest known sonata for the clavichord was written by the German Kuhnau and published

at Leipzig in 1895. The latest known sonata of importance ("Eroica") was written by the American E. A. MacDowell and published in the same city in 1895. Mr. Shedlock does not mention this last work, but he had no lack of material in two full centuries of sonata-composing for writing a book of 245 pages, which no student of composition can afford to ignore, and which is so admirably written that it will appeal even to the general reader who knows enough of music to be able to play a sonata.

Mr. Shedlock devotes one of his chapters to "The Sonata in England." Patriotism alone can excuse such a thing, but, on the other hand, it must be admitted that the best treatises on the sonata have been written in England, viz., the present book by Mr. Shedlock, and Dr. Hubert Parry's article in Grove's 'Dictionary of Music and Musicians.' In 'The Art of Music,' too, Dr. Parry has many excellent remarks on the sonata. His thorough familiarity with this branch of music (he has composed two sonatas himself) gives the more weight to the opinion expressed in the following sentence: "The aspect of pianoforte music in general seems to indicate that composers are agreed that the day for writing sonatas is past, and that forms of instrumental music must be more closely identified with the thoughts which are expressed in them."

Dr. Parry was by no means the first musician who expressed doubts as to the vitality and future of the sonata. Schumann wrote, as long ago as 1839, that "although from time to time fine specimens of the sonata species made their appearance, and probably would continue to do so, it seemed as if that form of composition had run its appointed course." He did, indeed, compose two sonatas himself, but his heart was not in this work as completely as when he wrote his shorter pieces in freer form, and the same may be said of Weber, Schubert, Chopin, and Rubinstein, as well as of the semi-classical Mendelssohn, whose four sonatas Mr. Shedlock simply ignores (twenty years ago this would have been a capital crime in England), and even of the reactionary Brahms, whose three sonatas are among his earliest works (op. 1, 2, and 5), wherefore it is doubtful, as Parry says, whether they represent his maturer convictions.

Liszt's original and inspired sonata in B minor stands by itself. Mr. Shedlock thinks the germ of it may be found in Beethoven's sonata in A flat, opus 110, and, after quoting Charles Soullier's opinion that "la sonate est morte avec le dix-huitième siècle qui en a tant produit," he asks, "Is Liszt's sonata a Phoenix rising from its ashes? Shall we be able to say, 'La sonate est morte! Vive la sonate'? Time will tell. Hitherto Liszt's work has not borne fruit." After all, this sonata is so different from other works called by the same term that the question is less of the survival of a species than of a name. It differs from other sonatas very much as Liszt's symphonic poems in one movement and arbitrarily varied tempo differ from the symphonies in four movements of arbitrarily prescribed tempo, or as Wagner's organically united music-dramas do from the old-fashioned mosaic of operatic arias.

Mr. Shedlock's attitude towards the sonata is revealed in this sentence: "The history of the last seventy years almost leads one to imagine that Beethoven was the last of the great sonata writers;" and he then proceeds to show, in what is by far the most valuable and interesting chapter in his book, how Beethoven varied in his attitude towards the sonata, so that he may be regarded at once as its master and its destroyer. Under an outward show of

preserving classical formulae, he was, in fact, almost as great an iconoclast as Wagner and Liszt. He did not slavishly copy the three-movement sonata of Haydn and Mozart, but wrote some of his works in four, six of them in two movements. Of two of these Mr. Shedlock frankly says: "The title of 'sonata' given by Beethoven to his op. 90 and op. 111 does not affect the music one jot; under any other name it would sound as well." Beethoven also abolished the repeat, a survival from the old dance movement in binary form, and in the sequence of keys, freedom of modulation, moderate use of full closes, etc., modified the old sonata rules; and Mr. Shedlock does not exaggerate when he closes his chapter on this composer with the words: "In Beethoven, so far as sonata and sonata form are concerned, we seem, as it were, to perceive the beginning of a period of decay;" and a few pages before this: "The process of evolution of the sonata was gradual; so also will be that of its dissolution."

While Mr. Shedlock devotes most of his space to the architectural or structural side of his subject, he does not ignore the poetic or emotional aspect. A musician once asked Mozart regarding the andante of one of his sonatas, and the composer replied that he "meant to make it exactly like Miss Rose"—a pretty girl who had won his admiration by her grace and amiability. "This was the picture to which he worked," says Mr. Shedlock. "One of Beethoven's finest sonatas, the C sharp minor, was inspired by a beautiful girl: a strong appeal to the emotions calls forth a composer's best powers." In another place he remarks: "Very many, probably the greater number, of Beethoven's sonatas rest upon some poetic basis." According to Schindler, the master at one time (1816) conceived the intention of indicating these poetic ideas definitely. He certainly took great pleasure in discussing this project, and it is to be regretted that he did not carry it out. Like the havoc he created with the rigid formulae of the sonata species in his later works, it would have emphasized the fact that he was not so austere "classical" as some of his admirers would make him, but that he showed in many of his works the modern romantic spirit which Wagner and Liszt were the first to point out and insist upon in their interpretations of them.

The Hill-Caves of Yucatan: A Search for Evidence of Man's Antiquity in the Caverns of Central America. By Henry C. Mercer. With seventy-four illustrations. Philadelphia: J. B. Lippincott Co. 1896.

THE expedition of which this volume is the outcome was made possible by the generosity of J. W. Corwith of Chicago, and was carried out under the auspices of the Department of Archaeology of the University of Pennsylvania, of which institution Mr. Mercer is an officer. During the sixty days that these gentlemen, with their assistants, were at work in the field, they visited twenty-nine caves, in ten of which excavations were made. Of these ten, six are said to have yielded valuable and three decisive results.

Without going into particulars, it will be sufficient to say that these results are divisible into two classes, one of which is based upon the evidence found in the caves, while the other is deduced from the absence of all proof of a contradictory character. Thus, for example, basing his conclusion upon the similarity of the pottery and stone implements found in the caves to specimens in collections from

the neighboring ruins, our author asserts (p. 176) that the cave visitors were identical with the Maya Indians who built the ruined cities of Chichenitza, Labna, and Uxmal; while, on the other hand, the absence from the different culture levels of the caves of all evidence of a civilization lower than the Mayas are known to have reached, is believed to justify the conclusion that no earlier inhabitant ever occupied this region, and that the culture of these cave people was not developed in Yucatan, but was brought by them from somewhere else, and in geologically recent times. To the first of these conclusions there can be no objections; and even those of the second class may be temporarily accepted, though in so far as they are drawn from negative evidence they can hardly be said to be final. This fact our author clearly perceives, for he tells us, p. 177, that "the discovery of an earlier culture-layer at a cave unvisited by us will upset the inference."

Aside from these results, it is of interest to note that, when manufacturing pottery, the Maya Indians of to-day use a rude wheel or disk, turning it with both feet, instead of with one, as is the custom with us. Whether this invention was "indigenous to America" is uncertain. Dr. Brinton, for linguistic reasons, thinks not; but the Bishop of Yucatan takes issue with him on the point, and Mr. Mercer tells us (p. 165) that while it would be difficult "to infer the ancient existence of such a slow-moving wheel from the shape and texture of the potsherds found in the caves," yet "in many the fairly even thickness, the superior regularity of the rims, and the parallelism of the surface scratchings suggest clay-turning upon the hand rather than the hand turning upon motionless clay." Archaeologists will await with some interest the result of further investigations on this subject, as the existence of a potter's wheel in prehistoric America has hitherto been generally discredited.

The Far Eastern Question. By Valentine Chirol. Macmillan & Co. 1896. Pp. 196, with two maps and ten illustrations.

THESE studies, by a *Times* correspondent, set forth smoothly and succinctly, from a British standpoint, the conditions and problems, international and commercial, that present themselves since the convulsion of the Sino-Japanese war in the region now known as the Far East. Not so comprehensive as Mr. Norman's and Mr. Curzon's books (for Siam, Annam, and East Siberia are not treated), this volume supplements those in giving special attention to the commercial and industrial conditions and possibilities which have to be entirely reconsidered in view of such recent events as the foreigners' new privileges under the Treaty of Shimonoseki, the Russian diplomatic successes, the industrial encroachments of Japan, and the extreme depreciation of silver.

The chapters on these subjects are useful in their summary of events and in their suggestions. But for information about the political and moral condition of China, to which half the book is devoted, it is useless. The whole attitude of the writer is the "reportorial" one—the assumption that all one needs to do to know about anything is to go to the place and make some inquiries. This writer, for example, vouchsafes to pass judgment on Chinese morality, religion, and politics, to expound the history and traits of the nation, and to promulgate with repeated and severest emphasis a wholesale condemnation of the manner of life and thought among an entire people; and

on what basis? On the basis of a few months' sojourn in the open ports and Peking—nearly as satisfactory a source of information as a Chinese newspaper correspondent would find for writing about our people in the Chinese quarter of San Francisco. The preface alludes, forsooth, to the peculiar advantage of "studying" the questions "on the spot." This has the true "reportorial" ring; if you can only get "on the spot," you are certain to secure ample material for a good "write-up"—whether of a street-brawl or of a legal system, of an elopement or of the whole moral and political fabric of an empire. We have been treated of late to so many of these volitant surface-studies (of the West, of the South, of China, of the Orient—it matters not how great the survey, how deep the problems) that our senses are being dulled to the risk of it, and one cannot too often record a protest. The wise will understand that, for Chinese affairs at least, there are on record maturer views which alone it will be safe to trust.

Hunting in Many Lands: The Book of the Boone and Crockett Club. Edited by Theodore Roosevelt and George Bird Grinnell. New York: Forest and Stream Publishing Co. 1895.

THE second issue of the Boone and Crockett Club is somewhat of a disappointment. Hunting stories, unless well told, seldom have much interest for any but the narrator, or for those who have hunted the same game under similar circumstances. A bald statement of facts, such as the number of animals killed in a day, or a careful computation of the average number of shots needed to kill different kinds of game, makes very monotonous reading. There is so much in big-game hunting that appeals to every man, whether sportsman or not, so much in the silence of the woods and plains, in the observation and knowledge of game, in the picturesqueness of the companions of the hunt, and in all the small details that constitute outdoor life, that it seems a pity not to make more of them than has been done here. No doubt the task is difficult, and if overdone it were better not attempted. This very fault is noticeable in the article on "The Ascent of Chief Mountain," the style of which, though attractive, is better suited to some poetic Indian legend than to a nineteenth-century account of rugged mountain-climbing. Another criticism applies not only to this book, but to nearly all of its class. The old style of hunting story was exaggerated, boastful, ridiculous, yet thrilling. The present style is at the opposite extreme. Undoubtedly the habits of dangerous wild animals have changed—the fear of man has become part of their nature; but not a little of this change is due to the narrator. One notices an absence of detail, a belittling of danger, and seemingly a constant fear of telling a good story and being laughed at for it.

Still, notwithstanding some dreary wastes, 'Hunting in Many Lands' contains several readable articles. Among these may be mentioned "To the Gulf of Cortez," a most interesting description of a hunting trip in an obscure region, Lower California; "A Canadian Moose Hunt," which, with its series of mishaps, disappointments, and unexpected "red-letter days," reflects the bitter-sweet experience of many a big-game hunter. "Wolf-Hunting in Russia" reminds one in parts of 'The Jungle Book,' but leaves behind it a sense of disappointment, as if the tale might have been better told. The article on "Game Laws,"

and those concerning the protection of Yellowstone Park, are excellent and instructive, and are illustrated by some very attractive pictures. They are also important as showing that the Boone and Crockett Club is really accomplishing something of value, not only to sportsmen, but to the whole country—the protection of game, and incidentally the protection and preservation of its haunts and breeding grounds.

The Sentences of Publilius Syrus. Edited by R. A. H. Bickford-Smith. Cambridge, (Eng.): University Press; New York: Macmillan. 1895. Pp. lxii, 61.

THIS new edition of the 'Sentences' is, and honestly professes to be, a résumé of the labors of the Germans, W. Meyer, Woelflin, Friedrich, etc., etc. The author, known in our younger days as "Publius," not "Publilius," is that mimographer whom Julius Cæsar patronized for the sake of discrediting Laberius, to whom Publilius was already a dangerous rival—only inferior, perhaps, in not being a Roman knight. It is not possible to determine which of these sentences belong to Publilius, as only a small fraction are proved to be his by having been quoted as such in antiquity. Those given in this edition are selected from various mediæval collections, where they are found mixed up with wise saws in prose and verse from other authors, the whole being ascribed to Seneca; and this confusion is only worse confounded by their partly alphabetical arrangement under the initial letter of the first word in each.

It is a great pity that we cannot fully identify what belongs to Publilius, and that we have no more of the context with the verses possessing a distinctly proverbial character. We should in that case enjoy an opportunity to compare the Roman mime with the relics of the Greek mime which we possess in the remains of Herondas, in some idyls of Theocritus, and in other fragments of like character.

There is no easier road to poetic immortality than to write quotable poetry—that is, poetry in which clear-cut thoughts and tersely stated maxims shape themselves into one or two complete verses easily memorized and long retained. It is probably the great success of this trick at the hands of the mimographers of the Augustan age that is chiefly responsible for the labored and tiresome pursuit of such "sententia" by the poets and rhetoricians of the silver age. Nor did the taste for them soon pass away. In the dark ages, when readers were few and literary taste well-nigh extinct, when most of the great classics were sleeping semi-millennial slumbers in neglected corners of conventual libraries, the most popular books were stupid abridgments of ancient authors which would now be regarded as beneath contempt. Among these a collection of quotable maxims and proverbial sayings might well pass for the best sort of literature. This explains the curious fact that, while some of the greatest works of antiquity have come down to us in one or two manuscripts only, we have these 'Sentences' in no less than forty-four. Nor did the popularity of these "familiar quotations" end with the revival of learning. Since the discovery of printing there have been at least 276 separate editions of them, without reckoning reprints; and the maxims have been used and appropriated by moralists and other writers of all lands, by La Bruyère, by Calderon, by Metastasio, etc., etc.

The present editor, who modestly, if truly, calls himself an amateur, has selected judicious-

ly from his German authorities. It is not, we presume, from that source that proceeds the curious inaccuracy on page 18, where the verse "civis potest accidere quod cuicumque potest" is twice quoted with the substitution of "civis" for "civis." The English reader may be grateful to Mr. Bickford Smith for a satisfactory presentation of the "Sententiae" and their bibliography, and for an original Index Verborum (a very necessary addition to such a book) which leaves nothing to be desired, unless it be a classificatory index of the maxims by subjects, which some readers will miss.

The Nation.

NEW YORK, THURSDAY, APRIL 23, 1896.

The Week.

THE most hopeful development of the canvass for the Republican Presidential nomination is the presentation of Speaker Reed by the Maine convention upon a gold platform. That the Republicans of New York should declare clearly for sound money as they did last month was a foregone conclusion, and consequently their action did not materially affect the development of opinion in the party on this question. But the case of Maine is altogether different. Two years ago the Republicans of that State yielded to the temptation of a shuffling deliverance in favor of "bimetallism," the financial plank in the platform of 1894 declaring for "a financial policy not in favor of monometallism, either of gold or silver, as the basis of a financial system, but international bimetallism, to be secured by strenuous efforts of the national power." Mr. Reed was already then an aspirant for the Presidential nomination in 1896, and this platform of 1894 showed that his managers thought the road to that nomination lay along the path of silence regarding free coinage, and compromise regarding bimetallism. It is therefore an immense gain to find the party in his State this year adopting a platform which, of course, he framed, and which declares that "he is opposed to the free and unlimited coinage of silver, except by international agreement; and until such agreement can be obtained, he believes the present gold standard should be maintained."

We greatly mistake the temper of the public mind if Mr. Reed's declaration against free coinage and in favor of maintaining the gold standard does not give a great impetus to the movement for his nomination. He has labored thus far in the canvass under the misfortune of not standing for anything in particular, while Mr. McKinley represents the principle of protection. But the principle of sound money, and of the maintenance of the gold standard as essential thereto, is vastly more important than any question of tariffs. Moreover, the country is coming to recognize this fact, and Republicans everywhere outside the silver States are growing more insistent upon a clear statement of the party's attitude. Both the New Jersey and Kentucky conventions on Thursday declared for the gold standard. Even in North Dakota the silver craze has subsided, and the Republican convention on April 15 adopted a resolution squarely opposing free coinage "until it can be arranged by international agreement." Public opinion seems now in the

mood in which a determined effort by the business men in the Republican party can avert the threatened danger of the nomination at St. Louis of a man whose character and record on the financial question would, in case of his election, throw doubt upon the maintenance of the gold standard.

If the country wants a President who doesn't know his own mind about the currency, and is only sure that, if he were given a chance to carry out his ideas, he shouldn't know how on earth to do it, Morrison of Illinois is just the man. His open bid for the Democratic nomination is frankly made on a platform of cheerful idiocy. There are a great many puzzling things about this currency business, he sagely remarks. If we go to the silver basis, we shall only have less money of a worse kind, but if we stay by gold, we can easily see that "the property of the financially weak will pass to the strong." For his part, Morrison would like to take a middle path—that is, take to the woods; but "if you are going to ask me how this is to be done, I say frankly I do not see the way."

The Democrats of Missouri held on April 15 their State convention for the choice of delegates to the national convention at Chicago next July. The interest of the gathering centred in its position regarding the silver issue. The result was an overwhelming victory for the advocates of free coinage. They not only put their plank in the platform, but they carried, by a vote of 530 to 5, a resolution instructing their delegates to the national convention to refuse to vote for any person for temporary chairman of that convention who is not a pronounced advocate of the free coinage of silver at 16 to 1, and then, to cap the climax, by a rising vote they put in nomination as their candidate for the Presidency at Chicago next July "Silver Dick" Bland. The sound-money men in the Democratic party should take warning from this action of the Missouri convention. It shows that they must immediately organize their forces and fight for the control of every State convention, or they will find, when they reach Chicago next July, that the majority of the delegates have been elected upon platforms declaring for free coinage. Four conventions have now been held, all of them in States beyond the Mississippi. The success of the silverites in Oregon, Washington, and Colorado was not surprising and is not discouraging. But this cannot be said of the free-coinage vote in the Missouri convention, and the presentation of the wildest silver lunatic in the Union as that State's "favorite son." The friends of sound money were not prepared for so great a defeat.

Secretary Carlisle's address before the Chicago workingmen on April 15 is a good specimen of the kind of argument that should be heard in every part of the country, if we are ever to get a sound currency. With his customary clearness and pungency he illustrated the old truth that the laborer is the first man to be hurt by a depreciated currency and the last man to adjust himself to it. Especially skilful was his turning the flank of the latest silver onset—the Oriental bogey. We cannot long compete with China and Japan, say the silverites, unless we go to the silver basis. They are underselling us now, and will do so more extensively every year unless we get off this terrible gold standard. Workingmen ought to understand that they will soon be out of a job if something is not speedily done for silver. Mr. Carlisle's answer is crushing. Speaking solely from the standpoint of the laboring man, he affirms truly that this is but a thinly disguised proposition to reduce wages one-half. In other words, in order to compete with Japan, the Philadelphia bimetallists say we must pay only Japanese wages. Of course they do not say this openly; they talk learnedly of an international par of exchange and a broader standard of value; but what their proposals really mean is payment of wages in currency depreciated one-half. If it is necessary to reduce wages one-half, the reduction might better be endured on the gold standard. Then a man would at least know what he had got, what his wages would buy; but his silver pay would fluctuate from day to day. This argument knocks all the remaining stuffing out of the Oriental bogey.

Mr. Edward H. Van Ingen has continued his pursuit of the newspapers which published his name in connection with the familiar Cobden Club lie in the campaign of 1892 until he has brought all the chief offenders to the point of retraction. It will be remembered that on the evening before and the morning of the last Presidential election, the Republican press of this country published, under flaring headlines, a statement that Mr. Van Ingen, as an American merchant, had brought home a corruption fund of half a million dollars from the Cobden Club to be used in buying votes for Cleveland. Mr. Van Ingen brought suit against Dalsiel's news agency in London for sending the story, and it was compromised by the payment by Dalsiel of 200 guineas and costs, amounting to \$4,800. He also sued the *Mail and Express* and the *Recorder* of this city, and obtained a verdict against the former of \$4,000 and costs and one against the latter of \$1,000 and costs. The *Press* also printed the story. It now publishes the confession of Dalsiel that "no such fund ever existed, and the re-

port was entirely unfounded," and adds that, "as this completely exonerates Mr. Van Ingen, it only remains for us to express our regret at having published such false and unfounded charges." The *Press* further pays \$3,000 and costs rather than have the case go to trial. We may now reasonably hope to escape the Cobden Club lie in all its forms this year.

The poor Hawaiians must rub their eyes as they read one Republican platform after another and find not a word about their rights, their heroism, their chastity, their coming annexation. In Massachusetts there was a mild affirmation that we should retain "our influence" in Hawaii, yet not a whisper about annexation. But Maine is absolutely dumb about the glorious little republic, soon to be a State in the American Union. This is a very Brutus-blow, as Maine was the most fervent and furious champion of annexation only two short years ago. If the State of Stephens and Blaine and Hale and Boutelle has forsaken the Hawaiians, who will take them up? There is evidence, moreover, that the blow was deliberate and long preparing. The *Hawaiian Gazette* of March 31 published an extract from "a private letter" from Senator Hale, in which he told his anxious and puzzled correspondent that "annexation must wait for a while." But are not three years "a while"? And if annexation is to be left out of this year's State and national platforms, when will it get in, and where? The Hawaiians are slowly learning the sad truth that the Republicans never really cared a pin's worth for them. They temporarily were a fine theme for patriots to roar about, but have been lost sight of altogether in view of the much bigger game that has since been started.

The Senate took happy advantage of Senator Morgan's absence on Wednesday week to ratify the treaty between Great Britain and the United States providing for a commission to determine the damages we must pay for illegal seizures in the Bering Sea. Morgan had intimated a desire to oppose or seriously amend the treaty, and to submit a few more remarks of his cheerful kind extending over a week or two. But a not very mysterious dispensation of Providence has confined him to his house with illness, and the Senate unanimously jumped at the chance to ratify the treaty. This will save our reputation for fair dealing in the matter. As a matter of economy, it would doubtless have been money in our pocket if the last Congress had voted the \$425,000 agreed upon by Secretary Gresham and Sir Julian Pauncefote. Damages and expenses under the commission plan are likely to amount to twice that sum; but we have had a good deal of fun blustering and making faces, which is surely worth the difference.

Why does not some one, at some of the colleges, lecture and publish concerning the disappearance of the old form of popular government in the State of New York? We are not indulging in the language of exaggeration or of political invective when we say that very little remains of the old Constitution as redrafted in 1846, and amended in 1864, 1869, 1874, and 1894. In the first place, both the Governor and Legislature, as provided for by that instrument, have practically disappeared as bodies responsible to the people. Neither of them pays undivided attention, and the Legislature pays none whatever, to public opinion as usually expressed in civilized states through their intelligent classes. What they will do touching any measure is not to be ascertained by intercourse with them, and is rarely known to themselves beforehand. The practice of debating, too, for which both houses are organized, and which is presumed as part of their business, has virtually ceased, or is reduced to personal altercation. The intention of the framers of the Constitution, evidently, was that the objection of the mayor of a city to any legislation affecting it should be weighed before its second passage, but that provision has been wholly disregarded. The mayor's veto now simply means a delay of one fortnight, and his opinions on city legislation have no sort of consequence. The Constitution also provided that State offices should be distributed through competitive examination, but it had no sooner been adopted by popular vote than the leading State officers laid their heads together and devised a plan for filling the offices without competitive examination. The Comptroller, too, is a State officer elected for two years, whose duty it is to see that nobody receives money from the State who is not legally entitled to it. The Legislature, now acting under instructions, talks of taking this power from him by enactment, and giving the State money to anybody it pleases. Various other changes have taken place, the most important of which is the lodging in the hands of one man not in office, and therefore not responsible to the people, the whole patronage of the State, and the control of all State legislation, which is in itself a virtual change in the nature of the government. As far as our knowledge goes, these changes are all ignored in the colleges and law schools of the country, as well as in the text-books. The professors and writers keep on talking as if they had not occurred, and as if New York were still governed mainly in the same manner as in 1846.

The Greater New York bill was "jammed through" the Senate on April 15, but with a loss of Republican support, which shows what the measure is costing the party. When it first passed the Senate, only four Republicans voted against it. Finally, this number was increased to eleven, leaving the measure three votes

short of the necessary majority. It was saved from defeat by the solid support of the Tammany Senators, who, under Cantor's lead, joined hands with the Platt machine, thus giving indubitable evidence of the Platt-Tammany combine which is behind the bill, and which hopes to make it the first step toward capturing the governments of New York and Brooklyn for an indefinite period by means of bi-partisan Platt-Tammany commissions. It is not surprising that eleven Republican Senators should shrink from the responsibility of placing a burden like this upon their party. At this writing it is very uncertain what the fate of the bill will be in the Assembly. No less than thirty-six Republicans refused to vote for it on its first passage, and if the percentage of increase be as large in that body as it was in the Senate, the bill will fail, even though Tammany gives it solid support.

We doubt if anything quite equal to the proceedings at Tom Platt's rooms in the Fifth Avenue Hotel on Sunday ever occurred in this country. The government of the State was really in operation there. "The callers," says a friendly chronicler, "went in pairs and in threes, and at one time nearly every leading member of the Legislature was in Platt's rooms." The purpose of the convocation was to consider the Greater New York bill. The boss had returned from Florida with the determination of "jamming through" the bill, which was in danger of failing in the Assembly. Congressman Odell, a Republican candidate for the governorship, had been at Albany last week opposing the bill. He called on Platt, and, when his interview was over, declared that his opposition had been merely personal, that he "had always had the highest regard for Mr. Platt," and let it be known that he should not oppose the bill further. Mr. Odell had been through the process known as being "hauled off." He will be a docile Platt dummy now, and, if he makes no more "breaks," the boss may let him run for the governorship. Before Mr. Odell was disposed of, the "leading members" of the Legislature held an executive session of two hours' duration with the boss, and, when that was over, the boss announced: "The Greater New York bill will be passed and Gov. Morton will sign it. It will be passed when we determine to pass it, this week or next week, but it will be passed. Of that there is not the slightest doubt." All the deputy bosses echoed the great man's words, and went about the corridors of the hotel assuring everybody that the bill was "sure to pass." Fish felt so sure of it that he said no caucus would be held. In fact, the caucus had been held, and the legislating for the week to come had all been done in advance.

Our Jingoos must not suppose that war as a national tonic can be reserved until

sively for their own use. The people they want to fight may insist upon sharing the inspiring draught. Here, for example, is a Spanish writer hinting that all that Spain needs to arouse her from her prostrate condition, and to give her a place again among the great nations of the world, is a jolly good war with the United States. This sentiment is expressed in a pamphlet published recently in Madrid, 'The United States against Spain. By an Optimist.' The optimist is supposed to be Valera. Anyhow, he is some one who knows the United States. He is perfectly aware that the fierce and ignorant outcries against Spain have not come from the American people; they are traceable to reckless politicians and a still more reckless press. Hence, he argues, let the Spanish people be patient, considering the ignoble source of the insults, and expect the good sense and love of justice of the United States to make themselves felt in the end. But if war must come, he concludes, let us think of it as a "salutary crisis," as something that will sink all our differences, make our politics pure and noble, and leave us fronting the world, "all Spaniards." Valera has a fine turn for sarcasm, and he seems here to be making excellent fun of our youthful regenerators by war.

The news from Africa is disquieting. The continuance of the alarm, and the dispatch of fresh troops to Africa, show that a rose-colored view of affairs there is not tenable. Mr. Chamberlain has given notice to President Krüger of the dispatch of the troops, with an explanatory note, which is evidently necessary in order to avoid arousing the old man's suspicions. He does not come to London, and is said to be holding off in order to secure eventually the abrogation of that article of the convention which makes the approval of Great Britain necessary to the validity of any treaty between the Transvaal and any foreign Power. The Boers are said to be very restless under this, so satisfied are they of their power to face Great Britain single-handed. The Transvaal, it is said, has formed an alliance with the other Dutch state, the Orange Free State, and between the two they profess to be able to put 40,000 men in the field, which in a country like Africa is a formidable force, and could be subdued only after a long and bloody conflict, which would, however it ended, leave behind endless hates between the two races, and make the work of government increasingly difficult. It is not believed that war would elevate the character of the Boers and Englishmen. It is noticeable that the tide of Mr. Chamberlain's popularity has begun to slacken a little. The Jameson outbreak was a godsend to him, as his skilful management of it postponed a little longer his grand plan of a Zollverein with the colonies. Should the African trouble be well settled, he must take up this scheme, of which the *Economist* speaks with open

contempt, for in one breath he says the policy of free trade can never be abandoned by England, and in the next he proposes to abandon it for the benefit of the colonies.

The new land bill of Lord Salisbury's Government, remitting half the rates on the land and causing a deficit of \$7,500,000 in the revenue, is likely to excite a storm of opposition. It is the first attempt to help the land by legislation since the repeal of the corn laws. It is now proved beyond question that the farmers were, down to 1846, completely humbugged on the question of the duties on corn, and that the high price of wheat in England from the close of the war in 1815 until the abolition of the duties, went not into the pockets of the farmers, but into the increase of rent, for the benefit of the landlords. The fight made for protection by the landed interest was, therefore, really a fight for higher rents. The landlords were, however, altogether disappointed as to the effect of the repeal of the corn laws on rent. Rents were never so high as between 1846 and 1876. The land profited prodigiously by the great stimulus to industry given by free trade, and it may be said that down to 1873 the lot of the English squire was one of the happiest on earth. Luxurious living in this class greatly increased. Land was a favorite investment, and marriage settlements were made on a very high scale. The great improvements in transportation made about that time brought the ends of the earth into competition with England. A fall in rents at once ensued, and in twenty years had ruined a large part of the landlords, lowered the price of land about one-half, and effected a radical change in English society. Things have, during the last five years, been going from bad to worse, and the present bill may really be called a measure of relief. It is likely to lead to revolt even in all the Tory boroughs. A large part of the county expenses, which are now taken from the poor-rates raised by the county authorities, are to be paid by the imperial treasury—that is, by other interests. Sir William Harcourt predicted that the time would come when the whole poor-rate would be paid in the same fashion if the Tories had their way.

With regard to the Irish land bill now before the House of Commons, it is to be observed that Irish land legislation began with the encumbered-estates act nearly fifty years ago, when the Irish farmers were not represented. It was then believed, as it is still believed, that English and Scotch members of the House knew better what was good for the Irish than the Irish themselves. Within twenty years it was acknowledged that this bill had not worked well, and that the Legislature had committed a

radical mistake in overlooking the fact that, as a rule, all improvements on Irish farms were made by the farmers themselves, and that, therefore, the sale of these improvements under the act as the property of the landlord was a gross wrong and injustice. A Parliamentary title—that is, a title against all the world—was, however, given with each sale. In 1870 this title was disregarded and a new Irish land act was passed, in which the interest of the farmer in the estate thus purchased under a Parliamentary title was disregarded. This is now twenty-five years ago, and it is a solemn and suggestive truth that every Parliament since then, both Whig and Tory, has been occupied mainly with the Irish land question, each party in turn being either promoters or opposers of legislation thereanent. The Tories have brought in bills nearly as often as the Liberals, and the former have adopted and are acting on doctrines which they have pronounced immoral and detestable. Each bill, too, has, as a rule, been brought in by an Englishman who has not been in Ireland at all, or has been there only once, and he denounces its opponents on each occasion as public thieves. There is hardly a doubt that no Irish Parliament, however composed, would in 1850 have gone as far as the House of Commons will in 1896, if it passes Mr. Gerald Balfour's bill.

Recent events in Bulgaria and in Turkey have not, perhaps, received, either in America or in Europe, the attention which they deserve. Our ears have been filled with booms and the noise of Congress. In Europe the affairs of the Transvaal and the English advance toward the Sudan have been uppermost in the newspapers and in the minds of the public. Yet, during this time, the dynasty of Ferdinand of Bulgaria seems to have settled down, or almost to have settled down, upon a solid base. The "conversion" of Prince Boris—a religious incident inadequately described by the word *bouffe*—brought in its train, first, recognition of Ferdinand by Russia and afterward by the Powers, and then his very significant visit to his suzerain, the Sultan. The etiquette of this visit was arranged beforehand in long negotiations. He was given the rank of a sovereign prince. He took precedence even of the Grand Vizier. An imperial palace was allotted to him, and he received the title of Imperial Highness, as if he were a prince of the blood. The Sultan, in fact, lavished on him the most distinguished honors in his gift. He was received like the Prodigal Son. And all this, apparently, because Ferdinand has made peace with Russia, and because he is the one man who might have made Bulgaria a nation has been murdered. What the ultimate future of Bulgaria may be, no man can now say; but it is apparent that on her immediate future a seal has been set during these last few weeks.

ENGLAND ON HER KNEES.

WE hope our more eminent bimetalists, and especially President Andrews of Brown University, will read carefully the statement of the Chancellor of the Exchequer in Parliament on Thursday last. He will there see, as we pointed out to him at the time, how foolish was his talk of "bringing England to her knees" through his own little scheme over two years ago. He will see, too, how foolish was the talk of a good many of his congeners throughout the land who maintained that monometallism was bringing England to her ruin; that if she maintained her reliance on gold, collapse of her financial system was certain. Happily, all through this difficult period her finances have remained in the hands of business men who understood currency and exchange. There never has been any more chance of her changing her standard than of her adopting the Julian calendar. Nothing in the whole discussion has been so droll, and yet so melancholy to those who understood the English mind and polity, as the belief that she would change her standard because Mr. Balfour and some of the professors were bimetalists, because Moreton Frewen said America was unanimous for bimetalism, and because Senator Lodge thought her unkind to silver. All these antics on our side of the water have simply made Englishmen smile.

The Chancellor of the Exchequer says the Treasury was never so full. Consols were never higher, though the interest has been reduced one-half within a century. The deposits in savings banks have never been so great; the deposits in other banks were never so large. The production of gold has never been so great. The bullion reserve in the Bank of England was never so large. The revenue receipts have exceeded the expenditures. "Everything has an upward tendency." The exports, imports, railway earnings, and clearing-house returns all show a great expansion of business. The revenue from wines, spirits, and tobacco and tea has increased. Every class of the community is flourishing except the agriculturists, who, there as here, have now to compete with better soils and climates in all parts of the earth.

This ought to be astonishing reading for an American. We have nearly double the population of Great Britain. We have an immensely greater area of soil; we have far richer resources in coal and iron and other metals. We have a government which we maintain is much better, or at all events dearer to the people who live under it, than the government of Great Britain. We have no army; we have next to no navy. We have no colonies or dependencies. We have little public debt. Yet we are not happy. Walls over the badness of business meet one's eye in every newspaper. We have to borrow money every quarter to keep our paper at par. The success of the loan is received

with shouts of triumph, though, while it is being raised, every business man holds his breath. At this moment nearly every man of instruction and ability in the country is working, with great anxiety, to prevent the election of a President and Congress who shall declare fifty cents to be worth a dollar, and abolish the gold standard. The receipts fall below the expenditures. Debts contracted in the war, thirty years ago, remain unpaid. The principal commercial city in the Union is governed by a system of blackmail, carried on by a parcel of ignorant and penniless adventurers from various parts of the Union, who do not conceal their contempt for the population which submits to them.

Now what causes this difference? Nothing material. Our population and resources are, as we have shown, far greater than those of England. Our government, on paper, is as good or better. The difference arises out of the fact that common sense still presides over English affairs. Were our Congress and legislatures to take charge of England to-morrow, by the 1st of December the Treasury would be empty, the Queen would have taken refuge in Berlin, India would have risen in revolt, specie payments would have been suspended, and a bloody war would have commenced with the principal Powers of Europe. All this has been prevented, and public affairs go as smoothly in England as private affairs do in this country, simply by maintaining the supremacy of common sense, which is supplied in this country, unhappily in too small quantities, only by the Constitution. They are not desperately wrong who maintain that we should be better off to-day if governed exclusively by constitutional conventions, meeting only once in ten years.

In England, currency and finance are left by general consent to experts, to men who have given attention to such subjects, or are engaged in the management of currency. A few metaphysicians, or professors, or cranks may proclaim the near approach of ruin if some scheme of theirs be not adopted, but few mind them. They make their little speeches, print their little pamphlets, but the great world of business goes on its way. There are no "gold-bugs" in England. The poorest man is as much interested as Lord Rothschild in having the gold sovereign's quality as a measure of value preserved intact. The idea of submitting currency to a vote at a general election enters no one's head. When the Chancellor of the Exchequer says he will not have a thing, that ends the matter. The ablest men in all branches are still, as a rule, put at the head of affairs for the general good. In London, instead of a commission giving each other the lie for political reasons, the police is governed in silence, order, and admirable discipline by a one-armed Indian officer, whom no one ever dreams of interfering with. This means simply the reign of

common sense. It means the application to public affairs of the individual prudence and foresight which make our private affairs a success. It is as much within our reach as the reach of Englishmen. The use of it during the last thirty years would have given us by this time sound finance, light taxation, and a roaring trade. The Mikes, Jakes, and Barneyes, instead of ruling us, would be in the almshouse or the jail. The American dollar would be as famous the world over as the English pound.

The fun of it is that we can have this state of things any day we please, and there is evidence on all sides that the great prosperity of England, as set forth in the Chancellor's budget speech, is having a profound effect on what we may call without disrespect second-rate business men in this country. First-rate business men have long been aware of the good trade in England for the last year; but merchants and bankers whose interests and whose views are local and narrow, have known nothing of this. Now they have had the facts thrust upon them in this forcible way, and are set profitably wondering about the causes. England has so long been a sort of hobgoblin in this country, an example mainly of the things to avoid, that it is hard to confess that she is showing us how to do it. But if she is really showing us, and if the good times which she is enjoying do not, for some reason or other, take their way to us as they so often have done in the past, the determination to find out what that reason is and remove it, cannot but strengthen among sensible men. Bismarck said that he wanted the French republic to continue, instead of a monarchical restoration, inasmuch as the republic was a very "salutary hobgoblin" for Germans to gaze upon. The great English surplus and quickened trade and commerce constitute just now a most salutary hobgoblin for Americans.

THE ROAD TO VICTORY.

THE first essential to the restoration of prosperity in the United States is assurance of the stability of the currency. Such assurance has not existed for years. The lack of it was the chief cause of the panic of 1893, and continues the main reason for the prolongation of the business depression. What threatens the stability of the currency is the demand of a large fraction of the voters for the free coinage of silver at the ratio of 16 to 1, which would involve the substitution of the silver standard for the gold one; and the readiness of prominent politicians in each party, including the leading Republican candidate for the Presidency, to compromise with this dishonest demand by favoring a "bimetalism" that is necessarily incompatible with the maintenance of the gold standard. The election as President of a man whose record makes such a platform the only one on which he could consistently stand, would mean the

years of constant apprehension as to the safety of our financial system.

The one sure way of averting this peril is the election of a man who can be trusted, upon a platform which pledges his party against free coinage and for the maintenance of the gold standard. Such a result would establish the credit of the nation beyond question, and this would of itself induce a period of great prosperity. Secretary Smith of the Interior Department has expressed the opinion that "the nomination and election by either party of a sound-money man, on a platform declaring briefly and clearly that the dollar of this country should consist of 25.8 grains of gold, and that no legislation should be undertaken to depreciate this dollar, would increase business values in the United States 25 per cent. at once." We believe that this is an underestimate of the good that would be accomplished.

During the summer of 1868, gold ranged at a premium of between 40 and 50. There was an active agitation for the payment of Government bonds in the depreciated greenback currency. Butler in the Republican party and Pendleton in the Democratic advocated the adoption of the policy. Pendleton carried his party with him, and secured the adoption of a platform by the Democratic national convention which declared that "where the obligations of the Government do not expressly state upon their face, or the law under which they were issued does not provide, that they shall be paid in coin, they ought, in right and in justice, to be paid in the lawful money of the United States"—meaning greenbacks, instead of gold, the only coin then current; demanded taxation of Government bonds; and raised the clap-trap cry of, "One currency for the Government and the people, the laborer and the office-holder, the pensioner and the soldier, the producer and the bondholder."

The Republicans snubbed Butler, and nominated Grant upon a platform which contained this clear and explicit declaration in favor of paying the bonds in gold:

"We denounce all forms of repudiation as a national crime; and the national honor requires the payment of the public indebtedness in the uttermost good faith to all creditors at home and abroad, not only according to the letter, but the spirit, of the laws under which it was contracted."

Although Seymour, whom the Democrats nominated, did not believe in the greenback policy, he "stood upon the platform," and declared, in accepting the nomination, that "the resolutions are in accord with my views." The issue therefore entered into the canvass, and resulted in a strong movement by business men to defeat the Democrats on this ground. Only New York and New Jersey of all the Northern States were returned for Seymour, and his majority in the latter was small, while the count of New York for him has always been considered fraudulent by many.

The first act passed by Congress a fort-

night after Grant's inauguration in March, 1869, was "An Act to strengthen the public credit of the United States," which redeemed the pledge of the Republican platform by declaring that "the faith of the United States is solemnly pledged to the payment in coin or its equivalent of all the obligations of the United States not bearing interest, known as United States notes, and of all the interest-bearing obligations of the United States, except in cases where the law authorizing the issue of any such obligation has expressly provided that the same may be paid in lawful money or other currency than gold and silver"; and that "the United States also solemnly pledges its faith to make provision at the earliest practicable period for the redemption of the United States notes in coin."

The consequences of this victory for sound money were immediate and lasting. The premium on gold, which had ranged between 40 and 50 during the summer before the Presidential election, fell to an average of below 35 in the month after that election occurred, and was down to 13 within a year after Grant's inauguration; while specie payments were resumed only ten years later. The Republican party (no less than the country) found that honesty was the best policy in a series of great victories, while the Democratic party has not to this day fully recovered from the discredit brought upon it by its tenderness towards repudiation nearly thirty years ago.

The Republicans can make history repeat itself this year. Bland, as a later Pendleton, will go to the national Democratic convention as the advocate of free silver coinage, and will have a large portion of his party with him in this later movement for repudiation. The masses of the Republican party are sound on this issue. They are sick of "straddles" and "dodges." They are tired of the deceptive talk about "bimetallism." They are ready to welcome as clear and emphatic a declaration for national honesty as was adopted by their party in 1868. Upon such a declaration, and with a candidate who can be trusted upon this issue as implicitly as Grant showed that he could be trusted, the Republicans can sweep the country.

THE FUTURE OF THE CITY.

We do not need to wait for the passage or failure of the Consolidation bill to learn from it the objects of its promoters. The refusal to debate it on its merits, the aid extended to it by the Tammany members of the Legislature, the revelations of Lauterbach, and, though last, not least, the disregard of the vetoes of the two Mayors, all go to show that the improvement of the city government has nothing to do with the scheme. Its originators do not, in fact, deny that it is a plan for the creation of a large number of offices to be divided

amicably between the two machines, Croker's and Platt's. Consequently, the observations of the Mayors and of President Low and others on the advantages of consolidation in the abstract were thrown away. Consolidation as a means of improvement of anything whatever is not in the minds of the projectors. Even the "public improvements" which some of them talk of would be simply contracts to be divided between the parties, as the contract for the new aqueduct was.

The last two Legislatures have been, in fact, the most barefaced we have ever had—worse much than Croker's, for Croker's was known to be composed in the main of malefactors, and we flattered ourselves that a change of parties would have given us relief. What has happened since 1884 has shown us that we were mistaken; that in this State at least, the old idea that the Republican party was that of intelligence and reform must be given up, and that we are face to face with a crisis in which neither of the old parties can be called on for redress. Our experience since 1884 shows us that the old device of punishing one party by turning it out and putting the other in power, is no longer available. Should we attempt to apply it next fall, as many undoubtedly will, we shall probably find that Platt and his followers have made such arrangements with Tammany that defeat will not trouble them in the least, and, whichever comes into power, the Republicans will get their share of the spoil. There is every sign now that Platt is very indifferent as to the effect of his measures on the voters, and that his secret support will be given in 1896, and in 1897 too, to the Tammany candidate. The part he is making Mr. Morton play in this programme is its most melancholy feature. There is not the smallest reason for believing that Platt cares in the least who is President if the division of offices in the State is satisfactory to him.

These things are all to be considered by those who are in 1897 to make one more effort to deliver the city. It is becoming clearer every day that, if the thing be done, it must be done by a municipal ticket, that no help is to be expected from the politicians of either party, and that if it fails badly it will probably not be repeated in our time. The "Presidential year" is being successfully used by Platt to strengthen his own power, as the failure of the "Better Element" movement shows. Still, the separate election in 1897 will demonstrate how much there is in the city of real patriotism. But it is not a minute too soon to begin to think about it.

No one who thinks about it can avoid the conclusion that the use made by both parties of the cities of the State for their various "dickers," and the successful employment of men of low character as political leaders, are the result of great ignorance of city affairs on the part of the country constituencies. If one believed that the majority of the

voters really willed such assemblages as the present Legislature, and really willed with knowledge such measures as the Consolidation bill, one would have to give up completely all faith in democratic government. One would have to admit that the disappearance, even of its forms, was merely a matter of time. One goes on writing and speaking in the belief that people desire good government under republican forms, and that, with more reading and listening, they will finally determine to have it. But the misfortune of the present situation is that the city makes no impression on the country. As a rule, either the city press does not discuss things seriously, or its good faith is suspected. The news and comments of the great picture papers simply amuse people, and the real object of some of the others does not command respect. The country papers are as ignorant about city affairs as newspapers can well be, and the worldly success of the editors depends wholly on their devotion to the party. To quarrel with the Boss means for a country editor the loss of circulation, of advertisements, and of the small patronage through which the Boss keeps the country in good humor.

The situation is not unlike that which prevailed before the war with regard to the slavery question. That fight was largely won by the lecturers, and one of the greatest misfortunes of our time is their disappearance from the scene. We have, it is true, plenty of lecturers still, but they do not touch on questions of the day. They amuse and they gratify curiosity; but they do not attempt to influence opinion. The local paper has it all its own way. The lecturer in the old days, on the other hand, let light from the outer world into a great many places that would have remained dark; and he commanded a hearing not less by his eloquence as a speaker and a writer than by his superior knowledge. If we had people like Chapin, and Curtis, and Phillips, and Emerson, and Beecher going through the country clearing the popular mind on the subject of municipal government, international law, and currency, we should undoubtedly escape, sooner or later, such extraordinary phenomena as the result of our reform movement in this city, as the Jingo excitement after Cleveland's message, and as the nomination of a man like McKinley when the country is threatened with a monetary crisis. We mention these things because it would not be difficult to show that they are the product of pure ignorance. That the Northern mind was not easily aroused by slavery is shown by the fact that for fifty years it held its own in the Northern church and in Northern opinion, its pretensions increasing every year in extravagance, and its contempt for public opinion growing more conspicuous. Men like Platt were, in every State, all on its side. They were beaten by stronger forces than the country paper, and, in our opinion, something should be done to re-

vive the agencies which forty years ago gave righteousness its victory.

ACTION AND INACTION IN EUROPE.

PARIS, April 9, 1896.

I REGULARLY read, always with much interest and pleasure, often with much admiration, what appears under the name of Leo Tolstoi, the famous author of 'War and Peace' and 'Anna Karénina.' In the third number, which appeared in March, of a new review, *Cosmopolis*, which calls itself international, as it has three parts, written one in English, one in French, and one in German, there is a curious article by Tolstoi, entitled "Zola et Dumas: le Non agir." It is written in answer to a speech delivered by Zola at the banquet of the General Association of Students, as well as to a letter written shortly before his death by Dumas to a French paper. Tolstoi treats these two documents as representative of the two fundamental forces which act on humanity—the force of routine, which keeps it on the road that it follows; the force of reason and of love, which inclines it towards a higher ideal.

It is rather amusing to find Zola treated as the representative of routine; and why? Because, in his speech to the students, he recommended them to work, and told them that work would make their life happy and cheerful and deliver them from "the torment of the infinite." Tolstoi takes the opposite view; he sees no peculiar virtue in work, and aims to prove that much of what goes under the name of work is bad and detrimental to humanity. His criticism of work is paradoxical, but very clever; to sum it up, he considers work, in our badly organized society, "as a sort of agent of moral anaesthesia, like tobacco, wine, and all our other means of stultifying ourselves so as to cover the disorder and emptiness of our existence." The "non-agir" which Tolstoi places in opposition to the "agir" recommended by Zola and generally by all moralists, economists, and even by poets, as in the beautiful line of Longfellow,

"Act, act in the living present,"

is an approach to the Buddhist nirvana. Tolstoi, however, does not go so far as to consider the cessation of thought and of conscience as the supreme object which we ought to try to attain; he begs us to think, to look round, and to consider love and charity as the most important affairs of our human existence. "Seek ye first the kingdom of God, and his righteousness, and all these things shall be added unto you."

My mind could not help, while I was reading this Tolstoian theory of "Work not," establishing a relation between it and the present policy of the Russian Government, which might be summed up in two words, "Act not." Russia's diplomacy has been left entirely of late in the hands of Prince Lobanoff, who has an intimate acquaintance with all the courts of Europe, as he has been ambassador in nearly all its capitals; he has become, if not nominally, in reality, a chancellor, a permanent Minister of Foreign Affairs. The late Czar was his own chancellor, but Nicholas II. is very young, and he has shown no desire so far to assume all the responsibilities of diplomacy himself. The policy of Prince Lobanoff has been what Sir James Mackintosh called "a masterly inactivity." Nobody knew better how little Russia had gained by the policy of action which culminated in the Turkish war and ended in the Congress of Berlin. Russia has now

entirely changed her manner. She thinks no longer of making war on the "Sick Man"; she allows him time to die.

This policy of inaction has its source not only in the lessons given by the late Turkish war, but also in the events which took place after the war in Bulgaria. Russia had placed a nominee of her own in Sophia; she had organized and officered the Bulgarian army, and had thought her influence for ever paramount in the principality. But she subsequently lost her influence, at least in appearance. After the downfall of Prince Alexander of Battenberg, she saw with much displeasure the Government of Bulgaria fall into the hands of Prince Ferdinand of Coburg (whom she had every reason to consider a favorite of Austria) and of Stambuloff, who was the boldest adversary of Russian influence in the principality. She adopted towards Bulgaria an attitude of "non-activity"; she simply refused to recognize Prince Ferdinand, and she thus hindered his recognition by all the great Powers. For years, Prince Ferdinand tried in vain to conquer the sullen and silent resistance of the late Tsar; he never succeeded, and in the end he had to abandon the anti-Russian party, and, after the death of Stambuloff, he called to power the men who represented the moderate Russian party. It was not enough; we have since seen him making concession after concession to Russia. Young Prince Boris was converted to the orthodox church, and we hear now that a military convention has been proposed, if it is not already signed, between Russia and Bulgaria. This convention practically places Bulgaria, in time of war, in the hands of Russia, as, by its terms, Russian troops may land at Varna and occupy the principality. In this manner, the crossing of the Danube, always a most difficult occupation in front of an enemy, is avoided; what becomes, then, of the defences prepared with so much care and at so much expense by Rumania, which is a sort of vanguard of Austria in the East? It is plain that, by throwing himself into the arms of Russia, Prince Ferdinand has allowed Russia to extend, without a struggle, her sphere of influence in the direction of Constantinople and in the Balkan peninsula. Prince Ferdinand has found it easy to abandon the interests of Austria, which has helped powerfully to maintain him in Sophia during the last few years; he will not find it as easy to separate from Russia, if he ever chooses to do so. A natural attraction is exercised by the Russian orthodox church on the Bulgarian church; and so strong is it that Prince Ferdinand found himself obliged to convert his young son Boris to the national church, feeling that otherwise he would not obtain his own recognition by Russia. Edward Dicey has very well described the situation of what he calls the "peasant state," and, with his usual clearness of apprehension, he has seen that the Prince could not be recognized without making great sacrifices to Russia. These sacrifices, which Stambuloff was not willing to make, are now completed, and Bulgaria may be considered as a mere vassal state.

These results have been obtained by Russia's waiting game. The same policy of inaction, of inertia, has given her for the present a paramount influence in Constantinople. It is certainly worthy of remark that, of all the great Powers, Russia, which once professed and which still professes to be the protector of the Christians of the East, has been the least moved by the Armenian massacres. The famous "Bulgarian atrocities," the disorders in the Lebanon which

caused, under the Second Empire, an armed expedition to Syria, were nothing compared to the appalling horrors of which Asia Minor has been the scene during the last two years. Wholesale massacres of men, women, and children have taken place under the indifferent eyes of the civilized world; and when some sort of intervention by the great Powers was meditated, the chief obstacle came from Russia. France, disarmed and neutralized by the Russian alliance, could not repeat what she had once done in Syria; Russia's veto saved the Turkish Empire from an intervention which at one moment seemed imminent. By mere *vis inertia*, Russia became the dominant Power at Constantinople; her advice has become irresistible; her ambassador is omnipotent.

Russia has derived great benefits from her alliance with France, or compact—it is difficult to find a suitable word for an attraction which seemed instinctive on both sides, and which has drawn towards each other two nations placed at two opposite ends of Europe, living under different institutions, and having absolutely different ideals. A common dread, not to say hatred, of Germany is the tie which has united them; but this sentiment has not been allowed by the governments of the two countries to take an offensive form. The alliance is, so to speak, purely defensive, like the Triple Alliance of Germany, Austria, and Italy. The vague but very strong sentiment which is felt in France for the great Power which first showed her some sympathy after the unhappy war of 1870, has proved a greater benefit to Russia than to France. It has helped Russia to put her finances in much better order; no less than six or seven milliards of French money is said to be invested in Russian funds. The Russian Treasury, with the help of France, has been allowed to borrow to an almost unlimited extent, and to make conversions which produce a great economy.

The alliance, however, has not yet been tried on purely political questions—that is to say, on questions of great importance. It is understood that on all minor questions, in every capital, the French and the Russian ministers hold a similar attitude. The first question of great importance as to which the interests of France and of Russia are perhaps not quite similar, has been the recent question of the Anglo-Egyptian expedition to the Upper Nile. This expedition, though it had been preparing for a long time, took Europe by surprise. In Paris the Minister of Foreign Affairs, in his first excitement, sent a semi-official note to the newspapers which was conceived in an almost ominous tone. The French public is really very indifferent to what is going on in the valley of the Nile; it is felt that we have no right to speak loud at Cairo since, at the time of Arabi's revolt, we refused to join the English expedition which put an end to that rising. Our fleet was before Alexandria, with the English fleet, but, at the last moment, much to the surprise of our sailors, it was ordered back to Toulon. We gave at that moment *carte blanche* to England; but our Foreign Office has kept on its old way of interfering in Eastern affairs, and from time to time thinks it necessary to remind England that its occupation of Egypt is and must be only temporary. England invariably answers that it knows its obligations, but remains the judge of the time when the evacuation can be made without endangering the interests and the peace of Egypt.

When the expedition to Dongola was announced, France made objections to the use of

the reserve fund, which is under the control of a European commission. Germany, Italy, and Austria gave their consent; Russia could not well separate from France, but it is said that Prince Lobanoff made some remarks on the initiative which France had taken with too much haste, and without first entering into communication with Russia. Russia does not interfere in the interior affairs of France, and treats in the same manner the administrations which succeed each other, sometimes with great rapidity; but when it comes to external affairs which concern all the great Powers, Russia demands that the action to be taken by her in common with France shall be the object of previous negotiation and deliberation. If Russia had been consulted in time in this affair of the Egyptian funds, France would probably have avoided the crisis in which it is now involved. The expedition to Dongola has had the singular result of intensifying the state of complete hostility between our Senate and our Chamber of Deputies. This hostility may have for its consequence a ministerial and, perhaps, what is more serious, a Presidential crisis.

THE NEW DEGREES AT OXFORD.

OXFORD, March 30, 1896.

THE University of Oxford has seldom given its assent to a statute which promised to be of greater importance and more far-reaching consequence than the one passed last year and just now going into actual operation, by which men, not necessarily holding an Oxford B.A., are admitted as candidates for the newly established degrees of bachelor of letters and bachelor of science. It is a measure, moreover, of especial interest and importance to American students, for whose benefit it was in great part intended, throwing open as it does a field of foreign graduate study which previously had been in great measure closed to them. For heretofore the only access to an Oxford degree in course has been through the candidate (of whatever university rank or standing) laying aside his pride of previous degree, taking the regular entrance examinations of the university, entering as a freshman, and working three years as an undergraduate. For the M.A. he was obliged to pay his fees and keep his name on the books for the required twenty-seven terms from matriculation—a course which few men of previous training could or would adopt. In many respects, then, this new departure is a revolution in the Oxford system, and one hears even now rumors to the effect that it is to be emulated by the still more conservative University of Paris some time in the near future. This will no doubt have a tendency to divert part of the stream of Americans to Germany into other channels—a result which, for some reasons, is by no means to be deplored.

The new degrees are established avowedly to encourage research in Oxford by men already trained and even advanced in specialization. They correspond closely to graduate degrees elsewhere, and are thrown open under conditions which not only recognize work done outside Oxford, but relieve the candidates from some restrictions of ordinary undergraduate work, residence, and examinations. The conditions under which they are established are these: A candidate for either degree must be at least twenty-one years of age, and either be a B.A. of Oxford or give satisfactory evidence of a good general education to a committee of the Board of Faculties. Having satisfied these requirements, he must present a plan of study

or a subject of research for the approval of a committee of the Board of Faculty to which his work belongs, and satisfy the committee that (1) this work may be profitably pursued in Oxford, and that (2) he is fitted to undertake the line of research proposed. A minimum of eight terms' residence is required for the degree. The Oxford year of twenty-four weeks, however, is divided for purposes of residence into four terms, in addition to which in any one year a candidate for B.L. or B.Sc. is allowed to reckon forty-two days' residence, not necessarily consecutive, during vacation as a term counting toward the residence requirement for the degree. Any one, moreover, who has kept two years' residence in the University as an undergraduate is eligible for the degree, so far as residence is concerned. After the candidate has proved his age and his general education, and his subject and his special qualifications for grappling with it have been passed upon, he is handed over to a committee of the Board of Faculty under which his work will naturally fall. This, corresponding in all essential respects to a graduate committee elsewhere, supervises and directs his investigation, aids him with advice and counsel, and finally examines him on the results of his work. For upon the completion of eight terms of work and residence the candidate must satisfy his Faculty Board, through its committee, of his fitness to receive the degree, either by such an examination in the subject of his course of special study or research, or by such a dissertation or report of work done as shall meet with the approval of the Board. Any candidate directed to submit a dissertation or report is publicly examined on the ground it covers.

All this is, in its essentials, scope, aim, and method, almost exactly equivalent to the process of obtaining a Ph.D. in an American university. It may be added here that the degrees in letters and science do not lead to the degree of M.A., and that Bachelors of Letters and Science rank immediately after Bachelors of Civil Law and Medicine in the university polity. The titles of the higher degrees in Letters and Science have not as yet been fixed upon, but it is very possible that doctors' degrees analogous to D.C.L. and D.D. will be established.

The "Faculties" under which these degrees are granted correspond more or less exactly to the "departments" of an American university. For the purposes of this statute they are eight in number, Theology, Law, Medicine, Literæ Humaniores, Natural Science (including Mathematics), Oriental Languages, Modern History, and English Language and Literature. And in order to give some idea of the ground covered and the instruction offered in each, it may be worth while to enumerate the subdivisions in some detail.

Theology, Law, and Medicine are regarded as "superior" faculties, and the two former are divided into (1) a specific superior course leading to B.D. and D.D., and B.C.L. and D.C.L., accessible only to those already holding a B.A., and (2) a "school" in which an undergraduate reads for a B.A. as he would in any other school, like modern history or natural science. Theology covers (a) the Holy Scriptures, (b) Dogmatic and Symbolic Theology, (c) Ecclesiastical History, (d) Evidences of Religion, (e) Liturgies, (f) Sacred Criticism and Archaeology, (g) Hebrew. Law comprises (a) Jurisprudence, (b) Roman Law, (c) English Law, (d) History of Legal and Political Institutions, (e) International Law. Literæ Humaniores includes (a) Greek and Latin Languages, (b) Greek and Roman History, (c) Logic, and

Moral and Political Philosophy. Medicine covers Human Anatomy, Physiology, Medicine, etc., in addition to the general subjects under Natural Science. Under Natural Science are included (a) Mathematics, (b) Physics, (c) Chemistry, (d) Animal Physiology, (e) Animal Morphology, (f) Botany, (g) Geology, (h) Astronomy. Oriental Languages comprise (a) Sanskrit, Indian History, Literature, Religious and Comparative I. E. Grammar, (b) Arabic Language, Literature, History, Epigraphy, and Theology, (c) Hebrew Language, Literature, History, and Epigraphy, (d) Persian Language, History, Philology. Modern History covers (a) History of England, Political and Constitutional, (b) a period of general European history—six in number, from 476-1815, (c) a special subject, like Italy 1492-1518, (d) Political Science and Political Economy. English Language and Literature includes (a) portions of English authors like Chaucer, etc., (b) History of the Language, including Gothic, Old and Middle English, (c) History of English Literature, (d) a "special subject" in language or literature, chiefly foreign.

This outline will convey an idea of the general lines of instruction offered here; for as the whole system leads up to the schools' examinations under their respective Boards of Faculties, it follows that the main strength and body of the instruction is directed to preparing men for these. On the other hand, of course, the diversity of choice is greater than appears at first sight. Modern history, for instance, covers Indian history, geography, and palaeography; law includes Indian law; Oriental languages, some six Indian dialects, besides Burmese, Turkish, Chinese, and the like; while natural science takes both agriculture and anthropology under its protecting wing. There is, it need not be said, a considerable body of teaching devoted to modern languages, including Russian, besides Prof. Rhys's admirable Celtic, which has not yet risen to the dignity of a school. So, while the schools system defines arbitrarily and not always felicitously the provinces of human knowledge, there is still a considerable range of selection within these limits.

Moreover, the candidate for the new degrees is fortunately little hampered by this schools system in any direction. The list given above is rather indicative of what, in the meaning of the statute, may profitably be pursued at Oxford—of what, that is, there are men here to advise him about and direct him in his work. It is not intended as a list of courses of lectures to be taken for a degree, for, under the present construction of the statute, the candidate is not supposed to go into a school on the same footing as a candidate for the B.A. The primary intention is that of highly specialized work on a subject or period *already selected*, leading up primarily to a dissertation; and though the candidate may and doubtless will avail himself of lectures, his real work will be that of his thesis. Undergraduate instruction here is not, of course, in the hands of the University, but is given by the colleges or by the delegacy for unattached students, which in its practical working throws the student into the hands of a tutor who directs all his movements. The new statute, however, while treating the candidate for B.L. or B.Sc. as an ordinary undergraduate in every other respect, puts him in the hands of the University, answerable to it and directed by it through its committee.

A word as to the more practical details may not be out of place. An intending candidate should arm himself with proofs of identity, age, and acquirements in the shape of birth

certificate, diploma, and certificates of work done, and even personal letters from previous instructors. He should by all means have some definite piece of work selected, if possible—certainly some definite subject or period to offer—and be prepared, if necessary, to pass a general preliminary examination upon it if required. It is advisable in many ways to join a college, if possible, and even to live in college, at least for a time, for in no other way can one come under the peculiar influence of atmosphere and association on which so much stress is laid in the Oxford system. And, however one may sneer at restrictions as to the meaning of cap and gown, being in by 10 P. M. under penalty of a fine, and a dozen others, even these seem to lend a certain charm to the life here, which is almost ideal in so many other respects.

As to the facilities for work outside the routine of lectures, it is impossible even to touch upon most of them. The first and greatest of these, the Bodleian Library (with its annex, the Radcliffe), as to size, ease of access, facilities for work, and, above all, the invariable kindness and courtesy of those in charge, is hardly to be equalled anywhere. There are, too, great stores of books and MSS. in the less accessible college libraries and in the museums. There are the great archaeological, antiquarian, art, ethnological and scientific collections, together with the Botanic Gardens, the various laboratories (college as well as university), and institutions like the Indian Institute devoted to subjects connected with the Indian Empire, and the Taylorian to those connected with the study of modern languages. There is, too, perhaps a greater number of men engaged in advance research in Oxford than almost anywhere else in the world—men with or without official connection with the University or with colleges, who, though they may not lecture, are generally accessible for advice or consultation, and who, by their very presence, do much towards maintaining the atmosphere and tradition of learning that hang about the place, and insensibly form such a great factor in the training of men who come to this, perhaps the most dignified, certainly the most beautiful seat of learning in the world.

WILBUR C. ABBOTT.

Correspondence.

THE RUSSIAN BRYCE.

TO THE EDITOR OF THE NATION:

SIR: *Slavica non leguntur* was the categorical statement of a savant of bygone days. Since then the German countries have become the strongholds of Slavic philological learning, and France has produced some good works in the Russian language that enjoy the respect of Slavic scholars, while the name of good translations from Russian into German and French is legion. America, with its traditional friendship for Russia, has up to date shown but a spurious interest in the intellectual movement of its nearest trans-oceanic neighbor, and thus makes true the statement, *Slavica non leguntur*. With the praiseworthy exception of one or two writers who know Russia and Russian, the translations and compilations made in this country are unreliable and often worthless. But of this another time.

Until very lately Russians knew just as little of America and Americans, their acquaintance not rising above a reading of the literary productions that have become the possession of the

whole English-speaking world, and with it of the world at large. Now, through the excellent articles by A. P. Tverskoy that have appeared in various leading Russian journals and weeklies, it is possible to gain as clear an insight into American life as through the pages in Bryce's 'American Commonwealth.' These articles have been conveniently collected in a well-printed volume bearing the title, 'Sketches from the United States of North America' (St. Petersburg, 1895), and containing in 460 pages the following heads: Ten Years in America—The Presidential Campaign of 1892—My Life in America—Letters—The World's Fair.

In these there is unrolled a wealth of personal observations and experiences but rarely found in one man. It is the history of the intellectual transformation of a Russian emigrant into a staunch American; it is the joyous message of free America to the East of Europe. The autobiography of the author reads like a fairy-tale. He arrived in America in 1881 with a copy of Ollendorff in his hands and slender means. Of America he knew nothing, and he wanted to become a farmer, though as a nobleman and soldier he had never put his hands to a plough. He settled in Florida, worked in a sawmill, acquired a practical knowledge of its running, and entered into partnership with two Americans, whom he bought out in one year. By diligence and shrewd investments he in a few years had laid by enough money to take the contract for the building of a railroad. A few years later he became the superintendent of a large railroad system. Within eight years he was the owner of a large sawmill, wood-planing establishments, general stores, a railroad-carriage factory, a railroad with its branches, vessels and steamships, a million acres of land granted by State and private individuals, several towns along the line of railroad, etc., etc. He founded the city of St. Petersburg in Florida, became mayor of a town, and held several political offices. He has now retired from business and lives a happy life on his estates in Southern California.

In his short but brilliant career Mr. Tverskoy has had ample opportunity to become acquainted with American life in all its minutiae, and he has acquitted himself of his difficult task of critic with remarkable success. It is to be hoped that his work may become accessible to an American public in an English translation, that Americans may have again a chance to see themselves as others see them.

LEO WIENER.

CAMBRIDGE, MASS.

RUFUS KING'S CORRESPONDENCE.

TO THE EDITOR OF THE NATION:

SIR: The portion of the dispatch from Rufus King to the Secretary of State which remains in cipher in King's edition of Rufus King's Correspondence, vol. iii., p. 398, may be found deciphered in Am. State Papers, Foreign Relations, vol. ii., p. 401, as follows:

"I am assured that our affairs shall be taken into consideration as soon as the new cabinet is settled; and I am not without hopes that they may be satisfactorily adjusted. Having caused it to be understood that we should not consent to pay more than ten hundred thousand pounds in lieu of what might be awarded under the sixth article, I shall await a decision upon this offer."

By the convention of 1802, negotiated by King and Lord Hawkesbury, the sum of £600,000 was designated as the amount to be paid by the United States to Great Britain for

debts contracted prior to the treaty of peace of 1783.—I am, very respectfully yours,

J. S. REEVES.

WASHINGTON, D. C., April 14, 1896.

PIDGIN SPANISH.

TO THE EDITOR OF THE NATION:

SIR: In connection with the interesting remarks of your correspondent in the *Nation* for January 30, regarding "Pidgin English," and in view of the ever increasing number of Spanish-American stories contained in our current literature, perhaps you will let me remark that the average Spanish quotation, with its corresponding translation, bears much the same relation to Castilian as "Ralphese" to "Pidgin English." Thus, in the March number of *Harper's Magazine*, the writer of the paper on "Arcadian Bee-Ranching" refers to the musical names of the California ranches, and translates some of them for the benefit of its readers. He writes "Las Posas" for "Los Posos" (meaning 'The Wells'), and translates "Las Chupa-Rosas" "Humming-Birds' Nest," when every one familiar with Spanish America knows that "chupa-rosa" (literally, rose-sucker) is the vulgar Spanish-American for humming-bird, and in Castilian the poetic "colibri" is the exact equivalent.

In the same magazine are some remarks on the obscurity of the etymology of the word "gringo." This word was first applied to the soldiers of the American army invading Mexico in 1847, when the then popular song "Green grow the rushes, oh" was in vogue and was sung on the march. The two first syllables plainly show the origin of the word, which, curiously enough, appears to have originated in the same manner along the Pacific Coast from the singing of the same popular air by British sailors. I have trustworthy evidence of the word having been adopted in Peru in reference to them about the same period. Nowadays it is applied indiscriminately to all English-speaking people, much in the same manner as "gavacho" is to the French and "gachupin" to the Spanish by the Mexicans.—Yours truly,

EL BUTIRRE GRINGO.

TOPIA, DURANGO, MEXICO, April 5, 1896.

P. S.—You may like to know that your views on the Anglo-Venezuelan question are very much appreciated by well-informed Mexicans, and have caused a great deal of favorable comment.

Notes.

FURTHER announcements by Macmillan & Co. are 'The Interpretation of Literature,' by W. H. Crashaw; 'The Italic Dialects,' by Prof. R. Seymour Conway; and 'London Burial-Grounds,' ancient and modern.

Messrs. Scribner have now become, by purchase and arrangement, proprietors and American publishers of all the works of Robert Louis Stevenson, including the posthumous.

The Star Publishing Co., Chicago, will soon publish 'Camp-Fire Stories,' by Col. Edward Anderson, profusely illustrated.

E. W. Moes, assistant librarian of the University of Amsterdam, is about to bring out in parts, through C. L. van Langenhuyzen (New York: Lemcke & Buechner), a work on the local printers and publishers of the 16th century ('De Amsterdamsche Boekdrukkers en Uitgevers in de zestiende eeuw'), a chapter in the history of early printing as yet un-

written. Numerous facsimiles of marks, colophons, etc., will enhance the bibliographical and national value of this publication.

The forty-sixth volume of the 'Dictionary of National Biography' (Macmillan) all but disposes of the letter P. Priestley and Pope offer more of interest than any other names in the section that extends from Pocock to Puckering. Quite exceptionally, if we remember, the Birmingham philosopher is allotted to two hands, his biography proper being followed by an estimate of him as a scientist. Leslie Stephen might have been expected to be one of these collaborators, but he has reserved himself for the poets Pope and Praed. The former he biographizes in his best manner through eighteen pages, with a success for which he himself supplies the praise when he says, "There is, in fact, no more difficult subject for biography, especially in a compressed form." He makes the happy observation that "probably the nearest parallel to the combination [in Pope of a kindly disposition with seeming malignity due to unfortunate conditions acting upon a sensitive nature] is to be found in his contemporary, Voltaire." The notice of Praed is much shorter, and reminds us that his pre-nomen points to a relationship with the New England Winthrop, and that the first edition of his poems was published in America by R. W. Griswold. Another significant sketch is that of the Greek scholar Porson, which is readable but cannot be censured for compression in the purely personal and anecdotic part of it.

The eight-volume edition of Poe's Works, bearing the English imprint of J. Shiells & Co., and the American of J. B. Lippincott Co., is, without note or comment of any kind, biographical introduction, or chronological indication, or variant reading. It therefore does not properly compete with the Woodberry-Stedman edition just concluded, nor is it as beautifully made. The volumes are, nevertheless, both handy and well printed, and are embellished with twenty-four tasteful and effective designs (chiefly by F. C. Tilney) in photogravure, including a view of Poe's house at Fordham, his portrait, and those of Henry Cockton, Hawthorne, and Mrs. Browning. There may yet be other editions of Poe, but the public seems now to be sufficiently supplied for a long time to come.

The enduring popularity of Symonds's translation of Benvenuto Cellini's Autobiography is evinced by the issue of a fourth edition (Charles Scribner's Sons). This edition, like the third, is in one volume, which, in spite of its more than five hundred pages, is not very cumbersome to hold, while the print is handsome and legible. The only thing we find to object to is the inadequate illustration. The cuts are small and confused, Cellini's elaborate ornament and complicated grouping of figures being often nearly indecipherable, while the red bronzing of the ink does not add to their clearness. Cellini's known works are not numerous, and could be completely illustrated at no great cost; but half the number of drawings here given, if printed on as large a scale as the page would allow, and in black, would be preferable to the whole number as we have them.

The Loudon Virginia Rangers were "scouts" during the civil war, employed by the national Government along the Potomac. They had lively experiences, being often matched against Mosby's Partisans on the Confederate side. The history of the battalion is told by Briscoe Goodhart of Company A, and published by McGill & Wallace, Washington, D. C. Be-

sides the personal interest it will have for the members of the companies and their friends, it gives some instructive views of the petty warfare of raids and reconnoissances.

The "other side" is presented in 'Mosby's Rangers,' by James J. Williamson, of the Confederate Company A, a book of larger size and of greater historical pretensions (New York: Ralph B. Kenyon). A comparison of the two volumes shows how natural it is for each side to exaggerate its successes and alur its defeats. As they often describe the same skirmishes from opposite standpoints, the amusement is heightened by taking them together. It is a pity that the author of 'Mosby's Rangers' had not given at least a chapter to a frank history of the law under which they were organized, and to their actual practice of scattering after a raid and pretending to be peaceful farmers till called together again by preconcerted signal. He protests against calling them guerillas, but something more than a protest is needed when the law shows that they were irregular, and practically irresponsible, not on the pay-roll nor acting under definite orders, authorized to plunder and to keep the profits of their raids. What all this leads to, the history of war plainly tells. On the representation of the higher military officers the Confederate Government, at the beginning of 1864, disbanded all such organizations but Mosby's, and Virginia would doubtless have suffered less if his also had been suppressed.

Prof. W. M. Flinders Petrie, the Egyptian explorer and archaeologist, has recently again put English readers under a debt of obligation by editing two volumes of translations of 'Egyptian Tales' (New York: Frederick A. Stokes Co.). They date all the way from the fourth to the nineteenth dynasty, and yet the collection does not by any means exhaust the folklore of this ancient people. The service of Petrie is, however, only comparative, since all the tales thus rendered have been in print for some years in an excellent French translation, Maspero's 'Contes Populaires.' In reading the smooth version given by Prof. Petrie, the reader might suppose that no involved questions of grammar and vocabulary are presented by the original; but such is by no means the case, and many of the renderings are no more than shrewd guesses. The original matter of the present volumes must be sought in the introductions and notes, and here the editor has rendered a more conspicuous service than elsewhere. The tales present material valuable from the point of view of both literature and folklore. They throw light upon many questions of mythology, every-day life, and the current conceptions of the times, and they deserve also the attention of students of the Egyptian religion. In them a natural progression is observable, from marvels and tales of wonders and of strange lands to novels of adventure and delineations of character.

The number of persons in this country who will be interested in a translation, from the Arabic, of an account of 'The Churches and Monasteries of Egypt and some Surrounding Countries' (Oxford: Clarendon Press; New York: Macmillan), attributed to Abu Salih, the Armenian, is probably small. The book has required the expenditure of much erudition, and is a storehouse of quaint information for students of the history of Christian Egypt. The translation and many of the notes represent the labor of Mr. Basil T. A. Evetts of Trinity College, Oxford, and formerly of the British Museum. He has also had the assistance of other scholars, such as Alfred J. Butler, F.S.A.,

whose work on the 'Ancient Coptic Churches of Egypt' is our latest and best authority. The book is an illustration of the progress of research and of the increase of the resources of scholarship for which the present generation is noted. The original has been known for a long time, but has only now been put to use.

In 'A Dictionary of the Names of Minerals, including their History and Etymology,' by Albert Huntington Chester, Professor of Mineralogy in Rutgers College (New York: John Wiley & Sons), we have for nearly 5,000 names of minerals the original source and name of the giver, when possible; the etymology of each name; and a brief description of the mineral to which the name applies, for help in identification. In the nomenclature of minerals, fancy has been called into play perhaps more than in any other branch of science. As the author says: "We sometimes find as the reason for a name the simple idea of distinguishing the thing itself; but this is not the common reason. Names have been given to commemorate battle-fields, to sneer at the work of earlier investigators, and as a tribute to feminine loveliness. In short, the whole round of human passions has been gone over in the manufacture of these words, which are purely scientific in their uses, and for the making of which scientific methods might well have been employed." In addition to its general interest from the philological side, the book will be of great value to mineralogists, and save them much mental wear in struggling with half-forgotten roots and distorted or trivial meanings.

'The Water Supply of the City of New York, 1858-1895,' by Edward Wegmann, C.E. (John Wiley & Sons), contains somewhat more than 800 quarto pages and about one hundred and fifty plates, besides half that number of figures in the text. It is one of those valuable compilations which every citizen of New York who concerns himself with the growth and development of his city, and every engineer who is interested in water supply, may find of interest and of use. Moreover, it combines the historical and statistical information interesting to a layman with detailed descriptions, estimates, and illustrations which are of real value to the engineer. It begins with an account of the various systems and projects which preceded the first construction of the Croton aqueduct; the most prominent system being that of the Manhattan Company, and the most amusing project being a proposed adaptation of the system used on the Schuylkill at Philadelphia, by building a dam across the Hudson River near the foot of Christopher Street, the estimated cost of the dam being about one-sixth of what has lately been the estimated cost of a bridge pier near the middle of that river. Then comes an account of the construction of the old Croton aqueduct, and two chapters devoted to the work done after the completion of the aqueduct proper, first by the Croton Aqueduct Department and then by the Department of Public Works. There follow an account of the new Croton aqueduct, and a description of the Croton watershed and of the reservoirs which have been or are to be built to provide adequate storage capacity. The book proceeds from an exceedingly competent hydraulic engineer, and has evidently been carefully prepared by a master. The chief criticism that one would offer is, that the execution of the numerous plates is evidently decidedly inferior to the execution of the drawings from which they were made.

All who have felt the interest and charm of the great scholar and writer that was James

Darmesteter will be glad to know that a new volume of his essays has been collected by a loving hand, and is just now published: 'Nouvelles Études Anglaises. Avec avant-propos de Mme. Mary-James Darmesteter' (Paris: Calmann Lévy). The first of these ten studies tells the story of the different steps by which the reputation of Joan of Arc has risen in England from that of an abandoned sorceress to that of a virgin and martyr. Other essays regard the life and letters of George Eliot; the works of Wordsworth and of Oliver Madox Brown; the political songs of Ireland; the poems of Miss Mary Robinson (his wife); and various Indian matters. These valuable studies have been hitherto buried in old reviews and magazines, and have been hard to come by; they are all the more welcome now on this account. The new style of Mme. Darmesteter may be noted; it is perhaps a fresh tribute to a deeply cherished memory.

Volume vi. of the *Oeuvres Complètes* of Huygens, which was received by subscribers in this country early in the present year, well maintains the high standard of the earlier volumes. Two more will be required to complete the correspondence, which is advanced in this beautiful quarto only from 1666 to 1669, the period of the early residence in Paris. But if the movement is slow, it embraces the entire thought of the time. Some indication of all the great interests, and something from the hand of nearly all the great names, of the middle of the 17th century will be found in these volumes. Bits of gossip, natural portents, the flight of spiders, the case of the man who seemed to carry his X-rays about with him so that he could see through people's clothing, find place beside a discussion of the unity of God, of the nature of truth, of the doctrine of probabilities, or of a universal language. Huygens's supreme preoccupations at this time—optics, astronomy, and horology—of course occupy much space. The Scientific Society of Holland, which is responsible for the editing, may well be congratulated that it has been able to secure committees competent to carry out such a monumental undertaking. The indexes are especially complete, occupying about sixty pages: a chronological index; an alphabetical list both of writers and of correspondents; an alphabetical list of persons mentioned; a list of works cited; and, finally, an index of subjects, prepared with evident care and unusually complete.

Recent folios of the Geologic Atlas of the United States continue to furnish welcome additions to the fund of geological, geographical, and economical information, useful in so many applications. Locally of great value to the people within the limits of their several areas, the folios are of broader value in teaching, inasmuch as they supply, in a measure of detail never before attempted generally for the whole country, a body of first-hand facts upon which a sound superstructure of generalization may be reared. The several Tennessee sheets portray the different features of the Cumberland plateau and its bordering lower lands. The sheets for the slope of the Sierra and the plain of middle California vie with the transcontinental railroads in bringing the Pacific States near to us on this side of the country. Additional sheets for various parts of the country are in course of publication.

The latest report of the Connecticut Board of Education reveals the actual condition of a number of the public schools in that State, which is certainly such as must make conscientious educators grieve. Poverty and isolation appear in the pictures of the little frame school-

houses, as well as in the answers given by teachers to various elementary questions on school methods, and in the uniformly high percentage of pupils' failure to answer easy questions correctly. The candor and sympathetic quality of the report give assurance that reform and improvement will result from it. One sentence of practical import deserves quotation from a chapter on women's voting: "Men are elected to school offices for a variety of reasons, but women always because they are qualified."

The current Proceedings of the American Antiquarian Society (vol. x., part 2) are unusually rich in papers of permanent value. Prof. Egbert C. Smyth returns to the subject of Jonathan Edwards and his early writings, printing several of the latter, with specimen facsimiles of the MS., and establishing Edwards's claim to a high rank among the world's precocious intellects even in a scientific direction. Nathaniel Paine's list of early American imprints in the Society's library prior to 1701 is supplementary to Dr. Green's similar list for the Massachusetts Historical Society's library, to the extent of non-duplicates. Volumes common to both libraries are chronologically named without repeating Dr. Green's bibliographical descriptions. Justin Winsor contributes a convenient summary of the Literature of Witchcraft in New England. The battle of Bunker Hill is reviewed from a strategic standpoint by Charles Francis Adams.

The solid foothold of the *American Historical Review* (Macmillan) is manifest in the April number. Every one of the six leading papers invites careful reading. Most curious is Wilbur H. Siebert's "Light on the Underground Railway," a report of progress in a study yet to be given historical shape and completeness; and the map accompanying it, with red route-lines of the fugitives from Southern bondage, is also provisional. Virginia is involved in Justin Winsor's "Virginia and the Quebec Bill," in Prof. William P. Trent's "Case of Josiah Phillips," and James Ford Rhodes's terse and weighty judgment on the first six weeks of McClellan's Peninsular campaign. Charles Francis Adams adds an ornament or two to his study of the battle of Bunker Hill described above. Melville M. Bigelow, the well-known legal writer, begins an interesting translation, with annotations, of several Bohemian wills and inventories. Finally, Prof. H. Morse Stephens estimates some recent memoirs of the French Directory. Quite the most extended and important review is that of Senator Sherman's *Memoirs* by Edward L. Pierce, a capital performance, just and moderate, but ending in a prophecy, already shaken, that this political trimmer would (on his own word) be found among the opponents of Cuban annexation. We must notice also a list of New England town records (of Massachusetts chiefly), and an account of the Barton Historical Collection in Detroit, accessible to students.

In the *Green Bag* (Boston) for April the Hon. Walter Clark records two instances of judicial burnings alive in North Carolina of slaves convicted of murder "without the solemnity of jury," as the Act of 1741, not repealed till 1793, read. Burning was not prescribed in the law, but the mode of punishment was left to the discretion of the two or more justices of the peace and the "four freeholders (who should also be owners of slaves)" empowered to form a court. After 1793 a slave could be tried by a jury of freeholders—whether slaveholders or not is not stated.

We have already, on occasion of their photogravure reproduction of Stuart's head of Washington, noticed the series of American celebrities undertaken by A. W. Elson & Co., Boston. This auspicious beginning has since been followed up, and two fresh remarque proofs, of Marshall and of Hamilton, have just come to us from the above firm (New York: Knoedler). The Marshall is after a portrait from life by Inman, painted in 1831 for the Philadelphia bar, and now owned by the Law Association of that city. It has become familiar through engravings, but a better reproduction was still possible, and we have it here on a plate 13x15, bearing what relation to the scale of the original canvas we are not informed. The Hamilton is a copy of the original by Trumbull, now in the Jay house at Katonah, N. Y., which is thought to have been painted in 1793. The plate in this instance is about 16x20, and the scale larger than the Marshall. Both these prints are excellent specimens of the skill of the photogravurists who offer them for the satisfaction of amateurs, and with a laudable aim to secure them a place on the walls of schools, through the wise liberality of boards of education or by private gift—for they properly command a good price.

On April 24 a meeting will be held at the Columbian University, Washington, for the sole purpose of organizing a Southern Historical Association. Dr. J. L. M. Curry heads the call, which is signed also by Postmaster-General Wilson, Gen. Wade Hampton, Gen. G. W. C. Lee, Prof. Woodrow Wilson, G. Brown Goode, Prof. J. Randolph Tucker, Prof. Wm. Hand Browne, Col. Richard M. Johnston, Philip A. Bruce, Walter H. Page, Stephen B. Weeks, Prof. W. Gordon McCabe, Prof. W. M. Baskerville, and many other well-known and representative names. Miss Louise Manly, of Judson Female Institute, Ala., alone represents her sex in this list.

—Mr. Simon G. Croswell contributes to the *Harvard Law Review* for April an extremely suggestive paper on the development of the law concerning the use of electricity on highways. He confines himself mainly to an examination of the conflicting claims of telephone and trolley lines. Both these lines in the first place made use of the ground for the return current, and to a considerable extent still do so. The discharge from the trolley lines, however, is so powerful as to be mischievous. It passes along the gas and water-pipes into houses, reaches the telephone-discharging wires, and passes into the telephones and through them to the central exchange. This of course produces all sorts of undesired sounds and makes conversation unintelligible. There is also trouble from induction when the trolley wires are near to and parallel with those of the telephone. The telephone companies, being first in possession of the highways, brought suit against the trolley lines, endeavoring to compel them to discharge the electric current in some way which should not interfere with existing uses, *e. g.*, by means of metallic circuits for the return current. The same device, however, would relieve the telephones from most of their trouble, and in some cases the courts inclined to hold that whichever party could abate the nuisance at least expense should be required to do so.

—In other cases, however, the maxim, *Qui prior est tempore, potior est jure*, was regarded as controlling. The telephone companies were where they were by right, and it seemed reasonable that later occupants should be made

to respect this right. The other maxim, *Sic utere ut alienum non laedas*, was also invoked by the telephone companies against the trolley lines. They said that these lines could exercise their franchises without damaging other interests if they chose to take the trouble to do so, and that it was only equitable that they should be required to respect existing rights. But all this reasoning, plausible as it seemed, was suddenly brushed aside by the application of another principle. The trolley lines took the position that the primary use of the highways is for public travel, and that all other uses must be subordinate to this. The telephone, therefore, is only a licensed interloper, and the trolley as a common carrier need not regard such dubious rights as those of mere purveyors of intelligence. The telephone and telegraph lines therefore take their franchises on highways subject to the right of travel, and so the highest courts seem now to hold. But this principle in its turn may require modification. The iron pipes used for drains, for water, for gas, etc., which are laid under the highways, have no more to do with public travel than the telephone wires. May the trolley lines therefore discharge their electric current into the ground to the destruction of these pipes, without being called to account? Evidently the doctrine that the highway is primarily for travel must be modified so as to recognize the fact that what is secondary is not therefore to be ignored. *Qui posterior est tempore, potior aliquando jure sit.*

—An important unpublished document on the war of 1870 has just appeared in Germany, and is translated in the current number of the *Revue des Revues*. This document is an extract from the journal of Count Frankenberg, who, during the time that intervened between the battles around Orleans and the capitulation of Paris, played an important part, not only as an officer of rank in the Prussian service, but also, and especially, as an intermediary between Mgr. Dupanloup and Count Bismarck. On the 14th of October, 1870, he called on the Bishop of Orleans to arrange with him some details of hospital service, when the Bishop took occasion to say that he did not share the extreme tendencies or the stubborn animosity of the Government. In the evening of the same day, he returned the visit of Count Frankenberg and opened himself freely to him on the question of peace. Peace must be made, he said, without delay, or everything would fall into confusion. He himself had been urged to take the first steps, but this he could not do because Orleans was in German hands. Only one Frenchman could do it, and that was his old friend Thiers. The Bishop had read Bismarck's dispatch on the interview with Jules Favre at Ferrières, and did not think the propositions made to France extravagant or out of proportion to the situation. France must resign herself to a cession of territory, he said, and, after peace was made, she could be saved only by the return to power of the legitimate dynasty. Prussia survived Jena only because of the Hohenzollerns; and Austria was not broken up after Koeniggratz solely because she had the Hapsburgs to rely upon. The situation in France was more difficult on account of the schism in the legitimate family, and the Bishop urged the good offices of King William to heal the breach. The Count de Chambord ought to be King, and, as he had no child, to adopt the Count de Paris as his successor and heir. "I do not express in this," the Bishop said, "my own personal opinion only; the whole French episcopate is with me." These

advances of Mgr. Dupanloup were at once laid before the King of Prussia, the Crown Prince, and Count Bismarck. All three expressed their satisfaction at the peaceful intentions of the Bishop of Orleans, and declared that they in no wise desired the reestablishment of the Empire, but would be ready to treat with the one who should offer them the best terms and the most satisfactory warrant of peace. Safe-conduct, they promised, should be given to the friend whom Mgr. Dupanloup desired to send to M. Thiers. At this point the extract from the journal of Count Frankenberg ends.

—The reverse side to the glorious pomp and circumstance of war is graphically shown in 'With an Ambulance during the Franco-German War,' by Charles E. Ryan (Scribners). The author was a young medical student in Dublin when the great war broke out in 1870, and being, like most Irishmen, an ardent admirer of France, he volunteered to use such medical and surgical knowledge as he had acquired for the assistance of the French wounded. After some difficulty he got an appointment with the Anglo-American Ambulance and proceeded with it to Sedan, where he had his first experience in ambulance work. The greater number of the doctors with whom he served had learned their business as army surgeons upon the Confederate side during the American civil war. Their skill, kindness, courage, and amiability seem to have made a great impression upon the young Irish medical student, who never mentions the names of his colleagues without words of admiration and respect. The relation given of the disaster of Sedan fully confirms in its piteous details the vivid narrative of Zola in 'La Débâcle,' which, in his preface, Dr. Ryan greatly lauds, stating that "those who were eye-witnesses of Sedan can add little to his description." After tending as many as possible of the wounded of both armies with faithful and tireless care at Sedan, the Anglo-American Ambulance endeavored without success to make its way to Paris, and thereupon offered its services to the Germans, and was sent to Orleans, where, as at Sedan, it tended the wounded on both sides during the first German occupation, the brief French occupation after the battle of Coulmiers, and the second German occupation of the city of Jeanne Darc. In a simple and natural style Dr. Ryan describes the work of the international ambulance among the wounded, giving a graphic picture of the terrible sufferings inflicted on the unfortunate victims of modern military operations. Yet his volume is no mere gruesome tale of human suffering.

—The third volume of Mr. J. H. Wylie's 'History of England under Henry the Fourth' (Longmans) covers the years from 1407 to 1410. It exhibits the same merits and defects as its predecessors. Evidence of untiring industry is given upon every page; the references to authorities used are so full that often more than half the page is composed of footnotes; the primary authorities for the period have been carefully examined, and the very adjectives used in the description of an historical character's personal appearance are vouched for by quotations from contemporary documents; careful impartiality is everywhere observed, and the reader is enabled to draw a conclusion differing from the author's from the material the author himself supplies; and there is a judicious absence of irritating moral and philosophical comments. On the other hand, the defects that were conspicuous in Mr. Wylie's earlier volumes are again perceptible.

The old tendency to wander from the subject in hand is shown in irritating fashion, and the book has become not a mere history of England during the reign of Henry of Bolingbroke, but a history of the reign of that king with side glances at other countries and at anything else that happens to occur to the author at the moment of writing. This digressive habit is by no means offensive to the reader. Indeed, the most interesting chapters are digressions, as, for instance, chapter lxxv. in the present volume, dealing with Gilds and Misteries, as Mr. Wylie spells the better known words guilds and mysteries, and chapter lxxxiv., on Oxford. It is by means of such digressions that his book has grown to its present size, for neither the accessible material nor the importance of the reign of Henry IV. could in any other fashion have been stretched to such an extent. It is possible to recognize the real learning of Mr. Wylie, to be grateful to him for his industry, and to enjoy his digressions, while deprecating a system of writing history which produces an *omnium-gatherum* of miscellaneous information in the place of a carefully constructed account of the political, economic, and social tendencies of a definite historical period.

NICOLL'S LITERARY ANECDOTES.

Literary Anecdotes of the Nineteenth Century: Contributions towards a Literary History of the Period. Edited by W. Robertson Nicoll, M.A., LL.D., and Thomas J. Wise. London: Hodder & Stoughton; New York: Dodd, Mead & Co. 1895.

THE first volume of a series which seeks to do for the literary history of the nineteenth century what Nichols's 'Literary Anecdotes of the Eighteenth Century' has done for its age, deserves more than a casual notice. Dr. Nicoll and Mr. Wise have thus in the preface expressed their general aims:

"The editors hope to provide . . . a considerable amount of fresh matter, illustrating the life and work of British authors in the nineteenth century. To a large extent they rely upon manuscript material, but use will be made of practically inaccessible texts and of fugitive writings. While leading authors will receive due attention, much space will be devoted to the less known writers of the period. It is intended to supply biographies, letters hitherto unpublished, additions from manuscript sources to published works, together with a series of full bibliographies of the writings of the greater authors. Every precaution has been taken to avoid the infringement of copyright, and the editors hope that they will be forgiven any involuntary transgression."

This is a terse yet comprehensive account of the scheme, and the contents of the first volume fall readily under one or other of the heads indicated. To select a single example from each class, we have under "Manuscript Material" more letters from Shelley to Leigh Hunt; under "Practically Inaccessible Texts" Thomas Wade's 'Helena'; under "Fugitive Writings," Hawthorne's "Uttoxeter"; and under "Bibliographies of the Writings of the Greater Authors," 267 pages of "Materials for a Bibliography of the Writings in Prose and Verse of Robert Browning." The promise that "much space will be devoted to the less-known writers of the period" is also amply fulfilled. This is keeping close to the path of Nichols, for not all Mr. Bowyer's friends, nor even Mr. Bowyer himself, are universally celebrated. Thomas Wade, Richard Henry (Hengist) Horne, and Charles Wells are among the obscure men whose lives and writings are now more fully disclosed.

The frontispiece is an admirable portrait of

William Blake, after Phillips's original sketch. The plate used for the reproduction was etched by William Bell Scott. "This work is one of the strongest and most characteristic of Scott's etchings, which, for purposes such as the present, possesses the unusual value of being done on steel with the burin and not on copper with the point. Save through a few proofs circulated in Scott's lifetime, the plate is totally unknown." Blake wears his most prophetic aspect and looks every inch a man of genius, with a touch of that madness to which his great wits were near allied. One can almost hear him say:

"Bring me my bow of burning gold,
Bring me my arrows of desire,
Bring me my spear: O clouds, unfold,
Bring me my chariot of fire."

The "Anecdotes" begin with a series of unpublished documents which furnish fresh information concerning Blake's trial for treason in 1803. Scofield's deposition against Blake comes first, then Blake's memorandum in refutation, and thirdly the speech of Blake's lawyer, Counsellor Rose. Blake's trial has a distinct historical value apart from being a critical incident in the life of a most distinguished man. The mere fact that a public prosecutor could be found to proceed with a grave charge on the trumpery evidence which was adduced, shows that during the period of the Napoleonic wars the rage for suppressing *Majestätsbeleidigung* was even greater in England than it now is in Germany.

Tennyson is not directly taken up in this volume, but two early estimates of him are given—one by Arthur Hallam, the other by Mrs. Browning. Hallam's unflinching advocacy of his friend appears in two letters to Leigh Hunt. The first, written in 1831, is addressed to the editor of the *Tatler*. The second is above a year later in date and more familiar in style. Neither letter contains any views that are not elaborately expressed in Hallam's Essay on the Lyrical Poems of Alfred Tennyson which Mr. Le Gallienne has already published. The 1832 letter, however, bears clear testimony to the devotion of Hallam's set, the original band of "Apostles," to Shelley. "While at Cambridge I partook largely in the enthusiasm which animated many of my contemporaries, and indeed formed us into a sort of sect in behalf of his character and genius." Elizabeth Barrett's "Opinion," published in 1844, was doubtless based largely on the 1842 volume of Tennyson's poems. We do not consider it by any means so piquant as Mrs. Gaskell's tribute in 'Cranford,' but it deserves to be reprinted. It originally appeared in 'A New Spirit of the Age,' two volumes of critical essays in which Miss Barrett collaborated with Horne. The "Opinion" is printed from a manuscript in Mr. Buxton Forman's collection, which shows just how Horne cut up Miss Barrett's paper and interpolated "copy" of his own. The arrangement was fair enough, for they were avowedly working together and he had authority to use her contributions as he chose.

Three minor poets who receive generous recognition in this volume are Horne, Wade, and Wells. A biographical account of each is furnished by Mr. H. Buxton Forman, upon whose pen and library the editors have drawn largely. His sketch of Horne's life and character is one of the freshest and best things in the book. The curious know Horne's farthing epic "Orion," but few, in this country at least, are familiar with his exciting career and vigorous personality. He is like the worthies we run across in the publications of the Hakluyt Society. We do not judge such a

man by what he writes, but by what he is. Horne was not dependent upon Europe for amusement and enjoyment. He would have made his cycle of Cathay a very lively term of existence. From 1833 to 1851 he was a voluminous writer on a great variety of subjects, sometimes striking a style in verse that called forth praise from Roden Noel and even from Browning. His ballad of "Delora" is now first printed in its original form, with marginal notes in the manner of the "Ancient Mariner." It is somewhat spasmodic for the taste of the present generation, and would not be apt just now to run through many editions by itself. However, if we are to have agony we can stand it better from a man who could at the age of eighty swing dumb-bells weighing fifty pounds, than from a poor anæmic creature who never had a passion in his life. Horne once beat a shark in a race, once helped the captain and mates of a timber-ship put down a mutiny, and once won a prize claret bottle "for grace and agility displayed in swimming when thrown over the side of a ship, bound hand and foot." Here are some of his experiences in America. He served in the Mexican expedition of 1825:

"was at the siege of Vera Cruz and the taking of San Juan Ulloa, was taken prisoner and narrowly escaped being shot as such, got away, and, though he knew little of Spanish and less of surgery, was employed in translating Spanish dispatches, etc., and filled the post of surgeon in the cock-pit. As boarding officer he took several prizes, and finished with the yellow fever, his only illness save his last. Quit of the fever, and defrauded of his prize-money, he left the Mexican service, cruised off the Floridas, landed at New York, ascended the Erie Canal, visited several Indian tribes, broke two of his ribs at Niagara Falls, lost all his money there at billiards, and worked his passage up [sic] the St. Lawrence."

Upon the discovery of gold in Australia he left England again and became an extremely useful magistrate in the gold fields. Surely one ought not to grudge Horne his civil-list pension of £50 nor his occasional rants in "Delora."

A fresh opportunity is afforded Wade and Wells to win a place for themselves in the esteem of lovers of poetry. Next to creating a new poet of consequence, nothing could please lovers of poetry so well as the discovery of a true bard neglected by the contemporaries of Wordsworth in his age, and of Tennyson and Browning in their youth. Unfortunately, the chance of vindicating the claims of men like Wade and Wells is but indifferent. The present century is not open to the reproach of having turned a deaf ear to the truly great. Its excess has been on the side of running to fads. Wade and Wells undoubtedly possess enough good qualities to preserve their work from being called rubbish, but they will always remain caviare to the general. We cannot regret this particularly, because there is so much poetry of a high class to be read in the various tongues of the modern world that time devoted to the minor poets must be stolen from the time which should be devoted to their betters. Mr. Forman complains that, "with the sole exception of Thomas Lovell Beddoes, no nineteenth-century English poet whose merit equals that of Thomas Wade has been so liberally neglected," and accuses Mr. Stedman of "missing a good opportunity of telling the truth about this nearly lost poet." For our own part we cannot blame Mr. Stedman for his cursory mention of Wade in "Victorian Poets." A writer so completely under the influence of Shelley and Keats is an awkward person for erection into a literary cult. The

Fifty Sonnets of Wade, many published for the first time, "The Contest of Death and Love," and "Helena," both of which have been published but are extremely rare, may, however, succeed in accomplishing this wonder. At any rate they are worth printing.

The "Dramatic Scene" of Charles Wells is taken from "Joseph and his Brethren," and is really an interpolation "regarding the relative merits of Nile-side polytheism and Hebrew monotheism." The piece contains fine lines, but is marred by a rhetoric which is striving to become poetry, and by a weakness for sententious utterances such as:

"What thou hast said against our deities
I leave between our deities and thee:
Their proper honour is their proper cause,"

and

"The God of justice is the God of love,
And chastisement is love where sin is death."

The ten letters of Shelley to which we now come cover the years 1813-1822, and are full of warm affection for his correspondent, Leigh Hunt. The editors insist upon their value for the interpretation of Shelley's character, by their emphasis of the great change which came over him in 1814, the year when he threw in with Mary Godwin. The one letter prior to 1814 shows Shelley in the thick of his abstract, atheistical speculations. The rest show him merged in the palpitating facts of life, awake to the concerns of his friends and instinct with genius. "When once that point in the Shelley chronology [1814] is reached, there is no record of retrogression; variety—yes, and progress; but never any more letters, however trifling or matter-of-fact the subject, behind which it is possible not to see this particular personality—intellect, emotions, imagination, all alive, and creating fresh combinations of language and thought." This naturally raises the question of Shelley's letters versus his poetry—the question of Matthew Arnold's paradox that Shelley's prose will outlive his verse. Certainly there is nothing in the letters now published to support such a view. They are spontaneous, unaffected, and fresh from the heart, but their subjects are not of perennial moment. A criticism of Michael Angelo might be held to furnish an exception. For the rest, the chronic money difficulties of Hunt, and Shelley's assistance, the circumstances under which the "Hymn to Intellectual Beauty" was published, the relations of Byron, Shelley, and Hunt leading up to the publication of 'The Liberal: Verse and Prose from the South,' and the appearance of 'Frankenstein,' are the principal themes. We welcome the publication of new Shelley letters, but we must confess that, in our opinion, the editors have somewhat overestimated the value of their discovery.

The "Landon-Blessington Papers" show Landon in his most amiable mood. He lavishes articles upon Lady Blessington, redeeming her 'Book of Beauty' and her 'Keepsake' from insanity. His modesty will surprise those who remember "I strove with none, for none was worth my strife." In sending on a quarto sheet headed "Pleasure, Youth, and Age: An Allegory," he says: "I hope you will think it worthy of a place, not in the forthcoming but in the following Book of Beauty." We quite forget in the shower of compliments which he pays the fair editor that he ever threw his cook into a tulip-bed at Fiesole, replying to the remonstrances of his wife: "Well, my dear, I am sorry, if that will do you any good. If I had remembered that our best tulip-bed was under that window, I'd have flung the dog out of 't'other." The story may be

legendary, but no one could invent such a legend about the Blessington-Landon. His intimacy with the Countess extended from June of 1827 to the day of her death in 1849, and he could conclude a sketch of their friendship with the words: "Virtuous ladies, instead of censuring her faults, attempt to imitate her virtues. Believe that, if any excess may be run into, the excess of tenderness is quite as pardonable as that of malignity and rancour." The letters now published relate chiefly to Landon's contributions to the various annuals which Lady Blessington published in years when her income had become small, and she was forced to depend on her own energy for the funds which kept the salon at Gore House, Kensington, in existence. They fill up gaps in Madden's 'Life and Correspondence of the Countess of Blessington,' and are of considerable value to the lover of literary gossip. Besides letters, various minor papers and verses of Landon, which accompanied the letters, are set forth. An autobiographical note which Landon drew up for the Countess, and an extract from her diary concerning the first weeks of their acquaintance, are also included.

We must not altogether pass over Hawthorne's paper on Uttoxeter, which Dr. Nicoll and Mr. Wise have rescued from a file of the 'Keepsake.' Hawthorne himself introduced portions of it into his chapter on Litchfield and Uttoxeter in 'Our Old Home'; now we have it alone in its first form. Hawthorne never wrote more delightfully than on the subject of Johnson's penance and the market-place in which it was performed. The conclusion is an amusing little anti-climax. By an analogy drawn from his own experience, Hawthorne excuses the people of Uttoxeter from their failure to remember and be impressed by the one event that redeems their town from obscurity. We do not get much assistance from this essay about the pronunciation of the name. Hawthorne says it is called Yute-oxeter, but here he is hopelessly astray if the local researches of Dr. Birkbeck Hill are to be considered conclusive.

We have left ourselves no space to dilate on what in some respects is the most important portion of the volume, viz., the Bibliography of Browning's Writings. The following order of treatment is observed: I. Editions Principales; II. Contributions to Periodical Literature; III. Published Letters; IV. An alphabetical list of poems with reference to the position of each in the various editions; V. Collected Editions; VI. Selections; VII. Complete volumes of Biography and Criticism; VIII. Browningiana. The whole bibliography would reflect credit on the most precise and laborious German, and will be indispensable to the systematic student of Browning. The notes added to the separate pieces under section iv. are most ample, useful, and entertaining. The section Browningiana is brought down to February, 1895.

The paper, type, and illustrations of this volume are all very beautiful, quite eclipsing old Nichols; while the numerous reproductions in facsimile of original holographs will give the book a special value in the eyes of the bibliophile and the collector of autographs. It would be too much to say that the material collected by the editors presents any great public character in a new light, yet much of it is of high interest and none of it is trivial. If the succeeding volumes of the series equal the first in merit, the "Literary Anecdotes of the Nineteenth Century" will become one of those works "without which no gentleman's library is complete."

THE BEGINNINGS OF THE UNIVERSITIES.—II.

The Universities of Europe in the Middle Ages. By Hastings Rashdall, M.A., Fellow and Lecturer of Hertford College, Oxford. Oxford: Clarendon Press; New York: Macmillan. 1895. 2 vols., 8vo, 560, 582 pp.

MUCH of Mr. Rashdall's space is very naturally devoted to the earliest typical universities, Salerno, Bologna, and Paris. Concerning the study of medicine at Salerno, the facts regarding which are very uncertain and the legends numerous, Mr. Rashdall is extremely cautious. He ascribes its origin jointly to the survival of Græco-Roman medicine in Southern Italy and to the fact that Salerno itself was a health-resort, sought because of the mildness of the climate and the neighboring mineral springs. Its importance continued for only two centuries, although its final suppression was effected by Napoleon as late as 1811. Mr. Rashdall takes pains to emphasize the fact that women were prominent as teachers and writers at Salerno when that institution was at the height of its prosperity.

The story of the universities at Bologna and at Paris is intensely interesting, for those institutions not only have maintained a continuous existence to this day, but are the veritable parents of universities. The existence of a university at Bologna is explained primarily by the uninterrupted existence of the Roman law and its continued study and exposition, despite invasion, decadence, and change, social and political. The Seven Liberal Arts included the study of law, which was made a part of rhetoric, sometimes of grammar as well. Mr. Rashdall plays havoc with the time-honored superstition that Irnerius was the first teacher of Roman law in medieval Italy. He is able to prove not only that Roman law was studied at Pavia from at least the beginning of the 11th century, but also that the School of Law at Ravenna had kept alive the old traditions of Roman jurisprudence from a still earlier date. Irnerius, therefore, revived and forwarded legal studies, but did not found them. He did this at Bologna, whose earliest reputation as a School of Arts is put in the background by its later preëminence as a School of Law. Why Bologna was the seat of this revival, Mr. Rashdall explains thus:

"At Bologna—the point of junction between the Exarchate and the Lombard territory—these traditions [of Roman jurisprudence] came into contact with the new-born political life of the Lombard cities, and with that development both of professional and of scholastic law-studies which was one of the outcomes of the Lombard political activity. To a large extent the revival of legal science was common to all parts of Northern Italy. But in the Lombard cities the Roman law had to contend for supremacy in the schools as well as in the courts with a rival Lombard jurisprudence: it was not unnatural that the Roman law should achieve its decisive victory in the most Roman of the Lombard towns" (I., 108).

It is not possible to trace in detail Mr. Rashdall's thoroughly sane and well-balanced account of the University of Paris, the *alma mater* of the universities of Germany, and perhaps the most potent influence in building up a university out of the schools at Oxford. The key to the difference between the universities at Paris and at Bologna, and the explanation of the survival of the type of the former, are to be found in the power of the Chancellor and the right of the competent teacher to a license. The licensed teachers became, guild-fashion, the controlling power, and were the fore-runners of all modern faculties and aca-

ademic boards. The subordinate facts connected with these fundamental principles Mr. Rashdall works out in great detail, and he throws abundant light on many problems hitherto dark. The famous Bull of Honorius III., which in 1219 prohibited the study of the civil law at the University of Paris, is explained by Mr. Rashdall as due, not to a dislike for legal studies, and a desire to suppress or limit them, but to an attempt to protect the faculty of theology, at one centre at least, from the ruinous competition of the popular and well-rewarded study of the law.

The story of the "Great Dispersion" of 1228-29 is capitally told, and is built up in part from documents that have not hitherto been used. It is plain that the smaller universities of France, especially those at Rheims, Angers, and Toulouse, as well as Oxford and Cambridge, received a marked stimulus from the advent of wandering masters and scholars who left Paris at this time. But, as Mr. Rashdall says, the University of Paris lived upon its misfortunes, and out of the disturbances created by the town-and-gown riot that led to the Great Dispersion came positive proof that a new force had arisen in Europe; for after two years the court and the citizens were glad enough to urge the return of the teachers and scholars, at any price, in order to check the falling prestige and to restore the commercial prosperity of Paris. From that time on, the development of the university was more orderly and less troubled.

As an Englishman, Mr. Rashdall is justified in giving more attention to the history of Oxford and Cambridge than is usual in the writings of Continental historians of education. To American students also these details are of much interest. The time-honored legend that Oxford owes its origin to Alfred the Great not only is dismissed as a myth (following Mr. James Parker), but is asserted to be an imaginary creation that first appeared in Camden's 'Britannia' in 1600, and was transferred from this, three years later, to Camden's edition of Aaser's 'Annals.' The whole story—beginnings of which are found in Higden's 'Polychronicon'—with all its numerous and detailed appendages, "may now be abandoned," says Mr. Rashdall, "to students of comparative mythology and of the pathology of the human mind." Similarly, the "cobwebs with which academic patriotism has surrounded the growth of the University of Cambridge" are swept away, and the first appearance of that institution on the pages of history is traced to "the dispersion which followed upon the Oxford *suspensum clericorum* of 1209." But, the true beginnings being established, the story of the subsequent history of the great English universities is admirably told. It includes not only their constitutional development, but their relation to the church and to the public, their student life, and their academic customs. Many of these details, especially where they tend to explain existing survivals of older customs, are intensely interesting. For example, it will surprise many, even well-informed university men, to be told that until 1884 Cambridge University had on its statute-book a *jus natalium* that excused sons of noblemen from an examination and a year's residence.

In reference to the number of students enrolled at the mediæval universities Mr. Rashdall is very conservative. He points to the fact that at the larger universities of northern Europe no official record of students' names was kept, that matriculation books are available only for some of the smaller universities and for the later part of the period which is

under examination, and that the estimates of university attendance which we possess rest exclusively upon a few *obiter dicta* of mediæval writers. Some of these large estimates are traced to the mediæval habit of exaggeration, and some to a direct attempt to support one side of some pending controversy. For example, the statement of Fitz Ralph, Bishop of Armagh, that there had once been 30,000 students at Oxford, is ascribed by Mr. Rashdall to the Bishop's anxiety to prove that the university was being depopulated in consequence of the kidnappings of the Friars, which made parents afraid to send their sons to Oxford. By examining a variety of evidence, Mr. Rashdall reaches the conclusion that the student population at Oxford could at no time have exceeded 8,000, and was probably always much below that figure. For Paris the highest possible attendance is put at 10,000, and probably no other university, except perhaps Bologna in the course of the thirteenth century, ever reached an attendance of 5,000.

It may perhaps be said, in criticism of Mr. Rashdall's work, that the reader would like to be given more generalizations, deductions, and applications of and from the immense collection of facts here recorded and sustained. The chapters on "The Place of the University of Paris in European History," "The Intellectual Revolution," "The Place of Oxford in Mediæval Thought," and "Student Life in the Middle Ages" are of this character, and well illustrate how interesting the whole subject may be made to the general reader. But we should be profoundly thankful to have put before us, in the English language, such a systematic presentation of the history and bibliography of the early universities as Mr. Rashdall has worked out. His collected and annotated material on all the universities, great and small, is a perfect mine of facts for the student of education and of mediæval history.

One of the main results of Mr. Rashdall's survey is, as he himself points out, to shatter a good many popular university traditions.

"The University of London, after being empowered by Royal Charter to do all things that could be done by any university, was legally advised that it could not grant degrees to women without a fresh charter, because no university had ever granted such degrees: we have seen that there were women doctors at Salerno. We have been told that the Mediæval University gave a religious education: we have seen that to the majority of the students it gave none. We have been told that a university must embrace all faculties: we have seen that many very famous mediæval universities did nothing of the kind. . . . We have been told that the collegiate system is peculiar to England: we have seen that colleges were found in nearly all universities, and that over a great part of Europe university teaching was more or less superseded by college teaching before the close of the mediæval period. We have been told that the great business of a university was considered to be liberal as distinct from professional education: we have seen that many universities were almost exclusively occupied with professional education. We have been assured, on the other hand, that the course in Arts was looked upon as a mere preparatory discipline for the higher faculties: we have seen that in the universities of northern Europe a majority of students never entered a higher faculty at all" (II., 712, 713).

Another result is to make it clear that all these institutions were not cast in a common mould, but conformed to the national and social environments in which they sprang up. Yet amid all these differences the early universities had a common ideal, and that the highest educational ideal of the time. To degrade the term "university," therefore, as we do in the United States with our "Normal

Universities," our "Business Universities," and our "Universities" that are but half-equipped secondary schools, is, as Mr. Rashdall justly says, to abuse the highest educational ideal that we find recorded in history.

It is impossible, within the limits of this review, to do more than touch upon the chief points of general interest in Mr. Rashdall's remarkable book. To say that it is indispensable to students of education and of the Middle Ages and a splendid example of scholarship and learning, is in no sense an over-statement.

Public Speaking and Debate: A Manual for Advocates and Agitators. By George Jacob Holyoake. Putnam.

MANY years ago Mr. Holyoake wrote a practical handbook on speaking and debate which had the success of being not only reprinted but pirated. This volume he has now rewritten, and in doing so has produced a manual which writers as well as speakers will find useful. It is not a systematic treatise—indeed, it is marked by a want of system—but is full of useful suggestion, illustration, and advice such as is often not to be met with in systematic treatises. No doubt the fundamental principles of the art of persuasion are the same to-day as in the time of Quintilian, but the materials with which the art deals and the weapons in its armory are by no means precisely the same. Pulpit eloquence, for instance, could not be practised until there were pulpits and congregations and a Christian faith. Had Massillon preached in the Coliseum to the Roman Senate, he would probably not have moved his audience either to repentance or to tears. If Antony were to endeavor to-day to rouse his auditors to avenge the assassination of Cæsar, he would need to remember that they had all read extras giving full details of the event. Public speakers go back to Cicero and Demosthenes for the great fundamental principles of rhetoric, as military men go back to Napoleon and Hannibal for those of strategy, not forgetting that neither Cicero nor Demosthenes ever spoke in the dread of the daily press, nor that Hannibal was unacquainted with transportation by rail, nor that Napoleon never saw a Maxim gun. For these reasons formal and systematic works on rhetoric need to be supplemented from time to time by manuals such as Mr. Holyoake's, designed to bring forcibly before the mind the practical questions which confront the speaker or debater of to-day.

At the same time a little more system would have been to the advantage even of such a volume. The reader is not made clearly to understand, for instance, that sharp lines of division separate the field, differentiating rhetoric which attempts persuasion simply from rhetoric which aims at victory, as in parliamentary debate; or from exhortation, the object of which is to arouse to action of some kind. A fervent sermon to the heathen, preached with genuine unction, has a different object in view from one on the coast defences, or one placing in nomination a Favorite Son; the failure of a speaker to notice such differences may empty the house for him.

Again, we miss a systematic analysis of the modes and figures of speech. While it is true that the rules of rhetoric teach us, as Butler says, only how to name our tools, a careful examination of the tools of the trade, and of the uses to which they can be put, will surely enable us to begin work with less risk of cutting our fingers. Irony is not by any means the only dangerous implement in the box, and

figures of speech are edged tools, and accidents will happen to the beginner even if he merely mistakes an analogy for a resemblance, as the author seems to do (p. 309). The chapter on Figures of Speech is really confined to Metaphor and Simile, but, after all, we forgive its inadequacy in gratitude for having recalled to us the story of the young preacher who, having described a man without faith or hope as "the captain of a crewless vessel, upon a shoreless sea," exclaimed, almost inevitably, by way of peroration, "Happy would such a man be to bring his men to land."

The value of this book lies in its practical advice, a good deal of which will not be found anywhere else. "Writing for the Press" has nothing to do directly with speaking or debate, but every speaker or debater sooner or later has to make use of the press as a medium for communication with the public, and in this chapter he will find some golden rules, accompanied by perfectly clear explanation of the grounds on which they rest. It is the first impulse of any one who is misrepresented to resent, to deny, and to attack the person misrepresenting. The readiest means are furnished by the newspapers, which are only too glad, if the persons concerned are at all well known, to print communications on such subjects. But how few persons remember that the editor will also print the reply, and that he too has the final power of deciding when the controversy shall stop, and what view as to its merits the newspaper which has made it public shall express.

A controversy of this kind has usually an effect not dreamed of by the person who begins it—that of hugely delighting the editor who "opens his columns" to it, the people who read it, and especially the friends and acquaintances of the parties. So full of peril is this species of self-vindication that some eminent men think it best never to reply to any attack—but this course is not open to every one. If a public reply must be made, the golden rule for the person who desires to vindicate himself is to avoid doing what he is most strongly tempted to do—impute an evil motive, of some sort to the person written about. "Even if he thinks he has been wilfully misrepresented by an adversary, a reporter, or by the editor, he had better not say so," first, because he can hardly ever be sure of it; second, because he can hardly ever prove it. The capacity for honest misapprehension and perversion is so diffused among mankind that there can hardly ever be any certainty that misrepresentation is wilful, and we may add as a final reason that an antagonist will have no difficulty in making the same charge in reply, while, owing to a universal human instinct unnecessary to analyze, there is nothing in the world that mankind at large enjoys so much as hearing persons of note call each other names and make mutual charges of villany.

In the same way the chapter on the "Theory of Epithets" contains much valuable advice, and brings out strongly the underlying principle of modern parliamentary debate—the assumption that all antagonism springs from honest difference of opinion, and therefore can be removed by argument. This assumption is not necessarily true. Interest, prejudice, passion, hatred, envy, and malice are often at the root of differences even with regard to points of constitutional law, and many an opinion is not founded on conviction, but is used as a mere weapon of attack. Nevertheless, it is the boast at once of the most civilized and the most successful forensic art to treat an adver-

sary's opinions as error and not as produced by original sin. Mr. Holyoake points out that the best practical test of what are allowable epithets or imputations in debate is to ask, Should we consider this fair debate if applied to ourselves?—a test which is at once good morals and good sense.

In conclusion, it may comfort the few readers who do not feel themselves to be already accomplished orators, to find that Mr. Holyoake's study of the subject confirms the view, so often repeated and so often forgotten, that, no matter what the natural gifts of a speaker, the greatest oratory has been always the product of unflagging industry and laborious preparation.

Feudal England: Historical Studies of the XIth and XIIth Centuries. By J. H. Round. London: Swan Sonnenschein & Co.

THIS book—in part reprinted from the *English Historical Review*, but in the main new—is one of the most important contributions to the knowledge of mediæval English conditions that have appeared of late years. For a decade or more after the appearance of Professor (now Bishop) Stubbs's first volume of 'Constitutional History,' the movement of thought in that field took the direction chiefly of the appropriation and popularization of his conclusions: but during the last ten years or so there has been a fresh impulse towards further investigation; and this further investigation has had the result, partly of securing greater precision, partly of undermining some not unimportant positions even of the great Bishop himself. In this work four scholars have pre-eminently distinguished themselves, and stand head and shoulders above all others—Mr. Seebohm, Prof. Vinogradoff, Prof. Maitland, and Mr. Round.

Mr. Round remarks, in more than one place, that while the task of the last generation of scholars was to interpret the "chroniclers," the task of the present is to supplement and correct that evidence by recourse to the "records"; and the remark is just. Not that the "records" were never consulted before: it was Palgrave who did most to make them accessible; and even Freeman made a good deal of use of the Domesday Book. But what is new is the effort, not to pick out mere illustrations or proofs for opinions otherwise formed, but to master the records as wholes, to determine their exact relations *inter se*, to analyze their contents, and to let the facts themselves spontaneously fall into significant order. And this result is what, in the volume before us, Mr. Round has gone far towards bringing about with the record of the great survey of William the Conqueror and the documents that cluster around it.

Setting out from the *Inquisitio Comitatus Cantabrigie*, and comparing it on the one side with the *Inquisitio Eliensis* and on the other with the Domesday Book itself, Mr. Round first reaches the important discovery that among the "socmen" there were two kinds of tenure, "thegnlund" and "soke-land," distinguished by important differences. He then produces some new and quite conclusive evidence in support of Mr. Seebohm's contentions that the *caruca* of Domesday always meant a plough team of eight oxen, that the *hide* contained four *virgates*, and that each *virgate* contained thirty acres—though he guards himself by inserting *geld* before each of the terms *hide*, *virgate*, and *acre*. His conclusions, that is to say, are limited to the assessment of land for the purpose of taxa-

tion, and the relation of this assessment to agricultural management is left undetermined. Next comes the most exciting discovery of all, viz., that in the "hidated" portions of England, the "hidation" was evidently arranged in multiples of a five-hide unit. In a large number of cases the "Hundred" itself was reckoned at a hundred hides—a fact that clearly has a direct bearing on the origin of that territorial division. Nor is this all; there is much to make it seem probable that "it was the Hundred itself which was assessed for geld, and which was held responsible for its payment." Moreover, it is clear that "the part which is played in the hidated district of England by the five-hide unit is played in the Danish districts by a unit of six carucates." In the Danish districts there were probably some other peculiarities; chief of them a small "Hundred," usually composed of 12 carucates, and forming a subdivision of the Wapentake. But the broad distinction between the five-hide-unit area and the six-carucate-unit area is beyond doubt, and indeed lies on the surface of the evidence, when once it has been pointed out; and it will have to be taken into account by all future writers.

The other main theme of the book is the origin of knight's fees. Here Mr. Round's view is not quite so novel, for he has already presented it in the pages of the *English Historical Review*. Taking for his point of departure the returns made to the Exchequer in 1166, to which hitherto but scant attention has been paid, Mr. Round argues convincingly that the view generally accepted, on Dr. Stubbs's authority, is altogether mistaken; that instead of the Norman Conquest making no change save in the direction of greater definiteness in the obligations resting on the landholders, and these obligations continuing to be determined by the hidage or value of the holding, the tenants-in-chief received their fiefs from the Conqueror to hold of the Crown by a definite quota, fixed more or less arbitrarily, of military service. Strictly speaking, this is but "a theory," for no contemporary account of an enfeoffment on such terms has hitherto been found: but Mr. Round's argument backward from the known to the unknown makes it difficult to escape some such conclusion.

To these epoch-making papers on Domesday and knight-service, Mr. Round adds a number of articles of less moment, though those on "The Alleged Debate on Danegeld in 1163," and "The Oxford Debate on Foreign Service in 1197," are not to be overlooked in any consideration of the constitutional position of the Church. He adds, also, and here we cannot but think him not altogether well advised, a selection from his *Quarterly* and other papers on Mr. Freeman's account of the battle of Hastings. The quantity of argumentative writing on the two sides is so great, Mr. Round and Mr. Archer are both such good mediævalists and such honest scholars, the question as to the "palisade" has been so confused by the introduction of the side issue of the "shield-wall," that a reviewer will hesitate long before he commits himself to a positive conclusion. After all, there are many other points wherein Mr. Freeman's incomplete information and over hasty judgment can be shown with far less question. Moreover, the current of historical thought is rapidly turning away from the sort of anticipatory democratic enthusiasm which colored all Freeman's judgment of past institutions. Very soon Freeman's work will come to be estimated aright, both in its strength and its weakness; and meanwhile we grudge time and energy spent

on the "palisade," which Mr. Round, we feel sure, could turn to better account.

It is curious to contrast Mr. Round's outspoken and not over-sympathetic criticism of Freeman with his carefully reverential attitude towards Dr. Stubbs. Doubtless Freeman was less adequately equipped for writing the history of the eleventh and twelfth centuries; doubtless his more positive temperament led him to more definite statements, while his friend avoided committing himself; but we cannot help asking ourselves what Mr. Round would have said if Dr. Stubbs had been, let us say, a German scholar, and not an English Conservative. For, in spite of Freeman's extravagances and Dr. Stubbs's moderation, the underlying conceptions of both were substantially the same—just as the Radical theory and the Whig theory of government are at bottom identical. Both, like Waitz, their German exemplar, seem to have carried back to the past the ideas of equality and self-government which have characterized our own age. The destructive process which Mr. Round has set going will not, it may be anticipated, stop with Mr. Freeman.

The time has certainly come for constitutional history to be written by Conservatives. And yet the presence in this admirable volume of a few pages (394-396), rather more in place in the *Quarterly Review*, suggests the reflection that if Liberal spectacles are not altogether satisfactory for looking at the past, Conservative spectacles are not to be altogether trusted for a complete view of the present.

Memoirs of Frederick A. P. Barnard, D.D., LL.D., L.H.D., D.C. L., Tenth President of Columbia College in the City of New York. By John Fulton. Columbia University Press (Macmillan & Co.). 1896.

WHOEVER expects to find in these memoirs a complete disclosure of those qualities of Dr. Barnard's personality which invested it with a certain halo in the popular imagination, will be disappointed. Something is here to account for that halo—his enthusiasm, his progressive spirit, an undying boyishness in him, responding to the boyishness of his students in one college after another, and securing for their offences generous consideration; but there are other things set down as frankly which make the halo dimmer for our instructed mind than it was when we set out.

Born in Sheffield, Mass., in the year of many great ones, 1809, at the tender age of four he was being schooled by Orville Dewey, the distinguished Unitarian preacher. But, though his education began so early, it was throughout extremely imperfect, and he did not consider that he was ever really educated at all. It is an interesting circumstance that, in the Stockbridge Academy, Mark Hopkins, afterwards the President of Williams College, was continually pitted against Barnard in all sorts of generous intellectual rivalries. Barnard's admission to Yale and his experience there repeat in a general way many other accounts that we have had of the feebleness and slackness of the college at and about the time of his attendance (1824-28). Not having studied arithmetic at all since his childhood, he devoted a few weeks to cramming it, and so discovered the beginning of an aptitude which afterward grew steadily with his growth and strengthened with his strength. At his graduation he was next upon the honor list to Horace Binney, jr., who excelled him in his classics. Barnard was the youngest student in his class.

His predilection was for the law; but inher-

ited, incurable, and increasing deafness compelled a different course. The chapter on his life in Hartford, whither he went directly from college, with glimpses of Catherine and Harriet Beecher, George D. Prentice, Whittier, Park Benjamin, and Fanny Fern, is the most entertaining in the book. He was a man of orations, and his first one was prepared for a Fourth of July celebration at Sheffield in 1829. It was a plea for the Colonization Society's plan of negro deportation. But even this was too radical, the village Elders thought, for popular approval, and he substituted for it one of the regulation sort. His deafness carried him back to Hartford, after a year's tutorship at Yale, to teach in Gallaudet's Deaf and Dumb Asylum, from which Gallaudet had just retired. Similar work followed in New York, whence in 1838 he went to Alabama and remained there until 1854, as professor of mathematics in the infant State University, which on his arrival had just been completely broken up by the insubordination of the students and the resignation of the faculty. Politics as well as education interested him, and an oration which he gave at Tuscaloosa, July 4, 1851, is here reproduced entire. It did not go very near the heart of the matter. The connection of involuntary labor and respectable idleness as cause and effect was the most vigorous thrust. With a mental reservation in favor of slavery, he was eloquent for the Union as "a peaceful asylum of the oppressed"—"the fettered thousands of other lands." As time went on, Dr. Barnard's complicity with the industrial system of the South became much more pronounced. Going to Oxford, Mississippi, as Chancellor of the State University, he ultimately became subordinated to what he worked in to a remarkable degree for a New Englander of education and character. As his biographer says:

"He accepted slavery as an unwelcome fact; he acquiesced in it as an established fact; he defended it as a fact that could not, in his opinion, be annulled or eliminated from the social state of the South; and finally he participated in it by becoming, of his own will, a slaveholder."

Subjected to suspicion, he replied: "I was born at the North; that I cannot help. . . . I am a slaveholder, and, if I know myself, I am 'sound on the slavery question.'"

As the catastrophe drew near, "he was equally indignant at the Northern agitators who were ready to imperil the Union for the sake of hastening emancipation, and at the Southern agitators whom he believed to be plotting the disruption of the Union." "There is not," says his biographer, "the slightest doubt that in his heart of hearts he was a Union man; but he behaved with such consistent prudence that his sentiments exposed him to no danger." Here, and in this connection, it is impossible to avoid a sense of something unsympathetic and sarcastic in the tone of the biographer. Leaving Mississippi, Dr. Barnard remained quietly at Norfolk for some time, and on the fall of that place in May, 1862, he passed within the Northern lines. His doubts were now completely dissipated, and in a little while he was a flaming Unionist, publishing in 1863 a "Letter to the President of the United States by a Refugee" in which slavery was denounced as something worse than "the sum of all villainies." His biographer comments severely on this letter, going so far as to deny that he was a "refugee" in any proper sense of the word. There is something of the manner of Purcell's *Life of Manning* in the remark that, as a consequence of

this letter, "his appointment to some permanent position of honor and usefulness at the North was assured; and, on the resignation of President King, he was elected as President of Columbia College."

The longest chapter in the book gives a brief history of the College, and in the four succeeding chapters the salient points of Dr. Barnard's administration are clearly brought out—his sympathy with scientific studies, with an elective course of study, and with the higher education of women. It is not without good reason that Columbia's College for Women bears his name, although its success may be regarded as an injurious criticism on the method of coeducation for which Dr. Barnard strove, but which he was unable to secure.

Algebra und Logik der Relativen, der Vorlesungen über die Algebra der Logik. Von Dr. Ernst Schroeder. Leipzig: Teubner. 1895. Vol. I., Part I. 8vo, pp. 649.

SCHRÖDER'S great treatise on deductive logic, the most extensive that has ever been written, cannot well be neglected in Germany; and it is hard to imagine how any person who has been through the work can ever be again guilty of such logical absurdities as have been scattered hitherto through the very best of German text-books. Everything, or almost everything, so far written about the logic of relatives has made use of some kind of technical algebra. The result has been to convey the idea that the logic of relations is an exceedingly specialized branch of logic. This is not true. At least, those who cultivate it maintain that it is much more general than ordinary logic. They hold, too, that our ordinary reasoning, so far as they are deductive, are not, in the main, such syllogisms as the books have taught, but are just such inferences as are particularly dealt with in this new branch of logic.

To make this plain, they point to the fact that the old syllogistic inference can be worked by machinery, but characteristic relative inferences cannot be performed by any mere mechanical rule whatever. Alike in the forms of inference which they have added to logic, and in the old syllogism, the relativists trace the following steps: first, the choice of premises, and second, the bringing together, or colligation, of the premises chosen, and the union of them in one conjunctive proposition. They show that, even in non-relative logic, there are occasional cases in which there are different ways of connecting premises; and, in the logic of relatives, the ways are simply innumerable, for it makes a difference *how often one and the same proposition is taken as a premise*. This being the case, it is plain that a machine cannot indicate the conclusion from given premises, since the number of such conclusions is endless. The different premises having been united into one, this one is subjected to certain inferential transformations, which in the case of ordinary syllogism can be analyzed into two steps. Following upon these, there is a substitution of a "term of second intention," or logical conception, for an ordinary conception of experience; and, finally, this logical term is removed. At every step of this there are different courses which reason may pursue; so that the conduct of the reasoning far transcends the powers of any machine. Nor can our ordinary procedure in thinking possibly be mapped out in advance by turning the crank of a machine.

We will not find fault with Dr. Schröder for devoting his own researches to the solution of problems which American thinkers had put

aside as of inferior interest, on account of their special and technical character; for every inquirer should follow his own bent. Besides, it is extremely useful to place within reach of German philosophers a work which may train them to a really precise logic. We repeat that it would be needless to fear that the work will be passed over in neglect and silence. To affect to treat such a treatise with contempt would, in Germany, expose any man who might attempt it to severe blame. It cannot, therefore, but prove a useful book. Another "Abteilung" of it still remains to appear, although nearly 2,000 large octavo pages are already before the public; and we may hope that, in that concluding part, Dr. Schröder may yet show how some of those who have laid the foundations of this method of studying logic, conceive that it ought to modify those general notions about reasoning and other mental processes which are expressed or implied in the hurried talk of the street, and leave their traces upon all our thought, and also how it ought to modify our general philosophical conceptions—conceptions based far more upon logical analysis than upon anything else.

As this is a branch of study in which American students have done more than their share of the work, our readers may like a slight hint of what the nature of the new light is supposed to be. First, what is the Logic of Relatives? It is a subject treated in all the more complete mediæval handbooks, and hinted at by Aristotle. But it was Robert Leslie Ellis, the editor of Bacon's philosophical works, who first got some idea of how it ought to appear in a modern shape. Namely, instead of analysing a proposition into subject and predicate, it analyzes it into subject, predicate, and objects—which last it conceives as so many additional subjects. In 1868 Augustus De Morgan published a long memoir on the subject, in which, besides establishing many important truths, he clearly showed that, instead of being a special branch of logic, it is, in fact, a great generalization of the old conceptions. In 1870 appeared the first of a series of contributions by an American writer, Mr. C. S. Peirce, one of which forms the acknowledged basis of the present volume by Dr. Schröder, who, however, has remodelled the whole and made extensive additions. Other Americans have materially advanced the subject, especially Prof. O. C. Mitchell of Marietta, to whose work both Dr. Schröder and Mr. Peirce attach a high value. Students all over Europe have done good work, most of them following more or less closely the methods of Peirce. Mr. A. B. Kempe, however, formerly President of the London Mathematical Society, in an important memoir in the Philosophical Transactions, has struck out an original path.

The first general notion of logic which becomes profoundly modified by the study of relatives, is that of deductive reasoning itself, which the old logic represents to be something purely abstract, intellectual, and virtually mechanical. The new school not only declare that deduction is regulated by choice and a deliberate plan, but, further, that it reaches its conclusions by observation; in fact, they hold that it differs from inductive reasoning mainly in this, that it observes objects of our own creation—imaginary or graphical—instead of objects over which we have relatively little control. This doctrine is not unlike Mill's analysis of the "pons asinorum." It is a two-edged weapon, cutting both of the great philosophical doctrines pretty seriously.

Another common notion of a logical kind which is strangely transformed by the new

views is that of generalization. The generalization of the books is, for the Relativists, merely the simplest and least important variety of a process which we will refrain from defining, but of which an example is the passage of thought of the geometer by which he comes to conceive that a straight line returns into itself.

Le Tartuffe des Comédiens. Par P. Régnier. Paris: Ollendorff. 1896.

THIS is a really fine and instructive piece of work. M. Régnier's intention had been to publish an edition of Molière from the actor's point of view, and probably no man is better qualified for the task; but advancing years have circumscribed his ambition, and the present volume is the only one he expects to bring out. This is a disappointment, for "L'Avaro," "Les Femmes Savantes," "Le Misanthrope," "Le Malade Imaginaire," annotated and accompanied by studies such as these in "Le Tartuffe," would be of the highest value to students of Molière and of literature in general. The actor who has, to use the French expression, to get into the skin of the character he is to play, must of necessity study that character in its every aspect and in its relation to every other character in the play, to the tone and to the purposes of the play. That is, he must do precisely the sort of work that any genuine student of literature must do in order thoroughly to understand the author and his productions. Every line, every word then becomes important; nothing must be alighted, still less overlooked. The analysis must be exact and it must be comprehensive. And these words fitly characterize the studies and notes of M. Régnier. It is quite safe to say that every lover of Molière, every investigator of the character of *Tartuffe*, will find in this book some new point or some new light upon certain parts of the complex characters of *Tartuffe* and *Elmire*.

M. Régnier discusses the question of the real character of the impostor as a necessary preliminary to the indication of the manner in which it is to be played, and he comes to the conclusion that, to make even a partial buffoon of him, to exaggerate the possibly comic side, is to err gravely. In other words, without naming Coquelin the elder, he condemns the travesty of *Tartuffe* which that commercial actor presented to American audiences after having inflicted it on French ones. The play is a comedy, no doubt, and contains scenes of the highest style of purely comic art, but it goes far beyond that: it is a powerful drama, in which terror thrills the spectator. *Tartuffe* is not only a hypocrite whose sanctified tone and upturned eyes disgust, but a formidable scoundrel, utterly unscrupulous and deadly in his vengeance. These points are admirably brought out by M. Régnier, who has not failed to perceive in the depth and power of Molière's genius, as exhibited in his celebrated play, a kinship to Shakspeare's philosophy and profound insight into human nature. Molière's "Tartuffe" stands among the great masterpieces of the French drama, alongside of Corneille's "Polyeucte" and Racine's "Phèdre."

The modest manner in which M. Régnier urges his points and indicates interpretations is very winning, and lends a singular charm to the numerous notes and explanations. Especially worthy of close attention and sure to yield much food for profitable study are his comments on *Elmire*, on the famous "pauvre homme" scene, on the great scene of the unmasking of the hypocrite, and on the final

catastrophe. A series of volumes of this description, taking up the masterpieces of French classical tragedy and comedy, would be of incalculable help to teachers and students of literature.

The Silva of North America. By C. S. Sargent, Director of the Arnold Arboretum of Harvard University. Illustrated with figures and analyses drawn from nature by Charles Edward Faxon. Vol. IX. Boston: Houghton, Mifflin & Co. 1896. 4to, pp. 190, plates 57.

THE ninth volume of Prof. Sargent's 'Silva' contains descriptions of the arborescent species of *Cupuliferae* which remain after the oaks are disposed of. The latter were brought into volume 8. First come the chestnuts and their nearest allies; then follow in succession the birches, alders, and myricas, and lastly, the willows and poplars. Illustration and treatment continue substantially unchanged. The beautiful plates are full of instructive detail, and exhibit the artistic feeling which has characterized all those which Mr. Faxon has given us before. He is particularly successful in imparting spirit to his larger figures, giving to them an air of freshness and elasticity which is as far removed as possible from the conventional drawings of plants found in many treatises. There is not, at any point, the slightest sacrifice of accuracy for the sake of securing this spirited effect: Mr. Faxon is too profound and true a botanist to permit this; therefore his figures and analytical sketches possess the highest degree of permanent value.

In the present volume the chestnuts are introduced by the great golden-leaved chinquapin of the northwest coast, a tree sometimes reaching the height of one hundred and fifty feet, with a trunk clear of any branches for more than a third of this distance, and ten feet through at the base. It is a member of an interesting genus, *Castanopsis*, which may be fairly recognized as a connecting link between the oaks and the true chestnuts, and is most fully represented in southeastern Asia. Of the true chestnuts we have two within the limits of the area of the 'Silva,' the chinquapin, *Castanea pumila*, and the large chestnut so widely known to all our readers. The latter species masquerades in the present volume under the specific name *dentata*, having had to resign the name it was known by in Prof. Sargent's work on the 'Forest Trees of the United States,' for the tenth census; but it is in good company, since its near relative, the beech, has had to take the name *Fagus Americana* in place of the one used before by Prof. Sargent, *ferruginea*, as well as of the one which has been adopted by a late catalogue, to wit, *atropurpurea*. These serious triflings over names are not rendering the study of botany very attractive nowadays. Out of the confusion which precedes a rearrangement there comes a good deal of annoying dust which may be even blinding. It seems, as we have said before, in noticing previous volumes of this work, a pity that the 'Silva' should share in the confusion incident to the times. Many of the names adopted in the 'Silva' cannot satisfy those who are thoroughgoing in their reform; for instance, they cannot be attached to the trees in the proposed New York Botanical Garden, and they do not satisfy the conservatives who have asked that changes should be made only where they are absolutely necessary.

After this comment has freed the mind of the reviewer from all sense of complicity, no

thing but praise remains for the text. Prof. Sargent and his associates have done all of their work well, and have cast most of it into convenient form. Six species of birch are treated of, five alders, and three myricas, one of the latter being the wax-myrtle, or bayberry. This last is known on the northern Atlantic coast as a pleasant, sweet-smelling shrub, but along the Gulf it becomes a tree forty feet in height, and claims a place in the 'Silva.' The willows, always a difficult group, because they intergrade so freely and are separated from each other only by characters which depend on flowers, and leaves which have to be collected at different times, have been well elaborated in this work. The resources of the Arnold Arboretum have placed at the disposal of the author and artist a wealth of material for description and delineation which is virtually without a rival. The fresh material could be examined at the most favorable times, and the results are apparent in the excellent discriminations. The same may be said of the treatment of the poplars, with which the volume ends.

The Structure and Life of Birds. By F. W. Headley, M.A., F.Z.S., etc. With 78 Illustrations. Macmillan & Co. 1895. 8vo, pp. xx, 412.

"THE aim of this book is an ambitious one. It attempts to give good evidence of the development of birds from reptilian ancestors, to show what modifications in their anatomy have accompanied their advance to a more vigorous life, and, after explaining, as far as possible, their physiology, to make clear the main principles of their noble accomplishment, flight, the visible proof and expression of their high vitality. After this it deals, principally, with the subjects of color and song, instinct and reason, migration, and the principles of classification, and lastly gives some hints as to the best methods of studying birds."

Our author seems to have lectured on ornithology to his classes and others, and very probably his book represents a syllabus of such discourses. It is largely a treatise on anatomy, with special reference to the evolution of the flying organism and to the physiological mechanism of flight. This is his main insistence, where he is at his best; the "after this" of the above quotation brings the programme to its conclusion at an accelerated pace. The leading facts of avian structure are concisely set forth in the simplest possible terms; the evolutionary features of the case, which no one has doubted since Huxley coined such words as *Sauropsida* and *Ornithoscelida*, are clearly traced. At the same time, we fear that the author brings the pterodactyls into too clear a light, so to speak. All he says is true enough, properly interpreted; but a reader might easily get an impression, not intended to be conveyed, of closer relationships between pterodactyls and birds than actually exist. This old reptilian mechanism for flight was a side-issue, like the present chiropteran modification among mammals to the same volant ends, and not in the direct line of avian descent from dinosaurian ancestry. The author ought not to be misunderstood in this matter, but he is likely to be, on the part of a good many readers. This portion of the work is the best illustrated of any, with numerous clear cuts of the somewhat diagrammatic sort, which are practically more helpful in anatomy than a more perfect representation of the actual intricacies would be. The diction is equally clear; it is crisp, with use of short words instead of long ones as far as possible, showing that the writer is no novice in his craft, though we note a number of misstate-

ments of facts which he could easily have avoided with more care and less haste in making printer's copy.

"Whether all that Mr. Headley says of flight will be found agreeable with the consensus of expert opinion on that subject, can be better foretold after the event—namely, when experts shall have come to any considerable agreement among themselves. The author has evidently been a close observer of the facts in the case; he handles them well and comes to some definite conclusions. He also has due regard to the results of others, such as Marey, Alix, Gadow, Fürbringer, Pettigrew, Muybridge, and many more; he is quite competent to discuss the mechanical principles involved, as well as anatomical structure and physiological action; he inclines to credit some of Gätke's views regarding great heights and velocities; altogether, he is well equipped for the aerial expedition—even for the soaring crux of the problem. Yet after all comes this warning, not to say wailing, note in conclusion:

"This ends my account of flight. Much, I hope, has been made clear, but much remains that is inexplicable. Mathematicians will, no doubt, some day arrive at a formula of flight that will claim to be a complete solution of the problem. Nevertheless, birds will still excite the wonder of men. Even those who can quote the formula at a moment's notice will, when they look at a swift doing his sixty miles an hour for mere play, or if they happen to see a soaring adjutant, relapse for a moment into blank astonishment, the mental state of the Pacific islander when a steamship first invades his lonely seas and claims a place in his philosophy. It will always be difficult to forget for long together that, however much is learnt on such a subject as flight, a great deal more remains to be learnt."

Gätke might have written that, and it is always the same when an able, honest observer lays down his quill, and feels how blunt the nib has worn after all he has done. As to swifts doing sixty miles an hour for play, the present reviewer has seen one of them, *Aëro-nautes melanoleucus* (after Baird, or *saxatilis*, after Woodhouse), doing nearer 260 miles an hour with perfect ease; and a relative of the adjutant-bird, our wood-ibis, *Tantalus loculator*, soaring on motionless pinions a mile or more high, thermometer 115° in the shade, air dead calm (at least where he stood), giving some color to the suggestion that has been made that such birds go aloft to enjoy a nap on the wing in some cooler upper air.

The rest of the book need not detain us much further than to mildly criticize the chapter on principles of classification, which hardly seems up to the mark. Perhaps, however, the author meant to be taken literally, and did not meditate the desirable application of those principles to any extent; for his principles are sound enough. His refutation of the supposed function of chalazæ in making the yolk stay right side up when the egg is rolled over, will worry those who have written in the wake of Owen on that subject. The hoatzin article is a good one—few realize that all such lizard-like birds did not leave the world's stage with the archaeopteryx. The book is indexed, if hardly with the minuteness which would have been desirable, and its excellence of manufacture is up to the standard which Messrs. Macmillan have taught us to expect in the issues of their house.

Campaigning in South Africa and Egypt. By Major-General W. C. F. Molyneux. Macmillan. 1896. Pp. viii, 287, 8vo.

THE larger part of this volume is devoted to an account, by an English staff-officer, of the Kafir and Zulu wars of 1878 and the fol-

lowing year. To the non professional reader its chief interest lies in the personal incidents, which are well told, and the pen portraits of well-known characters, as Sir Bartle Frere, the Prince Imperial, and Lord Wolseley. Regarded as a history, Gen. Molyneux's narrative is somewhat obscure and hard to follow, even with the aid of his sketch-maps, and is overloaded with technical details. Two facts, however, are very clearly shown: the great difficulty of the country for carrying on military operations, and the valor and extraordinary discipline of the Zulus. From an incident in the closing days of the war, it is evident that they had also a high sense of honor. In this they stand out in sharp contrast to the Boers, judging from the manner in which these treated a comrade of the author's who was so unfortunate as to fall into their hands during the war for the independence of the Transvaal. A most graphic description is given of some of the circumstances connected with the death of the Prince Imperial. The anecdotes related confirm the common impression of him as an impulsive, high-spirited youth, impatient of restraint and burning with a desire to distinguish himself.

There is little that is noteworthy in the General's account of the campaign against Arabi Pasha in 1882. The principal point emphasized is the extraordinary secrecy which Sir Garnet Wolseley kept in regard to his plans—the late Sir Edward Hamley, then commanding the second division, not being informed of them till the army and fleet were in motion. Gen. Molyneux, in describing his life in the desert during the days preceding the battle of Tel el-Kebir, calls attention to a fact, which we do not remember to have seen mentioned before, "That horses do not seem to be deceived by mirage. No matter how thirsty they may be, they never rush wildly to what you imagine to be a lake; and if you know your horse well, after a time in the desert you can always tell by his behavior whether the four-legged dancing thing you are approaching is a horse or a camel."

The Nation.

NEW YORK, THURSDAY, APRIL 30, 1896.

The Week.

THE platform of the Massachusetts Democrats is, as regards the currency, as good as any platform yet made. It adheres to the gold standard; denounces free coinage of silver and purchases of silver; demands the withdrawal of the greenbacks; denounces the legislation of 1878 for their reissue; calls for an elastic "banking currency," and praises civil-service reform. But the best thing it does is presenting the name of William E. Russell as a candidate for the Presidency. No candidate as yet spoken of has as much claim to fill Mr. Cleveland's place. Mr. Russell has already for three terms filled the governorship of a Republican State to the eminent satisfaction of both parties. He is still young and vigorous. He belongs to the new school of politicians who are to save this country from the old ones, if saved it can be. He is the only candidate yet spoken of, of whom no criticism can be made except that he is too good for his party, and that it is not capable of electing him, though it has twice elected Mr. Cleveland. He is one of the few men whom it would honor itself by electing. After what happened to Mr. Cleveland in 1884, and above all in 1892, we shall not say that Mr. Russell has no chance; but both his nomination and election seem too good to be likely. Of all the men who have been yet spoken of for the place, he is the one of whom it can be said that, not only on the currency, but on every matter which concerns the national fame and prosperity, he is himself a platform. We should not need to ask him what he thought about this or that or the other thing, but simply: "Are you the William E. Russell who was Governor of Massachusetts from 1890 to 1893?"

The Republican party of Pennsylvania touched the lowest level of political degradation when, in convention assembled, on Thursday, it declared unanimously in favor of Matt Quay as its candidate for the Republican Presidential nomination, calling him "wise in counsel and brilliant and able in action—at once the type of the American citizen, scholar, soldier, and statesman." Who would suppose, from this description, that the object of it was exposed only a few years ago as a defaulter and embezzler of public funds, placed in his charge as a State official, and that the full evidence of his guilt had been published in newspapers and pamphlets and circulated widely over the country? Had not his political friends made good the loss to save their party from scandal, he would have been sent to the penitentiary for his crimes. Yet now the Repub-

lican party in the strongest Republican State in the Union puts him forward as the "type of the American citizen, scholar, soldier, and statesman," and the chief Republican organ of the State has nothing more severe to say of it than this: "The general feeling was in favor of giving the Senator the prestige and position which come from such an expression, and, so far as his own candidacy is concerned, he will stand before the country with the State convention and a large portion of the delegation at his back." Yet this is the same newspaper which said in 1885, when Quay proposed to nominate himself for State Treasurer, that his nomination "would take the lid from off the Treasury and uncover secrets before which Republicans would stand dumb." Nothing seems to stand so dumb now in the Republican party of Pennsylvania as its moral sense.

Grosvenor and Manley put out their customary Monday-morning claims for McKinley and Reed, respectively, and are still able to do it without a smile. Each has accurate information, based not on press reports or general rumor, but upon exact telegraphic data derived at first hand from the delegates-elect themselves. Grosvenor's figures, on this irrefragable basis, are 444 for McKinley up to date, and the rest really not worth counting. Manley, on the same basis and with an equally earnest air of being careful to keep well within the truth, reckons McKinley 250, Reed 161, all others 217, and 83 doubtful or contested. The discrepancy argues many more "doubtful" delegates than Manley gives; many delegates must have telegraphed both managers that they were his, heart and soul. Mysterious "changes" are reported in the Oklahoma delegation: all six of them were at first conceded to Reed by the McKinley arithmeticians; now they claim four, on what grounds does not appear—perhaps Reed's belated gold-bug views have given the McKinley bankers a chance to effect a sound conversion. Manley throws out one hint, however, which is enough to chill the most Napoleonic. He intimates that he and his allies control the national committee, and so the temporary roll of the convention; that they will also control the committee on credentials, with all that the name implies. This suggests, no doubt, the true anti-McKinley strategy. Quay long ago gave it to be understood that something like one hundred so-called McKinley delegates would be "fired through the roof of the wigwam" when the convention got down to business.

This is a great year for veteran politicians in the Presidential race. Senator Allison, the Favorite Son of the Iowa

Republicans, will be sixty-eight years old when the next President is inaugurated; and ex-Gov. Boies of the same State, whom many Democrats want to enter in the contest, is some months older. Senator Cullom of Illinois is less than a year the junior of Allison. Mr. Morrison of Illinois is already well along in his seventy-first year, and Gov. Morton of New York is sixteen months older. Here are five men who either are septuagenarians already or will become such during the term of the next Presidency, and yet not one of them sees any ground of objection to his candidacy on this account. However, we have one youngster in the race, ex-Gov. Russell of Massachusetts being yet more than a year short of forty.

Speaker Reed has, barring his surrender to the Jingo crazes, kept the House firmly under bit and bridle. For speed and for reasonable economy in appropriating public money, the session has no doubt made an admirable record. But as adjournment draws in sight the wild horses begin to plunge and snort, and the Speaker apparently begins to cave in. The fact that his do-nothing policy has not seemed to mean delegates in his pocket may have something to do with it. The other fact, that his chosen lieutenants in the House, men like Cannon and Hitt, have made so spiritless a fight in their own districts against the McKinley boomers, may also have something to do with it. At any rate, he has felt compelled to do something, or pretend to do something, for the "old-soldier vote," and hence the general pension bill which the naughty Republican House is at last allowed to vote upon. When the pension bill itself was up earlier in the session, Mr. Reed saw to it that all the vicious amendments intended to let the Boys right into the Treasury were ruled out on points of order, despite the wrath of the true lovers of the veterans. But now he has given his consent to a general bill, weakening the defences of the Treasury here and there against the pension raiders, and doing as much mischief as can be done short of going the whole figure of a service pension. A wicked Democrat offered on Monday a substitute providing for a service pension, but this was indignantly denounced as an "attempt to put the Republicans in a hole." They insist upon doing all the putting in a hole themselves, the President's veto being what they aim at and hope for.

The success of the International Arbitration Congress at Washington, which adjourned on Thursday evening, was assured in advance, and the distinguished jurists, educators, and clergy, both Catholic and Protestant, who attended, lent the

weight of high character and great influence, as well as of sound reason, to the resolutions adopted. These recite the uncertain and oppressive nature of war as a means of settling international disputes, to say nothing of its immense evils, and affirm the superiority of arbitration, as well on grounds of material interests and permanency as because of the demands of religion, humanity, and justice. A settled system of arbitration established by treaty is urged as an immediate duty on the governments of the United States and Great Britain, and the extension of arbitration to all civilized nations at the earliest possible day demanded. Thus this congress has proved a fitting climax to the series of local congresses with the same object, and has given expression to the deliberate and intelligent opposition of the men of light and leading in this country to the whole Jingo madness that has been raging in press and Congress for four months past. A noticeable thing about the Washington gathering was the absence of Congressmen, even as spectators. They could not allow it to be supposed for a moment that they had aught in common with the most learned, intelligent, and philanthropic citizens of this country. As if sharply to emphasize their dissent from the congress, two of them chose the occasion for passing the lie in the capitol, and for throwing inkstands and everything movable at each other, while reaching for their knives. A Senator-elect covered with blood by the ferocious assault of a fellow-Representative is the appropriate answer of a Jingo Congress to an Arbitration Congress.

Louisiana's quadrennial election last week resulted in the defeat of a constitutional amendment by which it was proposed virtually to eliminate the negro vote, as was done six years ago in the neighboring State of Mississippi. This amendment proposed to require citizenship, involving a five years' residence, of the foreigner before he could vote, instead of giving him the suffrage upon his announcing an intention to become naturalized; and to require that a man, whether of native or of foreign birth, "shall be able to read the Constitution of the State in his mother tongue, or shall be a bona-fide owner of property, real or personal, located in the State and assessed to him at a cash valuation of not less than \$900." This was framed with the intention of being so interpreted and applied as to keep out nearly all the negroes and let in about all the whites. In order to provide for such whites as could meet neither the educational nor the property qualification, the amendment further proposed that the next Legislature should have power, by a vote of two-thirds of all the members elected to each house, and with the approval of the Governor, to modify, change, or amend this article of the Constitution, and that such modifications, changes, or amendments, when so adopted

and approved, should become a part of the Constitution without submission to the popular vote. This was the most extraordinary way of changing a constitution ever proposed, and it seemed so dangerous a method to many of the whites that they helped the negroes to defeat the whole amendment.

The Massachusetts Supreme Court has finally got at the latest attempt to "beat" the civil-service laws in that State, and has made as thorough work of it as our own Court of Appeals did of similar trickery. It decided on Saturday that the veterans'-preference law of 1895, which the late Gov. Greenhalge bravely vetoed, but which was noisily passed over his veto by the Republican Legislature, is unconstitutional. "Public offices," declares the full bench of the court, are not created for "the profit, honor, or private interest of any one man, family, or class of men," and "it is inconsistent with the nature of our government that the appointing power should be compelled by legislation to appoint to certain public offices persons of a certain class in preference to all others." Pensions may be voted to veteran soldiers and sailors, on the ground of services to the commonwealth, but it is not within the constitutional power of the Legislature to "give to veterans particular and exclusive privileges distinct from those of the community in obtaining public office." The mandamus prayed for is therefore issued to the Civil-Service Commissioners, the result of which will be to make all examinations hereafter truly competitive, and to compel those already appointed to office, under the law now pronounced null and void, to undergo an examination in order to retain their places. The decision comes as one more tribute to the courts and constitutions as our chief remaining bulwark against the spoilsmen. It will also serve to heighten the reputation of Gov. Greenhalge for sagacity as well as courage in withstanding the raging of the partisan mob.

Mr. Aldridge, the Platt Commissioner of Public Works, has been compelled to yield to the civil-service law, after a year of struggle against it, and has asked the Civil-Service Commission to hold competitive examinations for clerks in the canal department. Last year he defied the commission and the law, and appointed his own clerks, appealing to the courts to sustain him. The recent decision of the Court of Appeals has convinced him that the law is a real one, and is so strong that even the Platt machine cannot break it without suffering the consequences. He finds that if he appoints his subordinates in defiance of the law, he must pay their salaries himself, and this part of the business he does not enjoy. He will obey the law henceforth, expressing freely his contemptuous opinion of civil-service hum-

bug and of the Comptroller of the State in the meantime, by way of solace. The Comptroller is the chief object of his wrath, for if he had consented to violate his oath of office and pay the salaries of Aldridge's illegal employees, there would have been no trouble. We commend Aldridge's fate to Commissioner Lyman of the Excise Department, for sooner or later he will find that he must surrender to the law in regard to his employees.

The *Evening Post* publishes some extremely interesting information about the special "confidential" agents whom Commissioner Lyman has selected to execute the Raines liquor-tax law in this city and in Brooklyn. Great difficulty was experienced in collecting this information because of the obscure life which many of the seventeen special agents for this city lead. Their names are not to be found in the directory, and their addresses were not given at the time of their appointment, for reasons best known to their backers. Three days' search by the reporters failed in some instances to find any one who had ever heard of the appointee. The reason why such secrecy is desirable about careers of this kind is revealed in the brief sketches published. Only a very small proportion of the seventeen men selected for this city have ever followed any reputable business. Their records read like those of Tammany men which the *Evening Post* has published so frequently. Nearly all of them belong to the Boy class in politics, having spent their lives in "dealing" and dickering with Tammany, holding now and then some small political office, and spending most of their time in and around the saloon. In Brooklyn a respectable Special Deputy Commissioner, Col. Michell, was appointed for Kings County. He concluded that he would be allowed to select his special agents, who were to act under him, and he did select them. They were, as a rule, very good men, and went, accordingly, as a mere matter of form, for approval to the head office, where they were all dismissed and a set of Mr. Lyman's own, selected by Jake Worth, the Brooklyn Boss, appointed in their place. They are on the whole a better lot than the New York ones, the Republican party being in Brooklyn rather more respectable than in New York, but they belong to the office-seeking class, and it is fair to presume would eschew competitive examinations, and are distinctly worse than Mr. Michell's appointees. Mr. Lyman's object in refusing to make his appointments through competitive examinations, and his pretence that the positions are in any sense confidential, and that it was want of time which prevented his obeying the Constitution, are thus shown to be on their face dishonest.

The Mayor's approval of the bill forbidding the erection of advertising fences and boards within 350 feet of park entrances,

and along the sides of the parks, makes that most timely and desirable measure a law, probably, for there is no reason to doubt the Governor's approval. Under the law, the Park Commissioners will have power to order the removal of all present eyesores of this most offensive variety, including the monstrosity which has been erected at the head of the Riverside Drive during the past few weeks. Unless a law of this nature had been passed, we should very soon have been forced to ride, along many of our park approaches, through a double wall of garish bill-boards, decorated with all the horror of a sign-painter's skill. The Riverside Drive, with its many vacant adjoining lots, furnishes an exceptional field for this new system of torture, and it was being improved with an appalling recklessness and rapidity. The desecration will have to stop now, and all traces of it will be abolished without delay, for we cannot conceive of the Park Commissioners hesitating for a moment, after the law is signed, in the execution of what must be to them a pleasurable duty.

We do not see how the London *Times* can allow even its "own correspondent" in New York to go on insisting upon having a war over the Venezuela squabble, after Mr. Balfour's statements in the House of Commons on Monday. In fact, the news from both Washington and London gives the lie flatly to the *Times* despatches of last week. The Venezuela Commission give it out that a decision is not to be looked for from them for a long time to come. They also intimate, most unpleasantly, that they are far, as yet, from having any "unimpeachable evidence" that Venezuela ever owned a foot of land east of the Orinoco. This is strange. The Venezuelan case, we understood, was simply overwhelming. As for the British case, we saw that thoroughly "riddled" as lately as Monday in the *Tribune*. These Commissioners are evidently inflated by their own importance, and are ridiculously demanding proof better than that which satisfied the whole of Congress, the Secretary of State, and every well-equipped journalist in the country. No wonder Comptroller Bowler refuses to pay their rent.

If Mr. Chamberlain could have ridden through London in an open barouche with Oom Paul by his side as the captive of his diplomacy, it would have been a great triumph for him. But Paul is too sharp for him. He will not come to London. He will settle in South Africa British interference with the internal affairs of the Transvaal, and there is ugly talk of a racial war, and much fear that the present compliance, in spite of Krüger's prudence, may end in increased hatred and possible hostilities between the English and the Dutch in Africa, which would throw the country back fifty years

or more. Mr. Chamberlain's tone has been prematurely topping, and his advice to the Transvaal too patronizing. There is some reason to fear that things can go no further for the present in Africa, and that Mr. Chamberlain may have to carry out his scheme of a zollverein between England and the colonies. The day he is compelled to bring that about will be one of the saddest days in his history.

The French Senate had peculiar provocation, aside from its constitutional conflict with the cabinet, to make a stand for its rights on the vote for the expenses of the occupation of Madagascar. It was only on March 30 that the Government asked money on this account, it having been decided that the existing appropriation would expire on April 30. The Chamber hastened to vote the credit asked, and then adjourned till May 19. This made it necessary for the Senate to accept the bill precisely as it came from the Chamber, without the alteration of an item or a word, or else cause the whole to fail. The danger of thus limiting the Senate's right to amend money bills was pointed out in the Chamber, and that body was asked to adjourn only to a date when the Senate's amendments might still be considered before April 30. But this suggestion was promptly voted down (it is said, under direct prompting from M. Bourgeois), and so the Senate was put in the contemptible position of being dictated to by the Prime Minister. Its response was a flat refusal to vote the money at all until the ministry should recognize its constitutional responsibility to both houses of the National Legislature. On April 2 M. Bourgeois told the Senate that it might vote no confidence as often as it pleased, but that he would not resign. If, however, it dared to oppose him on a question of foreign policy, he would withdraw. He thought he could safely fall back on French Jingoism, but the Senate squarely met him, and resign he did, albeit with much backbiting and grumbling. The passive attitude of the President in all these cabinet squabbles is exciting more and more impatience among men anxious to see every reserve power of the Constitution put in play against headlong democracy and anarchy.

The outcries in France against the Senate are made suspicious by their origin. They speak mainly for the ardent wish of the Socialists and more reckless Radicals to get rid of about the last conservative barrier that stands between them and supreme control over legislation and government. It is not merely a nice question of constitutional interpretation or even of constitutional revision. A radical and socialistic democracy is fighting for a free hand. The Chamber's vote, by a large majority, that it must be preponderant in all conflicts over questions

of right, because it represents the principle of universal suffrage, shows the drift. So does the frenzy of the Socialists against the Senate. This existed and was expressed long before the present crisis. On April 12 the famous Bourse du Travail was thrown open again to the labor organizations. This public home of "labor," it will be remembered, had to be closed in 1893 by the Government, on account of the political agitation of which it had become a centre. M. Bourgeois, in keeping with his general radical policy, decided to open it again, stipulating that it should be used purely in the interests of "labor," not of politics. What the unions thought of the stipulation may be inferred from the opening ceremonies. Their spokesman declared that they had come back to their own, and would make the Bourse, as before, the home of a revolutionary propaganda. Cries of "Down with the Senate!" were heard on all sides, the band played "La Carmagnole," and a red scarf was thrown over the statue of the republic. All this was ominous, as were also the shouting mobs that have gathered to hear the Socialist orators.

For some months a violent agitation has been kept up by the medical students in Paris and Montpellier against the practice of admitting foreigners to the medical courses of the universities. They maintain that the influx of foreign students is reaching "disquieting proportions." In 1884 the number entered at Paris was 127; in 1894 it had risen to 169. This does not seem so disquieting a proportion in the total of 6,000. In the German medical schools there were, in 1892, no less than 4,077 foreign students out of a total of some 8,000. But, say the ardent medical protectionists in France, Germany does not allow one of these foreign students to practise medicine in the empire. We, on the contrary, are seeing our great winter resorts in the south of France gradually filling up with a motley array of German, Swiss, Russian, English, and even American doctors. This should be stopped. With the number of good native physicians increasing every year in disquieting proportions, how is the struggle for existence to be supported if the best part of the practice is turned over to interloping foreigners? But the hotel proprietors in the south of France reply that the prejudices of their foreign patrons must be consulted. The English, in particular, simply insist upon being drugged, embalmed, and buried by the loving hands of fellow-countrymen. Some unpatriotic physicians have also mildly objected that it is a good thing to encourage foreign medical students to come to France; that it spreads abroad the fame of French medicine; that it has actually increased the prestige and the fees of the leaders of the profession. The logic of protection is fairly lodged in the student mind, and we all know what terrible fellows the French are in proceeding to logical results.

GOVERNOR MORTON'S POSITION.

THE bill known as the Consolidation bill for the creation of "Greater New York" has passed both houses of the State Legislature over the veto of the Mayors of New York and Brooklyn, and now awaits the signature of the Governor. We have commented already on the methods used in its passage, on the contempt displayed by its promoters for local opinion, on the reliance, in the last resort, on Tammany for the necessary majority, as well as on the extreme smallness of that majority. Should Gov. Morton now sign it, he will, in the eyes of the great body even of his admirers and supporters, have completed the proof that he is in close alliance with Platt. The first instalment was his appointment of Aldridge last year; the second was his appointment of Lord on the Civil-Service Commission, and his removal of McKinstry without reason assigned; the third was his appointment of Lyman, and his uniting with him in an attempt to nullify the State Constitution in the matter of competitive examinations; the fourth will be his approval of the Consolidation bill.

These things suggest several observations, which we make with entire respect for Gov. Morton, but with little hope that they will produce any impression on him. There is no case on record of the nomination for President of a man suspected of being in league with a boss of Platt's description, or who had approved of a boss's methods in his own State. Two men, and two only, in the history of the United States, Blaine and Hill, have sought a nomination largely on the strength of their possession of the kind of skill in "getting delegates" which Platt displays. They both failed miserably. Blaine got a nomination, but it did him no good, for reasons a large portion of which will apply to Gov. Morton's case. In both instances, the voters dreaded to see transferred to Washington the arts and influences which had been successful in the locality from which the candidate came, or for which he was distinguished. Moreover, whatever the local boss may do, conventions nominate with a view to election. They nominate only men whom there is a fair chance of electing, and such chance it is not in Platt's power to give. He is a great man in Albany, but, in so far as his fame has spread beyond the borders of the State, it is malodorous. Outside the State, even among Republicans, he is an odious man. Any one who comes into the convention leaning on his arm will come heavily weighted. The convention will not be affected by the unanimity of the New York delegation, because they will not believe in its sincerity. Of all this, and a great deal more like it, Mr. Cleveland is a striking illustration. In 1892 he had to all outward appearance got no delegates, and was more hated by men of the Platt type in his own State than any one in the party. He had, in their estimation, no chance

whatever of either nomination or election. He was both nominated and elected, and carried his own State, with every jobber in his party hostile to him, by a plurality of 45,000. If Mr. Morton's reliance on Platt be justifiable, Hill ought to have been nominated and elected, and Croker ought to be Secretary of the Treasury or Secretary of State.

This State is carried at every election if not by the Independents, at least by persons of an independent way of thinking. We do not need to argue this point. We need only point to the election returns showing the way in which the majority shifts from side to side. It is this class, therefore, which any man who thinks he has a political future needs to cultivate. It is in this class that the bulk of Gov. Morton's friends are to be found. The only sincere rejoicing over his election in 1894 came from this class. It contains a large part of the intelligent, industrious, and thinking population of the State. It desires good government under the laws. It is hostile to bossism, to corruption, and to Caesarism in every form. For it, the Constitution of the State of New York and the Constitution of the United States are good enough. It desires to stand on the ancient ways, and earn its bread in thankfulness and honesty. It has seen with sorrow and apprehension the growth, in this State, of a system which leaves in neither State nor city a trace of American polity, and substitutes therefor the barbarous, secret, and venal ways of Oriental despots. It was glad of Governor Morton's election because he had filled several other places with honor and efficiency; because he was a gentleman, a man of means and integrity, who, it was believed, would neither countenance nor participate in "ways that were dark or tricks that were vain." That election was considered a protest not only against the financial heresies that were threatening the public credit in the nation at large, but against the process which was, in this State, gradually effacing party lines, and making the Republican leader not only an autocrat like the Democratic boss, but also a partner in Democratic villainies, and setting up a new sort of government, which completely deprived the people of their ancient remedy—the substitution of one party for another in the administration of affairs.

The qualities which, as has been shown in the past, conventions are most apt to honor, are courage and purity of character. For whatever purpose conventions may assemble, this is apt to be the outcome of them. It is not at all likely that Gov. Morton will receive the nomination in return for supporting Platt's schemes. Whatever this may do for him with the New York delegation, the supposition that he has hand, act, or part in Platt's form of government is likely to be fatal to his Presidential aspirations. Much as people have gone through, they are not yet

prepared to make the White House a Platt headquarters. If Gov. Morton wishes to succeed, he must keep clear of imputations of this sort, and, above all things, he must look after the reputation he will leave behind, whether he gets the nomination or not. This for him, at his time of life, is the main thing. The wretched creature who is trying to "run" and degrade him for his own purposes will soon pass into the same tomb as Tweed and Croker and Kelly, and, like them, be forgotten and despised. Gov. Morton expects better things of posterity. He wishes to live in men's memories as a gentleman at least, "whose armor was his honest thought, and simple truth his utmost skill."

ASSURANCE OF THE GOLD STANDARD.

THE tide now sets strongly, in the Republican party, toward the adoption in the national convention at St. Louis next June of a platform which will drop the nonsense about "bimetallism" and a "double standard," and declare as clearly and boldly against the silver heresy and for the gold standard as the plank adopted by the Connecticut Republicans last week, which reads as follows:

"We are unalterably opposed to the issue of unsecured paper currency, either by the Government or the banks, or the free coinage of silver, at any ratio, and favor a single standard of value, and that standard gold."

The only thing needed to convert hesitating politicians to this policy is a demonstration that the adoption of such a platform would insure victory in the election. Happily such a demonstration can easily be made.

The admission of Utah to the Union swells the number of votes in the Electoral College to 447, and makes 224 necessary to a majority. Utah's admission, although the new State has but three electoral votes, emphasizes the changes in the distribution of political power produced during the last few years by the incoming of six other Territories and the new apportionment of Representatives. Cleveland's overwhelming majority in 1892 blinded politicians to the difference between the conditions in case of a close contest now and such elections as those of 1876 and 1888. From the re-admission of the Southern States to the Union after the civil war down to the election of 1892, the "solid South"—meaning thereby the sixteen States in which slavery had existed—needed to be reinforced only by the small group of New York, Connecticut, and New Jersey in the North to constitute a majority of the Electoral College. In 1876, if South Carolina, Florida, and Louisiana had been counted for Tilden, he would have had 203 electoral votes out of 369, and might have spared Indiana's fifteen and still have had three more than a majority. In 1884, Cleveland had Indiana, New York, and her two neighbors, making with the South 219 out of 401 votes, but he could have surrendered Indiana to Harrison in 1888 and still have

had 204, or three more than a majority, if New York had kept company with Connecticut and New Jersey.

But the sixteen ex-slave States have now only 159 votes out of 447, instead of 138 out of 369 under the apportionment based on the census of 1870, and 153 out of 401 under the 1880 apportionment—but little more than 35 per cent. now, against about 38 per cent. in both of the previous decades. The addition of New York, New Jersey, and Connecticut makes only 211 out of 447, or thirteen short of a majority. With Indiana also the Democratic candidate under the old combination of 1884 would have but two more than a majority, instead of eighteen more.

The silverites in the South who talk so glibly about "sweeping the country on a free-coinage platform" evidently know no more about the existing conditions in the Electoral College than they do about the monetary standards of the world. "What do we care if we lose New York," some of them say, "or Connecticut and New Jersey, besides? We can make it up in the rest of the country." They do not realize that, even if they could keep the South solid for a free-coinage platform, they would still need sixty-five electoral votes in the North, not one of which would come from any State in the East. Where would they look for them in the West? Leaving out of account the exceptional conditions in 1892, when Illinois, Wisconsin, and California were carried for Cleveland, there is only one State west of the Alleghanies which the party has carried since 1856—Indiana; and no intelligent observer believes that Indiana could be carried for free coinage this year.

But the mining States? They cut a great figure in the Senate, where the nine States among the Rockies and west of that range have one-fifth of the members, but they cast less than one-twelfth of the electoral votes. If the whole nine went for a free-coinage Democrat, he would have but thirty-six votes from that immense section of the country, and would still be twenty-nine short of a majority; and nobody can study the political record of those States without seeing the absurdity of supposing that they would go solidly for the Democracy on any platform.

The truth is, that the right sort of a Republican candidate, standing on a gold platform, would be sure to carry the country over any Democrat standing on a free-coinage platform. Indeed, one can count up almost votes enough to elect him between the Atlantic and the Mississippi, north of the old Mason and Dixon's line, as will be seen by this summary:

Number of Electoral votes.....	447
Majority.....	224
New England.....	89
New York.....	36
New Jersey.....	12
Pennsylvania.....	32
Ohio.....	23
Indiana.....	15
Illinois.....	24
Michigan.....	14
Wisconsin.....	13
Minnesota.....	9
Total.....	314

It will be seen that only 10 more votes are needed, and Iowa, which is as surely Republican as Illinois or Michigan, would

furnish these, and three to spare. Kansas with 10, Nebraska with 8, and the two Dakotas with 7 between them, cannot possibly be carried by the Democracy this year. There remain excellent chances for more than one State further West, while in the South, Delaware and Maryland will repudiate free coinage, and West Virginia and Missouri could be hopefully contested by the Republicans.

There is no possible way for the most ingenious Democratic arithmetician to figure out a majority for his party next fall if it shall stand for free coinage. On the other hand, the Republicans can insure victory in November by adopting a gold-standard platform in June.

NEW MEXICO TWENTY-TWO YEARS AGO.

THE proposition to admit into the Union as States New Mexico, Arizona, and Oklahoma renders timely a revival of the now generally forgotten fact that a bill for the admission of the first of these Territories was passed by the lower branch of Congress twenty-two years ago, and that only a happy chance saved the nation from having had another unfit State during the long period since 1874. On the 9th of March in that year a bill was introduced in the House "to enable the people of New Mexico to form a constitution and State government, and for the admission of said State into the Union." The bill was referred to the committee on Territories, which in a few weeks reported it back favorably, and on the 21st of May it was passed by the overwhelming vote of 160 yeas to 54 nays.

Then, as now, the House was Republican by more than a two-thirds vote. Stephen B. Elkins, who had gone West to "grow up with the country," had returned as a Delegate in the lower branch of Congress from New Mexico, and aspired to be one of the first Senators from the new State—failing in which ambition at the West, he later sought a residence in a community nearer the Atlantic, and is now Senator from West Virginia. Mr. Elkins urged the admission of the Territory twenty-two years ago, on the ground that its population then was large enough to justify such action, his estimate being 135,000 souls, and that the lines of railway then under construction or projected through that region would cause a rapid and great growth in the early future. He concluded with this tremendous tribute to King Coal, whose dominion covered the territory from which he hoped soon to become a Senator:

"By an unnatural usurpation Cotton was once called and believed by some to be king; but time and the natural laws of commerce have served to dispel this delusion, and Coal, with his ebony brow, has come to the front, and by unanimous consent has been crowned king for ever, and from his dark throne, with his brother Iron, wields the sceptre of empire over all human industries, his realms being measured only by man's ingenuity. In the United States, the home and throne of this king is in the Rocky Mountains; his children live and

rule in the Alleghanies and the Mississippi Valley. The Rocky Mountains will play no ordinary or secondary part in the future of this country. So long unknown, light is beginning to dawn; we are but catching glimpses of the future grandeur and glory of this great empire. In New Mexico the time is not far distant when a thousand furnaces for the reduction of ores will light up the sides of her vast mountains, and this ore, drawn by a thousand engines busy by day and by night, will be poured into the lap of the Mississippi Valley, and millions of sheep, cattle, and horses will feed on her boundless plateaus."

Another argument which Mr. Elkins did not mention was even more potent with most of the Representatives whom he addressed—the belief that New Mexico would strengthen the Republican side of the Senate by two votes, and furnish three Republican votes in the Electoral College. Nevertheless, there were Republicans, especially from New England, who were not prepared to throw away all the principles which they had always professed regarding the danger to the nation of illiterate States. Mr. George F. Hoar, then a Representative from Massachusetts, made some remarks which were exceedingly creditable to the first State that ever imposed an educational qualification for the suffrage. He pointed out that, not many years before, the people of New Mexico had rejected by a large majority a proposition to establish a public-school system; that no such system had been established until 1871; that by the census of 1870 no fewer than 52,220 of the 66,464 persons over ten years of age, or about five-sixths, could not read or write; and that a very large proportion of the people could not speak the English language. He said further:

"Now, while it is true that no man should be debarred from the privileges of citizenship because he speaks Spanish only, or because he cannot read or write (and to the number thus returned in that Territory we may safely add a large percentage, because people frequently say they can write when they can only write a word or two, their own names perhaps), yet it seems to me that when Congress is considering the question whether the people of a Territory shall be formed into a State of the Union, the fact that they cannot perform the duties of American citizenship by voting intelligently on public questions, the fact that the great body of them cannot understand the laws of the country, cannot read the discussion of political questions, cannot obtain information about their interests from newspapers or magazines, constitutes a strong reason why we should require such a community to wait for admission until they are better prepared."

Clarkson N. Potter was then a Democratic Representative from this city, and he made an able argument against the scheme. He rose immediately after Mr. Elkins had paid his glowing tribute to King Coal, and remarked that it was "a thankless task to resist such an earnest and eloquent appeal to the House as the one just now addressed to it," and that gentlemen of his temperament "would find legislation much more agreeable if they could carry it on upon the principle recommended by Mr. Tittlebat Titmouse, who proposed a general bill for giving everybody everything." This being impracticable, measures must be treated with reference to those general public

considerations which ought alone to govern Congressmen, and Mr. Potter proceeded to take up various such considerations. One, upon which he laid much stress, was the influence which the admission of unfit States would have in disturbing the proper relations between the commonwealths in the Senate. Some of his utterances on this point have proved prophetic.

Mr. Potter pointed out that, even twenty-two years ago, sixteen Senators from eight States having a contiguous territory (Massachusetts, New York, Pennsylvania, Ohio, Indiana, Illinois, Missouri, and Kentucky) represented a majority of the people of the Union. "It is the most absurd thing possible," he said, "to call such a government a popular government." On the contrary, it was in this respect one of the most absurd governments on the face of the earth, and yet it was proposed to make it more absurd by introducing Territories with a mere handful of people, and giving them the right to send two representatives each into the Senate of the United States. Mr. Potter continued:

"I understand that, with the great physical prosperity of the country, such gradual changes are not observed. The attention of men in these hurried days is but too rarely given to the fundamental principles of government. But the time will come when this thing will not be longer tolerated. Every new State forced into the Union with its two members in the Senate of the United States will be a reason for coercing attention to this matter by the great States. What is the inevitable result of the further introduction of small States but to unduly reduce the influence of the older and larger States? Besides this, do not gentlemen know that the inevitable result of giving to the people in those small Territories—I mean Territories with but a small population—representation in the Senate of the United States must be that they will be controlled by influences exercised by men of wealth? I heard it stated not long ago that one of the Senators of a certain State had not been in the State in two years before he was elected. Who are the men elected to the Senate from these small Western States? Are they men who control the railways and mines and wealth of the States or not? Do we desire to repeat the experiment of Nevada, when, after all the years that have followed her admission, there is still a population not half so great as in some agricultural counties in my State?"

Happily for the country, the slow-going Senate did not act upon this matter until near the end of the next short session, when it made some amendments in the bill which the House did not have time to consider, and the measure failed. What we escaped by this lucky chance can be appreciated only when we reflect that the population of the Territory was but about 18,000 larger by the last census than Mr. Elkins claimed in 1874, and that the percentage of illiteracy is still almost 45 per cent., and when we recall our bitter experience since Mr. Potter's day with Montana, Idaho, and other Territories equally unfit for statehood.

ENGLAND'S REVENUE AND AMERICAN TRADE.

EVER since the remarkable statement of the British Exchequer for the fiscal year

ending March 31 was published a fortnight ago, the enemies of free trade and sound currency have kept the silence of dismay. When complaint of dull trade and paralyzed industry was loud on every side in our own country, here came the statement of a nation, living under unrestricted trade and a gold currency standard, showing an increase, over the preceding fiscal year, of £7,290,000 in Government revenue, leaving an almost unprecedented annual surplus of £4,208,000, or \$21,040,000. This increase was all the more striking and significant in that tax levies, under the British budget-estimate for an approaching fiscal year, are commonly based on the expectation that revenue will hardly exceed expenditures. The extraordinary gain of the past year, therefore, simply means that the trade from which the revenue is derived has expanded far more rapidly than the estimates had anticipated. Nor is it least significant that all this happened with our own national revenue still falling short, by millions, of official expectations.

It was not in reason, however, to suppose that friends of fettered trade and debased currency would rest idle under so startling an object-lesson. We understand that the critics of that school, having now recovered from their first shock of astonishment and dismay, are about to enter on their own explanations of the phenomenon. It is maintained already, by some of these oracles, that the expansion in Great Britain's revenue is distinctly a result of its heavier exports to the United States under the Wilson tariff. Prior to August, 1894, it seems, the profits of British industry were curtailed by the exclusion of their merchandise from our markets. Now, with the bars let down, they are "flooding" our entire market, and heaping up such profits that Great Britain's tax receipts have bounded up along with them. The bearing of this argument, as an authority of similar acumen once observed, lies in the application thereof.

But we greatly fear that the argument of a lower American tariff as the chief factor in British trade and revenue expansion will find some trouble with the figures. During the fiscal year ending June 30, 1895, the United States imported merchandise from Great Britain valued at \$159,083,243. This was a large and natural increase over the year of panic and trade stagnation which preceded it. But the fiscal year 1894 was not the "banner year" of the McKinley tariff. It is the year beginning July 1, 1892, and ending June 30, 1893, in which, as protectionists are wont to boast, the McKinley act had its full influence on trade. In those twelve months the United States imported from Great Britain merchandise valued at \$182,859,769. That is to say, if the Wilson act has been the only factor in the international trade movement, it has cut down our British imports 15 per cent. since the days of the McKinley law.

We do not suppose that serious and in-

telligent economists will found on such comparison of the figures any final conclusions regarding the operation of the tariff. The prostration of American industries, through the currency experiments of 1890, has had vastly more to do with the decline of our foreign trade since 1892 than did any change in the customs legislation. The figures do, however, amply demonstrate that the lower duties under the Wilson act have had little or nothing to do with the expanding British trade. A very noteworthy revival in foreign commerce has been going on in parts of the world quite unconnected with American financiering. While annual exports from England to the United States, since the fiscal year 1892-3, have decreased \$23,770,000, Great Britain's total exports to all foreign countries have increased \$45,000,000.

The London *Economist*, in its comment on the latest trade statement for the United Kingdom, has analyzed this remarkable export movement, which has extended further in the current quarter. The increase, it appears, was largest in the case of textile and metal goods. Of the textile fabrics, China, India, Japan, and Germany contributed virtually all the increase over the preceding year. Worsteds, however, one of the largest textile commodities of export, "exhibit a falling off in consequence of a check in the trade with the United States." In the metal exports, during the month of March alone, "India took quite nine times the weight of railroad material that was shipped in March last year," while in other metals "South Africa, India, and Australasia are largely increasing their demand." But in shipments to America "there is again a serious falling off." These citations, taken quite at random, are amply corroborated by the figures and illustrate the general tendency. They simply signify that while our nation's enterprise and industry have been lying prostrate under chronic assaults on the standard of the currency and chronic tinkering with the import duties, Great Britain, with its laws fixed for all time in both particulars, has been reaching out after the expanding foreign trade of other nations. While the United States has been wondering vaguely whether it could or could not suppress its trade with Europe, England has been absorbing the new and growing markets of Africa, Australasia, and Japan. It is hardly a matter for surprise that, with this rapid extension of Great Britain's foreign trade, the annual revenue should rise to the index-mark of real prosperity.

This is the truth, looked upon from a commercial point of view. There remains, of course, the vantage-ground of Jingo criticism. We do not doubt that when these indisputable commercial facts have penetrated the thick skulls of our protectionists and inflationists, we shall hear denunciations of England's greedy snatching at the foreign trade of nations. Lodge would punish the grabber, we

imagine, by adopting an unsound currency in the United States. McKinley would get his revenge by putting up absolutely prohibitory bars against our own foreign trade. As for American industries, they have grown used to the Lodges and McKinleys since the triumphs of 1890, and might be expected to take their dose in silence.

THE NEW NATIONAL PORTRAIT GALLERY.

LONDON, April 1, 1896.

M. ALFRED STEVENS is not the only artist who has said boldly that, in painting, subjects may be dispensed with (*en peinture on peut se passer de sujet*). But this is not quite true when it is a portrait that is to be painted. The great artist may, or indeed will, make a sitter merely the motive for a beautiful arrangement of color or of lines; for that reason, however, he does not disdain the lesser task of producing a likeness. On the other hand, there are portraits, quite feeble and incompetent as paintings, that have enormous value historically. Certainly, a national portrait gallery may depend for its interest more upon its subjects than upon the artistic merit of its pictures, as a visit to the new building in St. Martin's Place will prove.

For at last the English collection of historical portraits is hung in a manner befitting its importance. The National Portrait Gallery was founded as far back as 1856, when, it is worth noting, the stately portrait of Sir Walter Raleigh, by Zuccaro, was the first purchase of the Trustees, the famous Chandos Shakespere, presented by the Earl of Ellesmere, the first donation they received. But for many years the pictures were hustled about unceremoniously, finding temporary refuge now in Westminster, now in South Kensington, where a shabby shed gave them shelter, and again in the Bethnal Green Museum, for all practical purposes as remote from the centre of London as the Louvre or the Prado. At the best their hanging in these places was a makeshift. Sir George Scharf, the late Director, might do all that was possible to increase the educational usefulness of the collection, but it is doubtful if any one journeyed to see it except the conscientious tourist and the student of more than average enthusiasm. At Bethnal Green, however, as likely as not, the portraits would have remained indefinitely had it not been for the generosity of Mr. Alexander, who provided for them the permanent home which the richest country in the world was still too poor to furnish at the public expense. The new building adjoins the National Gallery, though altogether separate from it, so that for position no better site could have been found in London. Architecturally, the gallery is not all that could be desired—the rooms are over-small, and in many the light is not so good as it might be. But on the whole it is satisfactory enough, and of course the greatest improvement upon the temporary asylums that preceded it. Besides, Mr. Lionel Cust, the new Director, has hung the pictures to such advantage, with so genuine a respect for chronological continuity, so right a feeling for decorative effect, that the defects of the building are the more easily overlooked and forgotten.

As for the collection itself, now that it is displayed as it deserves (the pictures cleaned and put in good order), no one can exaggerate its interest. Those who agree with Carlyle that, in historical investigations, one of the

most primary wants is to procure a bodily likeness of the personage inquired after, will here be enabled to study and master the history of England as they never could in books alone. From Edward III. even to Queen Victoria, the country's sovereigns can be passed in review: Plantagenets, Tudors, Stuarts, Hanoverians—in all their might or weakness, beauty or coarseness; attended by the long train of courtiers, warriors, and statesmen, poets, artists, and scientists, frail ladies and gay gallants, who have made or marred the strength, the greatness, the romance of England. Whatever else these portraits may leave in doubt, one truth is established beyond dispute: not until recent generations has royalty thought so ill of itself as to commission the least accomplished artists to paint the royal portraits. From Holbein and Zuccaro to Winterhalter and Angeli is a far cry; and late Hanoverian rooms must inevitably dwindle into dulness and insignificance after the splendor of the early Tudor and Stuart series. Once, in England, it was the pride of kings to play the patron of art with some discretion and to their own greater glory. They may have appreciated the quality of the work as little as their degenerate successors, but, in justice to themselves, they sought their portrait-painters always among the most distinguished artists of the day; and their court, dutifully, as a court should, followed suit.

This is the reason why, from the æsthetic standpoint, the earlier rooms in the Portrait Gallery are the most delightful. Trustees and directors, of course, have not enjoyed unlimited freedom in their selection; often enough, being obliged to take what they could get—at times, the copy instead of the original, at others relying upon the follower if the master was beyond reach. But when all artists of a school accepted the fine convention of its leaders, even lesser achievements, even copies, were not without style and distinction. There are finer Holbeins in the National Gallery; the one beautiful Antonio More (a Sir Thomas Gresham, simple, severe, stately), and the two or three Zuccaros (Elizabeth, queenly and imperious, beruffled and jewelled; Raleigh, with pearls in his ears), are outnumbered by the works of unknown artists. But, for all that, the room in which the Tudor portraits hang has a splendor of decoration not to be surpassed in any other section of the Gallery. The traditions of these men were not dishonored by Geeraerts—it was he who painted Mary Sidney, Countess of Pembroke, "subject of all verse"; by Mierevelt—and the rich harmonious Sir Horace Vere, a landscape in the Low Countries, then a battleground for English soldiers, painted beneath, may be counted his masterpieces; by Van Dyck—not so well represented, however, save in his dignified portrait of Sir Kenelm Digby; the plain, homely features of that "prodigy of learning, credulity, valour, and romance," made familiar to the fortunate possessors of his 'Receipts in Chirurgery and Cookery,' by the engraving therein published as frontispiece.

A special interest is given to this period by the appearance on the walls of the first two English painters of note, William Dobson and Robert Walker, neither as famous to-day as he should be. Dobson was called by Charles I. "The English Tintoret," and, now and then, in the winter shows of Old Masters at the Royal Academy, there is to be seen a canvas by him which proves that King Charles was not far wrong as a critic. But here, though his

several paintings give some idea of the breadth and elegance of his style, none is so worthy of him as his own portrait, an arrangement in brown, with not a little of the swagger with which Velasquez loved to paint himself. Walker threw in his fortunes with the Parliament rather than with the Court, and Cromwell sat to him more than once. His "Cromwell," included in the national collection, is less plain of feature, less stern of aspect, than some other of the Protector's portraits, and an unexpected touch of jauntiness—"dandiacal," it should have seemed surely to Teufelsdröckh—is lent to it by the obsequious attentions of a youth in red who ties a scarf upon his hip over his armor.

With the second Charles we come to a lavish array of Lelys and Knellers—a series of portraits as gay and extravagant, as sumptuous and amusing, as the court life of the times. To look at all their splendid courtiers, in flowing curls and dainty velvets and silks, at all their lovely women arrayed like courtesans and posing as shepherdesses, is to read with new understanding the plays of Congreve, the memoirs of Gramont. The Gallery is very rich in examples of these two men: almost all, portraits to be remembered with pleasure for their beauty no less than their associations; a few, perhaps, leaving a stronger impression than the others—the Sir William Temple, by Lely, for instance, because of the charm of his face, that one likes to fancy with the gardens and groves of Moor Park for its background; the Buckingham, by the same painter, because of the cynical wickedness stamped upon every feature; the Congreve, by Kneller, resplendent as the mere "gentleman" whom Voltaire would never have travelled to see. Standing out with distinction, holding their own in the midst of the gorgeous flamboyance of Lely and Kneller, are three small portraits by Hogarth: one of himself, a grotesque little figure at his easel in a room wonderfully full of atmosphere and light; another of Lord Lovat, awkward and big, and somehow suggesting the lumbering form of Dr. Johnson.

The generation of painters that could boast the names of Reynolds and Gainsborough and Romney follows next in order, but hitherto their masterpieces have not come in the way of Trustees and Directors. The National Gallery can make a more brilliant showing; the Winter Academy serves as reminder of the treasures which could so appropriately find a place on national walls. Good portraits by them there are of course: Reynolds's well-known Goldsmith, with the humorous, ugly, attractive face; Romney's masterly sketch of himself; Gainsborough's General Lawrence in scarlet coat—to mention but three. Still, in this period there are great gaps which, it is hoped, will gradually be filled; for, assuredly, now that Englishmen have learned the value and importance of their national portraits, they will be eager to make the collection as perfect as possible. Opie, Hoppner, Lawrence, Raeburn, Beechey, do their utmost to maintain the beauty and stateliness of the walls, until these are given over to the commonplace of the quite modern pictures. Not even Mr. Watts's generous gifts of portrait of famous men, painted by himself, can relieve the dull Victorian dreariness, to which Winterhalter's "Prince Consort" and the copy of Von Angeli's "Queen Victoria" seem to set the standard. As far as the artist is concerned, the latest rooms of all might as well have remained closed for ever. But, in a portrait gallery, as I have said, there are other interests to be considered.

It is when one studies the collection for its associations, personal or romantic, that it is found most inexhaustible. Not more than the slightest hint of its wealth, in this respect, is possible in the space at my disposal. If it is the history of literature that appeals to you most keenly, you may here come face to face with almost all your literary heroes, beginning with the primitive Chaucer—the Chandos Shakespeare, rings twinkling in his ears; a Ben Jonson, red and coarse, the bricklayer rather than the poet's rare Ben; a Drayton all too self-conscious in his laurel wreath, down to the sketch of Stevenson by Mr. Richmond, the portraits of Browning and Tennyson and Rossetti by Mr. Watts, added but yesterday. And, as a rule, they are grouped on the walls as they were in life: there is a Queen Anne room full of poets and essayists, in turbans—Pope, unexpectedly discovered with a blue eye in one portrait, with a brown in a second, hanging by its side. And again you meet in company Byron (in an Albanian costume), and Keats and Leigh Hunt, Coleridge and Southey and Lamb—Lamb attired by Hazlitt in a Velasquez dress for the occasion, looking very old-masterish and impressive. And there is a little corner where Mrs. Browning in ringlets, and George Eliot with hair drawn primly down over her ears, and Christina Rossetti as her brother drew her, and Miss Strickland in velvet and pearls, as were proper for a "high-priestess," as Mrs. Carlyle called her, and a round, cheery little Miss Mitford, and a matronly Hannah More hang in company—with the women writers; sex rather than time being the bond of relation.

The history of artists is as amply illustrated; many following the example of Dobson and Walker and Hogarth, and painting their own portraits. Among them you may see Reynolds, an ugly youth, shading his eyes with his hand; and Benjamin West, as handsome as Gilbert Stuart could make him; and Barry, inspired by his own face as he never was by his allegorical and symbolical flights; and Blake, his simplicity of character apparently incomprehensible to Phillips, the Academician; and Bonington, in high stock, the typical youth of 1830, as Delacroix must have known him in the days when they shared their studio. But how go through the list? Or how, without making a new catalogue, record the names of all the actors and actresses whose familiar faces look down from these enchanted walls? How record the endless succession of soldiers and sailors and statesmen who have been the very backbone of England's power and might? They are almost all here—only a very few missing. And there is not a portrait that is not labelled, names and dates carefully given; sometimes, as well, a quotation, or a line, of one kind or another, to jog the sluggish memory. "It has always struck me that historical portrait galleries far transcend in worth all other kinds of national collections of pictures whatever," Carlyle told Earl Stanhope in the first embryonic days of the Gallery. Could he see it now, he would be but strengthened in his opinion. London possesses no more interesting national institution than the Portrait Gallery which has just been opened. N. N.

THE COMPLETE "FAUST" ON THE GERMAN STAGE.

WEIMAR, April 7, 1896.

"Oft wenn es erst durch Jahre durchgedrungen,
Erscheint es in vollendeter Gestalt."

SLOWLY but surely the great dramatic poem

in which the genius of Goethe found its fullest expression is emerging into view for the Germans in its "finished form"; and this progress is due not so much to scholars and teachers, though these have their modest share in the work, as to the theatres, which are always the most potent agency for the popularization of the classics. It would be too much to say, no doubt, that the Second Part of "Faust" is likely to become truly popular even with the help of the stage, but people are at any rate becoming accustomed to it. Some of the best theatres, notably that of Leipzig, have dropped on principle the practice of giving the First Part alone. The rendition of the complete "Faust" at Weimar has become a regular annual festival. The Vienna performances have long been famous, and now, since last year, Munich has a new adaptation of its own. In short, the work has been played so often, in so many places, and with such success, that its dramatic availability, within the limits imposed by time and space and human powers of endurance (behind the curtain and in front of it), must now count as an established fact. The interesting question is no longer, Whether? but, How?

In thus doing its part to make the real "Faust" known the stage is atoning for its own sins and for sins not its own. For many years after the death of Goethe the Second Part was pretty generally held to be poetically worthless. The idea prevailed that the poet had written in his prime a sufficiently complete tragedy, of wonderful depth and power, ending with the death of *Gretchen*; and that then, in his old age, when his poetic powers had failed, he had unluckily tacked on the Second Part as an after-thought, making of it a repository of allegories, crotchets, and mysticism such as could only torment the real lover of poetry. It was not very surprising, therefore, that the First Part, which had not only become a literary classic, but had begun to be played with success before the completion of the entire work, should go on its course as a successful stage-play in serene disregard of its late-born complement. To play it alone seemed not only permissible, but actually like coming to the rescue of the real Goethe, the great Goethe, against his own senile aberrations. And then the composers came in with their work. Berlioz did not scruple to appropriate Goethe's lines for a radical perversion of Goethe's purpose—an artistic *lèse-majesté* which musicians sometimes still try to condone. Gounod wrote his famous opera, which has familiarized myriads in all parts of the world with a portion of Goethe's plot, but is nevertheless a mere travesty of Goethe, though matters are mended somewhat if it is given, as it really ought to be, under the name of "Marguerite." Thus the whole influence of the stage made for the dissemination not only of imperfect but of wrong impressions concerning Goethe's masterpiece.

For the inevitable effect of giving the First Part alone, whether as play or opera, is to focus attention upon the love-story. *Gretchen* becomes the real centre of interest; and as for *Faust*, one hardly knows what to make of him. His character appears detestable in spite of the Devil, and the naïve mind has no further use for him. Perdition seems the right fate for him if for anybody. One is driven to surmise that the poet must really have intended a tragedy of sin and damnation on the lines of the old legend. And when reminded that the Prologue cannot possibly be read on any such supposition, one is tempted to take refuge in the theory of a change of plan; the theory

that the poet actually started his hero for hell, and then, midway in his course, decided (so to speak) to reverse engines and make for Paradise under the flag of Pelagian universalism. But this theory, though it still finds occasional defenders, is to my mind untenable in the light of present knowledge. No one can tell definitely and positively just how the young Goethe conceived the moral of the tragedy which he was destined to finish after a lapse of sixty years; but it is very certain that there was no damnation in his programme. Perhaps there was no salvation either; for he had invented a mythology of his own which took no account of the traditional heaven and hell. *Faust* was thought of as a soaring idealist driven to desperation by much brooding over human limitations and the general badness of life. The Devil was to be a tormentor who should recommend the pleasures of time and sense as an antidote for intellectual troubles, knowing full well, however, that his victim would never be satisfied. Very likely there was no question of a mortgaged soul; the Devil was to get his reward as he went along. *Faust's* tragedy, possibly, was to be the universal tragedy of death, following upon a particularly energetic quest for the greatest possible fulness of life. He was to go down before a stronger power—the Power that had decreed man's finiteness and mortality. But that he was to go down morally, turn traitor to his better nature, and fall at last into the clutches of the mediæval Devil—of such a purpose there is no clear indication from first to last.

In the middle portion of his life, without needing to modify his youthful plan radically, Goethe determined to convert the old theological legend of sin and damnation into a drama of mental clearing-up, of reconciliation to life through life, and to "save" his hero in the traditional sense. The *Faust* of the First Part was now conceived as a wanderer in the dark who was to be led out into the light. This meant a Second Part, an ascent following the descent. We know now, too, that the idea of this Second Part, and to a great extent also its details of plot, were distinctly present to Goethe's mind during the years in which the First Part was receiving the form in which the world knows it. This being so, one sees at once that any representation of the story which ends with the death of *Gretchen* is not really Goethe's "Faust." It leaves a false impression, except, indeed, as the spectator mentally corrects what he sees from what he knows.

But this consideration would have to count for little if the Second Part were highly abstruse or dramatically weak. As a matter of fact it is neither. One can easily find fault with its occasional long-windedness, its mannerisms of style, its now and then tantalising symbolism. Still, the great fact remains that, speaking broadly, the matter of the poem was seen with wonderful vividness and described with superb art. Signs of decadent power are obvious only in a portion of the fourth act, which was the very last to be completed; elsewhere there is not a weak line to be found, though there is some curious diction. As for the abstruseness, that has for the most part been read into it. And it is all dramatic, too. The feasibility of playing the "Helena" was discussed by Goethe in 1827 with Eckermann, who had remarked that the piece made severe demands upon the reader. "But it is all sensuous," Goethe answered, "and if you think of it as acted it will strike the eye favorably. More I have not intended. Enough if the general mass of spectators find pleasure in what

they see; the higher import will not escape the initiated." What Goethe here says is vastly important and applies equally to the other portions. It is all sensuous, meant to be seen and heard; and the reader who has no chance to see and hear must visualize as best he can. The symbolism will take care of itself according to the degree of his general culture. Thus the stage is the best corrective (next to common sense) for those vagaries of allegorical and metaphysical interpretation which gave the poem in an early day such a dubious repute.

It was perhaps a consequence of the words just quoted that Eckermann, shortly after Goethe's death, undertook to prepare a stage-adaptation of the Second Part alone. Wishing to save the entire seventy-five hundred lines, he decided, with more plety than practical judgment, to distribute them over three evenings. In due time he sent his first "evening," with music by Eberwein, to several prominent theatres, all of which declined it. It was finally played at Weimar in 1856, but once was enough. Previous to this, however, namely in 1849, a portion of the Second Part was produced successfully at Dresden under the name of "The Rape of Helena." The piece was the work of Karl Gutzkow, who put together parts of the first, second, and third acts and made up a kind of semi-independent "phantasmagory," such as Goethe himself had at one time thought of. This was not "Faust," but it was a beginning which showed that Goethe had been quite right in supposing that his work would "please the eye." About the middle of the fifties, accordingly, the Second Part was laid hold of by a Hamburg man, Wollheim da Fonseca, with a view to exploiting it for stage-effects. He not only cut the text unmercifully, which is allowable and even necessary, but he added much matter of his own, amalgamated the characters of *Homunculus* and *Euphorion*, made *Helena* the ghost of *Gräthen*, et cetera. In short, like the recent London ballet of "Faust," this adaptation made no pretence of fidelity to Goethe; but it was given with success at Hamburg, independently of the First Part, and was afterwards repeated in several other places.

The first attempt to play the whole "Faust" in a spirit of decent loyalty to Goethe's plan was made at Weimar in 1875 by the late Otto Devrient, who arranged the poem as a mediæval "mystery in two days' work." The first performance was a great success, and Devrient's adaptation has since been given in many places. It is still regularly used at Leipzig and Weimar, though with many deviations from the printed book. The three-storied mystery-stage never really existed, but was invented by the elder Devrient to obviate the evil of frequent and tedious changes of scene behind the curtain. In the middle of the stage and somewhat back, one sees a raised arch with a hole underneath. This hole is "hell," its character being suggested by a series of black dragons and chimeras drawn against a fiery background and revolving for a while in an endless chain. On either side is a low flight of steps leading to a second story, which is "earth," while a third story farther back represents "heaven." In the Prologue, *Mephistopheles* emerges from the hole and lounges on the steps while talking in presence of the angels with the Lord in "heaven." In the performances I have seen, the Lord was invisible behind "clouds," but on the mystery-stage, at any rate, he should appear to the eye in the guise of an old man—the Ancient of Days. So, too, the archangels' parts were sung by women, but they ought to be spoken by men. In the

further course of the action, where no heaven or hell, but very much earth, is required, Devrient's three stories are utilized in various ways—conveniently for the stage-director, but in a manner destructive of all illusion. In view of recent progress in the art of "open transformation," as the Germans call it, the mystery-stage seems hardly worth keeping. It costs more than it comes to, and Goethe, at any rate, had nothing of the kind in view.

Devrient's version gives the First Part very completely, cutting judiciously here and there, but omitting nothing except the irrelevant Intermezzo. This makes a performance more than five hours' long, which is rather too much of a good thing. At Leipzig this time was shortened a little by omitting the Walpurgis-Night, but it would be much better to sacrifice the Prelude, which has nothing to do with the play and sounds like a school exercise in declamation. On the other hand, the Second Part is reduced by free cutting to about four hours and a half. The superb opening scene—sunrise in the Alps—produces a fine effect on the stage, though not so fine as one might be led to expect from its matchless literary charm. The fairy-choruses become, of course, a ballet. The *terza rima* does not declaim easily, and the deep pregnancy of the lines is easily marred by an inadequate *Faust*. The first scene at the Emperor's court takes but moderately well. The masquerade becomes a short, bizarre spectacle, with much pantomime, leading up quickly to the Emperor's signature of the wonder-working greenback. The paper-money scene, to the reader a price-less bit of satire, is distinctly weak on the stage, but *Faust's* descent to the realm of the Mothers and the subsequent evocation of *Paris* and *Helena* call out strong applause. The Bacchalaureus scene is a little less effective than its pendant in the First Part, but the scene in Wagner's laboratory quickly restores interest. *Homunculus* comes into being, under *Mephisto's* paces, as a tiny human figure in a large glass jar which is carried about the stage by the Devil. The figure is made luminous by a fine electric wire, and its voice proceeds from an invisible *Fräulein*. The motley army of classical spooks which Goethe conjures up for the Walpurgis-Night is reduced to a matter of Sphinxes, Griffins, Sirens, and Phorkyads; these last being conveniently housed in "hell." The festival in the Aegean Sea is omitted. *Faust* gets quickly to the temple of Manto without the aid of a visible Centaur, *Mephistopheles* borrows the guise of a Phorkyad, and a sudden open transformation brings on *Helena* and her Trojan maidens. The classical portion of the third act is greatly condensed, but, after the magic shifting of the scene to *Faust's* castle, the text is given much more fully. The love-idyl in Arcadia is picturesque rather than dramatic, but the *Euphorion* scene is both in a high degree, and, when well given, takes the house by storm. In the fourth act we are brought very soon to *Faust's* grand scheme of dyke-building. The battle is quickly disposed of, and we see the formal bestowal upon *Faust* of his swampy fief by the sea. The fifth act easily surpasses all that precedes in dramatic interest. The warder's song from his tower, the burning cottage, *Faust's* defiance of Dame Care, his final burst of energy, his death, the digging of his grave by the Lemurs, the battle of the devils and the angels for the possession of his soul—all these form a series of pictures which any lover of the poem may well wish to see with the bodily eye. Once seen they are not soon forgotten. On the other hand, the final apotheo-

sis presents a problem which the stage can solve at best but very imperfectly. The sacred mount and the holy anchorites are omitted, and we are brought directly to "heaven," with the Mater Gloriosa on the throne. But the play ends weakly in comparison with the book. The modern adult finds it hard to take a stage heaven naively.

The success of the first Weimar performances was such that the staging of the complete "Faust" at once became a practical problem for the managers. Some of them, averse to the mystery-stage, went back for the Second Part to the Hamburg adaptation of Fonseca. This was revived in various cities, notably in Dresden, where, in a greatly improved form, it is still made use of at the Court Theatre. In other places experiments were made on the line of maximum fidelity to Goethe's text. This principle was carried farthest at Hanover, where the play was spread over four evenings; and at Mannheim, where the performance lasted until two o'clock in the morning. These experiments proved ephemeral. Quite different was the case, however, with the new adaptation brought out by Adolf Wilbrandt in 1883 at the Burgtheater in Vienna. This achieved a memorable success, maintained itself in popular favor, and has lately appeared in book form with an excellent preface by the "author," himself a well-known dramatic poet. Aside from his discarding of the mystery-stage, Wilbrandt differs most radically from Devrient in that he takes three evenings for the play. The first ends with the rejuvenation of *Faust*, the second comprises the love tragedy, and the third is devoted to the Second Part. In this arrangement the First Part is given very fully, even the lyrical dedication being included; but the Second Part is reduced very much as by Devrient, though with manifold differences in scenic details. But, in spite of Wilbrandt's undeniable success, there are serious objections to the bisection of the First Part. "Faust" is not a trilogy, and ought to be played in two evenings. Experience has shown, moreover, that it can be played in two evenings of tolerable length without sacrificing anything really essential to Goethe's plot. It is not a case for worship of the letter. This view, which seems to be taken by most of the German critics, has lately been carried into effect at Munich in a new adaptation by Possart. This was produced about a year ago and received with prodigious enthusiasm. It has since been repeated, and bids fair to become a permanent attraction of the Munich Court Theatre.

This review will suffice, though I might offer more evidence of a similar character, to justify the statement with which I set out. There are no longer people who think that the complete "Faust" cannot be played, though there are those who think it ought not to be played. These delight in raising the cynical query how far, after all, that "higher import" of which Goethe speaks really comes home to an average audience in the theatre. All one can say on this subject is that everything depends on the preparation the spectator brings with him. No doubt many of Goethe's lines are too subtle, too deeply charged with experience, with history, with criticism of life, to be instantly grasped by the casual playgoer. The ideas, and the connection of ideas, will often be Greek to him because they correspond to nothing within his range of experience. But then that is true of all great plays. The theatre does enough, and does much, if it provides for people of some refinement a steady and elevating enjoyment of what they see and hear. And this is possible if the general drift of the

play is clear as it proceeds. He who would understand the great poets thoroughly must e'en study and grow older.

CALVIN THOMAS.

Correspondence.

"NAKED BED."

TO THE EDITOR OF THE NATION:

SIR: This expression, which was common, for centuries, in seemingly hypallagic constructions, which occurs in Shakespeare, and which is abundantly illustrated by glossarists, I adverted to, incidentally, in your 1,508th number. From my store of quotations for it I select, as follows, a few that are, comparatively, of late date:

"My love . . . suddenly leapt out of his *naked bed*." Anon., *Cloria and Narcissus* (1653), Vol. I., p. 174.

"In the interim he was forced to support his Weak Body with a Stick; Or else he would sit in a Chair, but very rarely come into his *Naked Bed*: Only he kept himself in his Cloths, with his Head upright." Sir Roger L'Estrange, *Twenty Select Colloquies of Erasmus* (1680), p. 178.

"Yet she never scrupled to oblige him so far as to undress and go even into the *naked Bed* with him once every week." Anon., *The Adventures of Rivella* (1714), p. 49.

"This young lady went into *naked bed* in her cabin." "She protested she would never go into *naked bed*, on board ship, again." Thomas Amory, *Life of John Bunce* (1756-66), Vol. I., pp. 94, 95 (ed. 1770).

To come into *naked bed*, for instance, de notes, as all students of English should be aware, "to come naked into bed"; it having formerly been long the custom, more or less, to sleep without a night-dress. And even now this way of speaking survives in Scotland, if not likewise in Yorkshire. Aged people about me, here in Suffolk, all remember it as having been current in their younger days.

One cannot but suppose that in *naked bed* must have been understood, at any time in a good number of bygone generations, in a sense different from that which it bore when first introduced. Unquestionably it was owing to mere thoughtless parrottry that it was retained, after the fashion of sleeping nude was given up, to mean, with reference to the wearer of a night dress, simply "in bed." Such being the case, it furnishes an example, in linguistics, of a tradition whose origin and import have been forgotten. Its use on Cape Cod, mentioned by your correspondent "P.," in restricted connection with a person confined to his bed by illness, as in "he is sick in his *naked bed*," is a noteworthy and interesting local Americanism.

"His coward lips did from their colour fly." Here Shakespeare hypallagizes. Only when inspected superficially, however, is there hypallage in the phrases spoken of above. *Naked bed* is there really a compound, and of the same class as *sick-bed*, *sick-room*, *blind asylum*, *mad-doctor*, *poor-house*. In technical language, it is a combination expressing attributive relation, and should, for distinction, be changed to *naked-bed*.

Tempest, which, also, according to "P.," is synonymous, on Cape Cod, with "thunder-storm," has the same signification throughout East Anglia.

F. H.

MARLESPORD, ENGLAND, April 15, 1896.

Notes.

THE following are among the most recent an-

nouncements of Macmillan & Co.: 'Women in English Life, from Mediæval to Modern Times,' by Georgiana Hill; 'The Education of Children at Rome,' by George Clarke, Ph.D.; and 'Outlines of Economic Theory,' by Herbert J. Davenport.

An active lieutenant of O'Connell's is commemorated in a work which T. Fisher Unwin, London, has in press: 'A Life Spent for Ireland: Leaves from the Diary of W. J. O'Neill Daunt,' edited by his daughter, with a preface by Mr. Lecky. Mr. Unwin will further bring out 'Bohemia,' by C. E. Maurice, in the "Story of the Nations" series; 'The Africander,' by E. Clairmonte; and Gaston Bois-sier's 'The Country of Horace and Virgil,' translated by D. Havelock Fisher.

A fresh batch of reprints may fitly lead off with the Murray-Putnam edition of George Borrow's 'Bible in Spain,' in two volumes of liberal typography, which follow close in time upon Macmillan's reissue of 'Lavengro.' The title fairly masks a stirring tale of travel and adventure which must ever interest the reading public in the eccentric author. A late historian of Spain, Ulick Ralph Burke, supplied for this edition what he did not live to see in type, viz., a very useful sketch of the political evolution of Spain after the Napoleonic wars and down to the time of Borrow's first visit in 1835, together with abundant notes, historical, geographical, and illustrative—the last much needed for an allusive writer. An itinerary, maps, and several photogravures and etchings of landscape and architecture complete the thoroughly good workmanship of this edition.

More showy than the foregoing are volumes iii. and iv. of the translation of Barras's 'Memoirs' (Harpers), of which we need say nothing except that they contain an index to the entire work. After making acquaintance with this writer in the first two volumes, one has little disposition either to trust or to read him further. The translator cannot be accused of making him attractive by a readable, idiomatic version. He slavishly follows the French even to the habit of the tenses, and is quite devoid of ease or skill. But whoever owns the first half of this work will want the conclusion.

The translation of the correspondence between Renan and his sister Henriette, of which our readers have already had an account, has fallen to Lady Mary Loyd ('Brother and Sister,' Macmillan). It may be read with pleasure. The print is excellent, and there are portraits of the author and of the subject of the Memoir which precedes the letters.

From the same house we have the third volume of Björnson's novels, 'A Happy Boy,' and a charming little volume composed of 'Sir Thomas Browne's Hydriotaphia and the Garden of Cyprus.' The editor in this case is the late W. A. Greenhill, M.D., whose conscientious labor on behalf of a brother physician has established an improved text, while supplying notes, indexes, glossary, and bibliography. A plate of burial urns and two title-page facsimiles are among the ornaments of this classical pocket companion.

The widow of Prof. Tyndall has very advisedly consented to a reissue of 'The Glaciers of the Alps,' which is still in request after thirty-six years, though long out of print. It is handsomely presented by the Longmans.

A fresh lease has just been given to Prof. Barrett Wendell's novels 'The Duchess Emilia' and 'Rankell's Remains,' by Charles Scribner's Sons, who have succeeded to the Boston publishers of a decade ago.

There is some invention in Albert Lee's 'Tommy Toddles' (Harpers), in the vein of 'Alice in Wonderland,' but the punning is flat and meant for the gallery of elders, the verse intolerable; and the misuse of *shall* and *will* alone should rule the book out for children. So we have praise only for Mr. Peter Newell's illustrations, at once original and humorous, with here and there a decorative stroke of no mean quality. Collectors have long since marked this artist's productions for preservation.

Brief genealogies of three related families of Hassam, Hilton, and Cheever have been bound together for private distribution by the author, Mr. John T. Hassam of Boston. In an earlier monograph on 'Ezekiel Cheever and Some of his Descendants,' Mr. Hassam had proved that this famous old master of the Boston Latin School was not the author of portions, at least, of a MS. book of Latin and Greek verse deposited as his composition, by one of his uncritical descendants, in the Boston Athenæum. He now reverts to the subject in the present volume, reprinting the MS., and adducing other sources from which the collection was derived. Moreover, the handwriting is not Cheever's. Probably no item of the contents proceeded from his muse.

Burdett's 'Official Intelligence' for 1896 (London: Spottiswoode & Co.), a stout volume of 2,130 pages, contains a mass of thoroughly compiled and arranged information on all securities dealt in upon the London Stock Exchange, including Government stocks, home, colonial, European and American enterprises of all kinds, and notably mining, prospecting, industrial, and general promoting companies. Its notices comprise the history, capitalization, revenue statements, and lists of directors of the several concerns. The whole is arranged in proper alphabetical order. As usual, Mr. Henry C. Burdett, Secretary to the share and loan committee of the London Stock Exchange, has had the oversight of this laborious publication, which is issued under the official sanction of the Stock Exchange committee. We can but announce its appearance: the fact that it is now in its fourteenth year shows the estimation in which it is held in all financial circles.

Velhagen & Klasing (Leipzig), whose excellent popular yet scholarly books have done so much towards making the German people acquainted with what is best in literature, history, and art, have now begun a general history of art. It is to be published under the direction of Dr. H. Knackfuss, author of their widely circulated 'Deutsche Kunstgeschichte,' and editor of their series of "Künstlermonographien." The first volume, however, has been prepared by Prof. Max Georg Zimmermann, and is devoted to the art of antiquity and of the middle ages. After some introductory chapters on art in the Eastern countries and on the beginnings in Southern Europe, there is presented a brief and clear history of Greek and Roman art in all departments. In describing the art of the middle ages, the discussion is confined to the architecture, sculpture, and painting of the countries of Western Europe. The second volume will be devoted to Gothic and Renaissance art, and the third to the late Renaissance, Rococo, and Modern art. The numerous illustrations of the parts already published (in *Lieferung* fashion) are for the most part half-tone cuts from photographs of originals, and are in every way as nearly perfect as it is possible to make them. In the complete work there will be about 900 illustrations. The price, twenty-four marks,

will doubtless allow the book to find its way into large numbers of cultured homes.

Kürschner's 'Deutscher Litteratur-Kalender' for 1896 is some four weeks later than usual. It still continues to grow, this volume containing 100 more pages than the one for 1894. Two good portraits serve as frontispieces: Gerhard Hauptmann, whose production of 1895, "Florian Geyer," met with something of a fiasco when first presented in Berlin, but after revision and copious cutting down, has since won success; and Frau Sophie Junghans, whose contribution to the literature of 1895 is the novel 'Geschieden.' The first section, describing new laws, or changes in laws, relating to literary productions in Germany, Austria, and Switzerland, is very short and shows that few changes have been made. Section iv. gives a description of the Schiller, Grillparzer, and Bern prizes, and the conditions under which the prizes are awarded. After the alphabetical list of contemporary German writers come, as if appendices, a list of German publishers, with the kinds of work each one is best prepared for; a list of periodicals, with a description of each and the principal names on the editorial staff of each; a list of theatres, with the names and generally the addresses of the managers; a list of some of the leading firms engaged in the technical work of bookmaking, engraving, etc., etc.

A somewhat similar undertaking of Dr. Kürschner's, one upon which he has been working since 1888, and the first volume of which is now announced for the present year, is his 'Handbuch der Deutschen Presse.' His purpose is to make a reliable encyclopædia of German periodical literature, containing information about every German paper in the world and its personnel. The book is being prepared under five general divisions.

The sad and eventful career of a German patriot and poet of the eighteenth century has been recalled by the recent unveiling at Teplitz of a monument to Johann Gottfried Seume. The oration which was delivered on that occasion by Prof. Sauer of Prague, the editor of *Euphoriön*, has just reached this country. A passionate lover of freedom, Seume was yet obliged to fight for two years in a Hessian regiment under English command against the armies of American independence; subsequently, in the Russian military service, he was present at the massacre in Warsaw in 1794; and finally he witnessed the complete degradation of his own native land. He died in 1810 before the beginning of the wars for freedom. In Seume's rugged character were combined ardent patriotism, religious atheism, ascetic morality, and healthy humor with the temperamental melancholy of Young and Gray, which, as Prof. Sauer points out, was very different from the blasé *Weltschmerz* of a later time. Deprecating the "century of paper," he nevertheless filled several volumes with his own writings. His graphic account of a nine months' tramp to Syracuse survives, and two lines from his poem, "Die Gesaenge," are familiar to thousands who never heard his name:

"Wo man singet, lass dich ruhig nieder,
Bösewichter haben keine Lieder."

The Quarterly Statement of the Palestine Exploration Fund for April, in addition to the regular reports of the excavations at Jerusalem, has an account of an interesting Latin inscription recently found in that city. As deciphered by Canon Dalton, it appears to be a votive inscription, set up about the year 117 A. D., by a *vexillarius*, or standard-bearer, of the 3d legion to Jupiter Serapis for the health or victory of the Emperor Trajan and

the Roman people. There is also a short description of some Bible coins found in Palestine, and a plea for the exploration of the plateau of Et-Tih, to the north of the Sinaitic peninsula, with a view to establishing the route of the Exodus and the mountain from which the law was given. This, the writer suggests, was not the traditional Sinai, but may have been Jebel Meleg, a mountain of most impressive dimensions, lying half-way between Ismailia and Kadesch.

The opening article in the *Geographical Journal* for April is a plea, by Dr. R. H. Mill, for the preparation of a geographical description of the British Islands based on the Ordnance Survey. This is followed by a sober but encouraging account of the resources of British Central Africa, by Alfred Sharpe. He is especially hopeful in regard to the future of the negro. As the sale of "gin, guns, and gunpowder" is prohibited in the greater part of the territory, the negro has not deteriorated through his contact with the white man, and his condition has distinctly improved. The unskilled laborer in the coffee plantation soon learns skilled work, "such as carpentry, timber-sawing, brick-burning and moulding, bricklaying, overseeing, bullock driving, etc." An African had the sole charge of the telegraph office at Blantyre, while others at this station owned land, paid their taxes in cash, and had bank accounts. Col. Holdich contributes some notes on the ancient and mediæval history and geography of Makran, the most southern district of southwestern Baluchistan, and Mr. J. Ainsworth describes a journey in British East Africa. Both these articles are accompanied by maps.

The industrial and commercial development of Japan is the subject of an interesting paper in the *Scottish Geographical Magazine* for April, by Mr. J. Troup, British consul at Yokohama. Notwithstanding the extraordinary growth of her foreign commerce and of every kind of industry, shown by a mass of figures and facts, he does not fear Japan's competition with the West, as some writers have done. The great discrepancy between the rate of wages is already diminishing with the increased price of food, and the dearth of labor occasioned by the war is apparently "becoming accentuated by emigration to Formosa." The other articles are upon Venezuela and the "shots" of northern Africa.

The disastrous ice-fall that occurred on the slopes of the Gemmi pass in Switzerland last September has lately been reported on in considerable detail by Heim of Zurich, who has made a special study of avalanches, landslides, and other catastrophes to which vigorous young mountain ranges are subject. In this instance, a great sheet of ice, detached from the lower end of an elevated glacier of the second order, rushed down the mountain-side, sped across the valley at its foot, and in part swiftly flowed up the opposite slope, then falling back like a wave from a steep shore. A destructive blast of wind was produced by the air outrushing from beneath the falling mass; thus a considerable space was laid waste on all sides, and even large forest trees were overturned. The report is published as a New Year's issue by the Naturforschende Gesellschaft of Zurich, and is well illustrated.

No controversy in the history of art has recently been more bitter than that concerning Raphael's artistic origin. Those who upheld his derivation from Perugino have based themselves largely on the belief, hitherto unassailed, that Raphael's "Sposalizio," now in the Brera, was a close copy of a famous altar-

piece once in the Cathedral of Perugia, but for the last eighty years the chief pride of Caen in Normandy—a work hitherto considered an undoubted Perugino, and, as such, held to be one of the important national possessions of France. In the April number of the *Gazette des Beaux-Arts*, Mr. Bernhard Berenson maintains that the Caen "Sposalizio" was not painted by Raphael at all, but that its real author was his second-rate fellow-pupil, Giovanni Lo Spagna, and that the Caen altar-piece, far from having served as a model for the gifted young Sanzio's masterpiece, is a mere imitation of that work.

The Phi Beta Kappa Society originated at William and Mary College, Va., in 1776. Much the larger part of the April number of the *College Quarterly* is given up to a reprint of the records from the Society's foundation to 1781 (when the advent of the British interrupted both meetings and records), and to illustrative biographical and other matter supplied by President Lyon G. Tyler. Here will be found the original charter granted to Harvard chapter. The editor also does something to elucidate the pedigree of President Monroe, in which a single link lacks positive evidence. The Monroes, while entirely respectable, "never held the same state in society as the Lees, Washingtons, Allertons, Ashtons, and a few other great families of Westmoreland and King George Counties," with which there were no intermarriages.

—The eighteenth century seems to be coming to its own at the end of the nineteenth; and in the flood of reprints none should be more welcome than a new edition of Johnson's best literary legacy, his 'Lives of the Poets.' Such an undertaking, in six volumes (the original edition was in four), under the editorial care of Mr. Arthur Waugh, is to be carried through—in this country—by the Scribners, who send us the first volume. The new 'Lives,' in handy and attractive form, is to be an exact reprint of the edition of 1783, in phrasing, punctuation, and spelling; and the editor has limited his functions to bibliographical and biographical notes. Johnson is a fit subject for such emendations, as even his enormous memory had its lapses, and he trusted to it too confidently or too indolently. He handed over the MS. of his Life of Rowe, with its many résumés, complacently remarking that the thing was pretty well done considering that he had not read one of Rowe's plays for thirty years. His reproach of Savage for having "a superstitious regard to the correction of his sheets," and his open scorn for Andrew Reid, who professed himself a "master of the secret of punctuation," have their implications concerning his own practice. More than once he openly repudiates painstaking, as when, referring to the praise bestowed on Congreve's "Incognita," he says, "I would rather praise it than read it"; or, impatiently turning away from Akenaide's Ode, he observes: "To examine such compositions singly cannot be required; when they are once found to be generally dull, all further labor may be spared; for to what use can the work be criticised that will not be read?"

—Cowley, Denham, Milton, Butler, Rochester, and Roscommon are dispatched in this first volume, and portraits of the greater four adorn the page. Mr. Waugh's notes are based, as he tells us, upon the monographs on eighteenth-century writers by Lealie Stephen, Mr. Craik, Austin Dobson, and others, and especially upon the 'Dictionary of Na-

tional Biography.' One is surprised to find no allusion to Birkbeck Hill's Boswell, and to discover that Mr. Waugh prefers, apparently, another edition. A reissue of Johnson with no aid from the first of Johnsonians would be a curiosity—excusable, perhaps, on the ground that Mr. Waugh so rigidly confines himself to a sort of sublimated proof-reading, and waives all attempts at criticism, or at letting Johnson expound Johnson. The 'Lives' surely have a flavor of their own which many readers would, no doubt, be thankful to be left to themselves to enjoy; but it would seem as if the temptation would have been irresistible to illustrate the more formal Johnson of the 'Lives' by the undress Johnson of the Literary Club. Doubtless the criticism in both characters is at bottom one and the same; and even in the printed page we find much of the pungency, the vigor, the elephantine gambolling of the autocrat of the club. As to his critical standards they were, of course, those of his age. Milton and Shakspeare were well enough for a barbarous period, but Dryden and Pope had made "English numbers" truly harmonious and perfect. Judged by Tennyson's saying, recorded by Fitz Gerald, that "Lycidas" is an infallible touchstone of poetical taste, Johnson had no taste at all. But a critic can, no more than a poet, be torn from the soil in which he grew; and in the formal landscape of the eighteenth century Johnson yields an impression of agreeable variety. In his 'Lives' we are but following Lealie Stephen when we say that he is seen at his best.

—Mr. Henry Bradley takes the floor in the current issue of the Oxford Dictionary—Field-Fish (Macmillan). His catholic vocabulary embraces the adjectival *fin-de-siècle*, "pertaining to, or characteristic of, the end of the (19th) century; characteristically 'advanced' or modern," with a first quotation from the London *Daily News* of December, 1890. We remark also the vocables *sine art*, *sine gentleman*, *sine lady*, without the hyphen. Orthographically, perhaps nothing is more curious than *stigrane*, whose present spelling is first recorded in 1794, for the substantive; and only in 1847 for the adjective, at the end of eleven quotations of which no two are spelt alike. The decline of the *fig* (including raisin) in special estimation is interestingly shown by a great number of obsolete forms, meanings, and expressions derived from that fruit. On the other hand, we miss the *fin* and *fin-keel* associated with the latest development of racing yachts and war-ships. Too recent, again, are quotations only of 1891 for "fifth wheel of a coach," and of 1883 for "figure-head" ("said deprecatingly of one who holds the position of head of a body of persons, a community, a society, etc., but possesses neither authority nor influence"). The transitive verb *finance* is shown to have been a neologism in 1866, but our "somewhat colloquial" substantive *find* ("that which is found") goes back to 1847 as a dictionary word, and to 1858 in literary use, in connection with gold. We hear much just now of "filled cheese," and this article has been known since 1890 at least, while the sense 'adulterated' applied to cottons is three years older. "First come, first served" is met with in 1545. The topical *fratily* was unknown to Johnson, but was recognized by Smart in 1846; Mr. Bradley says that "many writers prefer *first*, even though closely followed by *secondly*, *thirdly*, etc." That *finality* with which we were repeatedly familiar in the days of proslavery compromise turns up in 1833 in con-

nection with the Reform Bill. Mme. D'Arblay stands sponsor in 1778 for *fight shy* (with). It is common to speak of colors which "kill" each other by juxtaposition; Miss Yonge's reference to "tints that 'fight' with the fewest colors" harks back to Shakspeare's "note the fighting conflict of her hue, how white and red each other did destroy." Among the indeterminate etymologies is that of *filch*, which, "like many other slang words, [is] first recorded in the 16th century." The substantive *firm* "first occurs in translations from Spanish writers," but, in the sense of 'style,' "was probably taken, like other commercial words, from Italian."

—Readers of Sir William Fraser's former books on Wellington and Disraeli know just what to expect in his 'Napoleon III.' (London: Sampson Low, Marston & Co.; New York: Scribners). The volume is a farrago of anecdotes good, bad, and indifferent, jumbled together without any attempt at order or proportion. Sir William Fraser begins by stating that he had the honor of knowing two ladies to both of whom the Emperor Napoleon III., when an exile in London, proposed marriage, and on the strength of this acquaintanceship he seems to have been interested in the career of the imperial despot who ruined France by his corrupt government in time of peace as much as by his fatuous foreign policy. Perhaps the most interesting of Sir William Fraser's stories concerns a supposed project of the exile of Chislehurst to regain his throne. "Not only was his return to Paris intended, but every detail had been arranged. A private yacht was to be used to land the Emperor at some port undetermined in the northern corner of France, or possibly in Belgium. I had this from the proprietor of the yacht, the late James Ashbury; he had more than once mentioned the circumstance to me, and he repeated it the evening before his death. Landing secretly, the arrangement was that the Emperor should proceed at once to the camp at Châlons, where forty or fifty thousand men were assembled for the purpose of manœuvre; declaring himself, he was to head his army and march at once upon Paris" (p. 244). An entertaining piece of information for most Americans about the personal appearance of the "father of his country" is contained in the following comparison: "Speaking with an American of some eminence, I described Napoleon III., with hesitation, as having the eyes of that most intelligent of animals, the pig. Gen. R. observed, 'That was the term applied to Washington, "the pig-eyed Washington."' After hearing this I do not hesitate to put it down" (p. 185). These are typical passages from the volume of the garrulous old dandy, whose birth and career in the Guards and in Parliament enabled him to see much not permitted to the vulgar gaze, but who seems to be chiefly proud of the smallness of his feet, to which delightful fact he more than once pointedly refers.

—Already plans for the total eclipse of the sun at about midnight, Eastern standard time, August 8-9, are fully matured. The first observers who may have an opportunity to catch the total eclipse will be several parties of English amateurs on the west coast of Norway near Bodø, where the sun will only just have risen. Farther to the northeast, in Finland, near the Varanger Fiord, at Vardø and Vadsø, the scientific astronomers will be out in full force, among them Mr. E. W. Maunder of the Royal Observatory, Mr. Albert Taylor of South Kensington, Sir Robert Ball of Cam-

bridge, M. Deslandres of Paris, M. Tacchini of Rome, Mr. A. Lawrence Rotch of Boston, Mr. Taylor Reed of Princeton, and Prof. S. Glassnapp of the University of St. Petersburg, accompanied by Mr. Vutchikhovsky, together with some fifty amateur observers, chiefly English, for whose accommodation three tourist steamers will be run to the belt of the total eclipse. Going still further north, into latitude north 72°, the track of the shadow-path crosses Goose Land near Möller Bay, on the west coast of the southern island of Nova Zembla. Here will be stationed the representatives of the Imperial Academy of Sciences at St. Petersburg and of the Kasan Society of Naturalists. At this point the eclipse-path begins to curve southeasterly, crossing the Lena near Olekminsk, whither the Imperial Geographical Society will send Mr. Vornesenaky, Director of the Meteorological Observatory at Irkutsk. Five years ago was founded a Russian Astronomical Society which will ambitiously place in the field three parties on Russian soil, their chief station being on the Lena and the others on the Ob, and in the eastern parts of the Uleaborg province, to the north of Enontekiä. At all these stations the corona will be the chief object of study by means of ordinary methods of photography. Still further to the southeast, on the lower Amur, will be an important expedition in charge of Mr. Wittram, sent out by the Imperial Russian Observatory at Pulkova.

—From there the moon's shadow traverses the earth still in a southeasterly direction, crossing the great northern island of the Japanese Empire known as Yezo, or the Hokkaido, from Soya, its most northern point, to Akechi. On this island will be established not less than seven stations, three of them occupied by the Amherst eclipse expedition, headed by Prof. Todd of that institution, and equipped by the liberality of Mr. D. Willis James and his son Mr. Arthur Curtis James, in whose private yacht, the *Coronet*, the Amherst expedition sailed from San Francisco last week, via Honolulu. Their main station will be in the neighborhood of Akechi Bay, on the southeast coast of Yezo. A few miles southwest, at Kushiro, the Astronomer Royal of England, Mr. Christie, will establish himself, accompanied by Prof. Turner of Oxford, and Capt. Hills, R.E. Likewise on the island of Yezo will be two Japanese parties, sent out from the Government observatories of Tokyo; also the Lick Observatory expedition, led by Prof. Schaeberle, assisted by Mr. Buckhalter of the Chabot Observatory at Oakland, California. Not since the great eclipse of 1878 in our western country have so many eclipse observers been in the field, and clear skies will insure a rich harvest of results.

MARY ANDERSON'S MEMOIRS.

A Few Memories. By Mary Anderson (Mme. de Navarro). Harper & Brothers. 1896.

In her modest little preface to these "Few Memories," Mme. Navarro declares that she wrote them chiefly for young girls, "to show them that the glitter of the stage is not all gold, and thus to do a little towards making them realize how serious an undertaking it is to adopt a life so full of hardships, humiliations, and even dangers." It is doubtful whether her experience, as she relates it, will be regarded as a very terrible warning by such ambitious novices as may happen to turn to it for instruction. Most of them (for they were

sanguine race) will find much more in it to encourage than to dispirit them. As a matter of fact, considering her opportunities and the limited amount of her artistic capital, Miss Anderson's stage career was extraordinarily smooth and prosperous, running a course of continuous and increasing popularity, and ending in fortune and present, if not permanent, renown, while she was still in the full bloom of youth. Of course she encountered occasional checks, the ordinary and inevitable difficulties caused by pecuniary straits, the fickleness of public taste and professional jealousies—trials which she endured with patience and good temper and overcame by determination; but, on the whole, she prospered beyond all reasonable expectation, and reaped, almost in the days of her raw novitiate, the rewards which most actors, even when far more richly equipped, dream of enjoying only after many long years of arduous labor.

No one familiar with her stage achievements and her imperfect training would expect to find in Mme. Navarro's book any new or valuable reflections on the art of acting or stage production, any subtle or illuminative analysis of plays or characters, any striking or original views on the responsibilities or privileges of management, or anything like an intelligent comparative study of the methods of famous actors. It is only fair to add that she expressly and very properly disclaims all pretensions to literary or critical ability. As a contribution to theatrical literature her volume is of very small importance, but as a bit of autobiography it is exceedingly interesting on account of its unconscious revelation, in a thousand unpremeditated simplicities, of the personality of the writer, which belongs to a very high type of womanhood, high-spirited, frank, joyous, tender, enthusiastic, innocent, religious without a taint of cant, and self-reliant without a trace of envy. Only a strong and healthful nature could breathe so long the infected atmosphere of the footlights without contamination. From first to last in her book there is not one note of affectation or insincerity. In the beginning she writes like a bright school-girl, with very little sense of cohesion or proportion. She chatters of dolls and other nursery matters, and of tom-boy freaks which are not uncommon or worthy of record except as indications of character.

The *Richelieu* of Edwin Booth, she says, first inspired her with a passion for the stage, and the fact is curious, for it seems to indicate an appreciation of the effect of that elaboration of detail to which she never paid much attention. This performance set her to practising on her own account, and, in the secrecy of a garret, she began to rehearse not only *Richelieu*, but *Richard* and *Hamlet*. At this time she was a great, gawky girl of sixteen, and the absurdity of her choice, apparently, never occurred to her. Possibly these early experiments may have helped to develop that wonderful voice which contributed so greatly to her later success. At all events, it was in these characters that she first acted in a private rehearsal before Charlotte Cushman, who promptly recognized her natural advantages, and sent her to George Vandenhoff for "trimming and clipping." This correct and intelligent but formal and unimaginative actor doubtless regulated many of her rough edges and gave her valuable hints, but it may be doubted whether the ten half-hours which she spent in his company were of much material benefit to her. She probably profited more from the friendly aid of John McCullough, who esteemed her abilities very highly, and devoted many of his leisure hours

to rehearsing with her in scenes from various standard plays. It was to him that she owed the opportunity of making her first public appearance as *Juliet*, and she gives a naïve account of that, to her, memorable performance. A little later on she secured a week's engagement, during which she played *Bianca*, *Julia*, *Evadne*, and *Pauline*, as well as *Juliet*. Her first real popular success was won in New Orleans as *Meg Merrilies*, and she innocently dwells upon the effect which she created by her simulation of bent decrepitude, unconscious of the fact that Scott describes the old woman as being as tall and straight as a grenadier, and that she was abusing grossly the special qualifications with which beneficent nature had endowed her. To the end of her career she persisted in this misrepresentation, which is worthy of remark because it emphasizes the lack of true dramatic insight and adaptability more or less conspicuous in all her characterizations. A striking instance of this is afforded in her own confession that she was quite unable to adapt herself to W. S. Gilbert's conception of *Galatea*. Rightly or wrongly, he wished her to exhibit a little more consciousness of the comic or satiric value of some of her speeches, but she could not subdue her own personality to the suggested conditions, and in the end he was obliged to allow her to follow her own line. Possibly her way was the better, but that is not the question.

It was in Chicago that she met with her first serious professional reverse. In that city the critics attacked her savagely and her engagement was a failure. She faced the situation with courage and admirable temper, and it is much to her credit that she plainly was more concerned at the pecuniary loss sustained by her stanch friend John McCullough than at the temporary extinction of her own hopes. These were soon revived by successful engagements elsewhere, and were never dashed again. Her youth and beauty, the air of freshness and purity which she carried about with her, her nationality, and her fine flashes of declamatory power, made her a popular pet, and she had many powerful friends. One of them was Gen. Sherman, the most lenient of theatrical critics. It was at his suggestion that she played *Galatea* and *Lady Macbeth*, and he was courageous enough to declare that he preferred her in the latter character. But it is unnecessary to dwell upon Miss Anderson's stage career in detail. Everybody knows that it was prosperous, both here and in England, in an extraordinary degree, but her triumphs were personal rather than artistic, and she created no standard of excellence except possibly in *Galatea*, for which her classic face and figure preëminently fitted her, and in *Perdita*, which she played with an exquisite buoyancy, simplicity, and grace not easily to be forgotten.

The real interest and charm of her book lie in the story of her life outside the theatre, and especially that part of it which was passed in England, where her theatrical reputation and the kindly offices of influential friends secured her not merely the acquaintance but the friendship of many of the most distinguished men and women of the day; and she tells of these amicable relations with a delightful unconsciousness, which proves that her nature was entirely unspoiled by the flattering attentions bestowed upon her. She relates a most characteristic anecdote of James Russell Lowell. She had asked him whether he had seen Bernhardt in "*La Tosca*," and he replied sharply in the negative, adding, by way of explanation, "I refuse to have my mind

dragged in the gutter"—a pungent sentence, which expresses in a breath the whole abominable tendency of the later Sardou drama, the deliberate prostitution of genius for the sake of gain. Lowell, of course, was a friend of the higher theatre, but Cardinal Manning regarded the stage as an unmitigated evil. He told Mme. Navarro that he had prayed for her retirement from the footlights. His main objection to the actor's life is worth quoting:

"From our cradles," he said, "we all have a tendency to act. Small boys pretend to be men, soldiers, anything but what they are. Tiny girls play at being mothers, cradling their dolls. The so-called art of acting increases this tendency in those who witness it almost as much as in those who practise it. I cannot conceive how the latter can escape being led in time to an unconscious development of artificiality or exaggeration in their thoughts, and, as a natural result, in their speech and manner."

The fallacy of all this in general application is too obvious to need refutation, but the argument is curious as an illustration of the danger of studying a question from one point of view only.

With Tennyson Miss Anderson enjoyed uncommon intimacy, and she furnishes a fascinating glimpse of the poet in his inner home life, revelling in comic stories, of which he had a vast collection, contributed by Lowell and other friends, or plunging through rain and mire, in his great cloak and heavy boots, stopping at frequent intervals to descant upon the subtler beauties of nature or to point out some precious woodland shrub or flower. At other times she sat at his knee while he recited long passages from his own works in the deep rhythmical chant which was so strangely impressive. She was breakfasting with Mr. Gladstone in Downing Street when the party was startled by the crash of the dynamite explosion at the British Admiralty close by. The great statesman was chatting learnedly, eloquently, and gayly about old and modern toys, when the startling interruption came, and was the only one of the company who showed no sign of fear. He proceeded instantly to the scene of the outrage, and upon his return spoke briefly of the cowardice of the deed. A minute later he had dismissed the subject, and was joking about the intricacies of female cloaks and other garments.

Wilkie Collins, one of her warmest friends and admirers, confided to her the story of his torments from gout in the eyes, which wrung from him such cries of agony that he could scarcely find an amanuensis who could endure to listen to his dictation. As all the world knows, he sought relief in heroic doses of opium, and he declared to her that he dictated the finale of '*The Moonstone*' while under the influence of the drug, and, afterwards, did not recognize it as his own composition. He told her how Charles Reade, at the funeral of Charles Dickens, leaned upon his shoulder and wept. She has fresh stories, too, of George F. Watts, who painted her portrait, of Browning, Newman, Longfellow, Lord Houghton, Helen Faucit, Alma-Tadema, Max Müller, Ruskin, and others, but space will not permit their reproduction. In Paris she was introduced to Hugo, and noted that in kissing a lady's hand he never bent his own head, but raised the hand to his lips, which is a happy bit of observation. She tells, with her wonted ingenuousness, an anecdote of Bernhardt, who imposed upon her credulity in characteristically theatrical fashion. "I will act specially for you to-night," quoth that guileless Frenchwoman,

"but it will be bad for me." And lo, at the end of the performance, Sarah lay prostrate on the stage, pressing to her lips a handkerchief on which, as she showed after her revival with champagne, there was an ominous spot of blood. This stroke of acting impressed Mme. Navarro greatly, and it must be admitted that Sarah kept her promise.

The latter half of the book, relating her professional and holiday experiences in England and Ireland, and her American farewell, is much better than the first, and is written in an agreeable, vivacious, simple style. The matter of it is not often of much importance either as information or instruction, but it is entertaining, and the manner is so simple and honest, so free from boastfulness or petty jealousy or pretension of any sort, that the sympathy of the reader is enlisted from beginning to end. If Cardinal Manning had lived to read it, he would have been forced to acknowledge that there is nothing inconceivable in the proposition that a pure and strong nature may enact a sham without becoming one.

BRITISH FOREIGN POLICY.

The Growth of British Policy: An Historical Essay. By Sir J. R. Seeley, Litt.D., K.C.M.G., formerly Regius Professor of Modern History in the University of Cambridge. Cambridge (Eng.): University Press; New York: Macmillan. 1895. 2 vols., pp. xxiv, 436, 403.

The History of the Foreign Policy of Great Britain. By Montagu Burrows, Chichele Professor of Modern History in the University of Oxford. London: W. Blackwood & Sons; New York: G. P. Putnam's Sons. 1895. Pp. xiv, 372.

THESE two books are alike in their treatment as well as in their subject. Neither of them is, in the strict sense of the word, a history; the authors do not profess to have made any elaborate study of sources; references, even to secondary authorities, are in both books few and far between; and the object aimed at is rather to stimulate interest in the long story of British foreign policy than to narrate its detailed history. Sir John Seeley, indeed, frankly terms his work an historical essay, by which he denotes its nature rather than its length, for it fills two closely printed volumes, while Prof. Burrows's book is in every way even more of an essay than Sir John Seeley's. The prevailing intention in both works is the same, namely, to outline the story of the way in which the insular state of Great Britain and Ireland has been drawn in self-defence at times into Continental politics, and to exhibit the reasons for which, at other times, it has withdrawn from its position, and has either deliberately avoided foreign complications or looked indifferently upon the events in the history of other European nations.

Sir John Seeley's 'Growth of British Policy' has a sympathetic interest in that it is the last work from the pen of a busy writer and stimulating thinker, which occupied him during the closing years of his useful life. The essay is appropriately preceded by a brief biography of Seeley by his friend Prof. Prothero of Edinburgh University, who was acknowledged, for many years before his promotion to the chair of history at Edinburgh, to be the leading spirit among historical workers at Cambridge. Prof. Prothero's work has been done with graceful skill. The life of Sir John Seeley, as he portrays it, was not eventful, and its epochs are marked by the publication of his

different works. The son of a Fleet Street publisher, John Richard Seeley spent his youth and early days among books, and gave early evidence of literary capacity. He was born in London in 1834, educated at the City of London School, went up to Cambridge with a scholarship at Christ's College in 1852, was bracketed Senior Classic with two others in 1857, and afterwards obtained a fellowship at his college. In 1863 he succeeded F. W. Newman as Professor of Latin at University College, London, and in 1869 he succeeded Charles Kingsley as Regius Professor of Modern History at Cambridge, a post which he held until his death in January, 1895. Such an appointment as that of Seeley to the Cambridge chair would not be tolerated at the present time, for Seeley made no pretensions at that time to rank among English historical scholars. He had attained reputation rather as a religious thinker than as an historian, by the publication of his well-known book, 'Ecce Homo,' in 1865, in which he had laid weight on the human side of the life of Christ to the exclusion of the divine attributes, in a way that aroused the wrath of all the Christian churches in England. But Seeley's appointment by Mr. Gladstone was at least no worse than Lord Palmerston's appointment of Charles Kingsley to the same chair of history at Cambridge a few years previously, for Kingsley's only equipment for the teaching of history was the fact of his having written some historical novels.

After settling at Cambridge, Seeley devoted himself with enthusiasm to the work of instruction, and he became also a voluminous writer on historical subjects. He belonged, indeed, as an historian to the bygone school which looked upon the study of history merely as a useful guide and corrective in estimating current political forces, and he considered the work of the historian to be the inculcation of political lessons, and not simply the ascertainment of the truth with regard to the events of the past. Seeley, in short, was more of a politician than an historian. He had no inclination for the laborious work of research. He preferred to look upon history in the large rather than in detail. His imagination was stirred by great events and far-reaching issues, and his patriotism was ever aroused by the contemplation of the growth of the power of the British Empire. But these characteristics of his mind, joined to the possession of a singularly luminous and effective literary style, made him more of a power in his native land than a trained historian could possibly have been. A special merit of Seeley's books is their readableness. His 'Life of Stein,' for instance, is little better than a compilation from the great work of Pertz, but it is infinitely more readable than the work of the German biographer, and his 'Short History of Napoleon I.,' though a poor piece of work from the point of view of the historical student, has approved itself to the general reader more than many better books.

Seeley's last years were occupied in studying the earlier stages of the growth of England into an imperial Power, and the work we are considering may be regarded as an introduction to his 'Expansion of England.' But 'The Expansion of England,' though abounding in stimulating ideas, is, after all, only a brilliant essay. An indispensable preliminary to a more elaborate treatment of the growth of the empire was an introductory study of the development of the British policy which made the British Empire possible. This introductory study we have in the two volumes before us. Had Seeley lived, they would have been fol-

lowed, doubtless, by the more extended examination of the growth of the empire in the eighteenth century which he had in mind. The period covered is from the reign of Elizabeth to the reign of William III., and a leading contention of our author is that for this period the English foreign policy is dominated by the fact that there is as yet no Great Britain, and that Ireland is neither a helpless dependency of the British crown nor an independent nation. As long as England and Scotland remained separate kingdoms, and Ireland was practically a half-settled, half-conquered alien country, it was impossible for a British policy to exist, with an empire of the seas and colonies and trading dependencies in distant continents in prospect. The keynote of English history up to the time of William III. is the relation between the different parts of what is now the United Kingdom; and the foreign policy of Elizabeth, of the Stuarts, of Cromwell, and of William III. is subordinated to or affected by the important question of building up an insular state which shall, when united, build up the British Empire. Seeley points out that what characterizes the Elizabethan age is not the period of the great war with Spain which is naturally associated with it, but the long period of peace which preceded the open outbreak of war, during which England, in happy contrast to the nations of the Continent, remained undisturbed by religious war at home, forgot the fires of Smithfield and the Marian persecution, and prepared for an era of naval adventure and commercial extension in Asia and America. The successful struggle with Spain in the later years of the Queen's reign was the revelation to the world of a new phase of existence. But the struggle with Spain could not be triumphantly waged by an isolated England, and therein lies the importance of the right understanding of Elizabeth's policy towards other anti-Spanish parties like the Dutch and the French Huguenots on the one hand, and towards Scotland and Ireland on the other.

After the long period of the Civil War, of which a side not less important than the constitutional struggle between King and Parliament—namely, the independent action of England, Scotland, and Ireland—is skilfully indicated by Sir John Seeley, came the brief period of Cromwell's ascendancy, when the insular state arrived at a brief and premature unity, and the imperial policy of future times was foreshadowed by the conquest of Jamaica and the triumphant intervention of the Lord Protector in the contest between Spain and France. The reigns of the last two Stuarts, like those of the first two, are signalized by a period of reaction. The constituent parts of the United Kingdom again separate, and foreign policy is guided, not by imperial considerations, but by the French tendencies of the Stuart kings and their voluntary, though sometimes interrupted, adherence to the schemes of their cousin, Louis XIV. The Revolution of 1688, which had its origin as much in the national feeling of repulsion towards the disgraceful foreign policy of the later Stuarts in subordinating English to French interests as in the desire to overthrow an unconstitutional monarch, bent on restoring the Catholic religion in both England and Scotland, brought about a revival of the imperial policy of Cromwell in insular, commercial, oceanic, and Continental policy. It was William III. who, more successful than Cromwell in that his power rested on a bloodless revolution instead of on military force, was enabled to put

out to the people of the United Kingdom the line of their destiny. In insular policy, indeed, it was reserved for the statesmen of Queen Anne to bring about the union between England and Scotland which put an end to the possibility of a separation between the two once hostile portions of the island of Great Britain, but it was William III. who made that union possible, and, with regard to Ireland, the fastening of the Protestant domination upon the necks of the Irish people, which rendered Ireland a helpless dependency of Great Britain, was deemed necessary, owing to the resistance the Catholic Irish had offered to the Revolution of 1688 and their adhesion to the Stuarts and to France. It was in the reign of William III., too, that England took up her position as a preëminently commercial state, at peace with her former commercial rivals, the Dutch, and ready to share her trade (since in no other way could political union be attained) with her old antagonists, the Scots, and established herself firmly on the road to commercial greatness which had been pointed out in the reign of Elizabeth and partly attained during the government of Cromwell.

But British commercial greatness could not be firmly founded unless supported by a strong oceanic power and such a Continental policy as should prevent the interference of European Powers to its detriment. It was during the reign of William III. that Britain learned her rôle upon the seas; and the series of naval victories which had commenced with the defeat of the Spanish Armada in 1588, which had been illustrated in the days of Cromwell by the exploits of Blake, but which had recently been intermitted, began again with the victory of La Hogue in 1692. British commercial greatness, however, depended upon something more than naval power, and was based not less upon the maintenance and growth of her colonies across the Atlantic, and of her trading factories in India and the East, for the peaceful development of which Britain had not only to be supreme upon the seas, but to prevent the growth of any rival in Europe. The Continental policy of William III. is important both from an international point of view, in that he headed the league of Europe against Louis XIV., and commenced the work of restraining French ambition and aggression, which Marlborough carried to triumphant success, and also in its influence on British policy, which at the Treaty of Utrecht showed its commercial and colonial tendencies in the acquisition for the British crown of Gibraltar and Minorca and Nova Scotia and in the Asiento clause.

Although it suffers from publication at the same time with Sir John Seeley's masterpiece, 'The History of the Foreign Policy of Great Britain' by Prof. Montagu Burrows of Oxford has some merits of its own which should not be overlooked. His volume deals mainly with the eighteenth century, and therefore from one point of view rivals Seeley's 'Expansion of England,' and from another follows out in miniature the sequel of the story contained in Seeley's last book. Prof. Burrows has as clear a grasp of principles as Seeley, but he works upon a slighter scale, and does not attempt the examination of so many national and international forces as his Cambridge colleague. By far the most important part of his essay deals with the causes of the outbreak of war with Spain in 1739. It has been constantly the habit to regard the opposition to Sir Robert Walpole which led to this war as purely factious, and Prof. Burrows has done good

service in pointing out the reality of the grievances under which English commerce suffered from the Spanish maritime policy, which, when exemplified in the story of Jenkins's ear, caused the explosion of national wrath that overthrew Walpole and opened a long era of naval and colonial war. Prof. Burrows, further, never forgets that he was once a captain in the royal navy, and, throughout his book, lays weight on the naval importance of the British wars of the eighteenth century. He refers most appreciatively to Capt. Mahan's famous work, but, long before Mahan had been heard of, Prof. Burrows had shown his sense of the importance of British naval history in his 'Life of Lord Hawke,' of which he announces a new and improved edition. In his later chapters, when dealing with the wars waged by Britain with the French Revolution and Napoleon, Prof. Burrows hardly handles his subject with equal felicity. He is blinded by his admiration for the younger Pitt and for Canning. He actually attributes to Canning the chief merit for the successful resistance to Napoleon, and barely mentions the name of Lord Castlereagh, the great statesman who guided the formation of the last European coalition, who directed the policy of Britain in the final struggle, and who shares with the Czar Alexander I. the glory of overthrowing the Corsican adventurer.

BOUGAINVILLE.

La Jeunesse de Bougainville et la Guerre de Sept Ans. [Les Français au Canada.] Paris: Daupeley-Gouverneur. 1896. Pp. 190.

THIS monograph is, in size, rather more than a brochure and rather less than a book. Its author, M. René de Kerallain, seeks to present a picture of the leading incidents of the Seven Years' War in Canada, as seen through the eyes of a gallant, active, and intelligent young Frenchman who was in the thick of the fray from the capture of Oswego to the fall of Quebec. Louis Antoine de Bougainville has other titles to fame than his career as first aide-de-camp to Montcalm from 1756 till 1759. He was the first French circumnavigator, he bore an honorable part in the battle between Rodney and De Grasse, he was chosen a member of the Institute at its formation, and, under the Napoleonic régime, he became Senator, Count of the Empire, and member of the Legion of Honor. He was also, through his work on Integral Calculus, a fellow of the Royal Society. When we add that he had his full share of pleasure—pleasure according to French and eighteenth-century definition—it will be seen that he was a many-sided man. But Bougainville has found a detractor in the Abbé Casgrain, professor of history at Laval University, and one of the most spirited national writers who have dealt with the wars of French Canada. The Abbé Casgrain is perhaps best known through his 'Pèlerinage au Pays d'Évangéline,' in which he exposed the garbled character of "Selections from the Public Documents of the Province of Nova Scotia," Parkman's chief source for the fourth and eighth chapters of 'Montcalm and Wolfe.' Above all things he is jealous for the reputation of his compatriots, the French Canadians, and is anxious to rehabilitate the *habitant* of the eighteenth century whenever hostile testimony is brought to light. Bougainville, in his Journal and in his letters, admits that the Canadian is a good woodsman, but in other respects sets him down a poor creature. He taxes him with cruelty, chicanery, and

with the whole host of undesirable traits which a half civilized existence begets. The Abbé Casgrain is not the man to allow such a description to go unchallenged. In 'Montcalm et Lévis' he assails the quality of Bougainville's evidence by impeaching Bougainville himself. The essay under review is the rejoinder of one of Bougainville's descendants, an historical writer who is quite competent to meet the Abbé Casgrain on his own ground.

We have already called attention, in our review of 'Un Pèlerinage au Pays d'Évangéline,' to the Abbé Casgrain's comfortable eclecticism. M. de Kerallain takes up the charge, reiterates, and goes beyond it. Whereas we referred to nothing more than a convenient gift of shutting the eyes, this new critic ranges first among the counts of his indictment wilful *suppressio veri*: "Assurément, l'auteur canadien dont l'ouvrage nous a forcé de prendre la plume, ne méritait guère l'attention que nous avons dû lui prêter. Il ne lit point les textes qu'il a sous les yeux; quand il les lit, il ne les comprend point; quand il les comprend, il les fausse aussitôt qu'il y voit la moindre utilité." This is strong language. It is not diluted when M. de Kerallain explains that, in his contempt, he would have waited for the public to find out how it had been deceived, if the papers of Bougainville were accessible in their entirety.

"Si, pourtant, les textes dont il se sert avaient tous été mis par l'impression à la portée du public, nous aurions laissé probablement à la sagacité des historiens futurs le soin de faire justice de sa mauvaise foi. Mais le silence n'était point possible. Montcalm et Bougainville avaient protesté d'avance contre les interprétations perfides dont ils sentaient que leur mémoire, avec la fausseté de certains Canadiens, finirait par être l'objet. 'N'en croyez pas les Canadiens,' écrivait Bougainville à son frère comme s'il prévoyait son contradicteur: 'croyez toujours de préférence nos journaux. Les Canadiens se vantent et mentent. Nous autres ne savons dire que la vérité.'"

Various points in Canadian history have furnished matter for spirited discussion, but one does not often, nowadays, lay hands on a work which is so uncompromisingly polemical in tone. Last year the erection of a monument at Chateauguay gave rise to a controversy concerning the part of De Salaberry in that encounter, but personal bitterness was avoided. M. de Kerallain, on the contrary, does not willingly leave the Abbé Casgrain a single shred of reputation. He accuses him of pilfering from Parkman even when speaking words of disparagement, and he certainly produces some amusing cases of parallelism. The Abbé Casgrain is an editor as well as an historian. M. de Kerallain gives him no peace even here. His text is inaccurate, his arrangement bad, his notes either insignificant or incorrect. The Frenchman delivers his attack upon the Canadian all along the line. Montcalm and Vaudreuil could not have regarded each other with less cordiality of feeling.

For ourselves we accept as truthful the testimony of Bougainville to the maladministration of the colony and to the weaknesses of the French Canadians, so long as we are permitted to make one reservation. Bougainville did not think the game worth the candle, and, while ready to do his soldier's duty, was never in a mood to regard the colonists with sympathy. He appears to us in the light of a frank, honorable man. His family letters are models of affectionate solicitude. He has neither the arts nor the spirit of a vilifier. He strives to be scrupulously precise in his statement of facts. But a man so completely out of touch with colonial aspirations could not fail to see character, if not facts, through

a distorting medium. To take a single instance. At Carillon what he saw was the cantine of the engineer, De Lotbinière. "Il est de l'intérêt de ce Vauban que les ouvrages traînent en longueur. Il faut bien que la cantine ait du débit. Le vin y est à six livres le pot. Je marque ces variations de prix. C'est le thermomètre des concussions de ce pays." He saw, also, at the time of the massacre, what he considered to be connivance between the interpreters and the savages, but he did not see the gallant conduct of the Canadians, which has been signalized in Mr. William McLennan's stirring ballad. At the end of the campaign he summed up his impressions of war, people, and country in the following words: "Tout ce que je puis vous dire, c'est qu'en quittant ce pays nous chanterons de bon cœur l'*In Exitu Israeli*."

Against M. de Kerallain, then, we contend that Bougainville, with all his honesty, was prevented by general prepossession from giving an adequate account of the events which he witnessed. Against the Abbé Casgrain we contend that Bougainville was truthful and desired to send home minutely exact reports. He conducted himself with distinction throughout, and, if we make a single exception, did whatever could have been reasonably expected of an officer in his position. The one exception was his failure to watch Holmes's vessels with unremitting care on the evening of September 13, 1759. Says Parkman: "When Bougainville saw Holmes's vessels drift down the stream, he did not tax his weary troops to follow them, thinking that they would return as usual with the flood tide." This was the off chance against which Bougainville failed to guard, and Wolfe gained the heights. M. de Kerallain objects to Kingsford's phrase, "Bougainville was simply *outgeneralled*," and suggests the substitution of *humbugged*. At the worst, Bougainville's lack of vigilance on this occasion was not the Nemesis of an habitual slackness. It was the "one dark hour which brings remorse," rather than "the sin that practice burns into the blood." On the whole, Bougainville was an excellent staff officer, and Montcalm's warm friendship through years of closest familiarity vouches for the honor of his character.

Two questions, however, which this essay of vindication involves are of an interest quite equal to that of the vindication. The first of these is the comparison inevitably suggested between the venality of French Canadians in the eighteenth century and the venality of French Canadians to-day; between the venality of those who formed the *entourage* of Vaudreuil and Bigot, and the venality of their descendants as one sees it revealed in the late Mercier administration and in the city government of Montreal. The second is purely personal, and relates to the credibility of the Abbé Casgrain. We cannot but believe that the perusal of M. de Kerallain's criticisms will give him more than one bad quarter of an hour.

A portion of this essay has been sent to the *Revue Historique*. In its complete form it is a bibliographical rarity. Only 150 copies were printed, and these are for private distribution. M. de Kerallain writes with much wit, force, and erudition. A few books like his own would go far to remove the indifference of French readers to the subject of the Canadian wars—an indifference which he expressly deploras. The French as a nation still appreciate liveliness, though they do date their vital historical interests from 1789. We will close with an example of M. de Kerallain's liveliness, his own

parting quip: "Toutefois . . . nous dirons que la leçon doit nous servir à tous, et que, tous, étudiants ou écrivains, nous ne saurions trop appliquer le conseil où résumait son expérience un vieux théologien, après une vie quasi centenaire d'érudition polémique: 'Vérifiez toujours vos citations.'"

The Cities and Bishoprics of Phrygia: Being an Essay of the Local History of Phrygia from the Earliest Times to the Turkish Conquest. By W. M. Ramsay, D.C.L., LL.D., etc., etc. Macmillan. 1895.

SOME years ago, in his historical 'Geography of Asia Minor,' Mr. Ramsay announced his ambition to write a local history of the several countries of Asia Minor. That ambition promises now to be realized, for the volume before us is but the first of a series that is intended to collect all the information that can be gleaned from the authors, from inscriptions and monuments, from the survival of names and religious facts in modern times, and from other such scanty sources, and to interpret these in the light of the geographical and national conditions. No man is better qualified to undertake this task than Mr. Ramsay, who for the past sixteen years has busied himself by day and by night in investigating and pondering the problems connected with the history of Asia Minor. He first visited that country in 1880, in company with Sir Charles Wilson, one of Disraeli's travelling consuls who were spying out the land preparatory to its annexation to the British Empire. For the following eleven years the half of each year was spent in travel in Asia Minor, collecting inscriptions, mapping the country, locating the sites of ancient cities and towns, and studying the still existing monuments. He has thus come into possession of a mass of knowledge concerning Asia Minor such as no other man of this day and generation can pretend to. Indeed, there are only three or four men living who are in a position to check off Mr. Ramsay's statements, and no man may lightly dispute him. Whatever else may be said or thought of his work, it cannot be denied that he is a persistent searcher for truth. In fact, much of the time spent on his earlier journeys was wasted, and represented misdirected effort, owing in great measure to the necessity he was under of feeling his way darkly, for want of an instructor in the ways and means of archaeological travel—for Sir Charles Wilson may not be reckoned as such. Accordingly, no small portion of the second, third, fourth, and fifth journeys was occupied in correcting the mistakes and blunders made on previous journeys. Nevertheless, the spirit of the man must be noted and praised.

Mr. Ramsay has written much. Before ever he essayed a book, his articles on the topography and archaeology of Asia Minor were scattered in innumerable periodicals up and down the world. They were of value, though written in a style that sometimes baffled interpretation, and students along this line of antiquarian research longed to have Mr. Ramsay collect his results in the form of a book. But when, in deference to this demand, he produced his 'Historical Geography of Asia Minor,' his readers were greatly disappointed, for probably no worse made book exists. It was literally thrown together, and hurried off to the printer a year or so before it was ready for the press. The only redeeming feature was its soundness in matters of fact. It also gave offence for other reasons which need not be mentioned now. In his later books, which have followed in quick succession, Mr.

Ramsay has steadily improved as a bookmaker, and has avoided the error of going to press before he was ready. This last but one and most ambitious of his books is the best made of the series.

What he now has in hand is the local history of Phrygia, the first volume treating of the cities of the Lycos and adjoining valleys. It is ambitious, too, for the title-page informs us that it is to deal with Phrygia's history "from the earliest times to the Turkish conquest." The knowledge and ability to cover so vast a field *ex cathedra* is given to but few men, but it must be confessed that Mr. Ramsay has acquitted himself most creditably, and the sections which deal with Byzantine or even Turkish matters will be most helpful to future travellers. The value of the book as a whole is extraordinary; it is a veritable mine of information in regard to Phrygia at all periods of its history. Not only does it throw important light upon profane history, but the student of the early history of the Christian Church will find it a valuable aid. The Lycos valley is precisely the part of Phrygia which possesses the deepest interest for the theologian, as being the scene of some of the labors of St. Paul, who left there the impress of his enthusiasm and his genius in the churches of Laodicea, Hierapolis, and Colossæ. Now that the railway can bring travellers to the very gates of these old cities, the book ought to be exceedingly useful to more thoughtful travellers.

The present volume is divided into nine chapters, of which the first describes the general features of the Lycos Valley; the second, Laodicea; the third, Hierapolis; the fourth, the Middle Mæander Valley; the fifth, the Lower Mæander Valley; the sixth, Colossæ; the seventh, Lounda, Peltæ, etc.; the eighth, the Valley of the Kazanes and Indos; the ninth, the Phrygian cities of the Pisidian frontier. Mr. Ramsay's treatment may best be understood by a synopsis of, say, chapter iii., on Hierapolis: The Holy City; its Situation and Origin; its Religious Character; Mother Leto; Leto and Kora; the God; the Matriarchal System; the Brotherhood; the Religion of Burial; the God as Ruler and Healer; the Trade-Guilds; its History; its Magistrates and Municipal Institutions; the Gerousia. Under each of these heads the reader will find matter that is new, instructive, and suggestive. We cannot go into details in this notice, but in illustration we may mention the discussion of the matriarchal system, which throws an interesting light upon the many inscriptions, found throughout Asia Minor, in which descent is reckoned apparently from the mother. It seems that children were born while the unwedded mother was living as a courtesan before the goddess, in accordance with a custom that had prevailed in the worship of the Great Mother Goddess of Asia from time immemorial. It was a religious rite, involving no infamy, but quite the reverse, and might even be recorded on the tombstone of the Parthenos (here, simply *unmarried woman*) as an especial claim upon the respect and reverence of her family and townsmen. It is a remnant of the pre-Greek social system that was never really abolished, but decayed slowly before the advance of the Græco-Roman civilization. It was the memory of this antiquated social system that led to the troubles of St. Thekla, about 50 A. D.

Each chapter is followed by an appendix, in which the author cites the inscriptions of which he has made use in supporting the views set forth in the text; or perhaps it would be

more exact to say that these inscriptions have created the author's views. On the other hand, the reader's task is made difficult by disjointedness, as, for example, Mr. Ramsay's last word on the matriarchal system cannot be found in the chapter on Hierapolis, to which we have referred above, but must be sought here and there throughout the book. We admit that this cannot wholly be avoided in a work like the present, but it makes us wish that Mr. Ramsay would treat of Asian manners and customs in a separate volume.

Venezuela: A Land where it's always Summer. By William Eleroy Curtis. With a map. Harper & Bros. 1896.

MR. CURTIS'S account of Venezuela contains a good deal of useful information, put together in a second-rate way; it is marred by the fact that the author is not well equipped as an observer and is slovenly as a writer. He is not accurate, he is flippant, and he is not a man of the world. This last, we are aware, is a terrible accusation to bring against a gentleman who has been the director of the Bureau of American Republics, but it is nevertheless true. Mr. Curtis knows the United States, and he has seen a good deal of South America; but apparently the only standard he has to apply to South America is that furnished by the United States. Now this is all very well as far as it goes, but to understand any Spanish American state it is necessary to keep before the mind not the United States, but Europe. Venezuela is essentially European. The Andes are American; the Orinoco is American; so are the *llanos*; the race is mixed; but Venezuelan life, society, civilization, institutions, habits, and even government (they have tried to import the constitutional system of the United States, but have totally failed) are as European as those of the Venice after which the country was named. Leaving the peons and wandering Indians out of view, there is not an idea in a Venezuelan's head, nor a hope or fear in his heart, which does not derive its color and substance from Europe. His literature, his speech, his press, his religion, the house he lives in, the railway carriage he travels in, his cooking, the signs on his shops, his theatre, his ceremonial observances, the rocking-chair he takes his *siesta* in—everything in his existence is European. Venezuela belongs to the European world, and not to the Europe of great capitals either, but to a provincial Europe still more foreign and strange to us. For an American to attempt to describe the peculiarities of Venezuela by comparison with life as it is known in Maine or Illinois, is as if an Englishman should attempt to describe Algiers by comparing it with Yorkshire.

The result is inevitably to give an air of grotesqueness to description some of which is otherwise defective through its inaccuracy. One or two examples will show what we mean. In chapter xv. the author gives an account of Venezuelan fruits—the country produces every known tropical species—and sums up the subject by saying that "for every-day diet" there is nothing in the tropics "that will compare with the Concord grape or the russet apple." For every-day diet there is nothing in the tropics that will compare with a prime porter-house steak; but, after all, what of it? In the next chapter religion is discussed; Mr. Curtis describes the country as "a most inviting field" for Protestant missionary effort, and declares that "a dozen churches might be organized in Venezuela at once, and within a few years every one of them would be self-supporting."

In another chapter, in the course of a very light-hearted description of the cemeteries, he warns the traveller not to imagine that "Ella Duerme" on a tomb is "the name of a girl." A Venezuelan courtship he declares to have become so informal that "a young man takes matters into his own hands nowadays, and 'sits up' with his sweetheart, just as they do in Massachusetts or Illinois." It is only fair to say that it is by no means for clergymen alone that Mr. Curtis sees a great opening. At Macuto, a little seaside place near La Guayra, he would have some one build a modern hotel of a hundred or a hundred and fifty rooms. It is true there are some difficulties about it, for not only the material and furniture, "but the builders and servants, must be imported"; but, once built, and conducted on the American plan, it "would be full of guests the whole year round" (p. 30). Another hotel is much needed at Caracas (p. 46). Why is it, one wonders, that capital and labor do not flow into Venezuela, as they have done into the northern half of the continent?

A tendency at every turn to looseness of statement is a marked feature of the book, and nowhere is this more dangerous for an observer than in the tropics. The atmosphere is one of fancy rather than fact, and it is unsafe to take anything for granted or by common report. In Venezuela there is a mental haze (not unlike that which hovers over the coast of the *tierra caliente*) which envelops all matters of distance, measure, weight, and number, and obscures the harsh outlines of fact; this haze it is, in part, which makes any agreement upon the Guiana boundary line so difficult. Mr. Curtis does little to dissipate it. He gives the area of Venezuela at 597,960 square miles (p. 7), without, however, mentioning the important fact that an enormous part of this is not actually administered by Venezuela at all; he declares the States to be "independent in the management of their local affairs" (p. 10), which is true only on paper; at p. 48 the population of Caracas is given at 70,000, yet at p. 168 the number of foreigners is said to be 7,000, and this is said to be 26 per cent. of the population. The altitude of Caracas (a very important point in South America) is given at 3,900 feet (pp. 36, 43), though all the encyclopedias make it about 1,000 feet less; the number of English books about Venezuela is said (p. 52) to be three; the expenses of housekeeping are "about the same as in the United States" (p. 59), though the author himself points out that rent and service are much lower. Caracas he calls a "sort of one-story Paris" (p. 133), and declares social life there to be very much like what it is in "the Continental cities of Europe" (p. 168)—a sort of one-story Cosmopolis, perhaps. But the danger which lurks in generalizations has no terrors for this author. One singular remark about the habits of the Venezuelans is that there is little drunkenness among them, because they drink "light native liquors made of fruits and the juice of the sugar-cane," which "intoxicate easily," but "when the fumes of the alcohol have left the brain, there is no serious effect like that which follows brandies and other strong drinks." The native liquor of Venezuela is new rum, the properties of which every good New Englander knows. It does intoxicate easily, but the after-effects in Ciudad Bolivar or Maracaibo are substantially the same as in Chelsea or Salem.

The author seems to have taken up the study of Spanish, but he cannot be said to have attained a mastery of it. At page 121, he speaks of "pronunciamentos" (*sic*) as the

Spanish word for "a revolutionary party." The word for melon he pronounces "malony," and, that there may be no mistake about it, declares that it recalls the name of a "numerous and highly respected Irish family"; a woman's bonnet, he says, is called a "begorra" (p. 187). The Spanish for "there is none" he converts into the two English words "no hay," over which he makes very merry. He gives (p. 181) what he calls a "unique" death notice, but the term is much more applicable to his translation of it, beginning, "Day before yesterday went down to the sepulchre the honest and laborious Mr. Paul Emilio Gomez." *Limonade* he pronounces "Lee-monoddie." A town in Colombia he declares to be "famous only for its name." The name is St. Thomas; to distinguish it from another St. Thomas which threw off the Spanish yoke, it was called by the Spaniards, with "indignant irony," "*Santa Tomas de la Cabelleros*." Such a name, if it can be imagined in existence, would certainly make a town well known in the Spanish-speaking world, and so would Mr. Curtis's strange equivalent of "St. Thomas the Gentleman."

The best thing in the book is the account of the rise, rule, and downfall—if it can be called downfall to be living in Paris in luxury on the fortune which he wrung out of his impoverished country—of Guzman Blanco. Tyrant for tyrant, his figure is as picturesque as any that South America has produced, and that is saying a good deal. Mr. Curtis gives one or two stories of him which illustrate his character very well, and are new to us. The best are the stories of the scientific anniversary at which Guzman, in reply to an invitation to preside, said he would do so if all the papers were submitted to him for revision (p. 101); of his proclamation of the independence of the Venezuelan church of "the Roman Episcopate," and of his decision to return to "the uses of the primitive church founded by Jesus Christ and his apostles," including the election of the Archbishops "by Congress" (p. 206), and of his securing a proper reception for the officers and sailors of our fleet by means of a decree forbidding any citizen to charge them anything for supplies of any kind while on shore (p. 175).

The Feasts of Autolycus. By Elizabeth Robins Pennell. London: John Lane; New York: The Merriam Co. 1896.

MRS. PENNELL in the preface to her book would make herself out a "greedy woman," and in the chapter on the Virtue of Gluttony she encourages the cultivation of that quality in her sex. This is only a *façon de parler*, for Mrs. Pennell, when she has occasion to mention special dishes, selects with refined, delicate, and discriminating taste, and essentially those which are wasted in the gratification of mere gluttony. She was evidently "chaffing" her English audience (for the various papers of which her volume is composed appeared originally as separate articles in the *Pall Mall Gazette*). Mrs. Pennell discourses pleasantly of breakfasts, dinners, and suppers; she eulogizes "the subtle sandwich," "the incomparable onion," "the most excellent oyster," "the magnificent mushroom," and "the triumphant tomato." Of them she tells us nothing new, although she proclaims that "there is no knowledge nobler than that of the 'gullet science,'" and, in quotation of another writer, that "the discovery of a new dish does more for the happiness of the human race than the discovery of a planet." The first of these

aphorisms may arouse the languid interest of the epicure; but the second will not discourage the astronomer in his search of the heavens.

All that Mrs. Pennell has to say may be condensed within very restricted limits; but she has elaborated her subject with such facile grace that, in those who are able to envelop eating with a poetic halo, her love of that function, whether real or simulated, will inspire appreciative recognition. To tourists from remote portions of the United States and the Dominion of Canada, equipped with well-lined wallets and unjaded palates, who are about to go abroad for the first time, Mrs. Pennell's book, in its accurate knowledge, acquired through experience, of special local dishes and of the places where they may be procured in the various towns of Europe, will prove of value. To the gourmand, however, it offers nothing in the way of culinary preparations with which he is not entirely familiar, and of which he is not perhaps long since weary. As a pessimistic Chicago poet says in an Ode to Spring:

"Same old violets, same old blue;
Same old grass-plot, same old hue;
Same old look in everything;
Same old season; same old spring."

So may it be said of cookery at the close of the nineteenth century: Same old soup, same old fish, same old sauce, with the same old dish.

Criminal Sociology. By Enrico Ferri. D. Appleton & Co. 1896.

THE very competent editor of the "Criminology Series," in which this volume appears, Mr. W. Douglas Morrison, remarks that the public is in danger of being deluded by misleading statistics concerning the diminution of crime. He is evidently inclined to the opinion that crime is either increasing or at least keeping pace with the increase of population. At the same time he thinks, as most do who inves-

tigate the subject, that no good results are to be expected from resorting to punishments of greater rigor and severity. It is generally admitted that our system of penal servitude not only fails to reform offenders, but, in the case of the less hardened criminals, and especially first offenders, produces a deteriorating effect. Evidently, under these circumstances, we need to inquire into the causes that produce criminals. Prof. Ferri's work is an essay in this direction, and perhaps the best of those which we have lately had from Italian investigators. Under the head of Criminal Anthropology he takes up the individual conditions which tend to produce criminal habits of mind and action. He then examines the adverse social conditions that tend to lead certain sections of the population into crime. While maintaining that the only way to diminish crime is to ameliorate these conditions, he admits that criminal codes are nevertheless necessary for the protection of society, and concludes by pointing out the importance of some practical reforms in criminal law and prison administration.

While Prof. Ferri's methods appear to us to be considerably in advance of those of Lombroso, we can hardly regard them as strictly scientific in character. He is too ready to accept statistical returns as evidence, without the laborious verification which almost all statistics require, and his reasoning is frequently confused and wandering. Many of his conclusions are of such extreme generality as to be of little practical value. We know that drunkenness and crimes of violence are connected, and that poverty is related to crimes against property. No doubt, if we can put a stop to drunkenness and eliminate poverty, we shall have done much to suppress crime; but there is nothing new in this. Still, it is well to look at the subject from various points of view, and many of Prof. Ferri's suggestions deserve attention. The Anglo-

Saxon race, however, will hardly consider the proposition that the jury should be dispensed with in the trial of ordinary offenders, however it may commend itself to the theorists of Continental Europe.

HAVE JUST PUBLISHED:

RUSSIAN POLITICS.

By HERBERT M. THOMPSON. Large 12mo. \$9.

A clear and readable account of the bearing of Russian geography and history on the present condition of Russian politics, and of the bearings of the latter on questions of world-wide interest. The latest and best authorities on the points discussed are given. Probably the best existing guide to the very latest aspects of the subject.

IN INDIA.

By ANDRÉ CHEVRILLON. 12mo, gilt top, with frontispiece. \$1.50.

Translated by William Marchant. A highly vivid and poetical description of Hindu India (not Her Majesty's India). Luminous with the atmosphere, spiritual as well as physical, of that super-sensitive clime.

Unabridged One-Volume Edition of FIFFE'S MODERN EUROPE

(1792-1878). By C. A. FIFFE. 12mo. 1,120 pp. \$3.75 net. Complete text of the three-volume edition in somewhat smaller type.

ON PARODY.

By ARTHUR SHADWELL MARTIN. 12mo, \$1.25.

An essay on the art, and humorous selections. The Outlook: "A volume of infinite delight and resource to lovers of English verse. The book is an addition not only to the literature of literary study, but also to the literature of pleasure." *Chicago Evening Post*: "A very interesting as well as highly amusing volume."

EMMA LOU: HER BOOK.

By MARY M. MEARS. 12mo, \$1.

New York Times: "The neatest, closest, and most accurate description of village life in exactly the way an uncommonly bright girl would see it. It is so cleverly precise that it sounds as if it were autobiographical. It is its exceeding naturalness which is so taking. The girl is keen, sharp, and honest, and she is a typical American. We are inclined to give to the book the highest encomiums as a sound, wholesome, and most amusing story."

Minneapolis Tribune: "Told in so natural a manner that the reader lives with her throughout the whole. In the procession of mediocrity which fills the reader of modern fiction it is such a relief to find a book that holds your attention, on which you do not want to put down until you see the end. This is such a book."

"Indispensable to the best teachers."
—PRIN. RAMSAY OF DUNFERMELIN HIGH SCHOOL, FALL RIVER.

CONCLUSION OF THE ELEVENTH VOLUME.

MAY

EDUCATIONAL REVIEW.

Papers Prepared for the Harvard Teachers' Association:

1. Wider range of electives in college admission requirements, by Charles W. Eliot and John Elliot; 2. Modern languages as an alternative in college admission requirements, by C. E. Grandgent, Morris H. Morgan, and Julius Sachs; 3. Botany as an alternative in college admission requirements, by J. Y. Bergen, Jr., and C. B. Davenport; 4. College admission requirements, by A. Lawrence Lowell and N. S. Shaler. The University of Michigan, II, by B. A. Hinsdale; Professor Dewey on interest and the will, by William T. Harris.

DISCUSSION.—Recommendations as to uniform college entrance requirements made by the Conferences held at Columbia University, February, 1896.

The Week.

THE walls of the anti-McKinley Jericho have been knocked too flat by the blast of the Illinois trumpet to be rebuilt. Quay and Platt and Manley make a dismal pretence at continued cheerfulness, but they see the fatal drift away from them, and know it cannot be checked. With the ablest, most prudent and far-sighted Republican leaders against him, or at least gravely doubtful of the wisdom of his nomination, with the most conservative elements of his party East and West desiring another type of man, McKinley is moving on triumphantly to an almost certain victory at St. Louis. What does it mean? It means the triumph of ignorant, one-idea extremists. It means that the currency may go hang, provided only we may have another high-tariff debauch. It means, moreover, a distinct threat that we shall get another high tariff, as we got the last one, only by a corrupt bargain, involving the debasement of the currency. Senator Teller was most explicit on this point, in his rôle of Republican *enfant terrible* the other day. He taunted the Republican tariff extremists with their inability to reenact the McKinley bill in the next Senate. It cannot be done without placating the eight or ten Republican silver Senators who will hold the balance of power. But will McKinley or his kind in the Senate hesitate to give them their pound of flesh in the shape of shattered national finances? Not for an instant. Congressman Draper of Massachusetts is already out for a currency of lead, or anything whatever, if necessary to get high duties again. This is the threat to business and finance involved in the McKinley boom. This will be the meaning of his success at St. Louis and at the polls, as interpreted by his own friends.

Senator-elect Foraker hastens to notify the Eastern Republicans that they will get neither candidate nor platform at St. Louis. In the name of McKinley himself, he asserts that the Republican national convention will declare not for the gold standard, but for bimetalism, and against free coinage of silver only temporarily and conditionally. This would fittingly make nominee and principles alike two-faced, and complete the serious threat to stability of business and finance involved in the McKinley candidacy. Foraker, of course, is bound to exalt the Ohio currency plank as the sum of financial wisdom, and expects the advocacy of bimetalism to carry another Ohio man, whom modesty does not forbid him to mention, into the White House in 1900. But there is every reason

to believe that a determined effort to place the party squarely on the gold standard would be successful. Sentiment has changed greatly since the Ohio shuffle was adopted. A declaration for the gold standard is really about all that Eastern Republicans have left to fight for, and they may as well concentrate their energies on this important point. The platform has to be adopted before the candidate is nominated. No one doubts that McKinley would stand on any kind of a platform offered him. The despondent anti-McKinley leaders cannot do better than struggle to put him on a gold plank. He would look just as picturesque and be a good deal safer.

Vermont's unexpected declaration for McKinley is the severest blow Speaker Reed's candidacy has yet received. It is not simply a question of the delegates involved (they number only eight). Mr. Reed has all along confidently counted upon a solid New England vote behind him, but now the McKinley poachers have filled their bag from his own preserves. He is thus unable to pose any longer as even a sectional candidate. To be that is not of itself a great distinction or advantage in a canvass for the Presidential nomination, but it was the strongest rôle left the Speaker, and now that has been made impossible for him. His candidacy has never had a national character—some of his New England support has before looked dubious; and now one State has openly left him. It was a great stroke on the part of the McKinley managers, and it is not a little significant that their first undoubted success in breaking into New England should have been won in the most purely agricultural State. It is an indisputable, though very curious, fact, that the most genuine and unbought enthusiasm for McKinley is to be found among farmers—not, as one would have expected, among artisans and manufacturers. The only explanation is that the farming mind is peculiarly susceptible to the McKinley logic. We had good crops when we had a high tariff, and how are you going to get away from that? The bucolic mind in England during the Napoleonic wars was just as firmly convinced that there would never be another good harvest if peace were made. George Eliot's novels, with the insight they give into the mysterious operations of the agricultural intellect, are the political manual to which we should send any one asking for the reasons of McKinley's great popularity among American farmers. The proved venality of our "yeoman" voters should also be taken into account.

How shall we explain the enthusiasm for one who is neither a military hero, a

leader in civil life, nor a "magnetic" man? It is the fact, which was itself a mere chance, that McKinley's name came to be associated with a tariff act, the passage of which was coincident with a period of prosperity, and the repassage of which is believed by the masses to be capable of immediately restoring that prosperity. A mere chance, we say. In the Republican caucus which nominated Reed for Speaker in 1889, McKinley stood second with 39 votes, and Cannon of Illinois third with 22. Custom virtually decrees the naming, by the successful candidate, of his chief rival as chairman of the ways and means committee, and so "leader of the House." If Cannon had received the 39 votes and McKinley the 22, it would have been the Cannon tariff act, and we should have had to-day, with precisely as much reason, unbounded enthusiasm for Cannon—a man, by the way, with quite as much claim to the Presidency, in point of ability, as McKinley—and Cannon's claim would seem too ridiculous for consideration. In other words, the enthusiasm for McKinley is a matter of neither brains nor heart. It is not based upon admiration of the man's ability or upon affection for one who makes tens of thousands regard him as a personal friend. It is purely a matter of the pocket. It is based upon the belief among the masses that McKinley's election in 1896—or, for that matter, Cannon's, if Cannon had been appointed chairman of the ways and means committee in 1889—will give them constant work with easy hours at high wages. In short, it rests upon the theory that the tariff is the most important thing in the country, and that the Government can mark wages up or down. It is due to the spreading among the ignorant of the idea that prosperity is to be determined by votes.

McKinley's defenders have "pointed with pride" to a stump speech in August, 1891, in which he condemned free coinage. One trouble about this speech is that, even though McKinley may have been right on the silver question in August, 1891, he did not stay so long. Only two years later, in September, 1893, the Ohio financier was making speeches on the same question again, and this was the way he talked:

"The silver product of the country, one of the most important we have, should not be discriminated against, but some plan should be devised for its utilization as a money which will insure, not the displacement of gold, but the safe and full use of both, as exchanges among the people."

This speech was delivered at a most critical time. President Cleveland had called an extra session of Congress for the express purpose of repealing the silver-purchase act, and the House had promptly responded to his appeal. But the Senate

halted and hesitated for weeks, until the sound-money men of the country were almost in despair. It was in this gloomy period that McKinley raised his voice, not to help the men of both parties who were fighting for sound money against heavy odds, but to help the other side by protesting against any discrimination to the prejudice of silver, and demanding the use of silver as fully as of gold.

It is encouraging to find that Republican politicians and newspapers representing the business interests of the country are expressing the apprehension which prevails over the prospect of McKinley's nomination on a "straddling" platform. Mr. Depew says that the country has suffered for years because of the doubt about our currency, that this has been one of the causes of the financial and industrial depression from which we are still suffering, and that "the 'hold-up' in the Senate, by the silver Senators, of all measures for the relief of the Treasury, for the increase of its revenue, for the national defence, for the protection of American industries, unless coupled with the free coinage of silver upon an arbitrary ratio, has made the money question the leading and most important issue to be decided in this campaign." He adds that no party which fails emphatically to take the ground that the United States must be put permanently upon a gold basis "can carry New York, New Jersey, Connecticut, or Massachusetts. Upon any other basis Pennsylvania will be doubtful, as will also be Michigan, Minnesota, and Illinois. The question now can neither be sidetracked nor eliminated nor suppressed." The unanimity for protection, he declares, places that principle out of danger. Even more significant and encouraging is the similar attitude of the *Philadelphia Ledger*, published in the very stronghold of protection. The *Ledger* asserts that "the real issue of the campaign is the currency"; that "the tariff is an issue which need not be considered by either candidates, leaders, or organs"; that "the country could better do without any tariff than suffer the lowering of the currency to a silver basis"; and that "the Republican convention should nominate no man, the country vote for no man, who is not an open, manly, pronounced supporter of the gold standard of monetary value."

Senator Teller's blurring out of the truth on Wednesday week about the corrupt bargain by which the McKinley act was got in exchange for the silver-purchase act was a complete exposure, and stripped away the last rag with which Senator Sherman has attempted to cover his own shameful part in the transaction. He has asserted more than once, and specifically in his recent 'Recollections,' that Harrison would not have vetoed a free-coinage

bill, and that the purchase act was devised as a means of heading off free coinage. Not at all, affirmed Teller, while not a Senator dared contradict him. Harrison would have vetoed a free-coinage bill. If we had, as we threatened, put a free-coinage rider on the McKinley bill, he would have vetoed both tariff and coinage. This was perfectly well known to Sherman and the other Republicans, and to save their tariff they bribed the silver Senators with the purchase act. This is the undoubted truth. Senator Teller relieves Mr. Harrison from Sherman's charge that he was friendly to free coinage, but does not relieve him from the odium of playing the part assigned him in the corrupt bargain.

The early Democratic convention in Missouri, with its silver-mad resolutions, appears to have roused sound-money Democrats to the need of making a fight. They have buckled on their armor, and have already won a great victory in Michigan, where they last week unhorsed the boasting silver-men, and elected the delegates-at-large to Chicago, with a majority of the district delegates, on a gold platform. The silverites went down shrieking, "We are beaten because we have been bought up!" But this cry is not a good one to base a contesting delegation upon. Nor has it a proud, defiant ring about it, calculated to strengthen the nerves of silver delegates in other State conventions. A suspicion that buying-up may be done is a deadly one to implant in a silver breast, and the main result will be, we fear, to send hundreds of silver champions to conventions anxiously inquiring when the process is to begin, and where the paymaster is to be found. The Michigan victory, with the strong and uncompromising plank adopted by the Pennsylvania Democrats, is of excellent omen.

The Senate on Friday varied the exchange of billingsgate between New York and South Carolina by striking out two of the four battle-ships provided for in the naval bill. This action was taken on the ground of economy, but the point made against it by Congressman Boutelle is perfectly fair. He justly says that the Senate has been the inflammatory, bullying body in this Congress. It has done its best to plunge the country into two foreign wars. Senator Sherman, as chairman of the committee on foreign relations, has been chief incendiary. Yet now, when it is a question of getting ready to make his brave words good, of preparing to fight with ships instead of resolutions, he is found voting against the ships. This new inconsistency will not trouble a veteran in inconsistency like Mr. Sherman, but it is highly significant of the headless course of the Senate all this session. It has advocated a domineering, aggressive policy towards other nations, which, if it was seriously intended, would require the

building of a first-class navy at the earliest possible moment. It has derided the business aspect of a foreign war, delighting to call those who urged it cravens and traitors. Yet it weakly withdraws from even a moderate preparation for war, on the plea that there is no money available. It thus frankly confesses that its mouthings of last December and February was mere imbecile bluster.

The Platt-Tammany liquor combine, which has been suspected of being behind the Raines tax law, is very plainly revealed in the remarkable information published by the *Evening Post* concerning the surety company of which one of Platt's sons is the manager. There is no doubt about the accuracy of this information. It shows with startling plainness that Platt's son's company is openly giving bonds to liquor-dealers without requiring the usual oath or affidavit as to the truth of their statements, and is saying to them that this relieves them of all liability which might be incurred in case the statements which had been sworn to turned out to be false. In addition to this, the intimation is conveyed to all applicants that if they get their bonds from the Platt company they will be protected by the Platt "pull" with the confidential agents, and will not be disturbed if they violate the law. The consequence is that the Platt company, although its rates are higher and its financial standing is inferior to that of its rivals, is doing a roaring business, the great majority of liquor-dealers believing that the name of Platt is worth more than all other considerations combined.

The formal dedication on Saturday of the new site for Columbia College marked what is certain to be the beginning of a new era for this city. It is the first step towards the establishment in the heart of the city of a really good university, fully equipped with all the attributes and facilities of a modern institution of learning of the first rank. When the new buildings whose cornerstones were laid on Saturday shall have been completed, and the beautiful site upon which they are to stand shall have received its full allotment of structures, the old college will enter upon a new and larger life which cannot fail to exert an elevating and beneficent influence upon the city. It will become more than ever before the centre of the city's intellectual life, and will aid powerfully in the development of our greatest municipal need, a sensitive and active civic pride.

The Transvaal Calvinists are evidently as great sticklers for the doctrine of their own, as for that of divine, sovereignty. They want all sinners and filibusters to understand that it is a dangerous thing to trifle with either. It has been said of

Jonathan Edwards that he would condemn uncounted millions to hell without the flicker of an eyelash, though personally he would not harm a fly; the Boers, however, believe in punishment in both worlds. Yet no one supposed that their sentence of death on the Johannesburg revolutionists was anything more than a matter of form, to be hereafter graciously remitted or commuted by President Krüger. In fact, it is inconceivable that the accused persons should have pleaded guilty unless assured in advance of getting off on tolerable terms. But, though thus purely *pro forma*, their sentence will do a world of good to hotheads and adventurers in South Africa and elsewhere. The sovereignty of a weak power has come to mean, to far too many, a thing to sport with at will. Only one or two of the revolutionary missionaries' sons in Hawaii, for example, seemed to have the slightest idea that they were risking their necks. And the jaunty way in which Jameson and his gentleman raiders set out to overthrow the government of a friendly power, shows how vague were their ideas of law and international obligation. President Krüger has done well to magnify the terrors of outraged sovereignty, human as well as divine. He has also given Chamberlain a terrible lesson in diplomacy.

It begins to look as if Chamberlain's real reason for so anxiously desiring President Krüger to come to London was a hope that the simple-minded old Boer would bring the incriminating telegrams along with him in his grip-sack, *à la* Mulligan, and that they might be wormed out of him and suppressed. The Colonial Secretary must have learned of their existence from Jameson himself, or from Cecil Rhodes; and his feelings, with the certainty that they were hanging over his head all the while, we leave to those familiar with the villains on the Bowery stage to imagine. What was morally certain from the first is now put beyond serious question—namely, that Jameson was acting throughout with the cognizance, if not under the direct orders, of Cecil Rhodes, and that the whole raid, so praised in London music-halls and by the Poet Laureate, was simply a piratical expedition carefully planned by the leading officials of the Chartered Company. President Krüger has published the telegrams captured with Jameson at just the right dramatic moment, and we shall hear less about Boer bloodthirstiness and more about Boer astuteness. That there was treason at Johannesburg, and an attack on a friendly country plotted at Cape Town, is now clear; and the treason and the plot have not even the immoral justification of having been successful. Swift and complete disavowal by England, and stern measures with the implicated officials, are imperatively demanded. Chamberlain cannot be sure, either, that the innocent old Dutch farmer has not a

lot more of mighty interesting telegrams up his sleeve.

Mr. Chamberlain, besides suffering from the recalcitrancy and shrewdness of the venerable Oom Paul, is beginning to suffer from the proposed remission of taxes on land. The deadly parallel has opened on him, and will probably play on him now steadily for weeks. The *London Daily News* has two terrible extracts from speeches made in 1886, when Mr. Chamberlain was a furious Radical, and compared Ireland to Poland. In one he warns the farmers, in almost savage terms, that no relief of local taxation will do much for them. "But," says the great man, "even if the farmer could get all he desired in those two respects [protection and reduction of local taxation], that would not benefit him one iota, though it might enable his landlord to extract a higher rent." The other, from a speech made in 1883, is still more dreadful, and deserves full quotation:

"Lord Salisbury coolly proposes to hand it over indirectly, if not directly, to the landlords of the country in the shape of a contribution in aid of local taxes. I must say that I never recollect any public man propose in a franker—I might even say in a more audacious—manner to rob Peter in order to pay Paul. And what makes it worse is, that in this case Peter is represented by the landless millions who have no other wealth than their labor and their toil, while Paul is the great landlord, with 20,000 acres, who is seeking to relieve himself of his share of taxation by shifting it on to the shoulders of his less fortunate fellow-countrymen."

Mr. Chamberlain will probably say that a man has a right to change his mind in thirteen years, and so he has; but as long as the moral government of the world lasts, Providence will keep an eye on politicians of Mr. Chamberlain's stamp, through all their mutations. Mr. Chamberlain probably little thought, in the midst of the recent burst of popularity, that Oom Paul was getting ready the humble instrument of his humiliation.

The dissension in France between the Chamber and the Senate over the income-tax causes the *London Daily News* to remark:

"Whether such a convenient and efficacious mode of raising revenue be desirable in France at the present moment is a point for Frenchmen, and not for foreigners, to decide. But to denounce it as robbery, or, except in the strictly technical sense of the term, confiscation, is ridiculous."

In a certain sense this is true, but Frenchmen who consider an income-tax "robbery" or "confiscation" are not wholly to blame, and are really no more ridiculous than the people who talk about it as "scientific." An income-tax would be the best of all taxes if it were levied off people who liked it and told the truth about their incomes. In England and Germany it does reasonably well because there it is simply a tax, and is not thought of as anything else. In this country or France it would not be a tax. It would be a means on the part of the poor or more

numerous for punishing the rich or the minority for being well off. So that whether it is a tax or not a tax depends on the people who pay it. Considering the state of relations between the classes in France, it is not surprising that the class which has an income opposes, tooth and nail, the desire of the class which has none to make it pay the expenses of the Government, for to that it would come. The income-tax in such countries is the weapon through which the unsuccessful hope to make the successful smart. In this country the income-tax would have been, if leviable, a means by which the poor agricultural and silver States would make the rich or business States contribute most of the revenue, and the rate would have been increased in every Congress, and likewise the number of people who collect it. Salvation from it is one of the best pieces of work the Supreme Court ever did for us. For half a century in France the Socialists have been looking for it as a mode not of raising money for the Government so much as of carrying out their own views of state policy. The taxes of every country should be framed with reference to its social and political conditions. There is no more a science of taxation than a science of medicine. There is an art of taxation, which is an extremely interesting art, and consists mainly in finding out what kind of person the taxpayer is, and how he lives.

To people who ask what is the matter with Spain, why she fell from the primacy of Europe, why her government is so inefficient, and all that, a very good answer is furnished by the spectacle witnessed in Madrid on Monday. The bones of a thirteenth-century saint were carried through the streets in solemn procession by 800 priests, and nine-day services are now being held in the cathedral, with Queen and Ministry present, as a means of bringing to an end the prevailing drought and triumphantly concluding the Cuban war. Of the religious significance of all this we say nothing, but as a chunk of pure medievalism it has the highest political significance. It shows how poor is the pretence that Spain is really a part of the modern world. Much as she has undeniably advanced since the revolution of 1868, many as are her partial adjustments to present-day conditions, it is evident that the political ideas of the great majority of her people remain those of the time of the Armada. Philip really relied upon San Lorenzo more than upon his ships, and Madrid clearly thinks better of the fighting qualities of San Isidro than of Gen. Weyler. What can the most enlightened Ministers do when they have to get on, under universal suffrage, with a people who put their political trust in a saint's relics? It seems idle to ask when Spain is going to reform and modernize her government of Cuba; she has first to accomplish the harder task of reforming and modernizing the Spanish mind,

THE DIVIDED SILVERITES.

THE letter which Senator Wolcott of Colorado wrote last week to the chairman of the Republican central committee for his State is a sign of the times. It is nothing less than an offer to surrender from the heart of the silver camp. Senator Wolcott says that the Colorado Republican State convention, which is to meet next week, may decline to be represented at the national convention of the party at St. Louis, or it may select delegates. If the latter course shall be adopted, as he impliedly advises, he holds that "the duty of the delegation will be to attend the convention, make the best fight possible for bimetalism in the committee on resolutions and on the floor of the convention if there shall be opportunity for discussion before the whole convention, and, after having insisted by every proper method upon the duty of the convention to declare in favor of the restoration of silver as a measure of value equally with gold, to accept the will of the majority of the convention, and endeavor to secure the nomination of the candidate most friendly to Western interests." While declaring himself ready to make any sacrifice to secure the remonetization of silver (in the interest of national prosperity), and counting party ties as nothing in comparison with that end, he sees that "both of the two great parties are apparently opposed to free coinage by the United States," while the Populist party advocates the policy only as a stepping-stone to other measures "which would be, if adopted, destructive of free institutions," and he knows of "no fourth party as yet entitled to our confidence and support." He proceeds:

"Under these circumstances and conditions, therefore, I desire to be counted as a Republican, proud of the traditions of my party, glorying in its achievements, and still hopeful that the great party which has heretofore stood for the masses against the classes, may on this great economic question yet range itself on the side of humanity and of civilization."

Mr. Wolcott is the ablest among the younger members of the Senate, and the most independent, as was illustrated a few weeks ago by his leading the opposition in the upper branch to the Jingo craze that followed the President's Venezuelan message. He has great influence with his party in his State, having secured a reelection without difficulty at the end of his first term last year. He is the strongest man among the Senators from the silver States. The sole hope of success for those States in making an impression upon the St. Louis convention was a "united front" among their Republicans. They must stand together in the policy of menacing the advocates of the gold standard with a bolt from that convention and a consequent loss of their States to the Republican ticket in November. Such a stand would arrest the attention of the whole country, and might frighten weak-kneed Republican politicians. Senator Wolcott's letter has rendered the adoption of this policy impossible. It furnishes a

rallying-point for those partisans (and they are always a large element in every political organization) who have always voted the straight ticket for President, however much it went against the grain, and who are now ready to welcome a good argument for doing the same thing next fall.

The publication of it was followed by a speech from Mr. Wolcott's Colorado colleague, in which Mr. Teller announced that he would do his best to secure a declaration for free coinage at St. Louis, and would bolt the party if he should not succeed.

"I am frequently asked," he said, "what I will do if the political party with which I am connected, and whose record I am proud of, adopts the gold standard and puts itself in line with those who are demanding that gold, and gold alone, shall measure the values of the world. I have no hesitation in saying here, as I have said before and shall say again, that, whenever the political party to which I belong ceases to represent my sentiments and my judgment, I will cease to act with it. When the Democratic party, in which I was brought up and educated, became the party of oppression and wickedness, I got out of it. I should despise myself if I should lift my hand to put in power any one who, in the executive chair, would use the slightest influence to maintain the present system of finance. I should despise myself, as you ought to despise me, if I did not lift my voice against it on every occasion; and if I lift my voice one way and vote another way, you would have a right to accuse me of hypocrisy. Mr. President, as I speak, so I will vote; in the interest, as I believe, of the great masses of men in this country, in the interest of the great masses of men throughout Christendom."

This declaration is to be welcomed by all people who hate compromise and would have no more shuffling on the issue of the day. Mr. Teller was a member of the committee on resolutions at the Republican national convention of 1892, which reported that extraordinary plank affirming that "the American people, from tradition and interest, favor bimetalism," and that "the Republican party demands the use of both gold and silver as standard money," etc. Four years ago the Colorado Senator was ready to accept a declaration facing both ways, and to go home and tell his constituents that it meant free coinage, while New Englanders interpreted it the other way. This year he insists upon a plank which will mean the same thing in Massachusetts as in Colorado, and he will leave the party unless he can get such a plank.

The two utterances of the Colorado Senators ought to settle the question of free coinage at St. Louis. Mr. Teller shows that there are silver-men in the Republican party who put silver above party fealty. Mr. Wolcott shows that there are Republicans among the silverites who care more for the party than for the metal. Mr. Teller's attitude proves that his wing of Republicans cannot be held in the organization without a free-coinage plank; Mr. Wolcott's that the Republicans whom he represents will not bolt if the platform shall declare explicitly against 16 to 1. The real danger of the situation, however, is from the Wolcott wing of silver-State Republicans rather than the Teller wing. Everybody

will see that the party cannot satisfy the latter element. The risk will lie in the attempt to placate the men for whom Mr. Wolcott stands, and to "let them down easy." There is still another danger, and an even more serious one. A strong candidate can be trusted on a weak platform, but a weak candidate is to be dreaded on the strongest platform. There is a clause in Mr. Wolcott's letter which has a direct bearing upon this point, and which should be carefully considered by sound-money men. We refer to his making it the duty of the overruled Colorado delegation to "endeavor to secure the nomination of the candidate most friendly to Western interests." This can have but one meaning. Such a candidate would be one who was anxious to "do something for silver," and who would strain a point for that purpose. There is a timely warning in Mr. Teller's revelation that Mr. Harrison consented to the silver-purchase act of 1890 because silver Republican Senators threatened to place a free-coinage rider on the McKinley act unless the President and the sound-money men in Congress would agree to "do something for silver."

GOV. MORTON AND THE PLATFORM.

Gov. MORTON was elected, in 1894, on a platform which said, among other things:

"We arraign the administration of Gov. Flower for its glaring sins of omission and commission. The executive of this State was the accomplice of the odious Democratic machine which stole the Legislature. . . . He put the canals in the hands of party workers, and made a highway of politics of a highway of commerce; he blocked the path of ballot reform and of home rule in violation of his solemn pledges; he made a mockery of civil-service reform, and in every emergency was the ready tool of machine bosses instead of being the Governor of the State. . . . We pledge to the people an improved civil service, municipal home rule, an acceptable excise law, etc., and free and fair primaries, as fully protected by law as general elections."

The amended Constitution was submitted to the people at the election at which Gov. Morton was chosen. The platform said of this amended Constitution:

"We recognize the wisdom of the Constitutional Convention in dealing in important and needed revision and amendment of the Constitution of the State, and commend the action thus far taken by that convention to the favorable consideration of the people."

Gov. Morton ran on this platform, and on it received the hearty support of the honest and conservative people of the State. His majority was 156,000, the largest ever received by any candidate in this State, except one. The amended Constitution, thus approved by the convention, with which he must have been perfectly familiar, was submitted to the people at the same election, and received a majority of over 83,000. One of the most important amendments provided that all the appointive offices of the State should be filled by competitive examination "so far as practicable." Another provided that every act affecting a city should be submitted

to the Mayor thereof for his approval. That this latter was not meant to be a mere form was shown by the fact that the provision was also made that, if the Mayor so vetoed it, it would have to be passed by the Legislature a second time. This evidently meant that the reasons for overruling the veto should be weighty, and lucid, and capable of clear expression on paper. The amendment was meant to put a stop to the practice, in both parties, of forcing bills affecting cities hastily through the Legislature against the will and often without the knowledge of the constituted municipal authorities.

Now, suppose Gov. Morton had written a letter of acceptance containing, among others, the following passages:

"I note what you say with regard to my predecessor's administration of the canals—that 'he put them in the hands of party workers, and made a highway of politics of a highway of commerce.' I shall do, as nearly as may be, the same thing. As soon as inaugurated I shall put the canals into the hands of one of the most notorious and unscrupulous workers of the Republican party. I shall not consider his antecedents as regards the State service, nor shall I ask him what his views and intentions are touching the civil-service amendment of the Constitution. I shall simply tell him to go ahead and do what he did before. When I find him totally disregarding the law and setting the Civil-Service Commission at defiance, I shall neither remove nor rebuke him. I shall allow him to go on in his own way and fight the competitive system in the courts, and get all he can out of the canals as a highway of politics.

"As regards the Civil-Service Commission, I shall promptly reorganize it, and, without giving any reason to the public, shall remove one of its members, who is known to be faithful to his duties, and put in his place one of its bitterest and best-known enemies, and I shall do this not on my own judgment either, but under the advice and pressure of a characterless New York expressman, who desires that the majority of such commission shall be hostile to the new system of appointment as intended by the Constitution. As soon as I have arranged this, I shall sign a bill providing for a very large number of employees, with high salaries, and I shall allow these to be selected by the expressman above mentioned, and used for his own purposes. Sixty of these, one for each county, are to be, he says, 'special agents,' and I see that he has provided that they shall be 'confidential' persons in order to withdraw them from the examinations provided by the new Constitution. I am rather sorry he has done this, but he must have his way. I shall impose no restrictions on him as to their character and antecedents, but let him select them as he pleases, and think it not unlikely that he will select, for the most part, bummers without standing or occupation. At the head of this organization

he is to put a creature of his own, who tells me that he cannot have his appointees examined competitively, because 'there is not time.'

"I am much interested in the changes made by the amended Constitution in the matter of city government. The people evidently intend that the old system of legislative tinkering with city charters shall cease, and that, unless under very extraordinary circumstances, such as the complete domination of a city by a corrupt boss like Tweed, all proposed changes in municipal government shall emanate from the people of the place and from their duly elected authorities. In order to check departures from this sound and wholesome rule, I see the mayors have been given a veto power. But it will not be convenient this year to pay much attention to this amendment. I shall allow the expressman above mentioned to draft the largest scheme of city government ever set on foot, not excepting the reorganization of London, with the assistance of a young lawyer living in the country. I am aware that the expressman is a very ignorant, illiterate person, who has had no experience in real statecraft, and, as far as I can learn, the young lawyer is still worse. But they are both very anxious to try their hands at charter-making. I wish they would not, but I do not see my way to preventing them. I should like very much, too, to have the approval of the mayors of the two cities of New York and Brooklyn for their work, and should like to have it submitted, according to the American practice, to the people. But both the expressman and the lawyer say they care nothing about the approval of the mayors, and are unwilling to submit it to the people. In fact, both mayors and people have disapproved of it. This is a very unfortunate thing to occur in a Presidential year, but what can I do? Both the expressman and the lawyer are very obstinate persons. The expressman, it is true, holds no public office, but I am, after all, only a Governor of the State of New York, and he will control ever so many votes at St. Louis. The situation is a very disagreeable one all round. I wish from my heart Aldridge, and Lord, and Platt, and Lexow, and Lyman were a different kind of people, but they are what they are."

Now, the foregoing is an exact description of what has happened since Gov. Morton was elected, except what relates to his approval of the Greater New York bill. We ask, in all fairness, whether he could possibly have received the majority he did receive, had this public the remotest idea that things would run as they have run. We commend it to his careful consideration as a man of honor. Tens of thousands of voters feel that they have thus far made a great mistake with regard to his independence, both political and personal. It is for him to set himself right with the people who have trusted and exalted him.

THE UNFORTUNATE PRESS.

THE fate which has overtaken the New York Times will cause genuine regret among those who know anything of its history. It has played a very prominent and creditable part in both the politics and the journalism of New York. It made its way into profit and distinction over forty years ago, through the talent and industry of its founder, Henry J. Raymond, although its rival, the *Tribune*, not only was animated by Horace Greeley's passionate earnestness, but had a staff made up of such men as George William Curtis, Bayard Taylor, William H. Fry, and George Ripley. Until the war, and, indeed, one may say, until Raymond's death in 1869, it was a sober, dignified newspaper, that supplied conservative Republicans with the calm and moderation which the fiercer convictions of the *Tribune* made impossible. That such a journal was desired and, in proper hands, was profitable, was shown by the great success of the enterprise. Two fortunes, indeed three, were made out of it. Raymond made one, George Jones, the late publisher, made another, and, we believe, Mr. Gilbert Jones, his son, made another by his final sale of it for a large sum—a transaction which has raised him to a very high degree of financial fame and eminence.

Its want of later success, which we hope is only temporary, is another illustration of the misfortune, from the moral point of view, which seems to wait on New York journalism. The foundation of such papers as the *Herald*, *Tribune*, and *Times* by the labor and ability of one man is no longer possible. Each of these papers had its origin in little else than an energetic editor behind a small printing-press, and worked its way into success and influence by slow degrees. To-day the competition is so keen and the expenses of a newspaper so great that it has to be begun, as a factory or railroad is begun, by an investment of a million or two, besides having the right kind of editor and publisher. After all, of the two kinds of success a newspaper may achieve—the financial and the moral—one only is, as a rule, possible. It may fill the pockets of the proprietors and yet be a curse to their generation, or it may be full of the best sentiments and too dull to make any money. There is no property in the world harder to manage, and yet it has great fascination for many rich men, who lose in it with remarkable fortitude. To own even a failing paper is to some a perpetual joy.

It is this difficulty of management which probably accounts for the fact that while, during the last quarter of a century, we presume we may say millions have been flung into the maelstrom of New York journalism, hardly any attempt has been made to improve its quality as a whole. The American press continues to be the most famous in the world for its badness in all points but the gathering of news, in which it is preëminent. But when it is

considered as the chief literature of a great people, and the chief moulder of opinion, and the chief diffuser of intelligence, it is the most extraordinary phenomenon of the modern world. Nothing, or next to nothing, is done to mend it. Each new venture is on the same lines as the last, or is generally a little worse. Many millions are given every year to colleges and schools by patriotic and philanthropic men, but no attempt is made by this class to improve the press, which has a hundred times as much influence on the character and mind of the people as all the colleges and schools put together. They have for it an unconcealed contempt. They know it is vulgarizing and debauching their children, and they are ready to invest in it for pecuniary profit on the old plan, but they are not willing to make it better. There is no doubt that the French press is more venal, but it is written with far more education, in better style, with more knowledge of the world. Most of our journals seem to be composed for the class of slender instruction and childish minds known as domestic servants, and in any other civilized country would probably never get above the basement story. But many of our educated men even enjoy and admire the most scurrilous and mendacious of them all.

The note of the press to-day which most needs changing is childishness. Even if the papers are clean and decent, they are fit only for the nursery. The pictures are childish; the intelligence is mainly for boys and girls. The "good stories" are trivial, and are intended chiefly for junior clerks and laborers. The observations on public as distinguished from purely party affairs, are quite juvenile. The abuse is mostly boyish or street abuse, with neither rhyme nor reason in it. What is wanted in the way of reform is mainly maturity, the preparation of the paper for grown people engaged in serious occupations. Gravity either in discussing or in managing our affairs is fast vanishing under the journalistic influence. We laugh over everything, make fun of everybody, and think it will "all come out right in the end," just like ill-bred children who hate to have their games interrupted. It seems as if something might be done by American capitalists to elevate the most potent means of cultivation we have, which is to-day exerting most influence on the national mind and character. We believe we have yet to see, though we are very near seeing, the full effect on the coming generation of the present cheap newspaper press.

An illustration of what we have called the misfortune which waits on the New York press, has just been furnished by the *Journal*. After leading for years a disreputable and mischievous existence, this paper was recently bought by a California millionaire, who has proceeded to spend money on it lavishly. We were in hopes that his millions would go to raise its quality and make it a rational

and hopeful addition to the New York newspapers. Apparently nothing was further from his thoughts. He went to work at once to make a newspaper of the old bad stamp, and to rival the worst of the others in their worst tricks—wilder sensations, sillier inventions, more "good stories," more dreadful "reportorial humor," more space for scandals, divorces, invasions of private life, more childish pictures, still stupider remarks on public affairs, than any of its contemporaries. In publishing a long report of a not remarkable divorce case, for instance, it did nothing that its contemporaries do not do; but in printing a large cartoon of a duel which it was thought would precede the divorce case, but which never came off, it outdid them all. Not only does it flood the streets with this wretched mess, but it actually succeeds in getting commendation for it from the best quarters. That it should get a rousing testimonial from Tom Platt for publication in the railway stations is nothing wonderful, but that it gets just as rousing ones from men like Dr. Parkhurst, as it has done, is extraordinary. That a man of his standing should help in emptying buckets of imbecility and mendacity on the heads of his fellow-citizens for another man's profit is something really odd, to say the least.

It is, however, part and parcel of that absence of any sense of responsibility for the press of the country which is one of its curses. If any man chooses to print a blackguard newspaper and does not actually recommend theft or fornication in the editorial columns, it is supposed to be his affair exclusively, and but few of us refuse to buy the paper so as to help his venture. That readers are in any sense *participes criminis* seems to enter no one's head. This immense source of popular instruction is left, without a thought by preachers and philanthropists and patriots, to a swarm of young men, most of whom have failed in life, who make "copy" simply as a means of livelihood, and who must themselves be occasionally astounded by the sort of things they are paid for. There are already some signs of the growth of a moral sense on this subject. In parts of the West, leagues or clubs are said to have been formed to eschew the reading of newspapers—that is, to prevent greedy speculators from making private houses the receptacles each morning of their filth and imbecility; but any progress in that direction is necessarily slow. What is needed is a disposition on the part of rich men to lavish their wealth, without hope of return, on the leading instrument of popular education. It would be, in a far higher sense than the old Roman's, "sowing for the immortal gods."

COSMIAN HYMNS.

EVERYBODY remembers Dr. Holmes's "Ode for a Social Meeting, with Slight Alterations by a Teetotaler." Having mistaken

the nature of the occasion, his ode had to have its Bacchanalian and festive bursts given a severe turn—his "nectar" being made to read "logwood," "rubies" appearing as "dye-stuff," "the breath of the fragrance they shed" figuring as "the taste of the sugar of lead," and his final lilt of song, "Long live the gay servant that laughs for us all!" being transmogrified into, "Down, down with the tyrant that masters us all!" In like manner it might be said of a volume of hymns recently published, that it is a book of 'Hymns of Divine Praise, with Slight Alterations by Atheists, Agnostics, and Materialists.'

The work in question is the 'Cosmian Hymn-Book,' lately issued by the Truth Seeker Co. In the very title is a hint that this is no chaotic or even microcosmic affair. Let others sing of earth, or heaven, or hell, or even the solar universe; no such limitations shall fetter the Cosmian hymnist. His hymn-book, he announces, has "been prepared to meet a public want." This we could have believed; most books are, or think they are, so prepared. But he adds, with more originality, that "it is perfectly free from all sectarianism." This boast an examination of the book will show to be fully justified. It is free not only from sectarianism, but from everything that could possibly offend the most conscientiously irreligious.

Wherever the word God occurs, in any of the familiar hymns made over for this volume, some turn or substitute is delicately chosen so as not to grate in the old way upon a sensitive Cosmian ear. Thus those who were taught to sing (and perhaps refused to sing longer because so crudely taught), "God is with all who serve the right," may here find with joy that "Peace is with all who serve the right." Similarly, the outgrown old hymn, "Praise to Thee, Thou great Creator," becomes, when submitted to Prof. Huxley's cosmic process, "Praise to thee, all bounteous Nature." This is a very skilful way of avoiding offence to tenderly nurtured Cosmians, and is quite superior, in our judgment, to the device once favored by John Morley of spelling God with a small "g." But the careful editing of this hymn-book extends, we are glad to say, to the smallest details. "Sin" is, of course, excluded utterly; in place of that obsolete word we have "ill." Equally, of course, there is no recognition of the "soul"—an unpleasant word, suggestive of the possibility of being "lost," or even (what would be still more dreadful from a Cosmian point of view) "saved." Accordingly, instead of singing "Awake, my soul!" we are hereafter to call upon the "mind" or "heart" to awake. Similarly, "holy" becomes "noble"—though why the editor left "unholy" in the same hymn we cannot say. But it is his own lyric advice to "Gather your roses while you may," and we hasten on.

We can note, however, but a few of the

many pleasing details. All local indications, such as "below," "above," are properly removed from the indiscreet hymns which by such expressions fostered a superstitious and non-cosmic notion about a possible heaven and a too probable hell. The "hops of future joy" has a suspicious theological squint, and becomes "hope of future days," in which the most carefully brought-up Cosmian may venture to indulge. But it is in the new objects of ecstatic devotion, the new sanctities which the Cosmian darkens with his song, that the peculiar eminence of the 'Cosmian Hymn-Book' most clearly appears. We know the ideas, the longings, the hopes and fears, the religious conceptions which have moved Christian hymnology to its grandest outbursts; but the Cosmian strikes out an entirely new flight, quiring to the young-eyed cherubins after this fashion:

"Eternal matter! Quenchless force!
No hand can stay thy circuit's course,
But deep in the abyss of space
The systems run their destined race."

Or take this song of comfort for the afflicted:

"All—all result from Nature's laws,
Unchanging all are in their course;
And man, and all things, must submit
To Nature's far superior force."

These sentiments may be entirely true. They have been held, in one shape or another, ever since human thought was first recorded, but there is no record, we believe, of their ever having before moved men to bursts of glad song, except in burlesque. There was an extravaganza put afloat some years ago which was supposed to give poetic and devotional expression to the materialistic creed. It was first used, we believe, apropos of Buckle, and the first lines ran as follows:

"I believe in steam and rice,
Not in virtue or in vice;
I believe in all the gases
As the power to raise the masses."

The Cosmian hymn-writer appears to have taken this caricature as a serious model. About his own seriousness there can be no doubt. One of his hymns, it is true, has a word of condemnation for "cold breeding" that "affects to be quite at its ease," but he is always collected and altogether at his ease in the presence of eternal matter, quenchless force, and the laws of nature. He is, in fact, a powerful, if unconscious, witness to the indestructible nature of the religious instincts. If a blank creed like his must have its worship, its grotesque imitations of Christian forms, the world is evidently far from having entirely got through with religion. Even the revolutionary anarchists have a form of worship, consisting, as one of them testified before a London magistrate, in going out into the country on Sunday, sitting under a tree, and saying fervently, "Hang the priests!" The Cosmian hymn-book would fit well into that service.

CIVIL-SERVICE PRINCIPLES IN THE DEPARTMENT OF STATE.

WASHINGTON, D. C., May 1, 1896.

It has been well known for many years that political influence has been of little or no avail in obtaining positions in the Department of State at Washington, whatever may be said of the means whereby offices under that department have been secured. It has been the department's custom, for more than twenty years, to note in its Registers the public service of its officers and employees. These revelations, when carefully examined, are most gratifying to those who believe in the selection of capable men to fill executive offices, and their retention notwithstanding changes of administration.

The more important officers of the department, subordinate to the Secretary, are the Assistant Secretaries (of whom there are now three), a Chief Clerk, and six Bureau Chiefs. Many of these have been selected in the past because of their special training, and have held their offices for a long period. The office of Assistant Secretary was created in 1853. Mr. Frederick W. Seward, son of Secretary Seward, held it from 1861 to 1869, and from March, 1877, to October, 1879. He was succeeded in 1869 by Mr. J. C. Bancroft Davis, at present and for a number of years past the reporter of the Supreme Court of the United States. Mr. Davis had been Secretary of the United States Legation at London from June 7, 1849, to November 30, 1853, and he was three times Assistant Secretary of State—from March, 1869, to November, 1871; from January, 1873, to June, 1874; and from December, 1881, to July, 1883.

Another occupant of this post, after having acquired diplomatic experience, was Mr. John Hay, the author. He was our Secretary of Legation at Paris from March, 1865, to 1867, when he was transferred to a similar post at Vienna, which he held until September 30, 1868. Besides this service he had experience as our Secretary of Legation at Madrid from June 18, 1869, to October 1, 1870, before he was appointed Assistant Secretary of State November 1, 1879. He held the last-mentioned office until May, 1881.

The present chairman of the Committee on Foreign Affairs of the House of Representatives, Mr. Robert R. Hitt of Illinois, was Mr. Hay's successor. He also had had a special training for the post, having served as our Secretary of Legation at Paris for six years continuously prior to his entrance upon duty at the Department of State. He was Assistant Secretary for less than a year.

Mr. John Davis, now one of the Judges of the United States Court of Claims, was particularly well qualified to discharge the duties of Assistant Secretary when he received his appointment in July, 1883. He had been a clerk in the Department of State from September, 1870, to October, 1872; secretary to the agent of this Government before the Geneva Tribunal which decided our claims against Great Britain growing out of the civil war, and in 1874 was appointed clerk of the Court of Commissioners of Alabama Claims which sat at Washington and awarded the fifteen and a half million dollars paid by Great Britain. In 1881 he was assistant counsel representing our Government before the French and American Claims Commission. He continued Assistant Secretary of State until his elevation to the bench in February, 1885.

The present occupant of the place, Mr. W. W. Rockhill, has served not only as Chief

Clerk and as Third Assistant Secretary during the whole of this Administration, but from April, 1884, to July, 1888, he was our Secretary of Legation at Peking and our *Chargé d'Affaires ad interim* at Seoul.

The post of Second Assistant Secretary was not established until 1866—thirty years ago; and in all that time it has had but two occupants. The first—William Hunter of Rhode Island—entered the department as a clerk in 1830, rose to be Chief Clerk in 1833, and continued in that position until he was appointed Second Assistant in 1866. While Chief Clerk he acted on one occasion, from May to October, as Assistant Secretary. Mr. Hunter died in office, full of years and of honors, and was succeeded in 1886 by Mr. A. A. Ade, the present incumbent, who has himself been in the service of the department for twenty-six years. He was our Secretary of Legation at Madrid from 1870 to 1877, when he was transferred to the department. Here he was, for a year, clerk of Class One, then Chief of the Diplomatic Bureau until 1882, when he was appointed Third Assistant Secretary, which place he held until promoted to that made vacant by Mr. Hunter's death.

In 1875 Congress provided for another Assistant Secretary in the Department of State, which has since had nine incumbents. Of these, in addition to Mr. Ade and Mr. Rockhill, three had previous training in the department or in the diplomatic service. Mr. Charles Payson of Massachusetts, who held the position from June, 1878, to June, 1881, entered the department as a clerk in 1870, and rose to be Chief of the Diplomatic Bureau in 1873. From July, 1874, to April, 1876, he was Chief of the Bureau of Statistics, and again Chief of the Diplomatic Bureau until June, 1878. Mr. John B. Moore of Delaware, who filled this position from August, 1886, until September, 1891, when he became Professor of International Law in Columbia College, had earned a clerkship in the department by means of a competitive examination under the civil-service act on July 1, 1885, and held it until his promotion. Mr. Edward H. Strobel, who was for one year, during the present Administration, Third Assistant Secretary of State, and who has, since April, 1894, represented this Government as Minister, first to Ecuador and afterwards to Chile (where he now is), had been our Secretary of Legation at Madrid from June, 1885, to June, 1889.

The office of Chief Clerk of the Department of State is one of considerable antiquity. It was created by the act of 1799, which established the Department itself. Not a few of the Chief Clerks have been promoted from clerkships of a lower grade. Mr. Dayton had been a clerk in the department for four years prior to his appointment as Chief Clerk. Mr. Vail had served in the same way eleven years. Mr. Derrick had had sixteen years' experience, and, when superseded by Mr. Crallé, he was given a sixteen-hundred-dollar clerkship, which he held until again elevated to his former position in 1849. Mr. Trist was Consul at Havana from 1823 to 1828, then a clerk in the Department of State for more than five years, and again Consul at Havana for eleven years before he was appointed Chief Clerk. Mr. Chew served the State Department as a clerk in each grade from 1834 to 1855, when he was temporarily Chief Clerk, and again as a clerk of the highest grade for eleven years, when he was asked to become the successor of Mr. Hunter, for whom a higher position had been provided. His successor, Mr. Sevellon A. Brown, had entered the department as a clerk in 1866 and had gone from grade to grade. Mr. Chfl-

ton, now Chief of the Consular Bureau, who, during Mr. John W. Foster's brief administration, was Chief Clerk, had had twelve years' experience as a clerk in the Department.

Of the twenty-two persons who have held this place, two have died in office, one has resigned to accept a position outside of the Government service, and thirteen have been appointed to other Federal offices. John Graham of Virginia, Chief Clerk from 1807 to 1817, was appointed in the latter year one of our Commissioners to Buenos Ayres. Daniel Brent of Virginia, his successor, continued to act as Chief Clerk until his appointment as Consul at Paris in 1833. Asbury Dickins of North Carolina, who came after Brent, resigned the chief clerkship in 1836 to become Secretary of the United States Senate. Aaron Ogden Dayton of New Jersey then held the place for one year, when he was appointed Fourth Auditor of the Treasury. Aaron Vail of New York, his successor, also remained but a year, when he was appointed our Chargé d'Affaires to Spain. Daniel Fletcher Webster of Massachusetts was Chief Clerk from March, 1841, to April, 1843, when he was sent on a special commission to China, where he served until the latter part of 1844. Nicholas P. Trist of Virginia, who was Chief Clerk from August, 1845, to April, 1847, was appointed Commissioner to Mexico, and his successor, John Appleton of Maine, was, after a few months, made Chargé d'Affaires to Bolivia.

The bureau officers have seldom or never been changed for political reasons. Whenever a vacancy has occurred, it has been filled either by the promotion of a clerk from the same or some other department, or in a few instances by the selection of a man of ascertained fitness whose occupation had specially qualified him to discharge the duties of the office. Exclusive of the Secretary, there are borne on the Register of the Department of State seventy-eight officers, clerks, and employees. Of these, fifty (or 64 per cent. of the whole number) have served the Government more than ten years. To be exact, one has served more than fifty years, another more than forty, and still another more than thirty. Seven have been in the service more than twenty-five years, ten more than twenty years, sixteen more than fifteen years, and fourteen more than ten years.

SOCIAL REGENERATION IN ITALY.

ITALY, April 6, 1896.

THE King has just signed the decree, countersigned by the Ministers of the Interior, of Finance, of Public Works, of Public Instruction, and of Agriculture, Industry, and Commerce, nominating for the period of one year a civil commissary to exercise political and administrative functions in all the provinces of Sicily, subject to the Minister of the Interior. The commissary is invested with all the authority of the ministers enumerated above; he is responsible for public security, for the provincial and communal administration, and for the public works; is to readjust local taxation and primary instruction, to survey mines and forests—and this without interfering with the state budget. He may suspend functionaries dependent on the various ministries, giving eight days' notice to the respective ministers. The prefects of the seven provinces, though they cannot be suspended or dismissed, are to correspond with the royal commissary instead of with the Minister of the Interior. He can order inspections of all administrative and political offices; revision of all the provincial and

communal budgets, so as to proportion their expenses to the contributive force of each. Among the many provisions there is one specially just: No beasts of burden (meaning mules and donkeys) can be taxed in a commune where cattle are untaxed, and the one animal of the poorest is in any case to be spared. The budgets of charitable institutions and of the Chamber of Commerce are to be revised, and a project for the unification of the communal and provincial debts to be prepared within six months with a view to prolonging the term for repayment, and so lessening the amount of interest, with a reduction of the local taxes.

This decree, together with bills for the abolition of the tax on the exportation of sulphur, for bonded warehouses, etc., will be presented to Parliament for the special benefit of miners, so let us hope that there will be a bill for the abolition of the infamous truck system. In their report to the King, the ministers enumerate the reasons that render such steps necessary: because the act of amnesty would be null and void without remedial measures; because a delegation of the powers of the several ministers to one representative will facilitate the passage of the measures tending to bring the administrators into contact with the populations, render possible the maintenance of public security, moderate the expenses of the provinces and the communes, and lessen the burdens of the contributors. Other provisions regard the railroads in Sicily and the ferry-boats which are to unite the island with the continent. The proposal is feasible as far as it goes. The abolition of the tax on the exportation of sulphur is an act of justice, as the export tax on silk in Lombardy was abolished two years since; but great care will be needed to insure the benefit to the actual miners—the excavators and the transporters of the ore to the surface—and not to the owners and farmers of the mines. Should the royal commissary be able to reconstruct the municipal and provincial budgets and adjust the incidence of taxation equitably, the experiment will have been worth making.

There is, however, one great omission which will assuredly deprive the royal commissary of the support of the Socialists who are sufficiently reasonable to accept half a loaf when a whole one is not forthcoming. There is no allusion to a reform of the land laws, and without such a reform no real pacification of Sicily can be expected. An absolute necessity is the reform of all contracts between the owners and tillers of the soil; the abolition, if not of the *latifondi*, at least of the *gabellotti* (the middlemen), who, after paying an enormous rent to the absentee landlord, underlet the estate in large or small farms, which are again subdivided by the tenants—once, twice, and thrice—so that the real tillers of the soil are reduced to work all the workable days of the year, and then to find, when the crops are gathered in, that their portion is absorbed by debt, usury, and the hundred and one pretexts, priest-paying, guardian-feeding, etc., etc., which the various tenants have invented for their destruction. In a letter to the *Nation* last year I gave a résumé of the bill presented to the House by Signor Crispi for the amelioration of the *latifondi*. Some of its provisions were excellent, but the opposition offered was so universal that it was at once withdrawn, with a pledge that it should be presented anew with modifications and ameliorations. Since then nothing more has been heard of it, and the Marquis di Rudini, who is one of the great landed proprietors of Sicily, in an exhaustive

article in the *Giornale degli Economisti* for February, 1895, demonstrated, to the satisfaction at least of landlords, that the uncultivated lands of Sicily are incapable of culture, and that those vast expanses devoted to wheat are unsuited to producing other crops. What attracted the champions of the tillers of the soil in the bill referred to, was the proposal to divide all estates of more than 100 hectares, to let the portions at fixed rents, or on the system of *emphyteusis* of the Roman law, while a special and heavy tax was to be levied on all uncultivated lands to constrain the owners to cultivate them, or to let them on such terms as would induce peasants to till them. Rudini affirms that every effort has been made, by owners or middlemen, to bring waste lands under cultivation; that he himself has converted unhealthy marshes into vineyards, olive and almond plantations; has broken up *latifondi* and let portions out on long leases. All went well till the phylloxera destroyed the vineyards; then the tenants threw up their leases, and the proprietors had to replant American vines and sustain the loss of rent and crops. What, he asks, could compulsory legislation do in this case?

The great impulse given to Sicilian culture was the extraordinary demand for the hardly fermented juice of the grape (must) when the phylloxera had devastated the French vineyards, along with the large exportation to the United States of oranges, lemons, and limes before California and other States had brought their vast plantations to their present point. Sicily really lost a capital trade with England for wines and fruits by the carelessness of her manufacture, and, in the case of fresh fruit, by her fecklessness in selecting and packing it. Great Britain now receives such vast supplies from the Channel Islands and from Australia of fresh fruits and early vegetables that it will be difficult for Sicily to recapture the market which might have been her own. Grain and wine have fallen 50 per cent. in value during the past few years, and last year oranges, lemons, and limes were left hanging on the trees for want of purchasers. All these things have to be taken into account by the legislators and champions of the peasant class, for, even were the lands of the state and what remains of the ecclesiastical property to be distributed gratis among the peasants, beyond the produce necessary for home consumption without markets the surplus would be produced at a loss. The peasant cuts short all such reasoning by saying: "Give me enough land to till for the use of my family, enough to produce all the corn, broad beans, and vegetables which we must consume or starve, and we will be thankful and contented, and take any extra work that may fall in our way at such stipend as may be doled out to us. What we complain of is that we work in season and out of season only to see our mule or donkey sequestered, and be turned out of our huts as the winter season comes on. If we have a bit of land, we can't pay the land tax, and the *fisco* takes the land from us, compelling us to join the army of day laborers; and, what with compulsory festas besides Sundays and bad weather, we rarely if ever work more than 200 days in the year, whereas we need to eat 365 days."

The Socialists in 1893 confined their practical attempts to getting better contracts for the so-called *métayers* and day laborers; these were abolished as soon as the leaders were sent to durance vile. Now the agitation recommences, as also the demand for the expropriation of the *latifondi* for "public utility." But where are the funds to come from? The state coffers are

empty; the 140 millions for Africa, if advanced by the National Bank, must be repaid and with interest; there does not remain a single available article capable of taxation, nor can existing taxes on a broad basis be augmented. A progressive income tax, a progressive land tax (the small incomes and small farms excepted), would be a remedy, but where is the House of Deputies that would vote such revolutionary measures? Still, were even existing laws properly applied, some help would be forthcoming. We have proved over and over again that the charitable institutions, properly administered, would suffice to house, feed, and maintain all the old people who cannot work, and all the young children and orphans for whom no one is now responsible and who must steal or starve. There are sufficient institutions for educating them to honest trades and for putting them out in life, but one half of the funds go in administration when they are not spent for electioneering purposes, as was a large portion of the sums subscribed for the victims of the earthquakes in Calabria. Should the royal commissioner succeed in restoring order and honesty in the administration of the charitable institutions of Sicily, he will have provided a fund for the assistance of the populations willing to work and unable to find employers and employment; but we fear that the organized resistance of associated interests will prove too powerful in the future as in the past; and in the event of fresh delusions, the starving populations will assuredly have recourse to fresh revolutions.

If I devote more attention to Sicily than to other parts of Italy, it is not because the largest island of the Mediterranean has the monopoly of misery, but because those islanders do not choose to suffer in silence, and therefore force their grievances and their demands for redress on the public. The island of Sardinia is, if possible, in a worse plight than Sicily; and, without waiting for the results of the late inquiry, we have a whole library of Sardinian literature to prove the wasteful, senseless administration of past and present times. Brigandage, homicide, vendettas, are the order of the day. In Sardinia there have been no general or organized revolutions; the Socialists there have not found fertile ground for sowing their doctrines. The Sardinians offered an asylum to the house of Savoy when the first Napoleon annexed all their other provinces, even as did Sicily to the Bourbons. Yet for that fertile, loyal island nothing has been done. I visited it and spent a month there with Garibaldi in 1866, and was astonished to see the wild wastes of uncultivated yet so fertile soil, the gigantic orange groves and olive forests, the groves of pepper trees—"ogni ben di Dio," as the inhabitants used to say. "This will be a garden when Italy is united, free and one," Garibaldi said; and when he bought his barren rock at Caprera, he made frequent excursions to the larger island, always hoping against hope that "something would be done for it." Alas! Sicily, with a surface of 29,441 square kilometres, has a population of 2,700,000 souls. Sardinia, with a surface of 24,842 kilometres, has but 680,000 inhabitants. It is a desert. There are railroads; but, said a traveller just returned, you travel through waste lands—no houses, trees, or inhabitants. Malaria prevails. The denizens know only the tax-gatherer and the military officer who summons the conscripts to the annual levy. There, as in Sicily, the *latifondi* prevail; small proprietors have disappeared; the lands let for pasturage or for the cultivation of wheat do not yield a bare sus-

tenance to the peasants. Tourists exclaim: "Why, not even round London and Paris and Naples have we seen such splendid fruit orchards and vegetable gardens, to say nothing of the olive, lemon, and orange groves!" This is true for the three cities; but a few miles from these you find nothing but thistles, asphodel, and lentils—the white, sad cistus the only flowering bush. The land is fertile, the hands are sufficient, for the Sardinians do not emigrate unless forced to do so, but capital is wanting. Private individuals or industrial companies do not care to invest in an island where the *fisco* takes not the first-fruits but the seed and flower which might produce them. *Maggesi* (the leaving the land to repose one year in two or three, as a substitution for manure) prevails in Sardinia, as in Sicily. The Sardinians, fatalists by nature, are now so by experience. "Nothing is done, therefore nothing can be done." As for public security, the brigands secure themselves. Rarely, if ever, is a crime informed against. Do they not pay taxes to the Government to govern the island? Why should the inhabitants expose themselves to the revenge of the powerful? The Sardinians are more "resigned" than the Sicilians; but there is an end even to resignation, and it may be that the end is near at hand.

As I end this doleful letter comes the announcement that Senator Codronchi is nominated by royal decree the new royal commissary for Sicily, and also Secretary of State without portfolio. Codronchi is a moderate of pure water; has been Prefect of Milan, of Naples, and of other provinces. As Secretary of State, he will be able to expound his theories and justify his actions in the council of ministers; as Senator he can answer questions among his peers. If our hopes and beliefs were equal to our ardent desires for his success, we might end our letter with a brighter close; but we are not convinced, as we were almost a fortnight since, that the darkest hour which precedes the dawn is yet at hand. Africa looms yet too darkly on the horizon. J. W. M.

Correspondence.

NAKED BED ONCE MORE.

TO THE EDITOR OF THE NATION:

SIR: Illustrations of this phrase may be seen in that rare and valuable book, Wright's 'History of Domestic Manners and Sentiments in England during the Middle Ages.' At p. 257, in speaking of the thirteenth and fourteenth centuries, he says, "One custom continued to prevail during the whole of this period—that of sleeping in bed entirely naked." In the fifteenth century it "continued in all classes and ranks of society" (ib., 411). At p. 477 one of the cuts indicates the same practice in the period following the Reformation.

In the Countess of Essex's case (2 How. St. Trials 785), in 1618, one may see the phrase "naked bed," and specific illustrations of what it meant. T.

CAMBRIDGE, May 2, 1896.

TO THE EDITOR OF THE NATION:

SIR: In further allusion to the phrase "naked bed," which was again touched upon in the last issue of the *Nation*, it may be of interest to note that Mr. Pepys, under date of May 21, 1660, says, "so to my naked bed." The editor, Mr. Wheatley, in a note, refers to the custom of our English ancestors sleeping

without clothes, and quotes from "Venus and Adonis":

"Who sees his true love in her naked bed,
Teaching the sheets a whiter hue than white."

Mr. Richard Grant White, in a note to the line in *Macbeth* (Act II., Sc. 1), "Get on your night-gown," also refers to the ancient custom, but adds that Shakspeare knew nothing of this, and that by all such allusions in his plays ("Julius Cæsar," Act II., Sc. 2; the old "Hamlet," Act III., Sc. 4, "enter Ghost in his night-gown") a bed-room dress (*robe de chambre*), and not a night-dress, is intended. Mr. White seems to be mistaken in the assumption that Shakspeare knew nothing of the custom, since, even if Mr. Pepys's remark is a mere survival of expression, the quotation noted above, and the later incident given by your correspondent last week, would show that the custom obtained in Shakspeare's day. It would be interesting to know when the custom in this respect changed and under what influences.

Yours, HENRY LEFFMANN.

Notes.

MAYNARD, MERRILL & Co. have in press for immediate publication a 'History of the Army of the United States,' edited for the Military Service Institution by Gen. Theodore F. Rodenbough and Major William L. Harkin, U. S. A., with portraits of all the generals-in-chief of the army from 1789 to 1895.

Macmillan & Co. have undertaken to issue a 'Dictionary of Philosophy and Psychology,' under the editorial supervision of Prof. J. Mark Baldwin of Princeton University. Definitions will be combined with justificatory historical matter and with very full bibliographies. The contents will be wholly original and individually signed. The staff of the Dictionary embraces Profs. Andrew Seth, John Dewey, Josiah Royce, R. Adamson, W. R. Sorley, J. McK. Cattell, E. B. Titchener, Joseph Jastrow, and Lloyd Morgan, Dr. Benjamin Rand; and others.

Henry Holt & Co. will shortly publish a translation of 'La Musique et les Musiciens,' by Albert Lavignac, and W. Fraser Rae's biography of Richard Brinsley Sheridan.

Lempert, Hilliard & Hopkins have just ready 'Little Rhymes for Little People,' by Anna M. Pratt of Cleveland—a limited edition; and 'Lincoln and his Cabinet,' by Charles A. Dana.

The Transatlantic Publishing Company will soon issue 'A Society Woman on Two Continents,' by Mrs. James Mackin; 'Memoirs of a Little Girl,' by Winifred Johns; and 'Lo-To-Kah, the Ute,' by Verner Z. Reed.

'The Story of Cuba,' by Murat Halstead, is to be brought out by the Werner Co., Chicago.

The Chicago firm of Stone & Kimball, now become H. S. Stone & Co., promises a second series of 'Prose Fancies,' by Richard Le Gallienne.

Copeland & Day, Boston, have in hand a new translation, by M. S. Henry, of 'Aucassin et Nicolette'; the passages in verse being turned into English rhyme by E. W. Thompson. The form is freakishly small for so large type as that of the prospectus.

'Number and its Algebra,' by Arthur Lefevre of the University of Texas, is announced by D. C. Heath & Co.

Mr. S. M. Hamilton has chosen a timely subject, "The Monroe Doctrine: Its Origin and Intent," for his Part I. of 'The Hamilton Facsimiles of Manuscripts in the National Ar-

chives relating to America' (*Public Opinion Co.*). Here we have, admirably reproduced by photographic processes, six letters of Monroe, Jefferson, Madison, and Rush, together with excerpts from Monroe's message embodying the so-called "doctrine." If, in glancing over the handsomely printed quarto, the reader recalls the definition to the effect that "a popular song is one that everybody has become tired of," neither editor nor publisher is to blame, as each has done his share in a distinctly praiseworthy manner. And if the less hackneyed material promised in succeeding parts but equal this first in execution, a series of real value to the student will have been well begun.

Something like the service which Dumont rendered to Bentham was that which Harriet Martineau performed for Comte when she translated freely, and condensed to one-fourth, his 'Positive Philosophy.' After nearly fifty years, Mr. Frederic Harrison is sponsor for a new edition, in three neat volumes of Bohn's Philosophical Library, of Miss Martineau's *tour de force* (London: George Bell & Sons; New York: Macmillan). He prefixes a brief notice of Comte, but, for the rest, leaves the text unannotated, not caring to point out its relatively insignificant shortcomings. He does, however, add five pages of concluding considerations, embracing Comte's programme of future philosophical labors ultimately carried out, which his translator omitted as not being strictly a part of the work in hand. It is well to remember that this abridgment not only had the hearty approval of Comte, but was honored with a translation back into the French—or the beginning of one.

Charles Scribner's Sons have begun a taking little series of "Stories by English Authors," parallel to that by American authors also bearing their imprint. One of the two initial volumes before us has England for the scene of the short tales; the other, Ireland. Reade, Hardy, Collins, Lover, Carleton, and Barlow are some of the contributory writers. The frontispieces are portraits of Samuel Lover and Anthony Hope.

We can appropriately record here the appearance of the second volume of the handsome Dent-Macmillan edition of William Carleton's 'Traits and Stories of the Irish Peasantry,' edited by D. J. O'Donoghue. Here we have Carleton's house in Dublin for a frontispiece, besides illustrative etchings.

The late George Augustus Sala is to be remembered by his culinary as well as by his literary writings, and hence a reissue of his 'Thorough Good Cook,' with its preliminary "chats" (Brentano's). It is a plump square volume of nearly 500 pages.

An awkward shape has been given to 'My Mascot: A Collection of Valuable Receipts' (Boston: Sabra Publishing Co.). The scheme is to introduce each section with a printed receipt, and leave the housewife to fill up the blank leaves with approved receipts, written in her own hand. A harmless "sentiment" heads each folio.

In 1870 the Legislature of Maine authorized W. W. Thomas, jr., one of its commissioners on the settlement of the public lands, previously United States Consul in Sweden, to plant in the northern part of the State a colony of young Swedish farmers, with their families and their pastor. The fifty-one persons who formed the first company were chosen with great care, only those being taken who were able, among other things, to pay their passage to America; but provision was made by the State for aiding the colony in various

ways until it should become firmly established. The history of the enterprise is told with pardonable pride in 'The Story of New Sweden' (Portland: Loring, Short & Harmon), a report of the exercises at the quarter-centennial celebration in June, 1895. From the first the colony was remarkably successful, and the town of New Sweden is now the centre of a Swedish population of nearly fifteen hundred, with property of an estimated value of more than half a million dollars. The undertaking has a special interest as an example of successful colonization under State auspices.

'Father Archangel of Scotland, and Other Essays,' by G. and R. B. Cunninghame Graham (London: Adam & Charles Black; New York: Macmillan), is unhappily named, giving no hint of the fresh free air of the Argentine pampas which blows through almost every page from title to finish. Even when the scene shifts to Spain or Morocco, the pampa, the wild horse, the untrammelled Gaucho, is not forgotten. In Coruña, by a grave surrounded by exotic plumes, the lover of the free life of the southern plains feels "that pampas grass looks sad in Europe, and hangs its head as if it missed wild horses bounding over it, and sickened for the calling of the Teruteru." This strong, almost fraternal sympathy with the rude race which so long held sway over the La Plata plains, a race now passing rapidly away, constitutes the chief charm of the book. We see the Gaucho as in real life, swaggering and fighting at his *pulqueria*, swinging at a bound into the saddle and galloping off, like a bird taking wing, magnifying achievements of horsemanship by the camp-fire while the smell of smoke and leather rises in our nostrils; we can feel the excitement of the ostrich hunt, and discern the faint but fatal tracks by which the *rastreador* leads across leagues of pampa to the rendezvous of the horse-thief. This is something more than depicting a strange life—it is making it real; and we can in consequence forgive many slips in the use of good English, and a host of trivialities and foolish sarcasms in the tales of "Father Archangel" and "In the Tarumensian Woods." These mar the book; but the lover of horses and horsemen and of the unrestraint of wild life will find in it many morsels of rare flavor.

From the Hudson Importing Co., No. 10 East Fourteenth Street, we have received three volumes entitled 'English Minstrelsy: A National Monument of English Song,' which will make a strong appeal to all who are interested in British folk-music. It is edited by the Rev. S. Baring-Gould, who spent ten years in collecting new material for it, his intention being that it "should not confine itself to such songs as have been written for the harpsichord and the piano, by skilled musicians, but should include also the lark and thrush and blackbird song of the ploughman, the thrasher, and the milkmaid." The result is a collection of about 300 songs unequalled in scope, variety, and interest in its own field. The volumes are prefaced by historical sketches of English national song and of English opera, and the editor has added notes to many of the songs, in the belief that a knowledge of the circumstances under which they were written will add to their interest. There are a number of quaint old pictures, besides excellent etchings of Sims Reeves, Edward Lloyd, Charles Santley, Mary Davies, Signor Foli, Antoinette Sterling, and others. The type is clear and large, and the text carefully edited, it "being unhappily true that some of the finest old English airs are found associated with undesirable words."

Dr. Th. Baker has compiled a very conve-

nient 'Dictionary of Musical Terms' (G. Schirmer). It comprehends within 229 pages brief definitions of upward of 9,000 English, French, German, Italian, and other words and phrases used in the art and science of music. It does not purport to be an original work, but a compilation from the standard works of Grove, Riemann, and many others, general and special. Some of the articles, like Trill, are fully illustrated with musical examples, and the definitions, so far as we have examined them, are concise and accurate. Of omissions we have noted only *decrecendo*. On the other hand, the Japanese "Koto" introduces an element usually ignored in such works. Of recent musical inventions the Autoharp is mentioned; but why is the Æolian ignored—an instrument which brings orchestral music, performed with expression, into every home, and is destined to play a great rôle in spreading a taste for the best music?

As the great English Dialect Dictionary begins to go to press, the English Dialect Society puts forth three more glossaries, Nos. 74, 75, 76, in token of the vigor of the parent enterprise. Mr. Skeat edits nine specimens of dialects from various sources, expressly for the use of Prof. Wright, the Editor of the Dictionary, and has taken upon himself the labor of as many indexes. The ninth selection, a Yorkshire dialogue, he pronounces "the oldest good specimen of a modern English dialect that has come down to us." Incidentally he testifies to a change in Essex pronunciation in half a century, when the *a* in *skate* has acquired the sound of *i* in *kite*. On the other hand, a servant at the door receiving his name as Skeat, rhyming with *best*, would always pityingly announce "Mr. Skate," rhyming with *great*. The Rev. F. M. T. Palgrave contributes a list of words and phrases in every-day use in Hutton-le-Hole, Durham, with the prefatory matter characteristic of this series, which ought somehow to be digested for a chapter of the Dictionary. In this village he notes that Atkinson is pronounced Atchison; and Turnbull, Trummel. "Halleluias" is the usual term for Salvation Army folk. From the mining country of Bewick we pass to Edward Fitz Gerald's East Anglia in Walter Rye's careful reëditing of Forby. In this volume a New Englander will feel much at home, but there is a deal of hazardous etymologizing by sundry amateurs.

For fifteen years and more there have appeared in *L'Illustration* numbers of *pensées*, signed G.-M. Valtour, which were read with interest because they united, with a form at once strong and concise, real thought and the fruits of observation. These have now been put together in book form by their author, Gustave Vapereau, under the title 'L'Homme et la Vie: Notes et Impressions' (Paris: Hachette). They are classified under five headings, and a pleasant and instructive occupation it is to dip into them, flavored as they are by real wit, by sound satire and sounder judgment. One or two samples, by way of proof: "We rule our life by maxims we should not like engraved on our tombstone." "One may judge of a man's character by his opinion of women." "The increasing taste for illustrated works marks the growth of indolence of mind: we are spared the trouble of reading." "For many men politics are a means of getting an income without putting in any capital, and of having a profession without serving an apprenticeship to it."

'Le Mécanisme de la Vie Moderne,' by the Vicomte G. d'Avenel (Paris: Colin & Cie.), is a study of industrial and commercial progress in France which is as fascinating as a good, clean,

interesting novel, and, withal, full of much information obtained at first hand by the author. The subjects treated are the great dry-goods houses, notably the Bon Marché and the Louvre; the iron industry, especially as seen at the great Creusot works; the food supply, which is illustrated by a description of the Potin stores and factories; the banking establishments, and the wine business. Each study bristles with statistics, but M. d'Avenel is a writer who understands the art of being clear, and even the layman can follow intelligently the details so abundantly given.

'Les Chemins de fer aux États-Unis,' by Louis Paul Dubois (Paris: Colin & Cie.), is a study of the railway systems in this country which conveys in a compact form much information concerning the great lines, their workings, financing, and traffic. It is not a mere piece of writing around the subject, but a serious attempt to present to Frenchmen a view of a system of railroading differing in nearly every respect from the European systems.

The description of a journey from Damascus to Bagdad, in *Petermann's Mitteilungen* for March, is interesting mainly from the evidence which it gives of the energetic and partially successful attempts of the Turkish Government to control the wild Beduin tribes whose constant raids prevent the development of the region lying between the Mediterranean and Mesopotamia. Not only are the caravan routes being protected by garrisoned posts and flying columns of mounted infantry, but the natives are being induced to give up their nomadic life and to become cultivators of the ground. In this the sons of influential sheikhs, who have been educated in the Government school ("aschiret mektebi") at Constantinople, have given efficient aid. Dr. Baumann's account of the extensive Arab sugar plantations on the Pagani River in German East Africa is encouraging for the future of this colony. According to the census taken on December 2, 1895, the population of the German Empire is 63,344,508, an increase of 5.7 per cent. since 1890. The growth was largest in Brandenburg and Westphalia, where it was 11 per cent. Taking Prussia as a whole, the increase was 6.8 per cent.; for Alsace-Lorraine it was 2.8 per cent. There has been a gain in every part of the empire excepting the little province of Hohenzollern, which has lost 1.5 per cent.

Prof. Flinders Petrie, in an account of the last season's excavations at Thebes, given in London on April 8, says that among the objects discovered was a large inscribed tablet of black syenite. It records the deliverance of Egypt from the Libyans during the reign of Merenptah, about 1200 B. C., and then recites the various places taken in this monarch's Syrian war; and among these (in Northern Palestine, apparently) he spoils "the people of Israel." If this rendering of the name is correct (and it is accepted by Prof. Maspero and Dr. Naville), then the long-desired connection between Egypt and Israel through the monuments has been established. What light this discovery throws upon the time of the Exodus, held by some authorities to have taken place in this reign, remains to be seen.

The Southern History Association was organized at Washington on April 24 by the election of Postmaster-General Wilson as president; of Dr. J. L. M. Curry, Gen. M. C. Butler, Gen. M. J. Wright, John R. Proctor, Thomas N. Page, and Prof. Woodrow Wilson, as Vice-Presidents; of Dr. C. Meriwether as Secretary; and of Thomas M. Owen as Treasurer, besides a

large and highly representative administrative council.

—A magazine does not often bring out an article more seriously to be recommended to the general reader than Benjamin H. Ridgely's "Comedies of a Consulate" in the May number of *Scribner's*. As the typical American tourist is sure to "take in" Geneva, there is no place that could have offered better opportunities for photographic shots at his ideas of what a consul is there to do for him. The essential comedy of the consulate begins, of course, in Washington, in the ousting of one man to make way for another no better, if as good; and Mr. Ridgely is as quick to see this and as frank in admitting it as could be wished. It would be a gratification to believe that his article will be as faithfully thumbed as Beedeker on every ship that leaves our docks this season. There is a sting of mortification in the documentary evidence he supplies of the behavior and the insane demands of compatriots who flock to his office or pelt him with letters; but the writer who can shame us into seeing ourselves as others see us abroad will do his country a handsome service. Another article which, if it is not literature, is at least journalism of a desirable sort, is Isobel Strong's "Vaillima Table-Talk," to be concluded in June. It may be a trifle disappointing to find that actual undress utterances of Stevenson's are somewhat thinly strewn through a text descriptive of his domestic life, yet there are several sayings with an aphoristic ring that are among the things of his one would not willingly miss. An account of Women's Clubs in London, some very fair short stories, together with the first paper on the "Evolution of the Trotting Horse" and the inevitable verse, make up the rest of the contents of this magazine.

—Illustration and text from separate hands seldom hang together so well as do those of Du Maurier and Felix Moscheles in the latter's article, "In Bohemia with Du Maurier," in the *Century*. The common quality which fuses the two into one is the unaffected pleasure that has evidently gone to the making of each, although Du Maurier's pen-and-ink sketches were done in the fifties, and Moscheles's reminiscences were written at a date that gives them a long perspective of time. Where Du Maurier gathered a great deal of the material for his later fiction, and how he first began to discover his diversified talents, are the chief disclosures of interest in the recollections. Their charm consists in the picture they give of the young art-student's unconscious revelling in his own cleverness, and his overflowing delight in production, of which verse, sketch, and letters preserved here are the outcome. The beginning of Mr. Bryce's "Impressions of South Africa" is full of present and the promise of future interest, as he has applied to the country now looming into prominence the same powers of personal observation which made his visit here so fruitful. In this first paper the economic and political problems of South Africa are approached through a description of its physical features, in which a place is given to the picturesque qualities of the landscape, depending on "a warmth and richness of tone which fills and delights the eye," and on the charm of primeval solitude, silence, and dreary solemnity. It is encouraging to observe not only that Dr. Philip Coombs Knapp finds a negative answer to the general question, "Are Nervous Diseases Increasing?" but also that, contrary to popular assertion, he comes to the specific conclusion that, "without more evi-

dence in its favor, we must regard the belief in the greater nervousness of Americans as an error."

—Dr. Birkbeck Hill has not lacked explicitness in stating, in the opening sentences of the current number of the *Atlantic*, that he is editing his group of Letters of D. G. Rossetti "for readers on the other side of the Atlantic." All that can be done, in the way of elucidating and supplementing, by two persons possessed of interesting information about other interesting people, both the editor himself and the poet's brother, W. M. Rossetti, have not failed to do for these letters, which were all written to another poet, William Allingham. But the charm which it might have been hoped would make Rossetti's prose independent of editorial attractions is, so far, not to be found, though it may still be discovered in instalments of the letters yet to come. In his pleasantly written "Trip to Kyoto," Lafcadio Hearn writes down himself and his much-loved Japanese as indisputably among the Wordsworthians. Between his praise of the universal cheapness of pleasure in Japan, where "the delight of the eyes is for everybody," and the spirit of "Stray Pleasures" or "To the Daisy," the difference is not more than skin deep. Any one to whom the tone of this article, or that of Olive Thorne Miller's "Whimsical Ways in Bird Land," is sympathetic, must also be in sympathy with the article on "The Preservation of Our Game and Fish," by Gaston Fay. The tragedy of our wildfowl is an old story, but always a moving one, and this is an effort worthy of all success to rally their friends, first among whom should be the true sportsman, to their rescue. Among their enemies, secret and open, are the politician, the game warden, the dealer, the breech-loading and magazine shot-gun, and now the cold-storage system. It is shameful to have to add to this list women, who are responsible for orders like a recent one from an English firm for the skins of 500,000 ox-eye snipe, the smallest of their species.

—A point of interest in *Harper's Magazine* will be found in the article containing a small budget of letters grouped under the head "England and America in 1863." These letters are addressed to Cyrus W. Field, whose two most conspicuous correspondents are Messrs. Bright and Gladstone. Fortunately there is nothing in the tone of either (each expressing deepest consideration for American interests) calculated to stir animosity in the most bellicose mind, unless, indeed, it can be imputed as a common crime to two eminent English statesmen, otherwise so dissimilar, that they had no prophetic vision of the results of our great crisis—time having, in fact, flatly contradicted Mr. Gladstone. Mr. Field's relation to the negotiations for the Atlantic cable receives brief comment from the anonymous editor of this correspondence. Another of Professor Woodrow Wilson's historical papers, "At Home in Virginia," though going over the oft-trod ground of the gathering of the Revolution, has the individuality and vividness of treatment which produce a fresh picture before the mind of the reader. Prof. Brander Matthews has not profited by the example of the Louvre and other national galleries which give the freedom of their walls to the works of no living artist. His essay on "The Penalty of Humor" opens so promisingly that one hopes to find in it a contribution to all one's future thought on the subject. But the winding up, where one looks confidently for the essayist's deft applications

and final hitting the nail on the head, consists of an expression of ardent admiration for the works of Mark Twain. Coincidentally, a portrait of Mr. Clemens and an article "Mark Twain," by Joseph H. Twichell, lead off this number of the magazine.

—The article "Light on the Underground Railroad," in the April *American Historical Review*, has moved a Western correspondent to send us a leaf of his own experience. He says:

"In the winter of 1860-61, I was obliged to go from Chicago to Des Moines, in the heart of Iowa. Marengo was then the most western point I could reach by rail. The stage on which I there took passage at nightfall soon lost the track in the houseless, fenceless, and treeless prairie. We wandered till the horses were exhausted, and should have frozen had not the bark of a dog brought us at last to a hut. The next day we could get no farther than a farmhouse, 'out of sight of land,' midway between Brooklyn and Grinnell. Sheltered here and promised a lodging on the floor of the loft, we spent the evening in the common room of farmer Bates. There a gun, hanging high in old New England fashion on two wooden brackets, led me to speak of it. 'That gun,' said Bates, 'is John Brown's gun; he passed this way more than once, piloting negroes North—at one time about thirty—and on his last visit left the gun here.' Then, taking the gun down, he showed me how Brown had mended the stock and a piece of the lock which had been broken. The first remark of one of the stalwart boys was, 'That gun is going South next summer.' No doubt it, or at least the boy, did go, for the firing on Sumter followed within three months. The object-lesson afforded by fugitives with Brown as a guiding angel would not let the youth stay at home."

—A puzzle once solved loses all interest; but an enigma which may be plausibly explained in several ways, but demonstrably solved in none, has a perennial fascination. Who was the Man in the Iron Mask? Who was Kaspar Hauser? Was Louis XIV. really married to Mme. de Maintenon, after all? Was Swift married to Stella? Not that it matters greatly, in either case; but it would be a comfort could we substitute proofs for internal convictions, and so have them, once for all, settled and done with. With regard to Swift's case, the present annotator has long been convinced that there was no marriage. He has arrived at that conviction, not by a minute sifting and testing of each particle of so-called evidence, but by taking the sum of what was offered on one side, and contrasting it with all that tended to prove the contrary; the negative evidence seeming, to his mind, overwhelmingly preponderating. But, in the brochure (a reprint from the September *Anglia*) before us, entitled "Was Swift Married to Stella?" Prof. A. von W. Leslie has carefully gone over the ground, and shown how weak the evidence is. Statements dubious at first, and handed down through a succession of transmitters, taking a twist from each; remarks dropped casually in conversation and brought forward seventy or ninety years afterwards—in fact, much of this evidence is little better than Lord Peter's proof of the nuncupatory will, who remembered that he "had heard a fellow say, when we were boys, that he had heard my father's man say," that the father had expressed himself favorably in the matter of gold lace. Whether this view of the case places Swift's character, as Prof. Leslie thinks it does, in a less lurid light, need not be discussed here. But we must strongly protest against the way he speaks of the innocent, trusting, and hapless Vanessa, whose cruel fate has left a stain on Swift's memory which all the oceans cannot wash away.

—It will be remembered that M. René Doumic, in his discourse at Angers on the present literary crisis, gave utterance to a somewhat hard prophetic saying, to the effect that France was likely soon to consist of "a handful of mandarins in the midst of an unlettered people." M. Doumic has since, in an article in the *Débats*, thrown a little light upon what he means when he talks of "the lettered" and "the barbarians." The distinction which he makes between the two seems to be very nearly that which Matthew Arnold made between the Remnant and the rest of mankind. M. Doumic notes the extreme satisfaction which the Socialists take in the classical and lettered oratory of M. Jaurès. They seem to delight in that which it is their real mission to destroy. That M. Jaurès himself is one of the lettered there is no doubt. He is one of the most complete products of bourgeois education. A clever pupil, laureate of the Concours de la Sorbonne, section chief at the Normal School, he uses against his old teachers the arms which they have furnished him. He cites Homer and is full of Cicero, and his followers applaud his erudition instead of distrusting him on account of it. In this, to be sure, one only finds repeated a characteristic phenomenon of the first Revolution. Eloquence then was strongly tinged with classical remembrances, and much of it was drawn directly from Livy and from the Roman orators. The people applauded all this literature, and yet were none the less "barbares." Perhaps the truth is that they were moved by the rhetoric of their political leaders. But it is precisely the unlettered man who is moved by rhetoric, and is the slave of the phrase; for phrases leave incredulous those who know what the phrase is. It is only because of their ignorance that men are the dupes of words. The last word of rhetoric is to inspire a horror of rhetoric. M. René Doumic seems to have in his mind, when he talks about mandarins, not a new class to be hereafter developed, but the old class of the truly wise and cultivated who, in every age, have been the salt which has kept the earth sweet, while his barbarians include that half-educated class which is often farther removed from the light of civilization than the wholly illiterate.

MARCOU'S AGASSIZ.

Life, Letters, and Works of Louis Agassiz.

By Jules Marcou. With illustrations. Macmillan & Co. 1896. 2 vols., crown 8vo. I., pp. xii, 802, pl. 8; II., pp. x, 818, pl. 4.

ABOUT twenty formal biographies of Agassiz appeared from 1845 to 1893, with some thirty lesser notices of his life and works during the same period, besides uncounted articles compiled for cyclopedias or for newspapers. We have also many portraits, painted, engraved, or photographed, with busts, medals, and tablets. A list of Agassiz's own principal writings, or "works," 1828-73, is 418, or 425 with others published posthumously, 1874-80; and this is exclusive of countless fugitive pieces, printed correspondence, museum officialities, reported lectures, and the like, which we suppose would take a complete Agassiz bibliography beyond 1,000 entries. Here is certainly an embarrassing richness of material for any biographer, but it has been already so well worked up that a new Life of Agassiz must show its reason for being, and especially for offering to supplant Mrs. E. C. Agassiz's "Life and Correspondence," which has been very generally considered final since its appearance in 1885.

Accordingly, Prof. Marcou's compliments to Mrs. Agassiz are necessarily apologetic in form and in fact explanatory, his persuasion having been that "the true history of Agassiz has not yet been written."

The veteran geologist is the sole survivor of the small band of European naturalists who came to America with Agassiz in 1846, the only one now living who enjoyed Agassiz's friendship for nearly thirty years, and one of the few men to whom Agassiz ever even half-unbosomed himself. He is distinctively one of the school of scientists to which Agassiz belonged, now generally considered old-fashioned, out of date, and hopelessly heretical in the dogma and ritual of present-day evolutionary science. Prof. Marcou has been many years in gathering if not also in shaping his materials, with the

"design of presenting to the public the man himself; his origin, his character, his public life, his private life, his passions, his weaknesses, his faults, his errors, his genius; what he did and what he left undone; above all, to put him in his place, in a true light, in correct perspective, with its lights and shadows, in the field of history of natural science. I have tried to speak of him uninfluenced by the discordant voices which have celebrated his merits without discretion, or demolished his reputation without measure."

His subject is a man of enormous achievement, of world-wide fame, and of unquestionable genius, whom, nevertheless, many persons honestly believe to have been "vastly overrated," and whom some discerning ones have considered inferior to Jeffries Wyman as a biologist, though the latter's name is scarcely known beyond scientific circles. A renowned and erudite student of nature, his most significant and far-seeing generalization—namely, that ontogeny of the individual epitomizes phylogeny of the race—has had little to do with his renown and been little considered in estimating his erudition. A professional ichthyologist, of vast acquisitions in his specialty, his maturest generalizations regarding cycloid, ctenoid, ganoid, and placoid scales have come to be considered not less unsound and fanciful than Cuvier's notion of four types of all animals, or than Owen's archetype itself. A popular and sympathetic personality which won all hearts, his biographer represents him as uneasy in the presence of his peers, brooking no rival, and received in Paris and London with all the more cordiality because it was known that his stay would be short. The gifted teacher of a generation of men and women whom to know personally was an education in itself, his students ran the whole gamut between reverence and mutiny. A lavishly generous man, to whom business methods were unknown, who never counted the cost, he was often pinched for private means, yet had the address to secure vast sums of public money for scientific ends.

We sometimes hear of men who are said to be greater than their works. If there really be any such persons, Agassiz is among the number. His positive contributions to science extend over half a century—from the description of a new monkey in 1828, to a posthumous work on corals in 1880; they range through all branches of the biological sciences, and extend far into the department of physics, especially in the ice-age problems of geology. In so far as he had a zoological specialty, it was ichthyology, and in this his researches were extensively paleontological. The study of echinoderms, so successfully prosecuted by his distinguished son Alexander, long occupied him. He is also prominently identified with embryological research. His erudition was

vast and varied; a tenacious memory kept most of it available at a moment's notice; a well-ordered mind enabled him to utilize most of it on any occasion; a stubborn insistence upon fact kept him from dreaming much, and his imagination seems to have been seldom if ever overwrought. The result of his life-work, such as it is, has passed into history; and what has been found to fit the progress of science has become ingrained in our common stock of permanent knowledge. Agassiz, in short, is "classic" in natural history. Yet we doubt if the net result of his published work approaches the measure of importance and usefulness of his personal example, or has anything like the influence he exerted while living—and still exerts, though dead. This is what we mean by saying he was greater than his works. In his career as a teacher and popularizer of science is to be read his truest title to fame. We recall no other name, excepting that of Huxley, which has become so nearly synonymous with "science," or, at any rate, with the idea which that word conveys to most persons. As, by a late witty saying, "for the English public, 'science' means an article by Professor Huxley in the *Nineteenth Century*," so meant a lecture by Agassiz for many years to the average American. Agassiz did more than make science respectable; he made it fashionable—socially fashionable. No man could be devised or imagined better at this business, in this country at least. Art conspired with nature to fit him for it; his personal appearance, his manner, his delivery, even his slight foreign accent, told with immense effect, and gave him an irresistible hold upon his hearers. He was fully conscious of this power, loved the footlights as dearly as any actor, and made the platform a stage for dramatic situations. We may never see his like again in this respect, but the results remain visible and palpable. Thousands have applauded Agassiz's public pronouncements, for one person who ever read his books to any considerable extent; hundreds have been kindled to enthusiasm for the pleasant paths of knowledge by the contagion of his personal example, for one whose knowledge has been increased by his publications; and scores of students who have become prominent in science in indirect consequence of his teachings, turn to his writings chiefly to criticize or refute them.

The public really knows very little of Agassiz's technical work—or anybody's else, for that matter. How many of his admirers have any but the vaguest ideas of his theories or observations on glaciation? How many could assign the respective parts taken by Agassiz and Edward Desor in the history of echinoderms? How many could quote a single fish's name from the 'Poissons Fossiles'? If we turn to one of his greatest and one of his very few commercially successful works, one also of special interest to Americans, who so love and honor Agassiz's name, the result is still the same. This is no other than the celebrated 'Contributions to the Natural History of the United States,' which started magnificently in April, 1858, but broke down after four volumes had appeared, in 1862, and was never resumed, though ten volumes had been planned. Agassiz was then at the zenith of his popularity; he had just passed his fiftieth birthday, May 27, 1857, to which Longfellow dedicated the poem which is far better known than Agassiz's own great work. Prof. Marcou states that, with the exception of the preliminary Essay on Classification, which achieved some popularity and had decided influence, on its separate republi-

cation in modified form, the number of persons who ever read the 'Contributions' may be "less than one hundred" in America and "only a few dozens" in Europe. Similarly, Part II. of the 'Principles of Zoölogy' was never published, and various other projected works, which appeared in part, were never pushed to completion. Almost the only popular and practically successful book Agassiz ever wrote was his 'Methods of Study in Natural History,' which appeared in 1863 after running for two years in the *Atlantic Monthly*, went through about twenty editions, and had enormous educational influence. This is probably the one work in which Agassiz the writer and Agassiz the speaker came in closest touch; and hence its effectiveness. The greatest practical boon Agassiz ever conferred upon working naturalists was his 'Nomenclator Zoölogicus,' with the accompanying Index—the veriest drudgery imaginable for an author, yet drudgery of a kind that no hack or mere compiler could have performed; and only those who have to keep it at their elbows can be sufficiently grateful for this instrument.

The work before us is decidedly the most comprehensive, most incisive, most original, and altogether ungracious contribution to our knowledge of Agassiz that has ever appeared. We question its entire wisdom and we suspect its disinterestedness. While it will delight some, it will pain others, and cause to grieve not a few of the judicious. It is particularly remarkable for raking up old personalities and forgotten scientific quarrels. Who remembers anything about Agassiz's affair with James D. Forbes until he is here reminded of it? And who cares now whether or not the breach was ever healed between the vivacious Franco-Swiss king of the ice-age and the obnoxious British Islander—"tall, thin, dry, haughty, and extremely egotistical"—concerning whom Marcou quotes with gusto from Töpffer: "Je défendais vos de passer à moi, quand je dis rien à vos!" Who was Karl Schimper, that we should care whether or not "il n'a manqué à Schimper que d'être sobre," or now wish to peruse Agassiz's 'Erwiderung auf Dr. Karl Schimper's Angriffe'? On the other hand, the Desor matter was more serious, and, much as Marcou says about it that we wish to know, he leaves us in the lurch as to the real secret of the extraordinary relations between Agassiz and his long-time secretary. The first volume, dealing with Agassiz's early life in Europe, is remote enough from present interests, in both time and scene, to give us much accurate and original information not to be found elsewhere, and otherwise to pass unchallenged as the always delightful and seldom dangerous gossip of the great. The second volume, however, treating of the times when Agassiz was in the midst of us, is simply a heap of combustibles, which only require ventilation enough to flare up. Chapter xviii., for example, 1858-64, fans the embers of all the burning questions of thirty years ago, till we feel the heat and see them glow again. In recalling the *odium scientificum* to which the dissensions over Darwinism gave rise, our author is either mistaken or unjust. In Dr. Gray's case, which must be so familiar to most of our readers that we need not elaborate it, the note on p. 110 is probably erroneous in fact, and we do not think it quite right to say of Agassiz and Gray that "their friendship grew rapidly until completely checked by the publication of Darwin's 'Origin of Species,' in 1859" (i., p. 284). Certainly there was a coolness for a time while the great zoölogist and the great botanist were each endeavoring to readjust their pre-

conceptions to the new order of things; but it was happily removed before long, and the two met cordially, if infrequently, as long as Agassiz lived. This is not the only case where we suspect there is a little private axe hidden in the large and shapely bundle of faggots of fact which Professor Marcou offers. Sometimes he seems to be settling old scores of his own, with Agassiz for a stalking horse. Thus, for a piece of present-day practical politics, or eminently practicable polemics, commend us to what he says of the origin, progress, and present status of the National Academy of Sciences. We cite volume ii., pp. 157, 158:

"In March, 1863, during a session of the Board of Regents of the Smithsonian Institution, he joined Prof. Bache in his scheme for the foundation of a National Academy of Science. Bache was a rather ambitious man, full of academic distinctions, and a lover of power. In 1860 Agassiz had him elected a corresponding member of the Academy of Science of the Institute of France, and from that moment Bache worked at the creation of a National Academy, to bear some analogy to the French one. Under the pretext that the Government at Washington might be in want of advice, directions, and reports on scientific subjects, Bache, supported by Agassiz and Joseph Henry, obtained, through Henry Wilson, then Vice-President of the United States, an act by the Thirty-seventh Congress 'to incorporate the National Academy of Science.'

"Agassiz, who knew the defects of close corporations with Government privileges, like the Institute of France, hesitated in following Bache, as did Joseph Henry. But both had been in such intimate relationship with Bache, and the American Association for the Advancement of Science, founded in 1848, had given such scanty results, notwithstanding the influence exerted on the committee by Prof. Bache and his friends, that they thought a trial might be made. Agassiz may be called one of the founders, but not the 'prime mover.' Returning from Washington, after the act was passed by Congress, Agassiz was certainly not an enthusiast on the subject, and even showed a dislike to talk about it, simply saying that 'the National Academy was mainly to satisfy Bache's ambition for control.' A friend told him that it would soon fall into the hands of politico-savants, which he admitted might be true; and, in fact, a few years after the death of Bache, Agassiz, and Henry, the National Academy became, as predicted, a tool in the hands of ambitious Government employees at Washington."

Whether or not one should here read between the lines "pas même académicien," we are not disposed to inquire, in view of the fact that dissensions among the ninety-odd American immortals have often been expressed in identical terms within the verge of the Academy's chaste enclosure.

Our notice would be incomplete without some reference to Agassiz's religious opinions, as reflected by his biographer. His scientific conceptions seem to present-day scientists radically wrong; how, then, about that measure of ignorance which he, like most intellectual men, bundle up in what may be called a creed or confession of faith? Very likely Agassiz, like Faraday, Gray, and many other great scientists, knew the difference between what he knew and what he did not know, and was thus able to keep his science and his religion in separate watertight and fireproof compartments. Very likely, also, he could feel to the depths of his spiritual nature the difference between living religion and dead ecclesiasticism. Marcou cites on this score a letter written by Agassiz to the rector of Neuchâtel, December 14, 1841, during the tempest in a teapot which arose over some of Agassiz's *sans-à-propos* dealings with dogma:

"Heureusement que les temps de Gallée n'existent plus; mais aussi y a-t-il bien moins de mérite qu'alors à ne pas composer avec les

prétensions des *Ministres de l'Eglise*, et ce n'est certes pas une couronne de martyr que j'espère conquérir. Je dis 'de l'Eglise,' et par là j'entends les ministres de tous les cultes, qu'ils soient protestants, catholiques, juifs, ou mahométans, qui ne veulent faire de progrès en rien. Notez bien que je ne dis pas 'de la Religion.' N'oubliez pas que mes doctrines ne peuvent porter d'atteinte qu'à l'enseignement des docteurs de l'Eglise, et nullement aux vérités de la Religion." (I., p. 193)

Agassiz's religious ideas or ideals seem to have developed along the lines thus indicated, and his maturest views were probably not markedly different in spirit. We must make room for one more extract, of not much later date than the above, it is true, but no doubt reflecting what became an habitual frame of mind. Marcou is speaking (I., p. 231), but what he cites from a letter of Agassiz to Adam Sedgwick, June, 1845, is nothing different from what most scientists would say or have said:

"Agassiz, after his student life, was not a materialist, but a spiritualist, in natural history, an adversary both of agnosticism and of pietism; for he says: 'I dread quite as much the exaggeration of religious fanaticism, borrowing fragments from science, imperfectly, or not at all, understood, and then making use of them to prescribe to scientific men what they are allowed to see or to find in nature.'"

Altogether we shall be surprised if this work does not make a sensation which will be felt far beyond scientific circles. Some of Agassiz's old pupils, now numbered in the hierarchy, are not likely to let it pass without rising to remark upon various points. As a piece of literary handicraft, it is altogether admirable. As a biography, it is a model of much that ought to be in every biography and of some things to be sedulously shunned. The book is beautifully printed, the type is clear, the volumes are of handy size, and all the niceties of composition are observed. The illustrations are few, but of particular interest. The author's command of another than his mother tongue is perfect, and he need not have apologized for introducing so many pages of French text; most readers will be glad he did so. If there be a fault of the author's English style, it is too close pointing—construction of clauses too peppery with commas. The French text is all but faultless, as we should expect it to be under the circumstances; but Latin names have not always fared so well at the printer's hands, as witness "Corregonus" and "Jaucus."

WOMAN'S ENTRANCE INTO MEDICINE.

Pioneer Work in Opening the Medical Profession to Women: Autobiographical Sketches by Dr. Elizabeth Blackwell, author of 'The Moral Education of the Young,' etc. Longmans, Green & Co. 1895. Pp. 265.

THE story of the woman who took the first medical degree in America, and who was also first admitted to the practice of medicine in England, is a story of very great interest; it is told in this book in a very effective manner, and with perfect modesty and simplicity.

Elizabeth Blackwell was born in England, the third of a family of nine children, more than one of whom turned out to be unusually gifted. She dwells upon the advantage of growing up in the midst of a large group of brothers and sisters. The natural and healthy discipline which children exercise upon one another, the variety of tastes and talents, the cheerful companionship, even the rivalries, misunderstandings, and reconciliations, where free play is given to natural disposition under wise but not too rigid oversight, form an excellent dis-

cipline, she believes, for after-life. When she was eleven years old, the family moved to New York, and some years later to Cincinnati. She was seventeen when her father died, leaving the family unprovided for. She and her two older sisters opened a school, which they carried on successfully, and acquaintance with the very intelligent circle of New England society settled in Cincinnati, of which the Rev. W. H. Channing, nephew of Ellery Channing, was the inspiring centre, furnished a congenial atmosphere for their years of young womanhood. After the school was given up, Elizabeth taught in a small town in Kentucky, where she gained her first practical experience of negro slavery; her letters give a graphic description of the crude civilization of a Western slave State at that period. During some further teaching in other Southern States, the idea of studying medicine had finally taken shape with her, and then began the nearly hopeless effort to find a medical school which would admit a woman. Some glimmering of comfort she may have got from the indecision, at least, of one Philadelphia physician, who said to her, "You have awakened trains of thought upon which my mind is taking action, but I cannot express an opinion to you"; and upon being further urged, "I beg leave to state clearly that the operation of my mind upon this matter I do not feel at liberty to unfold." But usually the response was very prompt.

The story of the accident by which it happened that the Medical College of Geneva, N. Y., finally opened its doors to Miss Blackwell is of critical moment in the history of the progress which women have made in these eventful fifty years. We condense it from a letter which was published in 1892 by a well-known physician of New York who had been one of her fellow-students, and which is given in the appendix to this book:

"The class, numbering about 150 students, was composed largely of young men from the neighboring towns. They were rude, boisterous, and riotous beyond comparison. During lectures it was often impossible to hear the professors, owing to the confusion. Some weeks after the course began, the dean appeared before the class with a letter in his hand which, he said, contained the most extraordinary request that had ever been made to the faculty. The letter was written by a physician of Philadelphia, who requested the faculty to admit as a student a lady who was studying medicine in his office. They had decided, he said, to leave the matter in the hands of the class, with this understanding, that if any single student objected to her admission, a negative reply would be returned. It subsequently appeared that the faculty did not intend to admit her, but took this plan, which they thought would be a perfectly safe one, of avoiding the responsibility of a refusal.

"But the affair assumed a ludicrous aspect to the class, and the announcement was received with uproarious demonstrations of favor. At a meeting which was held in the evening, the most extravagant speeches were made in favor of admitting the lady, and were enthusiastically cheered. The vote was finally taken, with what seemed to be one unanimous yell, 'Yea!' When the negative vote was called, a single voice was heard uttering a timid 'No.' The scene that followed passes description. A general rush was made for the corner of the room which emitted the voice, and the recalcitrant member was only too glad to acknowledge his error, and to record his vote in the affirmative.

"Two weeks or more elapsed, and as the lady student did not appear, the incident of her application was quite forgotten, and the class continued in its riotous career. One morning, all unexpectedly, a lady entered the lecture-room with the professor; she was quite small of stature, plainly dressed, appeared diffident and retiring, but had a firm and deter-

mined expression of face. Her entrance into that bedlam of confusion acted like magic upon every student. Each hurriedly sought his seat, and the most absolute silence prevailed. For the first time a lecture was given without the slightest interruption, and every word could be heard as distinctly as if there had been but a single person in the room. The sudden transformation of this class from a band of lawless desperadoes to gentlemen, by the mere presence of a lady, proved to be permanent in its effects. A more orderly class of medical students was never seen than this, and it continued to be so to the end of the term. . . . In the honor list of the roll of graduates for that year appears the name of Dr. Elizabeth Blackwell."

We have no space to describe the untiring effort which had still to be made before Dr. Blackwell had added to her course of study the experience in the London and Paris hospitals which she, being in advance of the medical students of her time, deemed essential to her preparation. But we must make room for the charming description of the teaching of one of the heads of the Paris Maternité, where, in spite of sufferings from bad air and bad food, she spent some months; it shows what teaching means in the hands of one who is born with the vocation for it:

"If the pupils answer promptly and well, her satisfaction is extreme, her face grows beautiful, and her 'Bien, très bien!' does one good, it is so hearty; but if an unlucky pupil hesitates, if she speak too low, if intelligence or attention be wanting, there breaks forth the most admirable scolding I ever listened to. Alternately satirical and furious, she becomes perfectly on fire, looks up to heaven, claps her hands, rises upon her chair: the next moment, if a good answer has redeemed the fault, all is forgotten, her satisfaction is as great as her anger. At first, I was a little shocked at this stormy instruction, but it produces wonderful results. If the girls keep their temper under it and do not cry, it comes right at last; but a tear is an unpardonable offence, and considered an insult and a misunderstanding. Madame Charrier is a woman of great experience and always speaks to the point, and her lessons are very useful."

It was during her stay at the Maternité that Dr. Blackwell became subject to an attack of purulent ophthalmia, which, in spite of the most devoted care on the part of physicians and fellow-nurses, resulted in the loss of one eye, and prevented her from becoming the great surgeon which she had hoped to be. The further study and travel in England, the return to New York to practise, the opening of a hospital in 1857, after she had been joined by her sister, Dr. Emily Blackwell, and Dr. Zachræwaka, and the final decision to continue her work in England—these and other interesting matters must be sought in the book itself.

Fanny Kemble, who often rendered generous help to benevolent institutions by the use of her great talent, was appealed to on behalf of this struggling infirmary. "She received us courteously and listened to us with kindness; but when she heard that the physicians of the institution were women, she sprang up to her full height, turned her flashing eyes upon us, and, with the deepest tragic tones of her magnificent voice, exclaimed, 'Trust a woman!—as a DOCTOR!—NEVER!'" Even this does not seem so remote from the present time as the fact that the Springfield Republican thought it worth while to reproduce the remark of the "sprightly Baltimore Sun" to the effect that the first woman medical student, if admitted to the profession, ought to confine her practice to diseases of the heart.

One of the vacations in her medical course was spent by Dr. Blackwell in the women's department of the Blockley Dispensary at

Philadelphia; her eyes were there opened to the evil that is in the world, and the foundation was laid for that strong feeling of obligation which has led to an important part of the activity of her later years. Her little book on the 'Moral Education of the Young' was refused by twelve London publishers, and she was finally obliged to print it at her own expense, but its plain-speaking seems very innocent now. She believes that it has been well worth the efforts of a lifetime to have attained knowledge which justifies an attack on the root of all evil—viz., the pessimism which asserts that because forms of social evil have always existed in society, therefore they must continue to exist for ever.

An Artist in the Himalayas. By A. D. McCormick. Illustrated by over 100 original sketches made on the journey. Macmillan & Co. 1896.

MR. MCCORMICK, the artist who went to the Karakoram with Sir W. M. Conway, contributes in this volume an account of the picturesque aspects of the expedition. He does not attempt to add anything to the geographical information which has been given to the world by his leader. He is confessedly not a geographer, nor even a trained traveller. Previous to this Himalayan trip, his knowledge of the world was bounded on the east by London and on the west by Belfast. He had a studio in Chelsea, but orders came slowly, and he had brought himself to look the odds of farming or cattle-herding in the face when an opportunity to go out with Conway was put in his path by an *alter ego*, Jack Roubesh. The frontispiece shows Mr. McCormick to be a man of splendid strength, and he hailed with enthusiasm a chance to use his muscles, draw new subjects, and see the world. Jack Roubesh was able to go, too, so his happiness must have been complete.

The serious work of the Conway expedition was the exploration of the Baltoro Glacier and the high mountain region in the neighborhood of the Golden Throne. Mr. McCormick adds some interesting details to what we already know about the ascent from Askole to Pioneer Peak, and the return journey through the seracs and over the endless moraine. On the day of the great and final climb he was knocked up, and with heroic self-effacement remained in camp rather than interfere with the chances of the others. The wonder is not that he was ill at such an altitude, but that he did so well. What would Dr. Saussure have said to a man who could climb 20,000 feet within five months from the time he first saw a mountain? The kindness with which Mr. McCormick took to climbing finds a parallel in the facility with which his pencil lent itself to the reproduction of mountain scenes. His sketches bear no traces of the 'prentice hand. One cannot expect in black and white the mountain effects which M. Loppé has caught, but Mr. McCormick's drawings bear out what is said of them in the preface to 'Climbing in the Himalayas': "No traveller was ever accompanied by a better artist than Mr. McCormick, whose illustrations adorn this volume, and whose water-color sketches, some of which were recently exhibited, have received on all hands praise both high and well-merited."

We cannot pretend that Mr. McCormick's literary accomplishments are on the same plane with those which he possesses in the character of artist. He enjoyed what he saw and is energetic in description, but he is not always skilful. A certain redundancy of the ideas

expressed by "dreaming," "color," "strangeness," is to be expected, but one would prefer to have them occasionally in the form of *entrées* rather than always in the solid form of joints. The style is not too stilted to exclude a passage like the first of the following extracts, nor too compact to exclude the second: "The row the Indian 'shandrydan' made was not enough for the Kashmiri, but he must let in six sets of cymbals round his coster-barrel arrangement, and the noise was infernal." "Early in the morning we sent off the tents and baggage, except the Colonel's, with whom I stayed till lunch, when it began to blow a perfect storm." On page 109, in the character sketch of Dr. Robertson, "not often" should be "not seldom," unless the rest of the context is strangely out of keeping. The passage at present runs: "Now he is known to every one in England, as he was then known to every one on India's northern frontier, as a man of rare courage, coolness, and determination, not often combined with political judgment." As we are told immediately after that "he either does the absolutely right thing, or, at any rate, selects the best in circumstances when all seem equally bad," it is to be presumed that Mr. McCormick does not mean to deny Dr. Robertson's political judgment.

None of Mr. McCormick's adventures was particularly remarkable, and, owing to the narrow limits of his travelling prior to 1892, he has no such standards of comparison as Sir W. M. Conway is constantly making use of. Descriptions of *ekka* rides are always good, but a professional humorist would probably make more out of the subject than Mr. McCormick has done. His comments on the Gurkhas emphasize their cheerfulness, strength, and courage, but sometimes reflect upon their loose morality. At the present moment their assistance is indispensable to success in any Himalayan expedition. A good many of the Fifth Gurkhas are receiving a sound training at the hands of Alpine experts, and, with the advantage of trained guides on the spot, some follower of the late Mr. Mummery may well hope to vanquish a better mountain than Pioneer Peak.

Among other matters of interest in Mr. McCormick's book we may single out the three following for special mention: First, he found that, in order to reproduce Eastern subjects, speed of execution was necessary. "Rapid sketching was the only way to catch hold of the effects, and I made a careful study of the details of the scene to add to it if required; but in all cases I tried to get effect and drawing down at once, as that was the only way to retain any of the spirit and go of the scene." The illustrations in this volume seem to be taken without modification from Mr. McCormick's sketch-books. They are less highly finished than the illustrations which he furnished to 'Climbing in the Himalayas,' but they are even more animated. We have praised Mr. McCormick's mountain drawings. It will, then, be considered no disparagement to say that we prefer his drawings of the native figure and costume. When people are the subjects, photographs are not to be compared with good drawings, but with mountains the case is different. Only an extraordinarily fine sketch can compare for excellence of representation with Signor Sella's photographs. Not one of Mr. McCormick's mountain pieces seems to us so satisfactory as the photogravure of Dych Tan in Mummery's 'Alps and Caucasus.' Secondly, Mr. McCormick, like all generous men who go to India, was fired by the spectacle of the hard, open-air work which English officers

do during a considerable part of every year. He does not inflict upon his reader platitudes about the civilizing influence of Great Britain in that empire. He simply says he should like to take a hand himself. "Every evening in camp [at Srinagar], when the gray soft haze over the Bagh was lit up with the golden glory of the setting sun, we sat down with our companions, some of whom were officers come down from Gilgit, and smoked and talked of what each had seen and done, of war and adventure, and of living a life that made me feel it was the life a man should live. As I thought of the dreary days in the busy bustle of London and contrasted them with the glorious open life around, I felt that here was my abiding-place." Finally, the Conway expedition proceeded from beginning to end without hitch, accident, or unpleasantness. If men are of the right sort, nothing brings them together so close as experiences of adventure and danger. Anyhow, it is pleasant to read of an important exploration party which has no "Rear-guard" skeletons in its closet.

A Handbook of Greek Sculpture. By Ernest Arthur Gardner, M.A. Part I. Macmillan & Co. 1896. 8vo, pp. 268.

THIS is the first volume of a projected series of Handbooks of Archaeology and Antiquities. It deals with the history of Greek sculpture down to Phidias inclusive, breaking off just before the discussion of the Parthenon marbles. There are fifty-five well-executed half-tone illustrations. The second and concluding part of the work is expected to appear in the course of the present year.

For all its brevity, this handbook must take rank at once as the best account of Greek sculpture existing in English. Mrs. Mitchell's 'History of Ancient Sculpture,' published in 1888, is praiseworthy and useful, but (so rapidly does new material accumulate) it is already antiquated in parts, especially in regard to early Attic sculpture. Moreover, it is disfigured by many shockingly bad illustrations. And, finally, its text is rather that of a painstaking and judicious compiler than that of an independent master of the subject. Mr. A. S. Murray's 'History of Greek Sculpture' has the advantage of being the work of a trained and distinguished archaeologist. Originally published in 1880-'83, it was reissued in a second edition in 1890, but only the first volume was revised, and that very inadequately. It is, moreover, costly, and, while excellent in parts, is of very uneven merit. The small 'Manual of Ancient Sculpture,' by M. Paria, 'edited and augmented' by Miss Jane E. Harrison, though it has received no little praise, swarms with blunders and absurdities, the responsibility for which, it is only fair to say, rests chiefly with the English editor. There are no other books in English which come into consideration. There was thus real need for a work which should trace the history of Greek sculpture with a master's hand, and with due regard to the whole available mass of material. That need Mr. Gardner has admirably supplied.

In his Introduction he discusses (a) the sources of our knowledge of the subject, (b) the materials and processes of Greek sculpture, (c) the use of sculpture for architectural decoration, and (d) the chronological arrangement to be observed in the sequel. The second section, on a subject to which Mr. Gardner has made important contributions, especially in a paper published in the *Journal of Hellenic Studies* for 1890, will be of especial value to

the student. The history proper, so far as completed, falls into three chapters. Chap. i. deals with 'Early Influences,' chap. ii. with 'The Rise of Greek Sculpture (600-480 B. C.),' chap. iii. (incomplete) with 'The Fifth Century (480-400 B. C.).' Exhaustiveness of treatment is of course not aimed at, but the outlines of the subject are clearly and firmly drawn. The limitations of space and perhaps the temper of the author have reduced æsthetic criticism to a minimum. The term "history" is interpreted strictly, and the author seems half to apologize (p. 209) for introducing a cursory description of two or three works whose exact period and school cannot be definitely assigned. In short, the book is scientific in spirit. It aims at understanding, leaving enjoyment to take care of itself. Its most distinguishing characteristic is a rigorous exclusion of conjecture, however dazzling. But, for all its severity, it is thoroughly readable, and even fascinating.

While, of course, some of Mr. Gardner's views are open to discussion, we have noted almost no statements that could positively be pronounced incorrect. The head upon the statue of Aristogiton in Naples is said, on page 183, to be Lysippean in character. This head was enumerated by Graef among the copies of the Meleager, which, according to our present lights, is attributable to Scopas, or an immediate pupil of Scopas. The evidence on which Prof. Furtwängler bases his identification of the Athena Lemnia of Phidias is not quite correctly stated on page 265. There are two copies (not one) in Dresden of the statue in question; and it is not true that "the head of the Dresden statue is made in a separate piece." In the one statue the head, still partially preserved, was of one piece with the body; in the other the head was indeed separate, but it is now missing altogether. These trifling slips, however, do not affect Mr. Gardner's main contention, viz., that Prof. Furtwängler's brilliant identification, which seems to have been generally accepted in Germany, is without adequate evidence. For our own part, we are inclined to rate more highly than Mr. Gardner does the strength of the proof advanced; but the general attitude of mind which he displays in this, as in other matters, cannot be too warmly commended.

Statistics and Sociology. By Richmond Mayo-Smith. Macmillan & Co. 1895.

THIS volume is offered as the first part of a "systematic Science of Statistics"; but the claim appears to be somewhat too broad. In fact, it is only by a stretch of language that it can be described as a scientific treatise at all. The author seems to make no clear distinction between statistics in general and the statistics of human society in particular, nor does he appear to have considered the method necessarily employed in the study of human society, whether by means of statistics or otherwise. The definition of statistics as consisting "in the observation of phenomena which can be counted or expressed in figures" is altogether inadequate. Every other human being, as well as the census-taker, according to this definition, is a statistician. Lord Dunsyre was a statistician when he observed that his toes were equal in number to his fingers, and the child beginning to count is engaging in statistical investigation. Number is the widest of all the categories, and it cannot be admitted that statistics is nothing but arithmetic. It is undoubtedly true that unless phenomena can be enumerated they are not

available for the use of the statistician; but as practically all phenomena can be counted, this limitation is vain. It is the classification of phenomena that makes them available for scientific purposes; and without a clear comprehension of the principles and methods of scientific classification, the accumulation and analysis of figures profit nothing.

We are told, it is true, that the method of statistical observation is not of universal application, but we are not told when it is applicable, or how it is to be applied. We are advised that "fittingness and suggestiveness are more important" than mere accumulation of facts—a principle which is undoubtedly true, but lacks scientific precision. So of the statement that "always and everywhere with statistical analysis comes the question whether our classification is legitimate and scientific." Many such questions are suggested by our author, but he contents himself with asking the questions and not answering them. He observes that as population fluctuates it is necessary, in considering births, deaths, marriages, etc., "to adopt some sort of rate." But concerning the standard to be adopted we are left in the dark. "The most simple is that of the whole population." It has certain advantages, certain disadvantages; but whether the advantages outweigh the disadvantages or not we are not told, nor are we informed of the principles upon which such problems are determined. In comparing phenomena we are warned to take care that the comparison is a fair one, and advised to select typical statistics "which will prove the point in hand," sufficient in number "to show that the rule is general and not exceptional." Such counsels as these merely suggest the difficulties of scientific investigation. They show how fallacious are the inferences that may be derived from collections of figures, but they do not show how these fallacies may be avoided.

On the whole, while we concur in the opinion that "if we are not to be entirely confused and overwhelmed by the mere mass of data and by the conflicting conclusions to which they seem to lend support, it is necessary that we strive for and attain absolute clearness in respect to the ends to be sought and the methods of seeking them," we do not think this absolute clearness has been obtained in the present work. Indeed, we incline to the view that this treatise is not concerned directly with the science of statistics. It is essentially a collection of inferences from census reports and other collections of figures, many of which are no doubt valid, many also suggestive and interesting, but all, so far as we have observed, insufficiently verified. The United States census of 1890 was in several respects improperly taken, and some of its defects have been so thoroughly exposed as to be notorious. But in these pages we have failed to find any regard paid to its untrustworthy character, and inferences derived from its tables are offered without proper warning. It is hardly necessary to say that if there is to be any statistical science, it can be developed only from premises which have been themselves established in accordance with the canons of inductive logic. Conclusions derived from unverified observations belong not to the realm of science, but to that of speculation.

Although we cannot regard this work as sufficiently critical to possess much scientific value, it would be unjust to ignore its merits. It is full of observations which prove the author to be well aware of the worthlessness of much which passes for statistics, and to be familiar with the conditions upon which cor-

rect inductions are to be obtained. As a practical treatise it abounds in information which, while not meeting the strict requirements of scientific tests, is yet sufficiently accurate for ordinary purposes. Evidence may be in many respects imperfect and untrustworthy, and yet be admissible as revealing the existence of tendencies. It is in the discovery and isolation of such tendencies that the author does his best work, and achieves results of positive value. The principal rubrics comprehend the most important conditions of man as a social being—birth, death, marriage, sex, age, and crime. There are chapters also on the infirm and dependent, on race, and on migration. These chapters are full of interesting matter, presented in an attractive and readable way. There is very little positive and dogmatic statement, and if the author's conclusions are accepted subject to the cautions and reservations with which he offers them, the book will be found to be of service by the legislator as well as by the student of human society. And this, when we consider the manner in which statistics are generally collected, is more than can be said of most works of this kind.

The Development of Parliament during the Nineteenth Century. By G. Lowes-Dickinson, M.A., Fellow of King's College, Cambridge. Longmans, Green & Co. 1895. Pp. vi, 188.

"THE object of the following pages is twofold: first, to recount, as briefly and clearly as may be, the process of the 'democratization' of Parliament; secondly, to put what appears to me one of the most important questions to which that process has given rise—the question of the competence of a democratic House of Commons to direct to a satisfactory issue the socialistic tendencies of the future."

In this opening paragraph of the preface is clearly stated the plan of a very instructive and suggestive book, a book which, in less than two hundred pages of large print, brings England and the world face to face with a most remarkable transformation, not in the least understood by its authors and scarcely by its subjects. To analyze it adequately, to give even a correct idea of this work, by the minimum of quotation from its startling and illuminating epigrams, would be beyond the space at our command. A short summary must suffice, in the hope of sending readers to a book sadly needed in the day when Americans are talking about the danger from the spread of English monarchical institutions.

The authors and the opponents of Parliamentary reform in 1832 never contemplated a democratic remodelling of the ancient constitution of King, Lords, and Commons; they believed Parliament was, and ought to be, the means whereby varied elements and varied interests, weighed and not counted, should combine to preserve an ancient and complex system. The Tories maintained that this was perfectly done by the existing arrangement; the Whigs held that, by one act of vigorous readjustment, it might be done very much better; and the mass of the burgher class, who were the chief agents in forcing Lord Grey's Government to carry "the bill, the whole bill, and nothing but the bill," would have utterly scorned Samuel Warren's sarcastic title, "A bill for giving everybody everything." But the precedent had been set for changing the prescriptive system; and henceforth no change, however radical, was impossible. Yet no change was attempted for twenty years—and from 1852 to 1867 each new reform bill was taken up, as we should say, "to make political capital," and

not from any strong pressure from any class. Both of the great parties had united in opposing the sweeping constitutional changes advocated by the physical-force Chartists in 1840; and when these rose against a Whig Government, their counsel were Tory lawyers, whose politics were as unsympathetic as possible.

Every Reform Bill up to 1867 contemplated some new delicate adjustment of interests, not with a view to increasing the electorate, but to developing a greater variety of respectable constituencies; but none of these cunning devices met with any response till Disraeli's artful plan, transformed by the shock of clashing intrigues into a measure so democratic that it startled the very Radicals, added a vast body of urban constituents, because numerical increase was the only change that could be understood. Yet even then, Mr. Lowe, who had had in Australia an experience in which very few of his colleagues shared, was the only statesman of any party who understood and explained what had come about. Another half generation completed the work, democratized the county constituencies as well as the city, swept away, in only fifty years from the days of the first Reform Bill, the balanced and varied Parliament with which centuries had been familiar, and created a numerical electorate of millions, the representatives having practically changed their character to delegates.

Meanwhile the democracy—that is, the working classes, into whose hands the author well says the upper and middle classes have been forcing the political power—have, by a series of strange steps (chartism and trades-unionism among them), arrived at a position of a very socialistic character, in which the almost unchecked authority of a workingman's House of Commons stands an excellent chance of being used for a still further extension of suffrage, to include all adults—not merely women, but paupers—and for a redistribution of property in the very spirit of Karl Marx. Such an entire overthrow of English traditions never was in the mind of those who passed the Reform Acts of 1832, 1867, and 1884. But it is entirely on the cards if all the legislative power is in the hands of a single unchecked body—a national convention which, however loudly it might claim to represent the people, would really leave very much of what makes and always has made England, unrepresented. The only hope for law and property is in a second chamber. The author considers the House of Lords in its history and its capabilities. He contends that the charge, constantly levelled against it, of having obstructed and defeated the popular will is untrue; that, however obsolete the hereditary principle may be, and in need of substitution, it would be far more easy to make such substitution and reform the upper house than to save England from anarchy if it were abolished.

As was said above, this is a bare and very imperfect summary of the argument, omitting the terse and pointed language, the keen illustrative power, the grave yet hopeful tone of the book. It is, in all respects, the work of an historian, a scholar, a patriot, and a philosopher, and deserves to be widely read and deeply studied.

Masters of Italian Music. By R. A. Streatfeild. Scribners. Pp. 270.

In our comments on the 'Masters of German Music,' in the series entitled 'Masters of Contemporary Music,' the fact was noted that Mr. Maitland did not have a very imposing list of masters to deal with. Yet that German

list, which included Brahms, Max Bruch, Goldmark, Rheinberger, Kirchner, Reinecke, Bargiel, Hofmann, Bruckner, Nikodé, Richard Strauss, and six others, is infinitely more imposing than the meagre array of Italian names at the service of Mr. Streatfeild—Verdi, Boito, Mascagni, Puccini, Leoncavallo, Sgambati, Bazzini, and Mancinelli. Were it not for the veteran Verdi, now in his eighty-third year, this list of "masters" would seem almost comic, and it certainly reveals in a most painful way the decadence of musical Italy. Our author seems to realize the situation. He clings to Verdi with the despair of a man who sees a desert before him, and not till he has given him more than half the pages in his book does he proceed to the others. He knows that "at the present time, and indeed for many years past, music in Italy has meant opera, and opera alone." Yet lately the tendency of this opera has been "towards melodrama of an unusually sordid and objectionable type." And what makes matters worse, this tendency is already overcome, so that the author, while ostensibly treating of contemporary "masters," is really writing the history of an ephemeral fad. The account he gives (174) of the honors paid to Mascagni on account of his fifth-rate, vulgar "Cavalleria Rusticana" makes very amusing reading even to-day, and the joke will grow richer with keeping.

Yet, with the exception of Verdi and of Boito (a man of one opera, now in his fifty-fourth year), Mascagni is the most talented of contemporary Italian composers. Leoncavallo is less vulgar, but also less spontaneous, and to call either of these or any of the others of the young men "masters" is a serious misuse of terms. They do not deserve to be incorporated in a musical history any more than the erotic ephemeral novelists of our time deserve, or will secure, a place in literary history. At the same time one can understand Mr. Streatfeild's perplexity. He was called upon to write about the famous Italian composers of the day; and as he could find only two who came under that head, he had to make notoriety take the place of fame in the other cases. As it is, the value of his book lies partly in the demonstration it gives of Italy's present musical poverty, and partly in the chapters on Verdi and Boito, which are well written and interesting. If the book were called 'Verdi and Others,' its scope and value would be more obvious.

From Far Formosa. By G. L. Mackay, D.D. Fleming H. Revell Co. 1895.

THOSE writing to Tamsui or Taiwan must now address their letters "Japanese Empire." As valuable as timely is this richly freighted volume treating of the country and people that may be said to be restored, rather than awarded as the spoils of war, to Japan. Formosa has an area of 15,000 square miles and a population of nearly 4,000,000. The climate is excessively trying to foreigners, for the island lies betwixt the monsoons and the Kuro Shiwo, or Black Current of the Pacific, and between the twentieth and twenty-fifth degrees north latitude. It is a land of tropical heat, of constant and excessive moisture, of intense energy in vegetable life, with quick growth and rapid decay, and of chronic malaria in the lowlands. The eastern part of the island is a great mountain mass, having a rocky sea-face, for the most part without harbors, while the western portion contains plateaus, plains, and soil of amazingly fertile character.

This well-written, well-arranged, and well-indexed volume is probably the first general

work descriptive of the country and people. It presents facts collected and classified by one who has spent twenty-three years on the island among all varieties of people, native and foreign. The author, Dr. Mackay, was sent out by the Canadian Presbyterian Church. Admirably equipped for his work by nature and otherwise, he belongs to that too rare type of missionaries who work for the bodies as well as the souls of men. Dr. Mackay's idea, from the first, has been to raise up a native ministry, to find common ground of both faith and works, and to fit men to be preachers and lives of the Gospel in Formosa especially. Where he found no seed planted, there are now sixty churches, over a thousand communicant members, and thousands of Christian adherents. He has done what some missionaries fail utterly in doing—disarmed the prejudices of the white merchant, traveller, and tourist, and made the foreign residents his helpers and sympathizers. He has visited the wild savages in their mountain fastnesses, and has never quailed before howling mobs or men with murderous intent. Formosa is the land of toothache and malaria. When Dr. Mackay could not preach the Gospel, he extracted teeth and dispensed medicine. He has drawn out of their sockets no fewer than twenty one thousand decayed teeth. He has studied the flora, fauna, minerals, and resources of Formosa. Hence, his pages have unique value to the man of science. At Tamsui, his headquarters, he has colleges for men and women, and museums for the study of the ethnology, religious and natural features and products of Formosa, and he gives his young preachers, as far as possible, a very practical and many-sided education. His story, modestly told, possesses thrilling interest, and is much assisted by maps and illustrations.

Dr. Mackay married a native Formosan lady, and the frontispiece portrays himself and family. For the book in its present form the Rev. J. A. Macdonald is responsible, Dr. Mackay having sailed away for Formosa in October, fully believing that the Japanese occupation will greatly improve the general situation, and confident that his plans are flexible enough to meet the new problems.

There is an aboriginal population of Formosa, dwelling in the mountains and jungles, whose ruling passion is head-hunting. These swoop from their mountain lairs upon the Chinese engaged in camphor-wood cutting, rice-farming, or rattan-pulling. The houses of the chiefs and warriors are decorated with the spoils of many years, and Chinese brain-sauce is a favorite tit-bit at a feast. These mountain savages also look upon the Chinese with supreme contempt, and direct their hatred also against those aborigines who have been conquered by the Chinese and have adopted the dress, cue, and religion of their conquerors. These subject people are called Pe-po-boans, and occupy, in the main, the plateaus between the littoral and the mountains. The mountain savages look upon all men who do not wear the cue as their kinsmen, and this augurs well for the Japanese attempt to win them over to loyalty and obedience. The story of the French bombardment and invasion is told with wonderful fairness, and a chapter describing the work of the English Presbyterians in Southern Formosa (the Canadian Mission having the northern part for their field) concludes this extremely valuable work.

BOOKS OF THE WEEK.

Argyll, the Duke of. *The Philosophy of Belief; or, Law in Christian Theology.* Scribners. \$5.

The Nation.

NEW YORK, THURSDAY, MAY 14, 1896.

The Week.

NOTHING more amusing has been seen for a long time than the squirming of the spoilsmen in Congress over Mr. Cleveland's order bringing 30,000 more offices under the protection of the civil-service law, and leaving only a few hundred places, below those filled by Presidential appointment and Senatorial confirmation and above the grade of laborers and scullions, for the politicians to quarrel over. Although the immediate effect of the order is to make many thousands of efficient Democratic office-holders sure of retaining their places if a Republican President comes in next year, Democratic Congressmen who hate "snivel-service reform" abuse Mr. Cleveland for his action. Representative Berry of Kentucky says that "each Administration should be looked after by its friends," while Representative Bailey, a free-coinage lunatic from Texas, says that he has grown tired of criticising the President for his many un-Democratic acts, and contents himself with styling the latest performance "indecent."

Naturally, however, the greatest indignation is manifested by the Republican spoilsmen. Representative Payne of New York says that he was elected to Congress on a civil-service platform, and he "believes in a practical civil-service law," but that the President's order is issued so late in his Administration that "it looks as though he was endeavoring to take an undue advantage of his probable successor." Representative Odell of this State, who hopes that Platt will nominate him for Governor next fall, goes a step further. He declares that he is a believer in the theory that "to the victors belong the spoils," and, although he does not expect to have a great deal of influence with the next Administration if it shall be presided over by Mr. McKinley, yet, for the benefit of the "Republican boys" who do the hard work for the party, he "hopes that the law may be changed or the classifications modified by executive order, so that they may be taken care of." Representative Evans of Kentucky says that he "believes in practical and fair enforcement" of a "good civil-service law," but that it is "a mean political advantage" for the President to take of his prospective successor, to wait until all the offices are filled with friends of the present Administration, and then attempt to close the door so that they cannot be removed or changed. Senator Thurston of Nebraska says he is not familiar with the existing law, but he believes that, if a Republican Administration is inaugurated next March, "ways and means will be

devised to overcome the sweeping order of the President."

Most delightful of all is the attempt of Henry Cabot Lodge to reconcile his practice as a demagogue with his professions as a would-be statesman. In the latter capacity he attended the Massachusetts Republican State convention only seven weeks ago, and helped to secure the passage of this resolution:

"The civil-service laws, which remove the public service from the control of favoritism, patronage, and politics, should be honestly and thoroughly enforced, and the classified service extended wherever it is possible."

President Cleveland's order comes almost like a response to this demand; it extends the classified service "wherever it is possible," for hardly a place is now left outside of it. Lodge the would-be statesman feels constrained to say that he is "a believer in the policy of civil-service reform on general principles," and considers the action of the President beneficial to the service, since all previous extensions of the civil-service law have eventually helped to improve the public service, and the recent order may be expected to have a similar effect. But Lodge the demagogue points out that "there are many persons who will claim that the President has been too sweeping in his latest extension of the classified service"—in other words, in extending it wherever possible; and he contends that, if the next President wishes to reclassify some of the employees who are now protected by the latest order, he will have the power under the present law to do so, since the law that permits a President to extend the classified service also permits another President to curtail or limit the classifications. No reformer, however, need fear that the Lodges, and Evanes, and Odells, and Thurstones will have their way in this matter.

The McKinley boomers show visible signs of uneasiness over the assaults which are being made upon his financial record. Several of them have arrived in town simultaneously, and their explanations of the reasons why he is not able to say exactly where he stands at present fill many columns of the newspapers. They are all able to say that they have no doubt whatever of his soundness on the money question, and that he is "sure to be nominated," but they are all convinced that it would be folly for him to speak for himself now. Why? Gen. Alger explains that point most clearly by saying that the Major "greatly deprecates the opposition of the Eastern Republicans, and is fully aware that this opposition springs from a demand that he should come out and signify himself to be a sound-money man. As a matter of fact, though, the silver-men are making the same demands on him to come out and de-

clare himself for them. He must remain silent until the platform is adopted at St. Louis." That is a sufficiently plain explanation. If the Major were to speak now, he would lose the support of either the Eastern delegates or the silver delegates; by keeping still, he hopes to get both, and, after thus securing the nomination, he will let it be known which set of them he has deceived. As Speaker Reed expresses it: "McKinley does not want to be called a gold-bug or a silver-bug, so he has compromised on a straddle-bug." Gen. Alger's explanation is undoubtedly authentic, for not only has he come to us direct from McKinley, but others of the McKinley boomers, who also come to us direct from him, give the same one.

Despite the blare of the McKinleyites that the only issue is sky-high protection, it is the currency plank which continues to cause the hottest fighting in State conventions, and it is the currency plank which anxious business men first turn to as the great sign of the times for them. The Michigan Republicans voted down the mild gold plank offered by their committee on resolutions, and rushed madly off for a kind of weather-vane bimetalism. They did this in the face of Mr. Depew's plain warning that they could not carry New York, New Jersey, Connecticut, or even Massachusetts on such a platform. "Shall we bow to threats like that?" cried the McKinley-mad, silver-mad Republicans, and of course no man was craven enough to confess that he would. The surprising result was to leave the Michigan Republicans, supposed to be sound, on a silver platform, though the Michigan Democrats, thought to be hopelessly gone with the silver disease, had made a death-bed repentance of it and got upon a gold platform. In Indiana, things went better, and the emphatic declaration of the Republican convention against free coinage and for gold will be a decided help in the fight that undoubtedly needs to be made, and to be made earnestly, for a similar deliverance at St. Louis. The New Jersey Democratic currency plank is the strongest one yet written. It is not only as uncompromising as the Connecticut Republican platform in declaring against coinage of silver "at any ratio," and as resolute and outspoken for the gold standard, but goes further than any Republican platform in demanding also the entire divorce of the Government from the banking business, and the retirement of all legal-tender Treasury notes. Thus, speaking broadly, the silver cause is going down in both parties, though the sound-money men in neither can afford for a moment to relax their vigilance or determination.

One of McKinley's managers was asked the other day why the Ohio candidate for

the nomination at St. Louis does not say whether or not he opposes the free coinage of silver and favors the maintenance of the gold standard. He replied with perfect frankness that McKinley would be a fool to tell how he stood on the financial issue while a lot of delegates were still to be chosen in silver States. The convention in one of these States was held on Wednesday of last week, and the California Republicans showed their interpretation of McKinley's silence by adopting without any opposition a free-coinage platform, and instructing their delegates to support the Ohio candidate as the best man to stand upon such a platform. The same interpretation of McKinley's attitude is made by free-coinage Republicans in other Western States. Silver Republican newspapers reprint McKinley's financial record, and "point with pride" to it as proof that he is against the gold standard and will "do something for silver" if he shall be made President.

The Montana Republicans in their State convention on Monday adopted resolutions unqualifiedly commending the action of Carter and Mantle of their State, Teller of Colorado, Dubois of Idaho, and Cannon of Utah in putting free coinage before the tariff and everything else last winter; but an effort to instruct the delegates to walk out of the St. Louis convention in case silver should not be recognized, failed. It is thus shown in Montana, as Senator Wolcott's attitude showed in Colorado, that an element of the Republican party will support the ticket, no matter what the platform may say. Teller and Dubois have gone too far to retreat, both of them being committed to a bolt if they cannot dictate the platform; but it remains to be seen how large a proportion of the party in the silver States they can carry with them.

The Governor's "memorandum" about the consolidation bill contains mainly reasons why he should not sign it. In short, he shows conclusively that consolidation, as proposed, cannot supply the things which consolidation calls for. He admits, also, not only that no commission to be appointed under the bill can supply what consolidation calls for, but that even if the thing were possible, there would not be time to do it. That is, there is not even time for the commission to attempt the impossible. Then he adds that "this possibility is not a sufficient objection to warrant his disapproval of the bill." Perhaps not his disapproval as Governor, but it would warrant his disapproval as a reasoning man. We are not much concerned about the future of the measure; but we acknowledge a feeling of general regret that the Governor should leave the chair under the suspicion that he has not acted out of his own head about the chief public measures which have come before him—that Platt has been able to use him

for his own schemes of selfishness and folly.

The quiet establishment of a branch Tammany in Brooklyn is the first sign that the Wigwam is getting ready to rule Greater New York when the new city shall have been created. There has been a good deal of childish talk about Tammany opposition to consolidation, but it has been noticeable that whenever votes were necessary in the Legislature to pass consolidation legislation, a sufficient number was always forthcoming from Tammany members. Nobody knows better than these shrewd political operators that a large city will be more certain game for them than a smaller one. By having a joint boss-ship—one boss for Brooklyn and one for New York, animated by a common purpose, to plunder the people—the greater Tammany would be far more powerful than the smaller one has been. The decent people of the larger city, discouraged by the magnitude of the city and their own unorganized condition, would be more helpless than ever, and would be even more inclined than ever to say, "Oh, well, what is the use? We are sure to be outnumbered any way, and if we try to get a respectable government, we shall succeed only in showing our weakness." Then, too, by doubling the opportunities of public plunder, the zeal of all the plunderers is doubled also, and their courage and determination to rule will be stimulated by the very conditions which are so likely to discourage their respectable opponents. There will be a great assembling of all the shady political characters of the State, and even of the country at large, in the greater city, for nothing like its possibilities in the way of plunder has yet been seen in this country.

Trustworthy reports from various parts of the State agree in saying that the Raines liquor-tax law is working disastrously for the Republican party. Senator Coggeshall of Utica says its effect is so bad that it will cause the Republicans to lose the State this fall, and many other observers who are as practical politicians as he is agree with him. The law would have been a great political burden for the Republicans to carry if it had been put in force merely as a restrictive measure; but when, in addition to this, it is put in force primarily as a political scheme to give the Republican machine patronage, its effects cannot fail to be harmful. The whole State has been advised, by the way in which Mr. Lyman was permitted by the Governor to appoint his subordinates, that the law is to be "worked for all it is worth" for Platt politics. It is impossible, after this showing, to defend it as a piece of temperance legislation. It will drive from the Republican party thousands of foreign-born voters in all the cities of the State, and thousands of other voters of independent tendencies all over the

State, including many temperance advocates.

The recent State election in Louisiana, like the last two elections in Alabama, showed that the Democratic party can no longer command the substantially unanimous support of the white people of the Gulf States. The heavy Democratic majorities came almost exclusively from the parishes in which the negroes constituted two-thirds or more of the entire population. There are thirteen parishes in the State in which, by the census of 1890, there were more than two adult male negroes to every white male over twenty-one years old. Every one of these parishes at the recent election gave Gov. Foster, the Democratic candidate, a majority. In several of them, as Bossier, Concordia, and East Carroll, the vote as returned not only was large, but was practically unanimous. In the whole thirteen there were 11,415 white males over the age of twenty-one, and 37,789 negro males of the same age. In these parishes Gov. Foster's majority was 23,300. There are nineteen other parishes in which the number of negro voters exceeds the number of white, but in no one of which are the negroes more than twice as numerous as the whites. Of these parishes, twelve gave Democratic majorities amounting to some 12,000, and seven gave opposition majorities aggregating 6,600. The net Democratic majority, therefore, in these parishes is 5,400. There are twenty-seven parishes in which there are more white than negro voters. Of these, nine gave Democratic majorities and eighteen opposition majorities. The conditions in Louisiana are like those which have existed in Alabama for the last four years. Kolb, the Fusion candidate, both in 1892 and 1894, carried the white portions of the latter State, but was beaten by the enormous majorities cast or returned against him from the black-belt counties.

The regions in which the Democracy is now weakest are precisely the regions which, during reconstruction days, were most nearly unanimous in their adherence to it. The speed with which this independence of voting among the white people of the South has followed the repeal of the federal election laws and the abandonment by the Republican party of any demand for their reenactment, is surprising. That such a development would, sooner or later, take place when external pressure was withdrawn, was of course natural. It was not to be expected, however, that it would come about as speedily as it has done. Already both parties among the white men are bidding for the negro vote. The necessity of securing the support of the negroes led many Louisiana Democratic politicians to declare against the constitutional amendment by which the negroes would have been deprived of the suffrage. As a result, the

amendment was overwhelmingly beaten at the polls. Some of the Louisiana papers are bitterly deploring the fact that white men, and Democratic white men at that, did bid for negro votes; but the bid was made, and will unquestionably be repeated hereafter. The white men who have supported the Populist and Republican parties will, sooner or later, find a way to put a stop to the frauds by which they are cheated in the black belts. The negroes, when the whites are divided, will just as certainly be in a position to secure fairer and more generous treatment than they have received in the past.

Henry M. Stanley puts his finger on one great obstacle to the establishment of a system of arbitration between the United States and other nations when he says in the *Independent* that our sensational press is demoralizing the public mind. The morbid appetite that has been fed upon murders of individuals, naturally and inevitably grows to desire the murder of thousands in battle, with all the other concomitants of war. Our press is thus cultivating a taste for war among our people, and in the same measure making peaceful arbitration seem too prosaic for acceptance. This alarming tendency can be seen most clearly by an observer like Mr. Stanley, who is familiar with the United States, and who watches developments in this nation from another country; but it is visible to every thoughtful and candid man here who studies the signs of the times.

Lord Rosebery's talent for clever nagging never had a fairer subject than Mr. Chamberlain's late exploits in diplomacy, and in his speech at Rochdale on April 28 he did them full justice. Chamberlain's was "the new diplomacy," the country had been given to understand, but, new or old, Lord Rosebery maintained, it had been an unparalleled comedy of errors. Frankness and taking the country and the newspapers into your confidence was an excellent thing, but it had its awkward side. The Colonial Secretary invited President Krüger to come to England to discuss the policy England would recommend, and policy and invitation were both given to the public. The result was that the Transvaal instantly repudiated the policy, and said it would answer the invitation when it got ready. The new diplomat was asked in the Commons how he liked this, and cheerfully replied that it was of no consequence whatever. Then what followed?

"Our Colonial Secretary, in a vigorous practice of the new diplomacy, went to a public dinner, and said that the administration of President Krüger, the gentleman whom he had invited to England, and whom he was anxious to conciliate, was eminently corrupt. Well, if that is the method by which the new diplomacy conciliates the person with whom it is negotiating, it is a very new diplomacy indeed. [Laughter.] Then came the refusal

of President Krüger to accept the invitation, and now we are told, as the last act in this melodrama, that her Majesty's Government have withdrawn the invitation to President Krüger. [Laughter.] It is, I think, an unusual proceeding with regard to invitations, but it is evidently a part of the new diplomacy that has withdrawn the invitation to President Krüger and sent it to Sir Hercules Robinson instead. [Laughter.]"

All this, be it remembered, was before those fatal telegrams were published by the wicked Krüger. With these transfixing the bosom of the new diplomacy, Lord Rosebery could have made a still sorrier picture of it.

The South African trouble has at last been brought before the House of Commons by Sir William Harcourt, who said the whole story of the invasion of the Transvaal was an "inexpressibly revolting, sordid, squalid picture of stock-jobbing imperialism," and he might have put it stronger. Henry Labouchere did put it stronger, for he called the directors of the South African Company "a gang of shady financiers." In view of the telegrams discovered in Jameson's bag, no doubt remains that the raid was organized and paid for by the company, and that they expected to establish a republic of their own on the ruins of the Transvaal. We observe that Sir William Harcourt takes an entirely different view of Mr. Chamberlain's part in the matter from that of Lord Rosebery. He says Mr. Chamberlain was "surrounded by difficulties, and had shown a courage and decision worthy of his position." Wherein this courage and decision consist, and what made him so popular for some weeks after the outbreak, does not clearly appear. All he did was to disclaim all connection with the raid, and bring Jameson home for a feeble and limping trial. He has not done a single thing or said a single word to bring the authors of the crime to justice. All the evidence which has been supplied concerning the real nature of the transaction has come from Paul Krüger. Mr. Chamberlain feels the force of the telegrams, but falls back on the plea, with which our own sharpers have made us so familiar, that they are not "legal evidence." The truth appears to be that not only did the directors organize the raid, but they fully expected the result to be adopted or condoned by the imperial government. They expected, like the Sons of the Missionaries at Hawaii, to have simply to send an emissary to London to tell the Government about the new republic and about the incompetency and corruption of the Dutchmen. No one can read the history of the company without feeling that the precautions taken by the Boers to prevent their own government, for which they had suffered so much, from being at once taken out of their hands by the swarm of adventurers who were in possession of the mines, were reasonable and just, and that any wrongs which arose under them were

sure to be remedied after a while. The miners had only to wait and argue. What made Mr. Rhodes and the company so hasty was their feeling so rich. Everything seems possible and right to a suddenly enriched man. Then, the South African venture was, for England, a peculiarly aristocratic one. "Society" was in it to an extraordinary degree, and it was talked up in all the London drawing-rooms.

There is no reason to think that our latest "war" alarm will prove any more serious than those that have gone before it. Five men, captured upon a filibustering American schooner, have been sentenced to death by a court-martial at Havana. One of them is said to be an American citizen and two others claim to be such. The sentences are to be revised by the Spanish Cabinet, and there are indications that they will be modified. In the meantime, the journalistic warriors are "churning up" the incident in the usual way, by sending out all kinds of bogus news about it. Gen. Weyler is pictured as furious with anger at the attitude of the United States towards Cuba, and as threatening to resign if the sentences are not carried out. One report says he has sent word to Secretary Olney that the prisoners would be executed in spite of the latter's protest; but when the "story" got back to Havana from the United States, it was said that nobody there had heard of its details before. Yet it is upon this, more than anything else, that "war with Spain" is now in progress in the press and in the minds of some of our most thoughtful statesmen and observers. We think it entirely safe to say that hostilities will not begin before the end of the present week, and that whether there be war or not, the Cleveland Administration will see to it that the rights of American citizens are fully protected.

Despite the show of brave words in the speech of the Queen Regent to the Cortes, her references to the Cuban struggle are dispiriting. Misgovernment of the island is tacitly admitted, and the need of sweeping administrative reforms conceded. Yet those reforms cannot even be formulated, much less applied, until the rebellion is suppressed, and that it will be suppressed quickly no hope is held out. It is the fatal drift of things towards complete helplessness, both in Spain and in Cuba, with the ruin of the latter becoming more complete every day, the Spanish debt mounting, claims for loss of property owned by foreigners piling up, that makes the Cuban question so grave. The Queen makes rather nervous allusion to the sympathy and aid accorded the revolutionists by citizens of the United States, yet is able to speak warmly of the "correct and friendly conduct" of our government.

THE COMPLETION OF THE WORK.

It is almost thirty years since a small party, mostly civil-service reformers, sat down to breakfast in Washington, with the view of introducing their subject to the notice of a few men in public life, one of whom was a United States Senator. The talk of the reformers was rather amusing than otherwise to the public men. The Senator, a very intelligent person, confessed that he looked on it as a Prussian whim of some kind, and had to have civil-service reform explained to him. All agreed that the introduction of anything like the competitive system into the United States was a dream which might some day be realized, but not in the lifetime of anybody present. It was the millennium, and the millennium was a thing not to be hastened or too eagerly longed for. No one there really expected to see the reform accomplished. If it ever was accomplished, it was to be the result of an agitation lasting more than one generation, like the anti-slavery agitation.

There is one recipe for the dissipation of the gloom about public affairs which is just now filling the public mind, especially since "Prosperity's Advance Agent" made his appearance on the scene, and that is, looking back. It will be considerably strengthened by observing that to-day this apparently impossible or extremely remote reform is an accomplished fact, within the lifetime of the generation which saw the agitation for it begin. The President's last orders place the whole civil service under the rules, except offices which require confirmation by the Senate. Under Arthur there were 15,773 classified places; under Cleveland in the first term there were 11,757 added to these; under Harrison there were 15,598 added, making a grand total of 43,128 up to the 4th of March, 1893. Since then the additions have gone on gradually increasing, until now there are 85,200 places under the rules, or substantially, as we have said, the whole civil service of the United States, within thirty years from the beginning of the movement.

That the change has been powerfully aided by the example of other countries, especially England, and by its thoroughly democratic character, we do not deny, but the main stimulus to its growth has undoubtedly come from the observation of the working of the new system in all the departments in which it has been tried. It exemplifies, above all things, the truth of the French proverb that "nothing succeeds like success." The system has been extended, in the main, because its usefulness became more and more manifest. Its inclusion of the whole service is one of the best things we owe to Mr. Cleveland, whose retirement from office, to make room for Prosperity's Advance Agent, would be, at this time, nothing short of a national misfortune.

The fact is that the agitation on this subject, as regards the national service,

ceased years ago. It may be said to have died out at Mr. Cleveland's election in 1884. Since then the spoils system has had no open defender. Here and there an orator has raised his voice for it, but his words have been received as jests. Of late years the agitation has confined itself mainly to an attempt to get the reform introduced into the State or municipal services. Progress in this field has been hindered by the fact that, as a general rule, State and municipal officers are hostile to it. With some exceptions the places in the State and municipal service are filled by men who are interested in "beating the law"—that is, in preventing its execution by some device or other. The only conspicuous friends it has in public life in this State to-day are the Comptroller, Mr. Roberts, Col. Burt of the Civil-Service Commission, and Mr. Roosevelt of the Police—not counting, of course, the unpaid commission which has charge of the municipal service. None of the others, from the Boss down, venture to denounce it openly, but they curse it privately and treat it scornfully in the Legislature. In all probability it would hardly have found its way into the amended Constitution if the Boss had thought it would pass. He doubtless expected it to be defeated, and the civil-service clause of the instrument is now causing him and his followers great annoyance, and they are fighting against it by every means in their power. But the issue can hardly be doubtful after what has happened in the federal civil service. It is now the American system. Their little systems have their day, but the system under which this nation is to march to its destiny, whatever that may be, is undoubtedly the competitive system.

The Massachusetts Supreme Court, in declaring unconstitutional, the other day, the law giving a preference to veterans in appointments to State offices, passed by the politicians over Gov. Greenhalge's veto, laid down the rule which we confidently expect yet to see adopted and acted on in every branch of the American service, both federal, State, and municipal. Said the court:

"Public offices are created for the purpose of effecting the ends for which government has been instituted, which are the common good, and not the profit, honor, or private interest of any one man, family, or class of men."

"In our form of government it is fundamental that public offices are a public trust, and that the persons to be appointed should be selected solely with a view to the public welfare."

This is the true and only American rule. The use of offices for the reward of services, whether they be military or civil, whether service to the country or service to a party, is forbidden by American polity. We may give a man a money pension, or a suit of clothes, or a mule, or a farm, for having been valiant or patriotic, but we cannot give him an office—for an office is service, and the due service the appointee cannot render unless he is the fittest man.

A WORD TO BUSINESS MEN.

An article in the *Tribune* of Monday morning opens in this way:

"It would be a great thing for some people and for the country if they could only get hold of the truth that their worry about the money question is unfounded and wasteful. They are gratuitously spoiling business for themselves, and for others as far as they can, by lying awake nights for fear some ghost may carry them off. Are they not able to see, what many millions of 'the plain people' have seen all the time, that the money question is rendered harmless and empty by making the tariff the controlling issue?"

It is evident from these astounding observations that the supporters of McKinley, finding that the weakness of their candidate on the currency question is beginning to be better and better understood, have determined now to turn public attention away from it, as far as possible, and concentrate it on the tariff, the restoration of which they say would of itself, without regard to the currency, initiate a period of great prosperity. We have over and over shown in these columns by facts, figures, and dates, that this currency trouble began while the McKinley tariff was still in operation, and that the condition of the Treasury was extremely bad and getting worse before the defeat of the Republicans in 1892. We have also shown, as well as anything can be shown from human experience, that this is a necessary result, nearly as certain as the tides, of two things: one is Government banking with a fixed volume of paper; the other is the operation of Gresham's law on our stock of gold. The notion that these two things can be cured by a high tariff reminds one of the belief of people in desperate straits that something will "turn up" to avert a certain fate—a belief which is hardly ever wanting. It would be difficult to find among the most ignorant of European peasantry an idea more fantastic and absurd than the idea that there can be a great deal of national prosperity, no matter what the currency may be, through putting high duties on foreign imports.

Our own belief is that the nomination of McKinley at St. Louis will be followed by a period of very great depression, and that his election will cause one of the greatest panics in modern history. There are several reasons for this belief. One is McKinley's own character. The weakness of this is notorious. His closest friends acknowledge that he is singularly unfitted, through personal good nature and kindness, for a great office like the Presidency of the United States, requiring so much determination and self-confidence. Not only is his character weak, however, but the record shows that during the last twenty years of discussion on the important questions of currency and national credit, he has stood on both sides of them. He supported and opposed free silver coinage. He advocated the silver-purchase act, and gave no support to its repeal. He has declared himself a bimetalist of the incomprehensible variety, and

he is at this moment backed up both by the Eastern sound-money men and by the Western silver-men, showing that neither know exactly what his position is. From such a man in private life, no sensible merchant would take any advice. He would listen to him about currency as a matter of politeness, but he would not think for a moment of shaping his business ventures by anything he said on the subject, and we should not be at all surprised if McKinley's currency opinions were at this moment a joke in the business circles of Cincinnati. And yet merchants are asked to give money and votes to make this man President of the United States, an office which during the next four years will require two things above all—one is, absolutely distinct and educated views on the laws of exchange, and the other is great force of character.

Another reason is the nature of the crisis. We must beg business men to remember that it does not depend on them which question, the currency or the tariff, shall make itself paramount at the coming election. In all business, as one may say in all civilization, the currency is the main question. You can carry on business for ages without a tariff. You cannot carry it on in a great state for one month without a currency which commands public faith. The *Tribune's* request, therefore, that business men will dismiss the currency from their minds, and think only of the tariff, like so many of our journalistic utterances, savors rather of the nursery than of the market. It is, under these circumstances, a child's prayer. You must think of the currency before anything in the world, or go out of business. You must remember, too, that the currency question you are treating is not so much whether you will use silver or gold. It is not a "battle of the standards" simply. You are now, by incredible exertions and quarterly loans, maintaining a gold standard. A large party in this country want a silver standard, and they do not want a silver standard at par—that is, a silver standard as good as gold, and involving no difference in value, only difference in weight of the metal. They want a silver standard worth only half the gold standard, and threatening all wages, all debts, all deposits in trust companies and savings banks, all rents, all annuities, with 50 per cent. reduction. The adoption of such a standard would, therefore, cause such a panic as has not been seen in modern commercial history except in time of war after an overwhelming invasion, and we believe it would be the easiest thing in the world to persuade McKinley to agree to it, mainly for want of knowledge. He would know no better.

We must finally ask business men to remember that the convention which is to nominate McKinley is not composed of financiers or experts in exchange or currency, and its nomination will be simply advice to voters, and nothing more. When they nominate McKinley, they

simply advise you to vote for him. Now, who are the delegates? They are generally shiftless men or professional politicians. The vast majority of them find it hard work to make a living. A large number expect or expected some small office from McKinley. A swarm of them are ignorant negroes from the South. A very large number are simple-minded farmers. Very few if any have any knowledge whatever about business or currency. Probably not more than a dozen or two could get a \$500 note discounted at a bank. Such as they are, they are largely influenced by the howls and applause of a large audience, more ignorant or less known than themselves, in the galleries, who have no responsibility whatever. What business man is there who would take the advice of such a body on any point affecting his private affairs—how he should manage them, or what he ought to do? And yet the next Presidential election will, owing to the nature of the issues, be a great business operation. Usually, electing a President is preferring one good man to another, because he is more "magnetic," or was a good soldier, or believes in 50 per cent. on woollens or furs. The next election, on the contrary, will decide what the standing of the United States, and of every man in it, will be in the commercial world for fifty years to come.

Finally, the effect on foreign nations of McKinley's nomination and election will be great. We need not point out to business men the importance of this. To the Dervishes who believe that foreigners sell securities cheap in order to annoy us, we have nothing to say. But large numbers of foreign investors have been waiting to see what we should do about the currency before either selling out or going in. The nomination and election of McKinley will be to them proof positive that we mean to go down into the pit, and reach rationality and sound finance through a panic. Moreover, it is difficult to estimate the blow which his nomination will give the general faith in popular government. Few of those who are "hollering" for McKinley know anything whatever about his connection with the tariff—know whether he drew it, or even understood it—or could tell in what manner he is "Prosperity's Advance Agent," any more than if they were born in Calabria. They are bringing no more intelligence to the work of government than Russians or Moroccans. Think of the effect of this on owners of gold, on prudent fathers, guardians, and trustees.

WHAT THEY DO AT ALBANY.

THE Legislature at Albany usually sits about four months, but the time occupied by the session bears comparatively little relation to the bulk of legislation turned out. As little or no time is now occupied in debate, and measures are generally prepared not in it, but for it—

in New York or elsewhere—by those who desire legislation, more measures can now be got through the legislative mill than formerly in the same time. In three or four months the Legislature formerly turned out a single volume of laws; last year it turned out three. There is a significant parallelism (which unquestionably is a matter of cause and effect) between the periods of swollen legislation at Albany and those of dominant corruption and Boss government. A mere glance at the volumes as they stand in order on the shelves of any law library will serve to show this. Until 1866, we find the session laws almost invariably comprised in a single volume. As the Tweed Ring rises to the height of its power the tide of legislation begins to rise with it. From 1866 to 1872 it requires two volumes a year to contain the laws passed at Albany; after 1872 the effect of the reform movement against the ring begins to be felt, and after 1874 that of the new constitutional restrictions upon the power of the Legislature adopted in that year, stopping special legislation of certain kinds, and giving the Governor power to veto separate items in appropriation bills, and the session laws present for several years a very shrunken appearance. In 1878, although the Legislature sat until May 15, only 418 laws were passed, comprised in a volume of 610 pages.

Quite as apparent as the relation between the bulk of legislation and boss government is that between its bulk and the exercise of the veto power at Albany. In 1874 a constitutional amendment was adopted providing that no bill should become a law after the Legislature had adjourned unless approved by the Governor within thirty days, and giving power to veto separate items appropriating money, while approving other portions of the same bill. The years from 1874 until 1876, when Tilden was Governor, and from 1876 to 1879, when Lucius Robinson was Governor, were all one-volume years. They were followed by A. B. Cornell, and the legislation of the next three years is comprised in two volumes for each year. Cleveland followed, and legislation again shrank to one volume, and so remained even under Hill, the legislation during his term of office having been mainly Republican and opposed to Tammany legislators sent up from New York. The veto, too, was still feared under Hill. It was in 1891 that R. P. Flower appeared on the scene as an agent of the new Tammany. In 1892, 1893, and 1894 we go back to two volumes; in 1894 Platt comes into power, and in 1895, for the first time in the history of the State, the legislation of the State appears in three large volumes of over 1,000 pages each. The laws passed this year have not yet been printed; it ought to be a three-volume year.

Few people will be ready to believe that the public business of the State has increased so much in the last ten years that

we stand in need of three or four times as much legislation now as then, especially as there are some twenty or thirty permanent boards or heads of departments, such as the Board of Health, the Superintendent of Public Works, and the Railroad Commissioners, which transact public business *ipso facto* removed from the control of the Legislature, and when, too, the Constitution has considerably restricted the power to enact special legislation. What is it, then, with which the Legislature occupies itself every year for three or four months, and which, unchecked, produces such an enormous and increasing body of legislation? We ought to find out if we can, for any such annual dose means increased expense and unnecessary and annoying interference with every one's life, liberty, property, and happiness by a body which every one dreads.

To answer this question we have taken a year when legislation was at its minimum, and examined the result to see, so far as possible, what it was that occupied the time and attention of the Legislature. The year 1878 is a good year for the purpose. The Governor exercised the veto power with proper strictness; the Legislature was a better body, too, than it is now—the wave of reform which had swept the Tweed Ring out of existence having had an effect even upon the members at Albany.

The analysis shows that the main work of the Legislature at its best still consists, notwithstanding the constitutional restrictions of 1874, of special acts arranging, managing, and interfering with the affairs of persons, corporations, cities, towns, villages, and counties, all over the State, not on any general plan of legislation at all, but without any plan whatever, and unquestionably in the main in response to the private solicitation of politicians, lobbyists, and others applying for legislation as a matter of favor. These acts go by the name of legislation, but they are not in reality legislative. They establish no rule of action governing the relations of persons to one another, in respect to the State, or to property, contract, life, liberty, or family, and in fact no general rules of any kind. They give money to A, grant to B the right to establish a ferry, relieve C from the operation of a law, authorize the city of New York to establish a park, determine how the city of Brooklyn shall pay for the repavement of an avenue, authorize its Common Council to fix the proper cost of a sewer and pay John McCloskey for it, give the village of Athens the right to lease its ferry property, etc. Three-quarters of the work of the year consists of acts of this sort, and *one-half* of it relates to cities, towns, villages, counties, and corporations. All these acts are *outside* the limits of activity drawn by the constitutional restrictions of 1874. Special legislation within this field has ceased. Outside of it, it runs greater riot than ever.

We have not thought it worth while to analyze the laws of 1895, because the outside of the volumes and the index are enough, without any analysis. "Other than general laws" is the euphemistic description officially given to the whole of volumes ii. and iii. Some 150 of them relate to this city, more than a page of titles in the index to Brooklyn, 125 chapters or so to cities other than New York or Brooklyn; nearly two pages of titles to corporations, a page to towns, another to villages.

There is only one way to remedy these evils, and the diagnosis of the disease shows what it is. Special legislation must be still further restricted, and especially the power of the Legislature to manage the affairs of every city, county, town, village, and business corporation must be taken away by the Constitution itself. That the Legislature will ever cut down its own powers is a mere dream. The moment this is done the volume of legislation will shrink again, and it will be found that the needed work of the Legislature can be got through by a session once every two years at the utmost. Meanwhile it is absolutely necessary that a Governor be elected who will use the veto power.

Illinois resembles New York in having a great commercial and manufacturing capital, while the government is carried on at a political capital in another part of the State. It is, like New York, a populous State, and is filled with a great variety of industries of all kinds, carried on by corporations. It is also full of politics and corruption, and contains what is commonly known as the great wicked city of Chicago. In 1869 its annual product of laws was printed in four volumes, of which three were made up of private acts. In 1870 the Constitution was amended by restricting the power of the Legislature to pass private laws, in every possible way. Among the provisions were clauses prohibiting special acts "regulating county and township affairs, incorporating cities, towns, or villages," or amending their charters, forbidding the creation of business corporations or any alteration of their charters, except by general laws, and finally forbidding the passage of any special act in any case in which a general law could be made applicable. We have a clause in our Constitution adopted for the same purpose, but it is nugatory, because it leaves the whole question whether a general act is applicable, not to the courts, but to the Legislature itself, to determine. Such a provision is of no value.

The courts it is which, applying these provisions, can cure the complaint, because provisions of this sort, adopted in Illinois, most thoroughly put the whole matter in the hands of the judges. Laws such as are prohibited may be passed, but the courts treat them as null, and no one has an interest to procure legislation which has no effect. And now mark the

result. The laws of Illinois at the next session after the adoption of the Constitution of 1870 shrank to one volume; from that time to this they have remained in one volume of the size of an ordinary pamphlet. The whole legislation of Illinois for twenty years is no greater in bulk than the legislation of New York would be in three such years as 1895. We have before us the volume for 1895. It contains 350 pages, almost all of general legislation. Under the head of cities, towns, and villages there are sixteen references in the index; under counties, two; under corporations, five; under the head of Chicago not one, and yet the Legislature meets only once in two years.

LITERARY PROPERTY ONCE MORE.

THE question of international copyright has come up again of late in several ways. Action was for a time threatened in Congress, retracing the few and faltering steps we took in 1891 towards recognition of the rights of foreign authors; but the mischief is averted, for the present session at least. Triumphant McKinleyism would doubtless mean a frank and brutal return to the old piratical methods; the foreign artist, writer, engraver, musician becoming again as truly our natural enemies and lawful prey as the foreign manufacturer. Then there is the threat of the new Canadian copyright law, to which imperial assent has not as yet been given. This law is modelled rather loosely upon our own—in some respects it is more generous to the foreign author; but its aim is substantially the same, viz., to compel the publication in Canada of new books sold in Canada, no matter where they are written. It is the manufacture of books that the Canadian printers are bent upon securing as a monopoly, just as it was the manufacture of books that our copyright reformers had to concede to American publishers in order to get any bill at all in 1891.

Mr. Henry C. Lea declares, in a letter to Goldwin Smith (which the latter forwarded to the *London Times*), that this proposed Canadian law is one "of false pretences." This does not refer to the convenient assumption made by the Canadian publishers that they have only the good of Canadian "labor" at heart. Our publishers, Mr. Lea's firm among them, made the same assumption, with at least equal sincerity. The thing really aimed at, affirms Mr. Lea, is the building up of an immense contraband trade over the Canadian border. The book-trade in Canada is too small an affair to be struggled for with this suspicious eagerness; "it is the market of the United States that is really kept in view." This it is which makes the Canadian bill so serious a "threat" to English interests. Why so? Why, American "labor," asserts Mr. Lea, will at once rise up and sweep away our own law of 1891. In other words, the sight of successful piracy and smuggling will be too much for us, and we shall in-

sist on having a share of them ourselves. Or, to put the matter in another way, we thought we had cleverly got a monopoly of "English interests" in the publishing way, but, if the greedy Canadians are going to stick their fingers in the pie, we shall give up our slight pretence of decency, in the law of 1891, and openly hoist the black flag again.

What the rest of the civilized world thinks of our boasted international copyright law of 1891 may be seen by the allusions to it at the International Literary Conference lately convened at Paris. The United States is still classed with Russia as the two great countries which are barbarian in the matter of refusing adequate international copyright. This is because neither country will unreservedly accept the Berne convention, thus placing literary property on the same basis as other property in private international law, and making the rights and protection of authors entirely reciprocal, among the agreeing nations. Our law of 1891 is thus described by Zola, who, if any writer in a foreign language, should be in a position to profit by it: "In the United States there is, it is true, a kind of convention which gives protection to the works of foreigners, but under such complicated conditions, and through the observance of such vexatious formalities, that it is practically inoperative." If we really want to range ourselves alongside the educated world in the proper recognition of literary property, the thing for us to do is to give in our adherence to the Berne convention. That is what the delegates to the Paris Conference say. That is what we think our own copyright reformers will have to come to. Certainly our present position is one of unstable equilibrium. The Treloar bill and Mr. Lea's warning in the name of the labor organizations show us that the barbarians will not let us keep in peace the little we have won. If we have to make the fight over again, as we almost surely shall, we may as well fight to secure a full suit of civilized clothes, instead of putting up with a silk hat and cane, to go with our blanket and moccasins.

Zola maintains, with justice, that the root of the trouble is really a failure to believe that there is such a thing as literary property at all. He says he has talked with educated Russians who seem high-minded and clear-sighted on every subject except this; but the moment you begin to argue with them that a foreigner is just as much entitled to protection from the laws for his book or play as he is for his wine or silk, they shy off and smile at you curiously: this is really going too far. You seem to them an amiable but unintelligible enthusiast. They have no conception of literary property as a legal thing, an entity, an affair to make statutes and treaties about. It is only a kind of make-believe property. This amused and condescending air, on the part of legislators, in dealing with authors and artists, this

entire failure to grasp the idea of a literary or artistic product as property, we see of course to be the true explanation of all such compromising shifts as our copyright law of 1891.

It is tiresome work going over the tedious old fallacies on this subject. But there is one of them, connected with the eye single to the manufacture, as distinct from the writing, of books, that is set in stronger light with the passing of every year. This is the fancy that authors and artists differ from all other producers in being loftily unselfish, in not requiring the ordinary motives of gain to induce them to labor. That is to say, they are supposed to be bursting with great thoughts and fine ideals which they must give to the world, whether the world gives them hard cash in return or not. This conception is at the bottom of all the "manufacture-clauses." Authors are bound to write anyhow; so let us make them get their printing done on our own terms. But the class that lives by authorship, pure and simple, is amazingly small in every country. The vast majority of literary producers earn their daily bread by producing something else. If you cut down their profits by literature, you are not going to compel them to produce more literature to make up, but more of the something else. "Why are you so silent?" asked Catherine II. of Russia, addressing the taciturn Spanish Ambassador. "Madame," was his reply, "in my country men who speak are burnt." Something like that will be the answer of authors to the manufacture-clause logic. In the long run, writers who are pirated or mulcted for writing, will not write.

PARTY POLITICS IN JAPAN.

TOKYO, April 16, 1896.

THE definite alliance between the Government and the Jiyuto has done more for the solidification of political parties in Japan than any other event since the adoption of the Constitution. It has been a long and uncertain work to put order into the chaos, but at last there are signs that the aimless struggle of the past few years is ended, and that parties will now move forward with definite purposes. The more liberal ministers of state clearly recognize the new political conditions under which the Government is placed; and even the conservative ministers, by their opposition, show how much they fear that the old ideal of an independent Cabinet is doomed.

Early in January the members of the Parliamentary Opposition (there was then no Opposition party) introduced an address to the throne making the present ministers responsible for the retrocession of the Liaotung Peninsula and the failure of Japan's Korean policy. It was pretty clearly seen that this measure would not pass, inasmuch as the National Unionists—a feeble body, yet holding the balance of power—had determined to unite with the Jiyuto on this occasion in support of the Government. The address was defeated by a heavy majority (170 to 103), but the Opposition members were not disheartened by their failure, as they clearly saw that many of those who voted with the Government were in reality as

bitter opponents of the Government's policy as they themselves, and, but for pressure from certain leaders, would have gladly joined the Opposition.

The defeat of the address added stimulus to the revival of the long-discussed question of establishing a united Opposition party. Two difficulties have stood in the way of this union: the first, the selection of a new name for the party; and the second, the question of leadership. The Kaishinto—the oldest, most powerful, and intelligent of the Opposition parties—wished to sacrifice neither its name nor its preëminence. Except for the most pressing necessity, this organization would have preferred its old rôle of being a wrecker of parliaments to losing its title and importance. Even the successful move of the Jiyuto in joining forces with the Government, though it undoubtedly caused a renewal of the cry for the union of the Opposition parties, did not at once overcome the prejudices of the Kaishinto leaders. A new event, however, added zeal to the partisans of such a union. On the 11th of February occurred the Korean coup d'état, resulting in the overthrow of the former pro-Japanese Cabinet. The murder of two of the old ministers by the new Korean Government, the attacks in various parts of Korea upon Japanese soldiers and residents, and the entire suppression for a time of the pro-Japanese party, caused a deep feeling of resentment in Japan. It was generally felt that Marquis Ito was tamely submitting to insult in his endeavor merely to keep the peace with foreign Powers. In Parliament several members of the Opposition arraigned the Government as utterly weak, blundering, and faithless. Finally a leading member of the National Unionists (Mr. Sassa) introduced a resolution declaring that the Government did not deserve the confidence of the nation. In this resolution all the mistakes of the Government during the past nine months were detailed, and special stress was laid upon the failure of Japan's policy in Korea.

The Opposition parties were delighted at this turn of affairs. At last they were to secure the adhesion of the National Unionists, without whose aid all possible assaults on the Government must fail. The no-confidence resolution was not even urged by the anti-Government members; it was the voluntary contribution of a party whose declared position was that, though not wholly in agreement with the Government, they would sustain it in all important financial measures. Their feelings were now so strong as to break through every boundary of prudence or silence. The resolution would certainly have passed the House if it had come to a vote on the day it was introduced; but just before the vote was taken, in fact while a member was on the rostrum engaged in showing up the mistakes of the Government, an imperial rescript arrived ordering a suspension of Parliament for ten days. And now ensued one of those changes so characteristic of Japanese politics. The Cabinet used the ten days' interval in pulling the wires so deftly that, at the end of that time, the National Unionists agreed to withdraw their resolution. How this was accomplished is not certainly known, but it is probable that certain ministers of the present Cabinet, who have been identified with the National Unionists, were requested to use all their efforts to stop the anti-Government demonstration of that party. At any rate, at a meeting of the parliamentary members of the party held soon after the issue of the rescript, Viscount Shinagawa, their leader, stated that political com-

ditions in the East were too delicate and complicated to permit his giving his assent to the passing of the resolution, and he requested the members to withdraw it as soon as Parliament resumed its sitting. This was a bitter dose to a party which boasted that it was the most consistent of all political organizations in the country, and it is said that some of the members of the National Unionists felt so humiliated that they withdrew from the party.

However, on the 25th, when Parliament re-assembled, notice was given by Mr. Sassa that he wished to withdraw the resolution he had introduced. The Jiyuto members now had their opportunity. They saw that if they opposed the withdrawal, they would have the support of the Opposition parties, and, when the resolution came to a vote, they could count on the support of the very members who had first moved it; they carried out this manoeuvre with complete success, and the National Unionists, who had enthusiastically brought forward the resolution, were now forced to eat their own words by voting against it. Their humiliation was thus complete. Not even the organs of the Government or of their own party spared their ridicule. On the other hand, the defeat of their resolution removed the last obstacle in the way of an amalgamation of the Opposition parties. They had been gradually learning the lesson that they could not hope to command a strong following in the country so long as each party retained its independent organization. Their second defeat in this parliamentary session only emphasized their weakness. All the Opposition parties agreed to dissolve their respective organizations and to establish a new party with a new name. This was called the Shimpoto, or Progressionist party; and the Kaishinto, while sacrificing a title under which it has fought many battles, kept as much of its prestige as possible by adopting a new name in substance similar to the former one. On the 1st of March a celebration was held in honor of the consummation of this political event. The new party claims at least 103 members of Parliament—51 of the former Kaishinto, 33 Constitutional Reformers, 6 Oté Club, 5 Chugoku Progressionists, 3 Financial Reformers, and 5 Independents. The Shimpoto is therefore but little weaker than the Jiyuto. In the manifesto issued soon after its organization the new party holds to the following programme:

"Our party intends to introduce the system of responsible cabinets by the steady pursuit of progressive principles; to assert the national rights by remodelling the Empire's foreign policy; and to manage the national finances in such a manner as to encourage the development of industry and commerce—in short, to attain the reality of constitutional government, thus completing the grand work of the Restoration, enhancing the dignity of the Imperial Court, and promoting the rights and welfare of the people."

In regard to the leadership of the new party, much interest has been expressed, but nothing thus far has been made known to the public. It is more than likely, however, that Count Okuma will retain his position as chief adviser and director of the new party, as he was of the Kaishinto. His experience and ability are universally acknowledged. He has twice been a cabinet minister, and is thoroughly familiar with the details of practical government—an advantage shared by none of the other leaders of the party. He has a capacity for party management (a doubtful virtue, perhaps) in many ways superior to that of any one in the group of statesmen who have been prominent

in the Meiji era. Moreover, he has a certain popularity even outside of the limits of his old party, especially with independent voters who cannot identify themselves with his party, yet would like to see him restored to power.

The whole political situation at present in Japan is distinctly better than has yet existed. Two powerful parties dispute the field, while the small remaining third party, though now holding the balance of power, cannot hope to do so much longer. The Government is admittedly depending on the support of one of these parties. It can scarcely hope to remain in power when that support is withdrawn. It has been said that the question of appointing ministers of state was purposely left vague in the Constitution in order that it might be settled by the conflict of political opinion. It was held that political parties must assert and educate themselves so as to establish their claim to recognition by the Government. Only in this way could they acquire the requisite capacity for conducting government by party. If the founders of the Constitution, of whom Marquis Ito was chief, looked so far into the future as this view would indicate, they must acknowledge that the period of preparation is now coming to an end. They must see that the days of the Satcho cabinets are nearly ended, and the day of party cabinets approaching. Even the most recent results of the alliance between the Government and Jiyuto prove that this change is expected. As a reward for the services of the Jiyuto during the present session, Count Itagaki has just been admitted to the Cabinet as Minister of Home Affairs. That such a distinction should now fall to a Radical, and a leader of the Jiyuto who has criticised the present system of government in Japan for over twenty years, would be an absurdity if the ministers of the Crown were not ready to confess that the old system was indefensible. And Count Itagaki, honored and even loved as he is in Japan, would forfeit all the respect he has gained if he could not show that his position was essentially different from what it would have been had he accepted office ten years ago. G. D.

BARRAS'S MEMOIRS.—V.

PARIS, April 20, 1896.

Two new volumes of the Memoirs of Barras have appeared,* the two last, and complete what is to be remembered of the political career of the Terrorist Viscount de Barras, who left the political stage when he was still young and in full possession of all his faculties. He disappeared in the movement which he had himself prepared, before Bonaparte, whom he always considered his own creation.

The third volume extends from the *coup d'état* of the 18th Fructidor, year v. (September 4, 1797), to that of the 18th Brumaire, year viii. (November 9, 1799). The first *coup d'état* may be said to have been father to the second: *abyssus abyssum vocat*. It was essentially the work of Barras. Gen. Bonaparte helped it only at a distance; he was then in Italy, and he was cautious enough to do no more than send to the Directory, which was in need of support against the rising reaction, one of his lieutenants, Augereau, a coarse and brutal soldier, who hardly understood the questions at issue between the two fractions of the Directory, and between the Directory and the Councils of the Ancients and of the Five Hundred. The history of the *coup d'état* of Fructidor has

often been told. Three of the Directors, Barras, Rewbell, and La Revellière, prepared it with Augereau.

"Midnight strikes," says Barras: "Augereau's columns are put in motion. It is ordered that Carnot and Barthélemy be kept under guard in their apartments. Carnot had already fled from the Luxembourg. At daylight I order alarm guns to be fired; the grenadiers of the Legislative Body embrace the troops of the line and fraternize with them. Augereau had drunk a little champagne to brace himself, as if going into battle. . . . His operations frighten the conspirators; the Tuileries and the halls of Assembly of the Legislative Body are closed; guards forbid entrance to them. The Council of the Five Hundred assembles at the Odéon and the Ancients at the Medical School; they declare that the troops and the Republicans have deserved well of the country; laws popular and appropriate to the situation are voted; the Deputies who had conspired, with Fiehegru, their chief, are arrested. . . . Not a drop of blood was shed on this memorable day, which saved the country."

Carnot and Barthélemy, who were condemned to deportation, were replaced immediately by Merlin and François de Neufchâteau, two of the ministers. What Barras does not tell us is, that thirty-three members of the councils were condemned to exile; that the laws against the émigrés were again put in force; that the Directory dishonored its victory by many acts of private vengeance. The 18th Fructidor was, in fact, the reestablishment of the Reign of Terror, only in a milder form; the victims were not taken to the guillotine, but sent to Cayenne or to Oleron.

Talleyrand was one of the most ardent supporters of the *coup d'état*. Bonaparte wrote to Augereau September 23, 1797: "The whole army has applauded the wisdom and energy you showed on this essential occasion; it has taken its part in the success of the country with characteristic enthusiasm and energy." Augereau had hoped that the *coup d'état* would be the end of the Directory. "Have we made the 18th Fructidor for nothing?" said he to everybody. "What does Barras mean? Does he think that he must keep his four colleagues? Let him remain alone and live alone in the Luxembourg." Barras, who was sometimes called ironically King Barras, tells us modestly "that he was frankly Republican and had not ceased to be so." He thanked Augereau and Réal, who also urged him to take the whole power in his own hands; he would even have us believe that it was with sentiments of the greatest regret that he had to separate himself from Carnot.

Lafayette had been kept in the prisons of Austria since 1792. Mme. de Staël came to see Barras after Fructidor, and, as some negotiations were being carried on at the time between France and Austria, she asked him to make the liberation of Lafayette one of the articles of the arrangement which was in preparation. "You, dear Barras, who are not made of ice, who have a soul of Provence, such as I like, I address myself to you. . . . You must restore Lafayette to France, to the Republic." The question was discussed in the Directory, and it was agreed that Bonaparte, who was negotiating in Italy with Austria, should demand the liberation of Lafayette. "Bonaparte," says Barras, "accepted with much satisfaction the mission which we gave him." He found some difficulty in the *vis à-vis* which is the ordinary method of the Austrian policy, but, "finally, *Fatras Achéron* gave up its prey."

Napoleon was sent by the Directory to the Congress of Rastadt, after the peace of Campo Formio. He made a triumphal progress

* "Memoirs of Barras, Member of the Directorate." Translated by C. E. Roche. Vols. III., IV. Harpers. 1896.

through Switzerland. At Bâle the commandant of Huningue made him a speech. This General Dufour, who had hitherto been known as a fierce Republican, said to Bonaparte: "I do not know the forms of oratory. I will not compare you to Turenne or to Montecuccoli; I will merely say, Bonaparte is the greatest man in the universe." Bonaparte was accompanied on this journey by his wife, who was everywhere treated as a queen.

The members of the Directory had received the papers of the Count d'Antraigues, seized at Venice by Bonaparte. D'Antraigues (whose Life has recently been published) was at the same moment agent of the Emperor of Russia and of the French Princes. In the letters sent by Bonaparte, Pichegru was compromised; he appeared like a secret agent of the Prince de Condé. The Directors did not know exactly what to think of these papers. They had become jealous of Bonaparte and suspected his motives. When he came to Paris, "all parties were expecting him, and expected something of him." A great ceremony took place to celebrate the peace; the Directors charged Talleyrand to present Bonaparte to themselves, as negotiator of the peace. Talleyrand praised the young general, not only as a conqueror, but as a servant of the Revolution; he praised also "his love of antique simplicity, his devotion to abstract science; he spoke of his favorite reading, of the sublime Oasian with whom he learned to detach himself from the earth. Talleyrand said, with his grave, serious, and solemn air, what many of the spectators could not hear so seriously, that it would perhaps be necessary some day by solicitation to tear Bonaparte away from his studious retreat."

Bonaparte replied in an entirely different vein; he said only a few words, and ended thus: "When the happiness of the French people is founded on the best organic laws, Europe will become free." What were those best organic laws to be? Bonaparte did not say; the Directors and the spectators, and all Frenchmen who read the words of Bonaparte, were free to make their own reflections on the subject. In that "retreat" of which Talleyrand spoke, Bonaparte became the centre of innumerable intrigues. He was too active to remain quite indifferent to them. He had hoped after Fructidor to be made himself a Director, but he was too young for the post. He soon felt that he had better leave Paris, which was a hotbed of intrigues, and asked to be sent to Egypt.

After Fructidor, Madame de Staël, who had obtained the erasure of her father, M. Necker, from the list of the émigrés, claimed, in his name, two millions which Necker had lent to the King in 1789, but which he had really lent to the nation. These two millions were not paid by the Directory, and the majority of the Directors, imagining that Madame de Staël was always mixed up with some intrigues, ordered her to leave France, as they had a right to do, since she was a foreigner. Madame de Staël went at once to Barras, and he gives us the details of this interview with his usual cynicism. She came first alone, and returned a second time with Benjamin Constant, "who was still sincerely attached to a woman whose celebrity had preceded the celebrity which he desired for himself." Benjamin Constant wrote a defence of Madame de Staël for the Directors (the text of it is found in the Memoirs), and Madame de Staël remained in Paris.

On the anniversary of the execution of Louis XVI. (January 21) there used to be a national festival. The first had taken place in the year iv., just before the departure of Bonaparte for

Italy. In the year vi. he found himself in Paris, after his great victories, but without a political or military post. He was invited, however, to assist in the ceremony. Talleyrand transmitted to him the invitation:

"With a very cold and grave air, he answered that he had no public functions, that he had personally nothing to do with this festival; that, without pretending to discuss whether the condemnation of Louis XVI. had been useful or detrimental, he thought it an unfortunate incident; that national festivals were celebrated for victories, not for the victims left on the battle-field. Talleyrand answered that the anniversary festival of January 21 was just, since it was political; that it was political, since all countries and all republics had celebrated as a triumph the fall of absolute power and the putting to death of tyrants."

After some discussion it was resolved that, as the Institute was going to this festival, Bonaparte should go as a member of that body. Bonaparte was very anxious to leave Paris; he constantly spoke to the Directors about Egypt, and finally obtained permission to form an army in Toulon, and a fleet was placed at his disposal. The Directors learned in rapid succession the news of the seizure of Malta, of Bonaparte's victory in Egypt, and of the defeat of the French fleet at Abukir.

In the absence of Bonaparte, it seems as if Barras's Journal (for his memoirs have almost the form of a journal) becomes a mere account of intrigues. Fouché makes his appearance, and his influence begins to be felt. After the 18th Vendémiaire Barras had given Fouché a temporary mission in the departments of the South; since that time, Fouché had been living almost in poverty with a nun whom he had married (he had himself been a monk). The Directors helped him from time to time with a little money. Barras employed him as a spy, in his private police, and Fouché soon became important to him. He sent him to Italy, with the title of chief agent of the Directory. Fouché began his fortune there. He entered into close relations with Joubert, and concealed his own immorality under the high reputation of that general.

News of Bonaparte's death in an insurrection in Egypt arrived one day at Paris by way of Geneva. Mme. Bonaparte came at once to the Luxembourg, and asked Barras if the news was official. It was not, and Barras reassured his friend Mme. Bonaparte, who had found him surrounded with many people. She wished to speak to him alone, and feigned to be ill.

"I dismissed," says Barras, "the persons who were in my drawing-room, with the exception of my doctor, Dufour. He entered with me an adjacent room, where Mme. Bonaparte had retired. We found her more calm, almost smiling; she had with my doctor the same confidence and frankness as with myself. 'Are all your people gone? Are you free?' She looked round in an uneasy way. . . . 'Well, Barras, is it true that Bonaparte has been assassinated?' 'I believe it,' said I. 'Ah! ah!' said she, 'I breathe. Ah! my friend, if it is so, I shall not be so unhappy with the continuation of your friendship. People have believed that Bonaparte was in love with me, that he married me for this reason; he is a man who never loved any one but himself, himself alone; he is the hardest, the most ferocious egotist that ever appeared on earth. He has never known anything but his own interest, his ambition. You have no idea how he abandoned me. Would you believe it? I hardly have 100,000 francs a year—of allowance, I mean, for Joseph has all the capital in hand, and he pays me my allowance monthly.'"

And so she goes on, if we may believe Barras, speaking of her desire to buy Malmaison, of her debts, of the money she needs, of her diamonds, of which she has, she says, not more

than three millions' worth, but which the brothers of Bonaparte would dispute with her if he was dead. She asks him to receive her diamonds on deposit. Barras wisely refused, and advised her to place her diamonds in the hands of her notary—advice which she immediately followed.

Correspondence.

COLUMBIA COLLEGE IN 1770.

TO THE EDITOR OF THE NATION:

SIR: In connection with the recent laying of the cornerstone of Columbia College, the following letter of the president of King's College, in 1770, descriptive of that institution, is of interest. It was written to Jonathan Boucher, who for some time had been tutor of John Parke Custis (the stepson of George Washington), and was occasioned by inquiries of Washington as to the best college in this country to which to send Custis. As a result, apparently, of this correspondence, Washington brought the lad to New York in May, 1773, and entered him at the college under the particular charge of Dr. Cooper. Unfortunately, Custis had already engaged himself to Nelly Calvert, had therefore no inclination to study, and, after only six months of study, he returned South and promptly married. In his disappointment Washington wrote (December 15, 1773), as follows to President Cooper:

"The favorable account, which you were pleased to transmit to me, of Mr. Custis's conduct at college, gave me very great satisfaction. I hoped to have felt an increase of it by his continuance at that place, under a gentleman so capable of instructing him in every branch of useful knowledge. But this hope is at an end; and it has been against my wishes, that he should quit college, in order that he may enter soon into a new scene of life, which I think he would be much fitter for some years hence, than now. But having his own inclination, the desires of his mother, and the acquiescence of almost all his relatives to encounter, I did not care, as he is the last of the family, to push my opposition too far, and I have therefore submitted to a kind of necessity.

"Not knowing how his expenses at college may stand, I shall be much obliged to you if you will render me an account of them. You will please to charge liberally for your own particular attention to Mr. Custis, and sufficiently reward the other gentlemen, who were engaged in the same good offices. If the money I left with you is insufficient to answer these purposes, please to advise me thereof, and I will remit the deficiency.

"I am very sorry it was not in my power to see you whilst in these parts. I thank you very sincerely, Sir, for your polite regard to Mr. Custis during his abode at college, and through you beg leave to offer my acknowledgments in like manner to the professors."

PAUL LEICESTER FORD.

KING'S COLLEGE, New York, 23 Mar. 1770.

MY DEAR SIR:

I hold myself much obliged to you for good Will, as well as good offices, towards this College, as instanced in your Conduct respecting Mr. Custis and I am under still weightier obligations, when I consider your very friendly Suspension of Belief, with Regard to some Reports, which, you tell me, have been circulated in your parts to our prejudice. I am conscious that we have Enemies in abundance—that every Dissenter of high principles, upon the Continent, is our Enemy—that many of their Missionaries, from the Northern into the Southern provinces, make it their Business, nay, have it in charge from their masters, to decry this Institution by all possible means; because they are convinced, from its very Construction (being in the Hands only of Churchmen—which is very far indeed from being the Case of any other College to ye northward of Virginia,—and I know of none to the southward of

it—they are convinced) that it must eventually prove one of the firmest Supports to ye Church of England in America.

Hence there arose an opposition coeval with ye College itself,—or, rather, with the very first mention of an Institution so circumstanced which hath been continued, without Interruption, to this very day, with much Resentment, Inveteracy, and Malice. The College of New Jersey—and those of New England—were already on their own sole direction, and yet they could not be satisfied that ye poor Church should have any Influence in one: not that Dissenters of any Denomination are excluded from either Learning or Teaching; nay, we have educated many and have several at this very Time, who do Honor both to us and themselves.

However, owing either to the very Opposition, or to our own Care & Circumspection,—which may, perhaps, have arisen from the former—our numbers yearly encrease, and our present Apartments overflow. It would ill become any one, to boast of the Advantages enjoy'd by a Seminary over which he himself presides: but I will venture to affirm, that, with Respect to Discipline (which, it seems, is one heavy Accusation exhibited against us,) we are far from being outdone by any College on the American Continent: and I know of none in Europe, to which, in this Article, we are really inferior. Add to this, that the Expence however such Things may be magnified by our Adversaries, is not half so much as at any of the latter; and, I believe very little, if at all, more, than at most of the former. Our Tuition is only five pounds—one Dollar passing for 8 shillings New York Currency; Room-rent four; and Board, including Breakfast, Dinner and Supper, at ye Rate of eleven Shillings a week, for ye Time each Student is actually in College. These, (saving Fire-wood, Candles, & washing, which must be had every where) are the principal Expences, indeed almost the only ones, of the truly Collegiate kind: others, indeed may run higher—as in Dress, and sometimes in Company, than they do at Colleges in the Country; tho' even These will not be materially different to a Student of real gentility: For such an one will chuse to appear handsomely—habitual in all situations; and when he does go into Company, he will chuse the best for his Associates.

With regard to our plan of Education, it is copied, in the most material parts, from Queen's College, in Oxford; with the wh [ole (?) torn] System of which, (having been for many Years, both Learner [torn] in that Seminary, with the Character of which you are by no means unacquainted,) I looked upon myself as perfectly familiar.

The young Gentleman's Guardian may rely on every Thing in my power for his Ward's Emolument; but as my turning private Tutor as it were—it seems to me so inconsistent with my office (whatever others in my Situation may think of it) that I must beg to be excused. But I repeat—That I will shew Mr. Custis every mark of Care & Attention, and see that his other Teachers shall do the same.

I have only to add, that I wish he may be here in June,—as we do not admit pupils when absent—that I beg my best Respects to Coll. Washington, whom I shall be exceedingly happy to wait upon in New York (your self, I hope, in Company)—and that I am, Dr Sir yr affn Friend

and very obedt Servant &c.

M. COOPER.

I hope you will have patience with me—at present I suffer much by a severe Fit of the Gravel.

Notes.

HOUGHTON, MIFFLIN & Co. have arranged for the American publication of the unpublished Letters of Victor Hugo, in two volumes. They are addressed to his father, his wife, his daughter, to Lamennais and Sainte-Beuve; and, in exile, to Ledru Rollin, Lamartine, Mazzini, and Garibaldi.

Prof. McMaster's 'With the Fathers' and Prof. F. W. Taussig's 'Wages and Capital' are on the point of being issued by D. Appleton & Co.

'The Tale of Balen,' a new and long poem by Algernon Charles Swinburne, is in the press of Charles Scribner's Sons.

Henry Holt & Co. announce 'The Quicksands of Pactolus,' a story of San Francisco, by Horace Annesley Vachell, and 'In the Valley of Tophet,' by Henry W. Nevins.

In book form, Mr. James Lane Allen's *Cosmopolitan* serial, 'Butterflies: A Tale of Nature,' will bear the imprint of Macmillan.

Brentano's will publish directly 'Bicycling for Ladies,' by Maria E. Ward, fully illustrated.

The Bowen-Merrill Co., Indianapolis, have just ready 'The Trent Affair: A Review of the English and American Relations at the Beginning of the Civil War,' by Thomas L. Harris, A.M.

A new book of verse, 'Songs of the Soul,' by Joaquin Miller; 'The Pacific History Stories,' retold by Harr Wagner; and 'Care and Culture of Men,' by David Starr Jordan, President of Leland Stanford, Jr., University, are about to be issued by the Whitaker & Ray Co., San Francisco.

An English version of the late James Darmesteter's 'Nouvelles Études Anglaises,' edited by his wife as we remarked the other day, is to be brought out in London by T. Fisher Unwin.

We have already noticed the translation, issued in England, of Sonia Kovalevsky's novel, 'Vera Vorontzoff,' or 'Vera Barantzova.' It has now appeared in this country in a new translation by Anna von Rydingsvärd (Baroness von Prochwitz), under the imprint of Lamson, Wolfe & Co. The American edition is a very pretty piece of book-making.

'The Mathematical Papers Read at the International Mathematical Congress' (held in connection with the Chicago Exposition) has appeared as vol. I. of the Publications of the American Mathematical Society (Macmillan); a guarantee fund for the cost of publication having been contributed by that society and some other mathematicians. The volume has the usual handsome appearance of Macmillan's books. Among the contributors of papers are Klein, Weber, Minkowski, Hilbert, Hurwitz, Study, and others, besides the Americans. The brief account by Klein of the present direction of mathematical investigation will be found to be of interest to those (professors of mathematics even) to whom most of the volume is a sealed book.

Dr. Levi Seeley has brought together a great many interesting and instructive facts in his 'Common-School System of Germany' (New York: E. L. Kellogg & Co.), but his attempts to apply German methods in detail to the solution of American problems are not so happy. The system of school organization by "districts," in rural communities, and by "wards," or single schools, in cities, is unanimously condemned by our best authorities. Everywhere the tendency among progressive communities is to make the township, the county, and the municipality the units for educational organization and control. Germany can learn from us in this respect, rather than we from her. Nor is it correct to imply (p. 192) that in American cities there is, as a rule, any uncertainty as to the teacher's tenure. In the cities that Dr. Seeley cites as examples it is far too difficult to get rid of bad and inefficient teachers; their tenure is too secure. The chief lessons that we may learn from Germany are (1) the necessity for a high professional standard in the training of teachers, (2) the value of close and constant expert supervision, and (3) the substitution of teach-

ing, or instruction, for "hearing lessons" in the class-room. In most other matters, notably as regards the Kindergarten (pp. 225-231), our best elementary schools are far in advance of the average of those found in Germany.

The striking articles on Vives, Ascham, Mulcaster, Milton, Locke, and other English writers on education, contributed to the *Revue Internationale de l'Enseignement* by M. Jacques Parmentier of Poitiers, have been brought together in a volume entitled 'Histoire de l'Éducation en Angleterre' (Paris: Perrin). Most of these men were sages rather than educators, and their reflections on education are marked rather by practical wisdom than by scientific insight. Yet a debt of gratitude is due them for holding up a clear educational ideal in the sixteenth and seventeenth centuries, and so preparing the way for the more technical and detailed discussions that have sprung up since. The closing chapter of M. Parmentier's book is a tribute to the character and services of the late R. H. Quick, editor of *Mulcaster* and author of 'Educational Reformers.'

Dr. O. Laurent of Brussels, a voluminous writer on medical and educational subjects, has compressed into some 250 pages a miscellaneous assortment of information with the title 'Les Universités des Deux Mondes' (Paris: Alcan). The illustrations are interesting, but the book itself is more like a catalogue than a contribution to literature.

One can but praise the idea of Dr. Clemens Klöpper's 'Real-Lexikon der Englischen Sprache,' of which the first instalment is before us (Leipzig: Gebhardt & Wilsch; New York: Lemcke & Buechner). This work aims, above all, to meet the need of a better knowledge of England and Englishmen arising from increased contact by reason of Germany's colonial expansion, but also it is to assist in correcting misconceptions and supplanting downright ignorance even among the lettered class. Hence, besides being a legal, commercial, political and institutional encyclopædia, and a select gazetteer, it is a reader's handbook. We find not only Abernethy Biscuit, Aborigines' Protection Society, Adrian's Wall, Adullamites, African Lake Co., Agitation (O'Connell), *Academy*, Advertisements (with sample forms of birth, marriage and death notices), Agony Column (with choice instances), but also Abel Shuffelbottom (Southey's pseudonym when publishing his 'Amatory Poems'), Admirable Doctor (Roger Bacon's title), Adriel (in Dryden's 'Absalom and Achitophel,' identified with John Sheffield), St. Agnes' Eve (but with no mention of Keats), etc., with a hint of a questionable literary perspective on the part of the editors. America is expressly excluded from consideration in this work, yet the only Abolitionists defined are the younger generation, on this side of the water; the present *Lieferung* ends with *Alabama Claims*; and Mr. John Fiske is enumerated in the past tense with Spencer and Huxley as Agnostics, of which the definition is singularly beside the mark. The English is in general very correctly printed, but Aggression is out of place by being spelt with one *g*. A similar lexicon for France is announced for simultaneous issue by the same firm.

Soon after the promulgation of the Jules Ferry educational laws of 1881, there sprang up in France a not inconsiderable literature, emanating from the pen of such writers as Paul Bert, Ch. Bigot, J. Simon, Liard, Marion, Compayré, and others of similar prominence, whose aim was to meet the necessity of some sort of moral instruction in the lay schools. Quite recently the same want, still

unsatisfied, has given rise to a new growth of publications, differing from the earlier ones of a dozen years ago by their more immediate adaptation to the needs of teachers and pupils. A score of such "livrets de morale" are noticed in the April issue of the *Revue Pédagogique*. The idea of inculcating moral notions by means of special devices is sometimes scouted, but the problem which the French schoolmen are just now making such earnest and intelligent efforts to solve is a serious one and confronts modern society everywhere. This new class of educational literature deserves, therefore, to be noted as both meritorious and auspicious.

In the *American Anthropologist* for May, Mr. J. Walter Fewkes has an interesting article upon the "Prehistoric Culture of Tusayan." It is based upon an exploration of the ruined Moki village of Sikyatki; and so far as the pottery is concerned, his conclusions are, to a certain extent, in line with what H. C. Mercer ('Hill-Caves of Yucatan,' p. 165) tells us of the probable use of the wheel by the prehistoric potters of Yucatan. Speaking of the superiority of this ancient ware over modern Pueblo work, Mr. Fewkes says: "While there is no evidence of the use of the potter's wheel in ancient Tusayan, I believe that the symmetry of old food bowls was brought about by revolving the unfinished object around the hand, and that the principle of the potter's wheel was recognized and made use of in ancient as in modern fashioning of ceramic ware."

Mr. Edward W. James of Richmond continues, in the third number of his *Lower Norfolk Co., Virginia, Antiquary*, his pursuit of historic truth in a spirit which we look to see emulated by the new Southern History Association. He reprints from the *William and Mary College Quarterly* his census of slave owners in Princess Anne County in 1810, showing 8,926 slaves owned by 646 heads of families (against 421 non-slaveholding heads). What is curious is, that nine slave-owners on the list were free negroes, with a total holding of fourteen. From a document of May 1, 1728, it appears that a negro nine years old was declared "a tythable." Two documents relating to public schools (in 1728 and 1736), and an account of the eccentric Gen. Charles Lee, will attract attention. The *Antiquary* may be had of J. W. Randolph & Co., Richmond.

The *Tour du Monde* has begun the publication of a complete list of important exploring expeditions and journeys by distinguished travellers, which (a) were completed in 1895, (b) are now in progress, and (c) will start in 1896. Out of more than one hundred entries in which the objects of each expedition, its personnel, dates of departure or arrival, or the latest news is given, twenty-nine were of journeys in Africa, chiefly in the Congo Basin, twenty-two in Asia, mostly in central Thibet and the region of the headwaters of the Irrawaddy, the Yangtze and Mekong rivers, nineteen in America, ten in the polar regions, and seven in Oceania. France and Germany are most largely represented in the list, there being only ten American and five English expeditions chronicled. Among these are the journeys of Mrs. Beaumont in Alaska and Miss Kingsley in West Africa, who are, apparently, the only ladies that have travelled alone. An interesting and growing feature of the explorations of the present time is the commercial expedition sent out for the purpose of investigating the trade resources of half-civilised countries. In China there have been several missions of this character, French, German, and Russian, and in the Transvaal a French

one. The list also contains short notices of recently deceased travellers.

The Magyars on the eve of their millennium form the subject of a suggestive article in the *Annales de Géographie* for April, by M. Éd. Sayous. He draws attention to the fact that it is not the Hungarian people as a whole who begin this month to celebrate this unique anniversary, but only the dominant half of a population of some fifteen millions. They are dominant, not through wealth, station, privileges, or even numbers, but through their language. For their extraordinary increase, from two millions in the time of Maria Theresa, and four millions fifty years ago, to nearly eight millions now, is due not to the natural laws of increase, but to their absorption of other races—Germans, Slavs, and Rumanians. The definition of a Magyar, then, is "a man of any race to whom the Hungarian language has become the mother-tongue, and who makes of that language the banner of his patriotism." Naturally the language itself shows the influence of this absorption in the vast number of German, neo-Latin, and Slav words which it contains, these last being used to express religious ideas. Referring to the part which the Hungarian played in stemming the Ottoman invasion, the author believes that his future may be not less useful mainly because he opposes the conception of a nation to that of a race which so largely rules in Eastern Europe. Among the marks of material and intellectual progress are the multiplication and improvement of the means of communication, both railways and highroads, the growth of all kinds of industries, and the increasing interest of the people in education and literature. There are now in Hungary 2 universities, 18 academies, 150 gymnasia, and 70 normal schools for the instruction of teachers; 676 periodicals in the Magyar language are issued in addition to 187 in other tongues, and the annual product of the Magyar press is 1,500 volumes. Among other articles in the *Annales* is one on the economic situation of Cuba. A hypometric map, from Russian sources, of the region about the Carpathians is an unusually beautiful piece of workmanship.

Recent topographical sheets, prepared by the U. S. Geological Survey for various parts of the country, continue to increase the great store of information accumulated in our national map. Almost any sheet taken up at random excites an interested comment on the physiographical features that it represents. The Oriskany (N. Y.) sheet includes a large part of the "long level" in the floor of the Mohawk valley, welcome long ago during the construction of the Erie Canal, and explained in recent years by Gilbert as the path of the ancient overflow of the expanded Lake Ontario. A little to the south rises the strong escarpment of the Allegheny plateau, a thousand feet above the valley floor. The wild, uncivilized country along the boundary of Virginia and West Virginia is exhibited in the Tazewell sheet, a confusion of digitate hill-spurs, between branching and sub-branching valleys. Several sheets for Florida illustrate the "sink-hole" style of drainage prevalent in the low-lying, calcareous region of that State. The wonderful dissection of the Absaroka range by deep valleys is shown on the Ishawooa (Wyoming) sheet. The extraordinary flatness of the prairie in South Dakota appears on the Aberdeen sheet, where the surface lies at 1,800 feet for many miles together, interrupted only by occasional narrow and shallow valleys. The bold ascent from Lake Superior to a swampy plateau, 800 feet

above the lake, is well brought out on the Duluth sheet.

The departments of geology in our colleges will welcome the announcement that a new general geological map of England and Wales, prepared by the Geological Survey of the United Kingdom, is nearing completion. It is in thirteen sheets, on a scale of four miles to an inch. Seven of the sheets have now been issued, five are in the engraver's hands, and the one remaining will soon be prepared. The sheets have heretofore been colored by hand and sold at 10s. 6d. apiece; but one sheet has now been produced by color-printing, and sold at 2s. 6d., and the sale of this sheet justifies the expectation that this new system of publication may be continued and extended. As this would mean a reduction in the price of the whole map from about \$35 to \$8, it may be safely said that it will cause a ten-fold increase in its sale in this country, if that is of any consequence.

At the International Women's Congress which will meet at Berlin during the fourth week in September, every imaginable interest of the woman movement will be duly represented. The programme arranged for the seven days' session comprises addresses, reports, and discussions covering more than thirty different topics connected with woman's work and endeavors. An inspection of the exhibit of charities at the Industrial Exposition, which will then be open, is also planned.

—General du Barail, who has been publishing a brilliant and interesting series of "Souvenirs" in the *Revue Hebdomadaire*, reaches in the current number the epoch when the royalists were busy in their preparations for the return of the Comte de Chambord and the restoration of the monarchy. At that time General du Barail was Minister of War in the Broglie Cabinet, and, although he paid much more attention to the army than he did to politics, he had a general knowledge of what was going on, gathered from his daily talks with Marshal MacMahon. Not a word as to the royalist plans was spoken in the Cabinet, until one day, just after the return of M. Chemelong from Salzburg, M. Ernoul asked Barail point-blank how the army would behave in face of a restoration of the monarchy with the Comte de Chambord. Barail answered at once that the army would obey, without reserve and without hesitation, the orders of the Marshal-President. "And . . . the white flag?" "Oh, *mon Dieu!* I have such confidence in the discipline of the army as to believe that it will stand even the white flag if it be imposed upon it." At these words an icy silence set in, which was broken at last by the Duc de Broglie's saying: "*Subir le drapeau blanc!* What do you mean by those words, General?" Barail answered that it seemed to him that his words explained themselves, and asked in turn whether any one imagined, perchance, that the army would receive the white flag with shouts of joy. The army, he said, holds to the national colors; and it holds to them all the more strongly because at the present moment they are stained by defeat. Then, addressing the Marshal, he recalled to him how, in 1830, the sight of the tricolor had the immediate effect of deciding the troops to make common cause with the insurgents. The Duc de Broglie, who agreed with General du Barail, made no answer, but M. Ernoul replied, saying that Barail misunderstood the feelings of the masses. After the sitting, Barail was summoned to the President, who began to talk with him about

matters in general; but Barail came to the point at once by saying that he imagined that the Marshal might wish for his resignation. "No," MacMahon answered, "they asked for it and wanted Ducrot put in your place, but I told them that I would answer for you as for myself. *Mais, sapristi! vous n'êtes pas avocat, vous!*"

—*Histoire de la Langue et de la Littérature française, des Origines à 1900* (Paris: Armand Colin et Cie.) is the title of a new and very important work, the first two parts of which, an instalment of two hundred pages, have just appeared, under the direction of L. Petit de Julleville. It is the work of a group of scholars, specialists in certain lines of literature and language, and, as these last words indicate, the close union between the language and the literature is significantly marked. A third feature commends it further: the due recognition of mediæval literature, which receives a full share of attention. These three points are the fruit of the changes in views and methods which have been steadily becoming more and more prominent for years past, and one cannot but feel profoundly grateful to find them all combined in one work which, when completed, promises to be the fullest and most serviceable history of French literature yet produced. The names of the collaborators are a sufficient guarantee that the spirit in which the work has been planned and in which it will be carried out is the spirit of the most scientific modern school. Every one of the writers has made his mark; and while it is impossible, as well as needless, to mention all, a glance at the table of contents of the first two volumes, which cover the period of the Middle Ages, shows how intelligently the work has been distributed. The history of the language falls to Ferdinand Brunot; Petit de Julleville takes the narrative religious poetry, the later poets of the Middle Ages, and the drama; Léon Gautier, the Chansons de Geste; Clédat, the Arthurian romances and the poems of Marie de France; Sudre, the Fables and Roman du Renard, and Bédier, the Fabliaux; while Gaston Paris has written a preface to these two volumes which is one of the most instructive and thoughtful works that have come from his pen.

—Again, it is quite evident from the perusal of the first part—even did the prospectus not state the fact explicitly—that the aim of the writers is not to give the public the impression the works have made upon them individually, but a clear understanding of these works and an accurate knowledge of exact facts concerning them. This is unquestionably a great step in advance in a general history. This one will furnish ideas and documents and not merely opinions and impressions. The addition of a bibliography is a *sine qua non*, at the present day, and the new work has this necessary portion well attended to in a select bibliography, while the illustrations are not fanciful but exact transcripts of contemporary documents. It is interesting, but regrettable, to note that the division of literature into chronological epochs is maintained; the old classification into Middle Ages, sixteenth, seventeenth, eighteenth, and nineteenth centuries figuring here as in Nisard, Albert, Faguet, or stale Demogéot. As the progress made in the scientific study of literature is recognized in the allocation of special subjects to special authors, it is a pity that the arbitrary division founded on broad chronology has not been abandoned in favor of one based on the periods covered by the great literary schools. In amount the Middle Ages get a fair share—two

volumes; the same being given to the seventeenth and nineteenth centuries, while the sixteenth and eighteenth are to have one volume apiece. The first parts, which have come to hand, contain the preface, and the first two chapters, "Poésie narrative religieuse" and "L'Épopée nationale." The introduction, "Origines de la langue française," is to comprise eighty-two pages, and will appear when the first volume is finished.

—Lovers of Wordsworth and his family will welcome the new edition of Dora Wordsworth's 'Journal of a Few Months' Residence in Portugal and Glimpses of the South of Spain' (Longmans). Apart from the interest attaching to Mrs. Quillinan's book as the only publication of the poet's daughter, its pages have a more definite value. The last half-century has altered conditions of life in Portugal as everywhere else, and this simple narrative vividly depicts a bygone order of things. The greater part of the invalid's stay in Portugal was spent in Oporto, where she saw something of the natives, but more of the society of the English colony of wine-exporters, to which her husband by birth belonged. She describes at length a tour made from Oporto among the old cities in northern Beira (the cradle of the Portuguese national monarchy) like Braga and Guimarães, during which she had a better opportunity to study Portuguese life and to observe the characteristics of Portuguese scenery. From Oporto, when the winter was over, she went by sea to Lisbon, where she visited all the sights of the Portuguese capital, and from which she made the usual excursion to the beautiful city of Cintra. From Lisbon she travelled with her husband and stepdaughter through the south of Spain, visiting Cadiz and Gibraltar, Seville and Granada. She was by her long friendship with Southey sufficiently versed in Portuguese history and literature to appreciate intelligently what she saw about her, and this differentiates her book from the jottings of ordinary tourists. Considering the greatness of Herculano, the one famous scientific historian whom modern Portugal has produced, and the father of the Portuguese historical school, it is curious to read the following passage written about him in 1846, when he was still known only as a poet and journalist. "The history of Portugal," says Mrs. Quillinan, "the most romantic of histories, is still unwritten; so we must console ourselves with such a one as we may get from Senhor Herculano, librarian to the king-consort. He is a hater of the English, because the burgesses of Plymouth did not discover that a man of mark had come among them when he did them the honor to make their town his place of exile for a few months or weeks, I forget which, when Don Miguel was King absolute, many years ago. He has never forgotten the neglect, but has made for himself opportunities of abusing us, through the periodical press of Lisbon, in articles magnanimously signed with his own name. We will forgive him all that nonsense if he will truly and honestly digest the materials open to him, and give us an orderly and dispassionate compilation of facts" (p. 186). Certainly Herculano more than justified Mrs. Quillinan's hopes in his admirable history of mediæval Portugal.

—The history of the Ptolemies in Egypt is gradually assuming body and precision in many details by the aid of recent discoveries of papyri. The latest publication of these in England is Mr. B. P. Grenfell's collection, entitled 'Greek Papyri, Chiefly Ptolemaic' (Oxford: Clarendon Press; New York: Macmillan).

This little volume is a sequel to the editor's 'Revenue Laws of Ptolemy Philadelphus,' with their supplements, and contains chiefly the editor's discoveries for the winters of 1893 and 1894. The fragments are mostly records of wills, loans, and other business transactions belonging to the first and second centuries B. C., and containing in their dry detail much that illustrates the business, the civic and domestic life of the Egyptian people. A good instance of this is seen in the will of Dryton (126 B. C.), which distributes his property between his son, his second wife and her five daughters according to minute and reasonable provisions, and with an apparent freedom and security which are highly creditable to the civil administration of the period. The list of articles bequeathed to the women is curious, viz., two female slaves, a vineyard with walls of burnt brick, two dove-cotes, one of them unfinished, a wagon and ox, together with other more valuable real and personal property. The concluding sentence is highly interesting, and guarantees to Apollonia, the testator's second wife, all sums earned by her during his lifetime. That Apollonia was a clever business woman is attested by three other documents, which record loans by her of wheat, or money, the latter at the rate of 60 per cent. for one year, double the prevailing rate of the period. It is a curious fact that, in the face of so many chances, several documents relating to this family should have survived, as well as the second and the third will of Dryton. To these domestic details we may add an extraordinary piece of gossip from the Byzantine period (fourth century A. D.), a letter from Artemis to her husband, Theodorus, a soldier. She prays that he may come back to her safe and sound, and encloses to him a letter which she had addressed to a certain Sarapion. In this last—the Greek of which is as rude as the manner—she gives Sarapion a "piece of her mind," and informs him that his daughters are no better than they should be.

—The most important documents from an historical point of view are the record of a sale of land by a certain priestess to her husband (114 B. C.), and of a transfer of land by Sebittis to her daughter (109 B. C.). Each of these fixes the date of the transaction by a preliminary list of the first ten Ptolemies, including, as VI., Eupator and as VIII. Philopator Neos, whose reigns have been disputed by M. Revillout and others. As long ago as 1852, Lepsius had arrived at the truth, basing his conclusions on the evidence of hieroglyphic inscriptions and demotic texts. This evidence is now for the first time confirmed from purely Greek sources. Finally, we may mention an interesting literary discovery, a fragment of an Alexandrian novel written somewhat later than 174 B. C., in which some love-lorn damsel laments the desertion of her lover, with a genuine touch of passion and pathos. The style is poetic and rhetorical, consisting of rapid staccato sentences. The language and the situation remind one of Simaetha in the incantation scene of the second idyl of Theocritus. This dithyrambic fragment, of little more than twenty-five lines, is written on the verso of a papyrus which prosaically records the loan of 100 artabæ of wheat (174 B. C.).

LECKY'S DEMOCRACY AND LIBERTY.

Democracy and Liberty. By William Edward Hartpole Lecky. 2 vols. Longmans, Green & Co. 1896.

THE title selected for this book does not give

a very clear intimation of its contents, which embrace a discussion of the effect of universal suffrage on representative institutions and on liberty; the limits of State interference; Socialism and Socialist political economy; Church and State; popular education; woman suffrage; the eight-hour movement; divorce; Rousseau's theories; the Australian ballot; the referendum, and a host of other questions about which public interest is aroused in different parts of the world, and which together may be regarded as forming the network of problems affecting Liberty woven by the tireless loom of Democracy. On nothing which the author discusses does he fail to throw some light, often very brilliant. His clear and interesting style gives attraction to the driest topics, and his impartiality of manner disposes you to accept his verdict, even when it is directly opposed to all your preconceptions and prejudices. In a review it is impossible to touch upon more than one or two points.

To our mind, Mr. Lecky's most important and novel present contribution to political philosophy is the array of fact and argument by which he shows that universal suffrage (at any rate in communities such as those we live in), is a deadly enemy to representative or parliamentary institutions, through its effect in steadily lowering the character of the members of the representative body; this, under its influence, tending more and more to represent only the widespread longing of the ignorant and improvident to rob the thrifty, to undermine the security of contract and property, and, wherever law or liberty stands in their way, to blot them out. The case against universal suffrage rests mainly on observation of the unquestionable facts, first, that while we have numerous instances of legislatures of the first rank produced by a restricted suffrage, we have none whatever of any such body produced by universal suffrage; second, that, in several cases, parliamentary bodies of the first rank have run down *pari passu* with the extension of the suffrage. We may leave out the British Parliament, because the suffrage is not yet there entirely divorced from property, and many of the most prominent men in English politics obtained their entrance into public life while the suffrage was still narrow. Mr. Lecky is of opinion that deterioration in the House of Commons has set in, but there are plenty of other clearer instances. Italian, Austrian, Belgian, and Dutch Parliaments, elected by a high suffrage, have produced creditable legislation; in all these countries, since the basis of the suffrage has been greatly extended, there is a marked deterioration in public life. In France it is notorious that the character of the representative body has steadily declined until even the cabinets which it produces are cabinets of nobodies. It is in the United States, however, that the evil effects of universal suffrage on legislation are most clear; and Mr. Lecky's case is here even more telling than he knows it to be. The Senate, which, so long as it remained composed of men whose opening to public life had been furnished by a property suffrage, was a body remarkable all over the world for the ability and character of its members, has, since the full effects of universal suffrage have come into play, grown to be an impotent and ignorant body, which can no longer be relied upon either to originate good proposals of its own, or to impede vicious legislation set on foot in the House of Representatives. If it is said in reply to this that the Senate is not elected by universal suffrage, but by the States, the answer cannot be allowed to have much weight, because the bodies which

select Senators in the various States are themselves the product of universal suffrage. The character of the State Legislatures is too notorious to permit dispute. In this State, with its six millions of inhabitants, containing the chief city and commercial capital of the country, the men who make up the Legislature are obscure local politicians, most of whom no one would employ in private business of any kind. They debate nothing, but pass bills under the orders of a dealer in votes, who sells legislation like any South American dictator, and in many cases passes bills by the aid of members of the party nominally opposed to him in return for promises of place. The system in New York is, however, only a grotesque exaggeration of evils which every State capital illustrates. So far from the public having any confidence in a legislature, every recent constitution is full of provisions, dictated by the most profound distrust, restricting its powers in every direction.

On these facts, the case against universal suffrage, so far as it affects representative institutions, is a strong one; it is, we may add, reinforced if a different method is employed, and we inquire into the ultimate causes of the process we see going on about us. Why and how does universal suffrage produce its effects? The answer is, we believe, very simple. A popular vote is of two sorts: it decides a question, or it elects a person to office. The referendum, and our frequent votes on constitutional questions, are illustrations of the former, and the answer of universal suffrage to the questions propounded is, according to our experience, not generally unwise. When it comes, however, to electing to office, universal suffrage can do nothing more than decide between two candidates put up by a small number of managers. The theory of popular institutions is that candidates are brought forward by a sort of automatic natural selection of the fittest. A is observed by his neighbors to be a wise, prudent man, who talks and argues well, and manages affairs intrusted to him skillfully; his neighbors, knowing that a new legislature is shortly to be elected, discuss the advisability of sending A to it, and in this way A becomes a candidate. As a matter of fact, except in extreme cases, the deliberation of the voter is confined to the question whether he shall vote for one of two parties; and what a popular election decides is which of two parties shall carry on the government. The selection of the candidate is left to a small body of managers, who will generally put up as candidates men no better than themselves. So long as the suffrage is based on property, the managers of the machine will come from the propertied classes, and will select men who are fairly representative of those classes; as soon as suffrage is based on mere numbers, the machinery of politics falls into the hands of a much lower class, and necessarily the level of candidates falls too. Ignorance, so far as it is vested with power, tends to drive out intelligence, just as a debased currency tends to drive out gold.

But this tendency is greatly aggravated among us by our practice of making all offices elective for short terms. Constant elections have the effect of increasing the importance of those who manage the machinery, especially in cities, where it soon gets to be out of the question for a voter to have much voice in the selection of candidates without abandoning all other business and taking to politics as a calling. This, of course, in such a condition of government, involves consequences from which the better class of voters shrink. In the end we have the machine as we know it, with a

boss at its head, which virtually carries on the government; the representative system has shrunk to a form, and the members of the Legislature, though elected by the people, are really the boss's hired men. What would come next we can only guess; but we know that the aim of the more intelligent bosses has always been to transfer the system to Washington, where it would logically end in a machine dictatorship, controlling a Presidential puppet just as Governors are now sometimes controlled, tempered by occasional revolts and reform movements. The forms of popular representative government would be kept up, but for the benefit of one man or a small group of men.

Such is the case against universal suffrage—perhaps we might say (since the democratic principle, once introduced, seems always to lead to universal suffrage), the case against democracy—stated as strongly as we can put it. No American of mature years can read Mr. Lecky's book without feeling that the experience of his own country furnishes a great deal of the strongest proof in it. But it must not be supposed from this that Mr. Lecky's volumes are intended primarily as a warning to us. On the contrary, his thesis is that the country in which the effects of the introduction of pure democracy will be most felt is his own. In the United States, as he points out, following Sir Henry Maine and most modern writers on the subject, the Constitution imposes checks upon the Legislature of which the most important are the veto and other powers of the Executive and the high authority vested in the judiciary, which for ever prevents the legislative bodies produced by universal suffrage from interfering (as their nature would lead them to do) with the foundations on which society rests—i. e., property, contract, and liberty. In England no such checks exist. Parliament is supreme, and there is nothing to prevent universal suffrage from sending to Westminster a House of Commons which will pass any measures—no matter how subversive of the elementary principles of justice and civilization—demanded by a temporary majority. Nay, according to Mr. Lecky, this has already been done, the whole series of measures regulating rent and the relation of landlord and tenant in Ireland being in the nature of confiscation. This part of the book, while no doubt very effective as a Conservative argument in England, deals with a case the exceptional character of which prevents its being so weighty as the author would have us believe. Most English Liberals would refuse to admit that the principles of recent Irish land legislation were applicable to England, Scotland, and Wales. What Mr. Lecky calls confiscation they call justice; party feeling still colors every one's judgment about the matter. No English Liberal can deny, however, the force of the abstract reasoning. An omnipotent Parliament elected by universal suffrage must pass whatever measures a majority demands. There is no written constitution under which the courts can declare laws invalid because they violate the obligation of contracts or make life, liberty, or property insecure; consequently, were this tendency unchecked, there would be no country in the world where the future of liberty and free institutions of law and government would be as dark as in England.

The sum and substance of this part of the book, then, is that the condition of free institutions in the United States is an awful warning to England of her fate if she becomes entirely democratic. In such a case her Par-

liament will furnish a machine to promote the ends of demagogues, socialists, agrarians, and communists, the like of which the world has never seen. The conclusion is one which we cannot on our side any longer maintain to be wholly unreasonable. We can no longer say, Come to the United States and we will show you a pure democracy, where the offices are filled by the most capable men; where the taxation is the lightest in the world; where there are no schemes of spoliation in the air; where there are no great inequalities of fortune, no talk of foreign war, and where the dreams of the martyrs of liberty through the ages of oppression, cruelty, and superstition have at length been made true in the life of a free and happy people. On the contrary, we are confronted by problems very like those which, according to Mr. Lecky, confront England.

The question is, what is to be done; and, curiously enough, the remedies which the friends of liberty and good government recommend to check the ravages of the disease are fundamentally not unlike in the two countries. In both, what is dreaded is the behavior of popular legislative bodies. No one in England now fears the Crown or the courts; no one in this country fears the Executive, while the courts are our main reliance against legislation. In both countries tendencies are at work which, unchecked, must sap the life-blood of free institutions. In both countries conservatives instinctively turn for relief to those parts of the Constitution which reinforce permanence in institutions. One of the things threatened is property; therefore, by all means, they say, stick to property suffrage where it still exists, and strengthen and improve in every way the House of Lords, which represents property most distinctly. In this country, having the courts to help us, what we do is to restrict the power of the Legislature in every possible way—by limiting more and more the number of subjects over which it has jurisdiction, by curtailing as far as possible its powers of taxation, and by reducing the frequency of its sessions; so, we lengthen the terms of governors, mayors, and judges, and, wherever the judiciary is non-elective, keep it so. We can hardly admit it to be "the theory of American statesmen," as Mr. Lecky sardonically observes, "that the persons elected on a democratic system are always likely to prove dishonest, but that it is possible by constitutional laws to restrict their dishonesty to safe limits" (vol. i., p. 108.) We simply do what we believe our race has invariably done, when power has been insufferably abused by one branch of the Government; we restrict it, take it away altogether, or lodge it elsewhere. This is exactly what Mr. Lecky would do in England. It is all that any one can do, for the step backwards from democracy to privilege will not be taken through a democratic suffrage. Finally, it must not be overlooked that, in this country, we correct the evils produced by universal suffrage in one direction by the very same agency operating in another. All our modern constitutional changes are the products of universal suffrage.

So far as Mr. Lecky's book deals with the tendency of universal suffrage to ruin representative bodies and through them to produce other evils, his position seems to us impregnable. But it must be remembered that politics is not a science of demonstration. We may point out a tendency, but there are always so many forces at work that we cannot be sure how far the tendency will produce its extreme logical effect. Nothing is so certain as that an elective judi-

ciary in a city like New York tends to produce corruption on the bench; yet nothing is more certain, either, than that the judiciary here is to-day, after two generations of elective judges, better than it was twenty-five years ago. Nor can it be assumed that because democracy is introduced in a country, and a generation or two later we find a great many tendencies at work which all seem to point to the disruption of the ties of family, to the undermining of the foundations of property and contract, and to rendering life and liberty insecure, and corrupting the administration of justice, all these consequences are the results of democracy only. Divorce is rife among the well-to-do classes in this country, but it has not been forced upon them by universal suffrage.

Mr. Lecky draws a picture of the state of society in this country which is far from flattering, though it does not differ from that which is reflected in the press every day, and leaves it to be inferred that it is more or less a consequence of universal suffrage. We should be inclined to say that it was the consequence of a great variety of causes, and that of the amount of weight to be given to universal suffrage in producing the result no man can judge. Besides this, the argument from consequences is a weapon which the believer in democracy can also use. If it is to be assumed that the present condition of the most advanced societies of the world is to be attributed, as a whole, to the spread of democratic ideas, we must, to judge fairly of the effect, go back at least to the condition in which the world was while privilege still ruled it. We have also an example of that world still left, existing on an enormous scale, in the Russian Empire. If we go back a hundred and fifty years, it existed all over the world. The old world was not governed democratically, but by the very classes which in theory should always produce fitness, ability, and seal in government—the educated, the holders of property, long-established families. These classes had the power, and, what is more, had enjoyed it for ages, and were supported in its enjoyment by churches which had a hold upon conduct such as no religious bodies now have. Had they provided even decent government for mankind, democracy might never have established its claim to a hearing. As it was, they produced for justice widespread tyranny and corruption, for peace constant war, for liberty and happiness endless misery among large classes of those dependent on them. The equality of man was no doubt a dream, but it awakened the world, and, bringing democracy with it, set on foot those stupendous changes which have made the world of to-day, if not a paradise, at least a place where we are free to make of our lives what our faculties permit.

We have not a word to say against the truth of the picture of the evils of the state of society in which we live, but inasmuch as the old system produced a condition of things to relieve the world from which democracy had to be invoked, and inasmuch as democracy appears to be established as firmly on its throne as autocracy or the privilege of the educated minority ever was, we are thankful to believe that even the baleful and poisonous influence of ignorant and irresponsible suffrage is counteracted by other forces powerful enough to triumph in the end, and to justify those who still refuse to believe that man's inevitable alternative is either anarchy or privilege resting on force. If universal suffrage were potent enough to blot out again the freedom and justice and equal rights to attain which whole generations have laid down their lives, then

would our last state be indeed worse than the first; for even hope would be gone.

LAST POEMS OF MARGARET OF NAVARRE.

Les Dernières Poésies de Marguerite de Navarre, publiées pour la première fois, avec une introduction et des notes, par Abel Lefranc, secrétaire du Collège de France. [Publication de la Société d'Histoire Littéraire de France.] Paris: Armand Colin & Cie. 8vo, pp. lxxvii, 461.

In 1547 there was published a collection of compositions in verse—they scarcely deserve to be called poems—entitled 'Les Marguerites de la Marguerite des princesses.' This Margaret, "the pearl of princesses," was that Queen of Navarre, sister of Francis I., whose name in literature is distinguished chiefly as the author of the 'Heptameron.' Any one who has read aright this last-mentioned work, and has judged it intelligently, feels little surprise in finding that "les marguerites" of the Queen are chiefly expressions in various forms and at considerable length of the sincerest religious emotion. Mingled with poems of this character are others of a less serious cast, but all have such fervor and such tenderness that they reflect as in a mirror the sweet and noble mind of their writer.

The "Marguerites" were reprinted twenty years ago under the editorship of M. Félix Frank, and met with warm appreciation among their modern readers. That the four beautiful little volumes contained all Margaret's important poems was not questioned. It was known that some minor ones still remained among the manuscripts of the Arsenal and of the Bibliothèque Nationale, and extracts from them had been given by one and another student of the Queen's works; but no one suspected that a considerable part, and not the least interesting, of her poetical writings was still unknown. The discoveries that are made in the great libraries of to-day by literary explorers have a blending of chance and research that is the perfection of good fortune, and he would be a dullard who did not sympathize with the emotion M. Lefranc confesses he felt when, working five years ago at the Bibliothèque Nationale, he found in his hands a manuscript which no man had read, it would seem, since, three centuries and a half ago Jeanne d'Albret laid its leaves in an iron box with solid fastenings.

They were her mother's last writings; most of them probably composed in the less than three years that elapsed between the death of King Francis—the blow which killed Margaret—and her own death in 1549, at the not old age of fifty-seven years. And it is not strange that as Margaret, during this very period, had made a selection of her poems and given it to the world, her daughter should have felt that these were not then to be published, and, putting them away, put them out of her thoughts. One can easily believe that the expressions of her mother's eager, open, tender, feminine intelligence did not appeal to the rigidities and severities of Jeanne's masculine nature; and whether Margaret was or was not a Roman Catholic in her belief, she was a true Catholic in the larger sense, while Jeanne was a true Protestant, to whom Margaret's immense and persistent liberality must have been entirely unwelcome. Nowhere does Margaret's generosity of intellectual appreciation find fuller and finer expression than in these Last Poems. So her daughter looked them up; and now they are unlocked. As we read these

now, it must be with shame that the heights from which Margaret speaks are still so far above the common paths of the world; but this sweet, clear voice that sings this perpetual song of Love, Love, Love, will, it cannot be doubted, find responsive hearts.

Margaret's iteration and reiteration of the need of Love, the joy of Love, shapes itself into a "comedy" contained in this volume with a gracefulness and fineness unusual for her. For it must be said that her verse for the most part is very inartistic: weak in form and sadly wordy. Every word is gracious, but there are so many of them! A great deal of her verse is only serious doggerel, and has no poetic quality. She evidently wrote it as easily and as carelessly as one talks; it is, in truth, simply rapid talking to herself, and, just because it is so, it is a singularly interesting reflection of her mind. But this little "comedy"—"une Comédie jouée au Mont de Marsan, le jour de carême prenant mil cinq cens quarante sept, a quatre personnages, c'est assavoir la Mondaine, la Superstitieuse, la Sage et la Reine de l'amour de Dieu, bergère"—this little "morality" has great charm. The four lovely women who circle about one another, with mutually clapping and unclapping hands—La Mondaine, who loves her body, and asks to be asked why, and says why in the sweetest manner; La Superstitieuse, who is going on a holy pilgrimage; La Sage, who knows that man is both body and soul; and La Reine de Dieu, a shepherdess who feels

"Qui vit d'amour a bien le cuer joleux"

—these fair figures, and their courtous and pretty and wise and high sayings, take the heart captive. M. Lefranc has noted that Margaret inclined to make use of the form of dialogue, and remarks with discernment that this form was better fitted than any other to show forth all the "nuances" of her thought (and, it may be added, the many sides of her thought), and, also, to save any necessity of formulating explicit personal conclusions regarding the subjects of universal interest she treats. This may be observed in the 'Heptameron,' where the conversations are far more interesting and important than the stories to which they serve as prologues and epilogues.

But the longest and most important poem in this volume—175 pages long—is a narrative entitled "Les Prisons de la Reine de Navarre," in which phrase the "de" may be taken to mean not "the work of," but strictly "of," the prisons in which had been imprisoned the Queen of Navarre—"My Prisons," as she herself thought of them. It is not material prisons of which she writes—she was never literally a prisoner; but, perhaps because the imprisonments of others had throughout her life been a cause of anguish to her, she is apt to use the figure of spiritual prisons. For example, in a letter to her nephew Henri II., written just after the death of the King, her brother, she speaks of her many sufferings:

"Sans riens compter maladie et ennuy
Les jours mauvais et les fauchées nuicts
De moy, des mieus voïages et prisons,
Pertes, regrets, craintes et trahisons."

In more than one passage of the poem now spoken of is the sentiment expressed with ardor, "Ubi spiritus, ibi libertas," and it may be mentioned, in passing, as an interesting little fact, that this motto is worked on several pieces of tapestry executed by Margaret herself (who had pleasure always in this sort of work, and did much of it), and is especially to be remarked on a dais of black velvet and crimson satin which belonged to her, and was

very probably made by her own hands. This piece of work is called in several 16th-century inventories of the Château de Pau (where apparently it is still in existence) the "Dais des Prisons rompus," which gives it a close connection with this poem, and is a confirmation of the poem's authenticity which it is surprising that M. Lefranc does not point out.

The story she tells here is of three prisons successively dwelt in by her—three delightful prisons, in each of which she was perfectly happy—the prison of Earthly Love; that of Ambition, Riches, and Pleasure, or, in general terms, of Worldliness; and the prison of Science—that is, of Earthly Knowledge. From each of these prisons in turn she is delivered by the Grace of God, and each of them in turn becomes most hateful to her—never that—but something inferior to the liberty, the perfect liberty, she at last attains in the Love of God. The details, too numerous to be here entered upon, are often of great interest, especially in the portion describing her rapturous enjoyment of Learning, which is all fragrant with the fresh breezes of the Renaissance. The whole poem is a Renaissance rendering—the Renaissance checkered with the Reformation—of the subject-matter of Tennyson's "Palace of Art," and in conception it is more subtle, more profound, and far more sincere than the modern poet's picturing of the dealings of the Divine Spirit with the Human Soul. Not musical in sound, it is singularly musical in thought—that is, its "motives" are music-like in their vague yet piercing suggestiveness.

It is addressed, almost unquestionably, to her second husband, Henri d'Albret, though under the disguise of a man addressing a woman. This disguise Margaret often adopted, and it was more permissible in her day than in ours, when a width of intellectual scope is granted to women such as Margaret could not claim without apparent presumption. Another reason, also, probably influenced her in this instance. Her first prison of Earthly Love she describes as of her own creation, the walls made impassable and the bolts and bars riveted for his sake whom trustworthy eyewitnesses of her life say she loved at first with tender passion, as was her nature, and treated to the last with admirable respect, through all the sad twenty years of their union, though he (eleven years, alas! her junior) showed her constant disregard and unkindness. From the beginning, probably, the one who was loved was the man, the one who loved was the woman, and till the world recognizes that this is great Nature's will, there must be something of mortification for the woman in this relation, and Margaret's assumption here of a man's dress is easily explicable.

In the closest possible spiritual connection with this first "prison" is another poem of twenty-one "dixains," "Les Adieux"; her adieux to all the dear delightfulnesses of her love. She speaks now in her own person, uttering such poignant grief with such magnanimous sweetness and noble tenderness that these pages are certainly among the most touching ever written by a woman. Among the other "poésies" of this volume is a long dialogue between the Queen and her dead brother, and a "comedy" on his death, "sur le trépas du Roy." The last words of the "comedy," sung by all the personages, "Si bona suscepimus de manu Domini, mala autem quare non sustineamus, sicut Domino placuit? Ita factum est. Sit nomen Dei benedictum"—these words are echoed from every page of the Queen's writings. And, such being the case, the mysticism, the obscurity in which she

often veils her lofty aspirations, is of small consequence to those who care for her chiefly as a peculiarly womanly woman. Those who care for her as a *thinker* (M. Lefranc, for example) must needs pull the cloth hard—so hard that it almost or quite cracks. To speak of "the splendor of her intellect," as some of her editors are pleased to do, is as unfitting as to talk of "the splendor of her beauty," as they also do. Her plain face, where the vigor of the great Valois nose was blended, in her youth, with the timidity of her small eyes, and, in her age, with the kindliness of her mobile mouth, charmed by its expressiveness, and was in harmony with the Bearnais costume, almost the dress of a widow, which she always wore, even at Court, after the death of her only son. In like manner, the charm of her verses, robed in their quaint phraseology, is largely a matter of sentiment; their value is dependent on the reader. A somewhat intimate knowledge of her life is needed to place one in sympathetic relation with them. There are scarcely a dozen pages which, from their own merits, reward attention and deserve permanence. Her verses are as mortal as herself, for they are herself. In comparing her effusions with those of George Herbert, with whom she had much in common, one recognizes what "the Elizabethan age" did for its minor poets. Margaret was trained in the school of Marot. Traces of her reading appear in this volume, as in her other works, especially of her studies of Plato and Dante. She refers by name to Dante, and a fine passage of the "Prisons," the meeting of the traveller among supernal things with "un vieillard" is a (perhaps unconscious) copy of the "veglio solo" of the first canto of the "Purgatorio."

One becomes almost as prolix as herself in writing of her; it is because, as M. Félix Frank has well said, "she was one of those rare beings who are loved in death through the mists of ages."

My Confidences: An Autobiographical Sketch Addressed to My Descendants. By Frederick Locker-Lampson. Charles Scribner's Sons. 1896.

To a certain extent this book disarms criticism. It is not, we are told, intended as a contribution to literature, but simply to preserve for the writer's own descendants such little notices and anecdotes of two or three of their progenitors as will probably be interesting to them, if not to the public; and if they are printed in a volume, instead of being left in manuscript, it is because this is the only way to assure their preservation. He even doubts whether the present inheritors of the name will care much about them, but projects his vision into a dim future when, to some remote descendant of an antiquarian turn, they may be precious fragments of salvage. This is a quite intelligible feeling. If the present writer possessed an authentic record to the effect that an ancestor of his own once saw Ben Jonson at the Mermaid, and heard him say, in his big voice, "Drawer, more sack," he would be immensely proud of the fact, and would be pained to think that it could ever be totally forgotten.

Mr. Locker came of a family respectable rather than distinguished—London men of business, with some literary tastes. His grandfather entered the navy, rose in the service, at one time had both Nelson and Collingwood under his command, and seems to have been one of the best specimens of that lost type, the old sea-captain. Mr. Locker's father was attached to the navy in a civil capacity, and an interest-

ing letter from him is here given, describing an interview with Napoleon at Elba. His wife was a daughter of the Rev. Jonathan Boucher, a distinguished divine, and a rather conspicuous figure in Maryland colonial history. Mr. Boucher was eminent not only for piety, learning, and eloquence, but for his undaunted and uncompromising loyalism. His last sermon was preached at Annapolis, when Revolutionary passion was wildest, and with a pair of pistols lying on the desk, and concluded with a defiant "God save the King!"

Mr. Locker himself was born at Greenwich Hospital, of which his father was a resident commissioner, in 1821. His parents intended him for a professional career, but the boy, though a good cricketer, and with rather a knack of turning off English verses, could never take kindly to Latin; so that scheme had to be given up, and a clerkship was obtained for him in the Admiralty. Here it was that he made his first public venture in poetry with 'London Lyrics,' light, easy, and graceful pieces, which are still pleasantly remembered, and deserve to be. These brought him to the notice of Thackeray, who asked him to write for the *Cornhill*. His marriage, in 1850, to Lady Charlotte Bruce, a great favorite at court, introduced him to very distinguished people indeed, and seems to have wrought an improvement in his fortunes, as the Admiralty drops out of sight, and we find him travelling like a man of leisure, wintering in Italy, and collecting rare majolica and *éditiones principes*, to say nothing of paying £100 for a missing leaf of the First Folio. Even early in the sixties this sort of thing took a long purse.

After the death of his wife, in 1866, followed by the mention of his remarriage (to Miss Lamson) in 1874, the book loses much of its autobiographical character, and is made up of little disconnected sketches of persons and occurrences, apparently written for separate publication at various times. The last chapter, in which he describes himself in a pleasant country home, cheerfully awaiting the end, is at once pleasing and touching; and the whole book, if a little disappointing, leaves one with a distinct image of a bright, cheery, and amiable personality.

The Story of the Indian. By George Bird Grinnell. Illustrated. D. Appleton & Co. 1895. 8vo, pp. 270.

In this volume Mr. Grinnell has brought together his recollections of the manners and customs, religion, etc., of certain tribes with which he seems to have lived. His object, so we are told, was "to give only a general view of Indian life"; and if, in carrying out this plan, he has found it necessary to descend into particulars (as, e. g., when describing scenes he has witnessed and repeating stories he has heard), it is because "the concrete example conveys a clearer idea of an event than an abstract statement, and because the story of the Indian should not be told wholly from the point of view of a race alien in thought, feeling, and culture." To this explanation of his purpose and of his proposed manner of work there can be no objection. In fact, the knowledge which long association with the Indians has given him of their character, has enabled him to prepare an account which differs, in certain respects, from the usually received ideas, but which may, perhaps for this very reason, help us to understand the methods of thought and lines of conduct that characterize our red neighbors.

Take, for instance, what is said of their ideas

of marriage and about the position of woman among them. Instead of being the drudge and slave she is sometimes painted, we find that she occupied a well-defined and "respectable" position, and that not only was she consulted upon household and family matters, but that (p. 107), upon occasion, she was called into the tribal council and her opinions asked. Unquestionably, her life was hard and full of toil, and so, for that matter, in early times, was the life on the frontier of her white sister; but, in spite of certain drawbacks, she seems to have found time (pp. 26, 46, etc.) to gossip, dance, and gamble, and, on the whole, she managed (p. 47) to get a good deal of pleasure in life. Even in her marriage, the presents (p. 40) which passed between the parents of the contracting parties, and which are usually spoken of as the price paid for the woman, sometimes found their way back to the newly wedded pair. Evidently, in a case of this kind, there was no question of bargain and sale. It was simply another, and, so far as etiquette required the presents to be of equal value, an ingenious, way of increasing the dowry with which the young people began housekeeping. But even if this were not so and the marriage was a virtual sale on the part of the woman's father, as it sometimes was, there was a foundation of common sense in the Indian's view of the matter. "Marry a man who is willing to give something for you," said an Omaha mother to her daughter; and whether we regard this gift as a measure of the woman's value or of the man's love, it is, perhaps, as satisfactory a test as are the protestations that often, under similar circumstances, pass current with us.

In the matter of religion the account is not so clear. As well as we can gather from our author's somewhat incongruous statements, the Indian's pantheon was inhabited by an indefinite number of gods, or rather supernatural agencies, of different degrees of power. They were neither uniformly good nor bad, but sometimes one and sometimes the other; and they could be placated by prayers and sacrifices. All nature was alive with them; and every Indian had some such power—medicine, it is generally called—to watch over and protect him. Thus far all is plain sailing, and, as it agrees with what we know of Indian ideas, we accept it. But when we are told (p. 202) that before the Pawnees had been greatly changed by contact with civilization, they regarded *Atius Tirawa*—the head of their supernatural hierarchy—"as an intangible spirit, omnipotent and beneficent," we respectfully call a halt, for the reason that ideas like these belong to a phase of development in advance of that which the Indian had reached. With all due respect, we prefer, on this point, to follow Dunbar, who tells us (in his sketch of the Pawnees), that "it was very doubtful whether their conception of *Ti-ra-wa* could be rightfully called a conception of a spiritual being at all. It was rather an indistinct being with certain human attributes indefinitely magnified." "All success," we are furthermore told, "was regarded as an expression of his favor, and all disappointment or failure as a tokening of his disapprobation. He was changeable like themselves"; and although "stoutly affirming that they loved him a great deal, yet they evidently feared him," which they would hardly have done if he had been looked upon as a purely beneficent being.

Naturally enough, in a volume consisting in part, as this does, of "many memories" of different tribes, slips and incongruities are almost inevitable. Accordingly, we are not surprised

to find not only that there is an occasional clash between certain "general views," but that there is also, at times, a flat contradiction between some particular general view and its concrete example. Take, for instance, the statement (p. 54) that the buffalo must have been well-nigh invulnerable to the stone-headed arrow, and it cannot be reconciled with what we are told (p. 152) of the power of the bow in old times. Moreover, it does not agree with what Cabeza de Vaca and others tell us of the trade in buffalo robes, which, in early times, the Indians of the plains carried on with their neighbors. So, too, the struggle for existence, severe as it may have been in certain quarters (pp. 53, 56), can hardly have been general if the Southeastern tribes (p. 248) "found little or no difficulty in supporting life." Of the same character and even more objectionable is the assertion (p. 125) that, within the historic epoch, the Indians, in war, killed "women and children as gladly as men," etc. The statement is general, and yet not only is it not true of certain tribes east of the Mississippi, but on p. 139 we are told that the Piegiens, in a skirmish with the Crows and Gros Ventres, in which they were victorious, killed the men but took the women and boys prisoners, and, we may add, adopted them.

These instances (and there are others of the same sort) indicate the character of the conclusions to which we object; and our purpose in calling attention to them is not so much to criticise this particular volume as it is to sound a note of warning against the danger of indulging in generalities. Like ourselves, the Indians, considered either as individuals or in their tribal capacities, differed in many respects; and while these differences were of degree rather than kind, yet it would be difficult to give expression, save in the broadest possible terms, to a formula that would include all of them. Thus, while it is probably safe to say that there was but one phase of civilization from the St. Lawrence to Panama, yet if called upon to depict the constituent elements of this civilization in phraseology that would apply to tribes differing as widely as did the Iroquois and the Aztecs, we should find it as impossible as it would be to represent home life in Fifth Avenue and at the Five Points on one and the same canvas.

The History of the Australasian Colonies. By Edward Jenks. [Cambridge Historical Series] Macmillan. 1895.

As Prof. Jenks remarks in the opening sentence of his preface, "No sane person would attempt to write a complete history of Australasia in 300 pages." Within the limits that he has assigned himself his own work is admirable. It is clear, condensed to a necessary if almost fatiguing extent, thoughtful, unprejudiced, and characterized by a refreshing absence of rhetoric. We have set before us in a brief form the circumstances of the foundation of each of the Australasian colonies, with the difficulties it had to contend against, and the story of how they were successfully overcome till present prosperity was reached. If we find it hard to remember distinctly all that we read, the fault lies not so much with the author as with the necessity he was under of telling many things in a small space, and also with a certain sameness in several of the facts that he relates. Concise as he is, his last chapter, that on "Present Day Questions," is the only one that strikes us as inadequate, and here he has obviously retrenched, owing to "limits of space, already somewhat exceeded."

The histories of the different Australasian colonies have been in the main similar and not startlingly eventful. The first stage was usually military rule, penal settlements, and a small free population which for a time did not raise its own means of subsistence. Soon the number of immigrants increased, as they became self-supporting, then prosperous; while some governors greatly helped, others rather retarded progress. After a time, colonists were appointed to the Legislative Councils, which were given a certain authority; later, they were elected to these councils, and finally granted their present nearly complete self-government. Among the most important dates of this development are 1788, when the colony of New South Wales was founded; 1805, the year in which the wool-growing industry began; 1851, when gold was discovered. In 1828 we find the first Australasian constitution, in 1842 the first representative one. In 1855-56 responsible government was introduced into all the colonies except West Australia, which did not get it until 1890, being also the last to be abandoned as a penal settlement (1865), and even then not by its own desire but in deference to the clamor of its neighbors. The next great step will be some sort of a federation.

In a century the progress of Australia has been most remarkable. Mr. Jenks thus comments on it and its results:

"In this colonization there has been scarcely one of the difficulties which have threatened other attempts. The colonists have (with trifling exceptions) been all of one nation. Save in New Zealand, there has been no serious native opposition to face. The mother country has poured out her treasure and her brains for the service of her favorite children. No tax has been laid upon Australian industry for the benefit of English merchants. The outflowings of a populous and a free country have provided a generous stream of vigorous immigrants. A genial climate and a fruitful soil have rewarded honest effort with a liberality which is the best incentive to further effort. . . . Therefore the immediate prosperity has been great. But it does not follow that the prosperity has been without its dangers. The success of Australian endeavors hitherto has produced a buoyancy which too often degenerates into recklessness, a generosity which is sometimes perilously akin to extravagance. The good results which, in really sterling characters, follow upon a period of struggle and adversity, have not had an opportunity of manifesting themselves in Australia. The visitor is struck with the absence of originality in the life. It is almost a reproduction of English life a few years before. Instead of stepping forward ten years, as he expects, when he lands on the shores of Australia, he seems to have slipped ten years back. The so-called originality of Australian politics amounts principally to this, that the reform party in Australia has succeeded in doing what the reform party in England has only tried to do. There are few new ideas; the colonists have brought a fairly complete stock of ideas with them, and they have seen no reason to change them."

One point that we must be careful not to forget is the difference between New Zealand and her sisters; a difference in climate and in natural features, as well as in the character and number of the natives with whom the settlers have had to deal; therefore "the development of New Zealand has been at a slower rate than that of Australia, though on much the same lines. But even this difference is a factor of vast importance, for a different rate of development produces a different character of development."

Another fact is especially deserving of attention: British colonies, in distinction from those of other countries, are popularly supposed to be due almost entirely to unrestricted private enterprise. The history of

Australia does not help to confirm this view. "New South Wales, with the costs of transport, assistance to free emigrants, provision against famine, salaries of civil and military officials, expense of public works, and other items, is reputed to have cost the mother country, in the first thirty-four years of its existence, no less than ten millions sterling." In return, the squatter was not allowed to appropriate the spot on which he settled. "The Crown quietly assumed the ownership of Australian land; and the assumption stood the strain, not merely of the rush for sheep pastures, but, which is far more wonderful, of the rush for gold. The advanced guard of the exploring colonists might burst into country never trodden by the foot of white man; but they could claim no acre of it except through the grant of the Crown." As for paternal care and legislation,

"at first the whole community lived upon Government rations. The Government supplied seeds and tools for the farm, and took all the settlers' produce at a fixed price. Often it engaged in farming operations on its own account. Medicine and clothing were dispensed from the Government offices. All the public works were undertaken on the initiative and carried out under the supervision of the Government. This state of things lasted at least until Macarthur showed what could be done by individual enterprise; and there is little doubt that it has given a powerful impulse to what is now called the State Socialism of the colonies. When the colonists took the administration into their own hands, they found a Government machinery capable of being used for all kinds of economic purposes, and a community long accustomed to look to Government for help and direction in economic enterprise."

A Handbook of British Lepidoptera. By Edward Meyrick, B.A., F.L.S., F.E.S., Assistant Master at Marlborough College. Macmillan & Co. 1895. 8vo, pp. 844, numerous figures.

THIS volume will be a surprise to the many in this country who have known of the author only as an earnest and successful worker in the lower families of the Lepidoptera. It is by far the best work of the kind, in its comprehensiveness and completeness, that has been given to the public. Stainton's 'Manual of the British Butterflies and Moths,' which has been a standard for nearly forty years, will be, to a great extent, superseded by it. The amount of information that has been condensed into this handbook (it can be held in the hand without the slightest fatigue) is marvellous. By its aid, any student of British Lepidoptera will be able to name his specimens with accuracy, to learn of their structure and be directed in their classification. The descriptive text of each one of the two thousand and sixty-one species, through a rigid system of abbreviation, has been limited to an average of a half-dozen lines, followed in most instances by a description of the larvæ in three or four lines, the time of their appearance, and the habitat, in all cases indicating such as occur in North America. Analytical keys lead readily to the larger groups, to families, to genera, and to species. Keys so complete have rarely, if ever, been given. The illustrations of venation and other structural characters of many of the genera have been drawn from the author's personal observations. An introductory chapter, treating of structure, classification, etc., is especially satisfactory.

A marked feature of this volume is the new classification, now for the first time published in its entirety, based on the author's study for years of the Lepidoptera of the world. To

those of us who have not, during the last few years, been watching closely the forces at work in systematic entomology, particularly among the Lepidoptera, in their upheavals, disintegration, and reconstruction, it is rather startling to be asked to ignore the long familiar division of the Lepidoptera into "Butterflies" and "Moths"; to find the butterflies, as "Papilionidæ," flanked on each side in the middle of a volume, by moths, and next to the Pyralids—the Geometridæ, Sphingidæ, Saturniæ, and the Notodontidæ, with others, grouped into a superfamily of "Notodontina"—the *Agaridæ* among the "Tineidæ"—the stout-bodied *Cossus* of nearly three inches expanse of wings among the diminutive "Tortricina"; and, finally, to learn that the Lepidoptera, in all their beauty, variety, and seeming high rank, have their origin in the low, degraded, case-inhabiting aquatic larva of a caddis-fly. But all these incongruities and surprises must be accepted if it be admitted that a natural classification is preferable to an artificial one. A system would be natural if based on resemblances of allied genera and species resulting from community of descent, leading upward from the oldest to the latest developed. Mr. Meyrick holds that, beyond any doubt, the peculiar venation and other structural features of the wings of the Micropterygidæ—a small family of minute moths—show them to be the ancestral group of the Lepidoptera. According to three laws of control in the development of new organs or their subsequent loss, lines of descent have been worked out and indicated in diagrams showing the phylogeny of nine superfamilies (terminating in *ina*) in which the order of Lepidoptera is divided in this volume. In each of these, the phylogeny of the several families (ending in *idæ*) is similarly given. In tabulating the genera, their ordinal arrangement indicates the lines of descent, number one being the latest developed.

It will be seen from the above that the classification adopted is in accordance with the views advanced in Darwin's 'Origin of Species.' It has evidently been carefully elaborated by the author, beyond that presented by any other writer, and, unless it shall be shown faulty in any particulars, it will in all probability be generally accepted by American systematists. From the intimate relationship of the Lepidoptera of the United States to those of Great Britain—a number of species being common to the two countries and many others differing only by minute characters—this volume will be almost indispensable to American students of lepidopterology.

The Coming Individualism. By A. Egmont Hake and O. E. Weselau. Macmillan & Co. 1895.

WHAT the coming individualism may be is not easy to determine from a perusal of this book; but the indications are that it must be something disagreeable. Such a farrago of querulous protests, of indiscriminate censure, and of unsupported assertions as we have here is not often encountered, and any reforms that are calculated to confer upon these joint authors greater liberty than they now enjoy should be accepted with a good deal of hesitation. The reader is moved by the same sort of exasperation that is felt at the misbehavior of a spoiled child, and becomes strong in his belief in the saving efficacy of corporal punishment and personal restraint. More's the pity, for protests against "collectivism" are badly needed in England, and it would be a matter of no great

difficulty to make them effective; but so long as reformers persist in making reform odious by means of intemperate language and ill-considered assertions, so long will they fail to add to their numbers.

Yet whoever has patience with the mannerisms, or ill-mannerisms, of this composite authorship will find that it has reason on its side. The "Factory Acts" of England are the objects of a socialistic faith that amounts to fanaticism, and are constantly appealed to as demonstrating the necessity of restraining individual liberty by the state. As a matter of fact, the prosperity of the working classes of England was caused by free trade and not by restriction, and improved conditions of labor would inevitably have come if there had been no factory acts. So far as these acts were unquestionably beneficial, they did not restrain liberty, but overthrew a monstrous form of slavery—the apprenticing of pauper orphans to mill-owners. So far as they interfered with liberty, they were stoutly opposed by John Bright, and, until his character can be destroyed, the policy of the factory acts will require argument as well as dogmatic assertion to establish its wisdom.

One of the most amusing instances of the working of the protective measures which are creeping into English policy under the influence of the socialistic craze is afforded by the Merchandise Marks Act. The theory of this act was that the English would buy more English goods and less of foreign manufacture if they knew their origin, and hence it was prescribed that all foreign goods dealt in by English traders should be branded with the name of the country where they were made. The result was that the foreign customers of English merchants had their attention called to the fact that many of the goods which they bought were made in Germany and other countries, and it naturally occurred to them to dispense with the English middleman and to order directly from the foreign manufacturer, with whose existence the English Parliament had been at pains to acquaint them. At present the German manufacturers not only are securing this trade, but are actually ordering goods from English makers upon the superior qualities of which they have German names and addresses marked, while the poorer stuff is sent under the English brand. Such, at least, is the statement put forth in this book; but there are more sides than one to such a question.

Nothing seems more unlikely than that the English should change either their system of dealing with the traffic in strong drink or their banking laws, but these writers are not daunted by such considerations; nor is it wholly vain to protest against the most inveterate abuses, for only in this way can they be prevented from increasing. While we may not be convinced that the abolition of the monopoly of the Bank of England is desirable, it is well to be reminded of the objections that may be fairly raised against it, and in this country we evidently need to consider the subject from every point of view. We might say the same of the drink traffic, but it must be confessed that the wisdom of the policy of loading this business with all manner of burdens is firmly established in the minds of most people.

Altogether, this book will probably impress the reader with the idea that its authors are hopelessly wrong-headed; but, for all that, it may not be wholly unprofitable reading.

BOOKS OF THE WEEK.

Abbott, C. C. Notes of the Night, and Other Outdoor Sketches. Century Co. \$1.50.
Alexander, Mrs. A. Winning Hazard. Appletons.
Ancon, Sir W. R. The Law and Custom of the Constitution. Part II. The Crown. Oxford: Clarendon Press; New York: Macmillan.

The Nation.

NEW YORK, THURSDAY, MAY 21, 1896.

The Week.

MCKINLEY has not yet spoken, and it is the opinion of all his managers that he need not speak. One of them, Mr. Kohlisaat of Chicago, says: "Why should he speak? He has 600 delegates, and will be nominated before the end of the first ballot." What more do you want than that? When you ask if he is a silver-man or a gold-man, and are told that he is "sure to be nominated," is not that sufficient? The *Tribune* says the efforts to make him speak are "calumnies," that's what they are. When you quote a man's record to show that he has voted for free silver coinage, that he not only has allied himself regularly for years with the silvermen, but has stood on the floor of the House and denounced President Cleveland for using the whole power of his office to maintain the credit of the Government, and you use these quotations as evidence that such a man cannot safely be elected President unless he shall first say squarely whether he is for the gold standard or not, you are dealing in "calumnies." Why should he speak? says Kohlisaat, and all the McKinley organs echo that question, but not one of them ventures to answer another and far more pertinent question, Why should he not speak?

The answer to this is furnished in some information which the *World* has collected from the silver section. McKinley's chief supporter in Nevada, when asked to say if the delegates from that State are supporting McKinley because they consider him a "friend of silver," replies that the delegates "are earnest advocates of McKinley unless some more pronounced friend of silver can be nominated," and says their partiality for McKinley "is wholly based on his record in Congress on the financial question; though not so pronounced a friend of silver as is desirable, he is held to be acceptable as a compromise; it is not generally believed that he would veto any silver bill." In Idaho, support of him is based on the belief that "if nominated and elected he would do the cause of silver less harm than any other candidate." Mr. Myron A. McCord, who is leading the McKinley forces in Arizona, says: "I regard McKinley as the man most favorable to silver of all the candidates thus far named. His record shows it." The editor of the McKinley organ in Arizona says: "McKinley I believe to be the most favorably disposed towards free silver and Western sentiment of all the candidates." These answers are far more to the point than Mr. Kohlisaat's question, "Why should he speak?" for

they answer the other question, Why should he not speak? He would lose some of those 600 delegates if he were to declare that he is the friend of gold rather than of silver. That is why it is "calumny" to ask him to speak now.

As Speaker Reed's prospects for the Presidency grow dim his wit grows bright. "Advance Agent of Prosperity!" he said to a newspaper man the other day. "When I was a boy, the advance agent of the circus would go through the country and cover the sides of the barns and the fences with the most gorgeous posters of what the circus would be." Then he pictured the procession of knights in armor and ladies in silk attire, mounted on Arabian steeds, and followed by elephants, lions, tigers, and other wild beasts in a high state of natural fury. When the circus actually came, it usually consisted of a few persons riding horseback in the usual country style, one drowsy elephant, and a few weather-stained boxes mounted on wheels and supposed to contain wild animals. "It never came up to the show-bills," he added, "but there was always at least one first-class acrobat who could ride two horses at once." If Mr. Reed did not say this, it was nevertheless what he was justified in saying. The McKinley canvass has been a country-circus advertising dodge from the start. It has drawn the wondering admiration of all the undersized intellects in the country, and has been discussed by them in a practical way by the turning of handsprings and the riding of horses in all attitudes except the right one; and the movement is still going on. The "first-class acrobat riding two horses at once" has been the principal figure on the posters all the time. What a pity that Speaker Reed himself invested this acrobat with the tinsel that now makes him such a glittering attraction to all the small boys of the countryside.

Senator Teller's victory in Colorado is as sweeping as it is unique. He secured not only a tremendous endorsement in the platform for himself and his ideas, but a delegation, handed over to him ostentatiously as his personal property. The others are instructed to "act in harmony with the views of the Hon. Henry M. Teller." Why men instead of dummies should have been chosen for this purpose, it is hard to see. Even the "compliment" of an election as delegate must seem more than usually dubious under such circumstances. Such open action by a State convention is unparalleled. So also is the attitude in which Senator Teller will enter the convention. He is solemnly bound to refuse to abide by its decisions unless it decides in a way which

he and everybody knows in advance to be impossible. That is to say, he will go to St. Louis as an announced bolter, and yet demand a share in the deliberations of the convention. This will present a puzzling question to the convention casuists. There are some delegates whose "regularity" cannot be disputed. Yet they are regularly elected for the express purpose of thwarting and defying the convention and bolting it. This difficulty goes far deeper than a mere question of candidates—far deeper than the controversy which Conkling precipitated and which he and Garfield fought out in the convention of 1880.

A dealer in railroad bonds sends us the following extract from a letter written by his London correspondent:

"When the Venezuela dispute is settled, and gold-standard candidates of both your great parties are nominated, there will be unprecedented sales of American securities in the autumn; history has no record of such a plethora of money as in this city at present waiting for investment."

Probably every man who has business correspondence with London or with any part of Europe has received similar letters. Indeed, the writer of the foregoing extract has merely stated as a fact, without assigning reasons, what M. Leroy Beaulieu said at greater length in the *Forum* magazine not long since—that the Old World is gorged with capital seeking investment, and would gladly send it to the United States if assured that the gold standard would be maintained and that the Government would retire from the banking business. Some people think that we do not need foreign capital. Others say that if we had free coinage of silver, we should have enough money of our own, as though silver bullion grew on trees and it was only necessary to pluck it off and make it legal tender, in order to make everybody rich. This is one of the most widespread fallacies of the day. It keeps company with the notion that silver is deprived of an inalienable right when it is denied admission to the mint, and that the admission of gold to the mint while silver is excluded, is an act of partiality and favoritism contrary to the principles of free government and the Constitution of the United States.

It will probably be a long time before these misconceptions are wholly uprooted, but it ought not to require much time or effort to convince people that an influx of foreign capital would be for the benefit of everybody, and especially for that of the borrowing class and the wage-workers. Borrowers are interested in getting money at the lowest rates, and these are to be obtained by the abundance of capital in the loan market. To wage-workers

an abundance of capital means plentiful employment. That "Industry is limited by capital" is one of the maxims of political economy. It means that industry cannot exceed the limits fixed by the food, clothing, implements, and materials existing at any time for the support of labor during the period of production. If anybody thinks that industry can go beyond this limit, let him try and see how long he can work without eating and how much he can produce without other tools than his own hands. *A fortiori*, the more food, tools, and materials we have, up to the point of absolute saturation, the more employment there will be for labor. Consequently, anything which removes a barrier to the introduction of foreign capital is a boon to the working class and to the borrowing classes. One such barrier, and the principal one, is the doubt still surrounding the silver question.

A movement has been started by a number of shipbuilders on the Atlantic Coast to get the two leading parties to favor the policy of "discriminating duties." These people are not satisfied with the absolute prohibition of foreign-built ships from American ownership, but they want a higher rate of duty placed on goods imported in American ships than in foreign ones. Since successful shipping requires cargoes both ways—exports as well as imports—it follows that if foreign countries should adopt the discriminating policy, the American ships would make their outward voyages in ballast. As this would be the condition of the foreigners in respect of the inward voyages, there would be no gain, on the whole, to the American shipowner, but a loss to both consumers and producers. The petitioning shipbuilders say that all that they want is just enough discrimination "to create a preference for American ships, in order to give them the carriage of American commerce." What is American commerce? It is the sum total of our imports and exports. Of course, we can give bounties from the public treasury to the carriers of the outward-bound cargoes, but we cannot give any preference as to such cargoes by discriminating duties. Only the foreign governments can do that, and they would be very likely to retaliate. In any view of the case, discriminating duties are a fraud on the public, and they ought not to be tolerated or even considered by the national Democratic convention, which the shipbuilders are principally trying to influence, any more than a new tariff on wool.

The Bar Association of the State of Michigan adopted resolutions the other day in favor of a permanent court of arbitration for the settlement of disputes between nations of the English-speaking race, and decided also to organize a propaganda to push the movement until it

should be carried into effect. A committee was appointed by the arbitration conference at Washington to continue the work, and this committee, we understand, is now actively engaged in the duties assigned to it. Hardly anybody can be found who is opposed to the project; even those who think that it is impracticable say that they would favor it if a safe and sure way could be found to carry it into effect. The most gratifying response was given by President Cleveland to the committee which presented to him the action of the Washington conference. Everything seems so favorable to the movement that nothing can prevent its success except mere inertia and the common belief that it will now go of itself. Unfortunately, no good cause ever goes without pushing. The action of the Bar Association at Grand Rapids should be imitated in every State in the Union.

Congressman Fowler of New Jersey made a very pointed address the other day to the committee on banking and currency, of which he is a member. This committee consists of fifteen of the ablest men in the House, yet they cannot agree about any thorough-going measure of currency reform, although they have reported some small amendments of the national banking act. The reason why they are "all at sea" is that the country itself is in the same predicament. Mr. Fowler is a believer in what is called a credit currency as distinguished from a secured currency. Yet he hits the nail on the head when he says: "To suppose that the people of the United States will give up a secured currency in a day, a week, a year, or a decade even, for a credit currency is a most violent presumption, even if such a thing were sound in principle." With this conservatism is mingled a great deal of ignorance, for in no country, past or present, have the masses of the people ever been able to grasp the principles of finance or form any sound opinions thereon. Mr. Fowler proceeded to discuss the old Suffolk Bank system of New England and the present systems of Canada, Scotland, France, and other countries where an elastic credit currency prevails. The usual answer to arguments based upon the experience of other countries is that a credit currency may work well in other parts of the world, but would not do for us. This Mr. Fowler rightly considers an impeachment of our civilization and a declaration that we are unfit for self-government and self-control. "Would any man seriously contend," he asks, "that the president, cashier, or board of directors of a bank would be more foolish in loaning the notes of a bank than its deposits, when circumstances will bring them to its counter for redemption with the certainty and promptness of the checks drawn against deposits?" Mr. Fowler's whole argument betrays a mind well grounded in the principles of money and banking and fully competent to give them expression.

Gov. Morton has not yet signed the bills which the Legislature passed providing for the payment of the fifty-one men whom Superintendent Aldridge appointed in the Public Works Department in defiance of law, and he may well hesitate about giving them his approval. The amount of money involved is about \$30,000, and there is a practical certainty that in the end Aldridge will have to pay this out of his own pocket. He has no legal claim against the State, and there is no chance that the courts will hold that he has. He knew perfectly well what he was doing when he appointed these men. The new Constitution went into force on January 1, 1895, and on April 15 of that year the Governor and the Civil-Service Commission decided that, under its provisions, the employees in Aldridge's department must come within the civil-service regulations and be subjected, before appointment, to competitive examination. Aldridge refused to take this view, though advised by legal authority to do so, and appointed his fifty-one subordinates without examination and in defiance of the law. The Comptroller refused to pay these men, and Aldridge carried the matter into the courts. The Court of Appeals decided against him in its now famous opinion, in which it took the ground that the civil-service laws were so strongly entrenched in the Constitution that the Legislature could not reach them. Aldridge then had the Legislature pass a bill referring the question of payment to the Board of Claims. The Governor signed this, but it was discovered to be useless because contrary to the Constitution. Then Aldridge had fifty-one bills passed, providing for the payment of each employee separately, and these are now before the Governor. If he signs them, they will undoubtedly prove to be futile, for the Comptroller will refuse payment again, and the courts must sustain their former ruling.

The tributes paid by various city officials and the press to the late Deputy-Comptroller Storrs are no doubt just and deserved. He appears to have been a most valuable public servant, assiduous, trusty, and a complete master of all the matters falling within his province, and of many lying outside it. So indispensable had he made himself by his knowledge that his tenure of office was made secure by the sheer dread, on the part of his superior officers, of what might happen to the city's business without him. But we think that Comptroller Fitch and other zealous guardians of the American, as distinguished from the Chinese, system of appointment to office should not have failed to point to Mr. Storrs as a warning example of that terror of all true patriots—an "aristocracy of office-holders." A man steadily in office for forty years must surely have become arrogant, lazy, igno-

rant, and careless. We say he must have become so, because we all know that permanency of tenure inevitably results in those evils, and we are really incredulous to hear Mr. Fitch testifying that the late Mr. Storrs was extraordinarily industrious, and courteous and painstaking to a degree. This seems to us a dangerous admission. Simple-minded people will be led to ask why it would not be a good thing for all public officers to be kept in their positions, instead of being turned out just as they begin to understand their duties. We cannot too carefully guard against such insidious undermining of our institutions.

The governmental difficulties into which the Cuban war is plunging Spain are imperfectly appreciated in this country. In Prime Minister Cánovas's cushion the financial thorn is undoubtedly the sharpest. The war is costing \$6,000,000 a month; upwards of \$80,000,000 will have been spent by August. Gen. Weyler holds out no hope of subduing the rebellion short of two years' time. Where is the money to be found? With Cuba all the while steadily approaching ruin, Spain's security for borrowing is impaired. So is her commerce with the island, the prosperity of her merchants and artisans depending upon it, and therefore their ability to bear increased taxation. Spain has confessed bankruptcy once within the past generation, and the Cuban war, if much prolonged, seems bound to drive her again to similar straits. Why, then, does not the Government grant Cuba home rule, or go back to the policy of Prim and renounce the island outright as a possession which, Spaniards privately admit, is now little but a source of trouble and loss to them? We suppose no party or form of government in Spain could do that and live. The sentiment of national dignity and honor seems now to attach itself chiefly to the retention of Cuba. Spain may be impoverished, but she will maintain her lofty tone to the end, like the decayed nobleman in Valdés's novel, who had but one shirt to his back, but who did not for that cease to bear himself with fierce pride. Spain, in fact, appears to be able neither to subdue Cuba nor to govern it; neither to keep the island nor to let it go.

Sir William Harcourt's attack on Cecil Rhodes in the House of Commons, followed up later in an address to his constituents, serves to show the division of sentiment in England over the complicity of the Chartered Company in the Transvaal conspiracy. On the one hand there is a widespread and keen sense of humiliation that the country should have been compromised, in the eyes of the world, by officials who acted like sordid stock-jobbers, and whose plots came so conspicuously to grief. But, on the other, there is alarm at the vast property and political

interests involved in any action that might be taken to punish Rhodes and cripple the company. It is the latter feeling which ties Chamberlain's hands, and apparently commits the Government to a waiting policy. "Something must be done," cry Harcourt and Labouchere, but that only means, say the other side, that, as Lord Palmerston said was always the case when that cry is raised, you want us to do something foolish. Cecil Rhodes is unquestionably the ablest Englishman in South Africa. The development and consolidation of English rule in that region, and the building up of the great property of the Chartered Company, are due more to him than to any one else. What about the interests of the more than 14,000 shareholders in the company—more than 4,000 of them being foreigners? Have they not a right to be consulted before any action is determined upon which may ruin them? That is what is said, and it cannot be denied that there is force in it. But the indecision of the Government which way to turn is undoubtedly making political capital for the Liberals.

The Tory Parliamentary programme, as outlined by Mr. Balfour in the Commons, is shrewdly conceived. First the education bill is to be passed, and, as all the Irish members favor it, a smashing majority is expected. Then the agricultural-rating bill is to be taken up—a choice bit of confiscatory legislation, as Chamberlain described it thirteen years ago and as the *Economist* terms it now. The Liberals and the Irish will fight this bill tooth and nail, but just behind it will lie the Irish land bill, which, with some trifling amendments, all parties approve. But they cannot have it, Mr. Balfour will keep telling them, unless they stop opposing and debating the agricultural bill. Let that slip through and there will be a good chance for relieving Irish tenants; otherwise, no one knows when anything can be done for them. These are clever tactics, but the main confidence of the Tories, after all, is their great Parliamentary majority. They are as majority-mad as our own Republicans. They think they can do anything they please. After all the damaging criticisms that may be made upon their measures, they have 180 majority, and what are the Liberals going to do about it? But veteran politicians are not disturbed by this sort of talk. Sir William Harcourt told the National Liberal Club the other evening that he had seen too many majorities of his own disappear, and too many majorities of his opponents melt away, to be either very much elated by being in the majority or depressed by finding himself in the minority. A majority, he said, was very much like a fall of snow, which might possibly come, but was absolutely certain to go. So he warned the complacent Tories not to put their trust in a majority

which, like so many others, was bound soon to "join the majority."

The rumor from London, fortified by the language of the Liberal organs, that the party is going formally to abandon Irish home rule because of the support given by the Irish in the House of Commons to the education bill of the Conservatives, has had a good deal more importance ascribed to it than it deserves. Since Mr. Gladstone's retirement and the defeat of his bill, home rule has been nothing but a pale ghost. The dissensions among the Irish would have finished it, even if Liberal interest in it had not been almost completely destroyed by the large majority received by the Tories after the Lords had thrown it out. A measure that is certain not to be passed in the lifetime of anybody now in politics, is not likely to remain long in sight even in a party programme. No matter what anybody says, everybody knows that home rule is dead. It needed both Gladstone and Parnell, a united Irish party, and a fiercely discontented population in Ireland, to give it any vitality. Gladstone and Parnell are both gone. In the absence of any stimulation from above, the popular demand for home rule has for the moment been appeased by the successful working of the new land laws. But its greatest enemy has been the divisions of the Irish representatives, who have been fighting like cats and dogs for two years, and giving as deplorable accounts of each other as two hostile Southern editors. This has already greatly disgusted the English public, and would have turned away the attention of all active Liberals from home rule, even if there were the remotest chance of passing such a measure within the next quarter of a century.

The retention of home rule on the Liberal programme has been for some time only nominal. It is there because it has been there, and for little other reason. As a matter of fact there is more real sympathy between the Tories and the Irish than between the Irish and the Nonconformists. The principle of authority, or leadership by somebody, finds much more favor both with the Irish and Tories than with the Liberals. Then, the Irish have never hesitated to make terms with the Conservatives when they could get anything out of them. The educational system provided by the new bill is far more important to the Irish Catholic clergy than anything, short of home rule, the Liberals are ever likely to offer. When one considers that the Tories are in power till 1902 for certain, and possibly as long again, and that they are completely independent of the Irish for their majority, the wonder is the Irish have not been even more eager than they have been to bargain with them, on the old plan of getting all they can out of the English, no matter of which party.

MCKINLEY'S SILENCE.

THE question what currency the nation shall use hereafter is the most important question which has come before the American people since the war. It has only a business aspect. You may love and honor silver or gold as much as you please, you may weep in silence over "the dollar of the fathers," but when you leave your chamber and go out into the cold world with your dollar, you find that no one cares a cent about your feelings. All to whom you offer it ask you brutally, What is it worth in gold? And when you speak of gold, some cynical wretch is sure to say, What is exchange to-day? To venture in business, to start a house, to enter into a partnership or enter into any operation requiring time, it is essential you should know what the currency of your country is to be for at least five years to come. Next to this comes the question, What will Congress do about the currency as it exists to-day? If you cannot get an answer to this, the next in importance is, What will the next President do with regard to any legislation Congress may pass with a view to deteriorating the currency? If this next President should be McKinley, you have the answer to this one question already, so long as he does not change his mood. In 1890 he said, in substance, in debate, that he would not prevent Congress from deteriorating the currency if it chose, and he abused Cleveland for interposing his veto between such legislation and the country. Said this great man in debate:

"A single voice, a single man, elected to execute the laws, not to make them, commanded the majority on that side of the House to be silent, and they were silent. [Applause and laughter on the Republican side.]

"As I said a moment ago, we are after practical results. [Derisive laughter on the Democratic side of the House.] We propose to give to this country what gentlemen upon the other side of the House could not do: what you did not dare do for four years. We propose to give to the country a silver bill that will take all the silver, practically, of the United States and make it available for the uses of the people."

So we know what he would do on one question—if he does not change his mind; but whether he will change his mind nobody as yet knows, and he will not speak because if he did so he would offend so many people.

We learn from the *Tribune* that "the reticence of self-respect" is the proper and polite name for Major McKinley's refusal to answer any question touching his position on the money question. It is the more important to have a good name for this thing because of "the impression, now grown into a conviction," that McKinley "will be the Republican candidate" for the Presidency. What to call the refusal of such a person to state his opinions on the leading question of the day we never knew until now. It is to be called "reticence of self-respect." We thought that this was the name for the refusal of a private man to state his opinions. If we went into such a man's

office and asked him what he thought on the currency question, we have always supposed that he would be justified not only in refusing to answer us, but in expelling us from his premises, using no more force than was necessary for the purpose; and that, when putting us out, he might observe that self-respect made his reticence necessary. But it now appears that the term is also available for the use of candidates for high office, who do not wish to let people know what they think until they are nominated, while it is still not available for small private places. If, for instance, a clerk applied for a place, and pleaded "reticence of self-respect" in support of refusal to tell who was his last employer, and what he thought about theft and forgery, he would still be dismissed as a crank; but when a man asks to be made President of the United States, he may still say that his dignity will not allow him to mention his views about the matter which most nearly concerns the people of all classes and conditions, and will be in a sense his special care in case he should be elected.

But, alas! this plea is not open to Major McKinley of Ohio. The trouble with him is that he has not been "reticent." He is "short" of self-respect, as they say in the Stock Exchange. He has spoken, and spoken profusely, on this very matter on which the people now wish to hear him. He has already declared himself what is called "a silver-man" by every means within his reach. If he now keeps silent, it is with the view of making believe, by a species of fraud, that he is not a silver-man. He wants every silver-man in the country to suppose he is a silver-man, and every gold-man to suppose he is a gold-man. We know that he wishes us to suppose that he is a silver-man because he has spoken freely on that subject; and we know he wishes us to believe him a gold-man because he would otherwise produce once more his silver reflections. Consequently his reticence comes too late.

In 1890 he called on the House in strenuous terms to pass the silver-purchase act of that year. He wanted to purchase \$4,500,000 monthly to encourage silver. He condescended with Bland, "a free-silver man as we know him to be," yet powerless to pass a free-coinage bill, and compelled by the dictation of the President to sit silent. In 1891, in a speech at Toledo, O., February 12, he declared:

"During all of his [Cleveland's] years at the head of the Government he was dishonoring one of our precious metals, one of our own great products, discrediting silver and enhancing the price of gold. He endeavored even before his inauguration to office to stop the coinage of silver dollars, and afterwards, and to the end of his Administration, persistently used his power to that end. He was determined to contract the circulating medium and demonetize one of the coins of commerce, limit the volume of money among the people, make money scarce, and therefore dear. He would have increased the value of money and diminished the value of everything else—money the master, everything else the servant."

Or take this extract from a speech of

his made at Findlay, O., September 27, 1894:

"The Democratic party has been in control of every branch of the Government since the 4th day of March, 1893. Its legislative branch has been in session for more than twelve months, yet it has given us no silver legislation whatever, except to strike down the Sherman law at its special session called for that purpose, and in response to the urgent recommendation of a Democratic President. The party that struck silver down, and gave it the severest blow it ever had, cannot be relied upon to give that metal honorable treatment."

In fact, he began to work and vote for silver as far back as 1877. He has been doing it steadily down to this year. There is no more confirmed and steady silver-man in the country. We do not say that he was a silver-man through fraud or selfishness. He was probably a silver-man through sheer stupidity and ignorance. He has no more idea of the laws of currency than one of his negro delegates at St. Louis will have of the higher mathematics. We are far from railing at him for this. It is not every man who understands currency, and the quality of a man's brain is fixed by the Creator. But the attempt to give the country to understand at this date that he is really not a silver but a gold-man, or a heavenly-money man, and that he is keeping silent now through dignity, and not through fear of being found out, is shocking. It is revolting. Every man in the community who has children to bring up and a moral sense of his own, ought to rise against it and bring to naught this attempt at imposture.

He ought to rise against it for two reasons. One is, that to give the sanction of the popular vote to such an attempt to allow candidates for the great place which McKinley seeks, to "lie low," no matter what their antecedents may have been, until they found out how the convention was going, would really be putting the Presidency up at auction to be bidden for by the leading knaves of the community every four years. The other is, that the particular question in the arena to-day is far too important to allow of any delay or subterfuge about it. The convention will not meet till next month; the election will not be held till November. The politicians have at last got hold of the currency of the country, and are using it as a stake in their miserable game, and mean to do so for six months, and cover the whole land with fraud and humbug. Will the business men permit this? Are they to be satisfied with the assurances of Chris Magee and Gen. Alger, when the candidate himself, the only man who knows, dares not tell his countrymen what he thinks on the most momentous question which, except the war, has been submitted to the American people since the Revolution? Will they not speak out at this crisis for frankness, for loyalty, for truth, and for honesty, as well as for the gold standard—the honest measure?

PROSPECTS OF A BOLT.

THE news from Ohio and Illinois touching the course of Democratic politics does not improve the prospect of a sound-money platform at Chicago. In Illinois the organization of the party was taken away from Senator Palmer and his friends by the "snap convention" of last year. That was an unfair and irregular proceeding, but it served the purpose of its promoters. It put the Democratic party of the State into the hands of Gov. Altgeld, who has attached his fortunes to the silver wing of the party without any apparent reason except that he can annoy President Cleveland more in that way than in any other. As for Ohio, the Democracy of that State has been on the wrong side of every money question that has come up since the war. Last year Senator Brice kept it straight by a supreme effort, but the money question was not then of paramount importance as it is now. It is much to be feared that the party will now go as it went in the days of old Bill Allen—that is, for the poorest kind of money there is any chance of getting.

It behooves the gold-standard Democrats in all parts of the country to contemplate their position in case the party at Chicago votes for free coinage, by the United States alone, at the ratio of 16 to 1. That, as everybody knows, means the single silver standard. The pretence that it means bimetalism is not maintained by any honest person. Whether bimetalism could be maintained by an international agreement is a matter of dispute. Very few persons think that it could be preserved at the legal ratio of 16 when the market ratio is 30; but, however that may be, there is no prospect of an international agreement. Both the gold-standard people and the silver-standard people are tired of talking about international agreements, and, even if that were a hopeful solution of the difficulty, it could not be reached in time for this year's campaign. The day of straddles is past. There is nothing to do but to vote for one standard or the other. For office-seekers this is a dreadful predicament, but for business men and for the public in general nothing could be better than to have this question put before the country so that it shall be voted on fairly and squarely.

The silver standard will never be adopted by this country. No party can hold itself together which sets out to produce that result. No party which aims to reduce the dollar to fifty cents can avoid a prodigious bolt. There may be a bolt in any case, and bolting may extend to both parties, but it is certain that if either of them declares for free coinage at 16 to 1, there will be a dismemberment of the organization of that party, with the prospect that the fragments will never come together again. Moreover, the division will not be a sectional one. It will run through all the States east of the Rocky Mountains certainly, and through those of the Pacific Coast probably. There is

no chance of the Republican party making a declaration of that kind. There is every probability that it will pronounce for the gold standard outright in order to offset the bad impression made by McKinley's straddling. Any bolt which may follow at St. Louis can be easily reckoned with. It will be of small dimensions, of a purely sectional type, and will not put the party in real jeopardy as a bolt of the other kind would put the Democracy.

We should not apprehend any harm to the republic from a bolt in the Democratic party, not even if it were a thunderbolt. Both the old parties long since outlived the objects that called them into being. Whether they are longer useful for any purpose may well be doubted. If this question could have been submitted to a popular vote at any time the past winter, while business men opened their newspapers each day with fear and trembling lest they should find the country involved in some war without a cause, the verdict would have been overwhelming that both parties deserved perdition, and that anything which should dissolve and disperse them would be heaven's blessing to us all. For this reason we have not looked with alarm upon the formation and growth of the Populist party. By bringing the seeds of disintegration into the other parties it has promised to clear the ground for new political divisions based upon living issues, to disestablish the old machines, and to awaken the dormant patriotism and unused talent that find no place to work for the country under the tyrannical and corrupting boss system. The Populists have pretty well sapped the Democratic party in the South, and that is the reason why it is now going for silver and fifty-cent dollars. Why should not all the believers in that doctrine range themselves under one banner, and vote for one candidate? Then all who are opposed to them will range themselves on the other side. The advantage of such an alignment is that each man will then know what he is fighting for, and can work with some assurance that the blows he strikes will tend to produce the result he aims at.

It may be said that if a Democratic bolt takes place without any Republican bolt of corresponding size, the bolters will contribute to the election of McKinley and the enactment of a new McKinley tariff. The answer is that it will not be the bolt, but the bad Democratic platform, that will do the mischief. The election of the Republican nominee will be assured, and the only question for Democrats to decide will be whether this result shall be accompanied by an open revolt, or by abstention from the polls, or by quietly voting the Republican ticket. It would be much the better policy for the sound-money Democrats to walk out of the convention and make a public declaration of their reasons for doing so. One reason for taking this course is that the disintegration of the Democratic party will promote the breaking up of the Re-

publican party also. There are plenty of differences among Republicans as to silver, greenbacks, and the tariff, which will find room for expression whenever the Democratic pressure is withdrawn. The two parties have braced each other up for many years. When one of them actually falls, the other cannot remain standing very long. Moreover, Republican success at the polls does not necessarily mean another McKinley tariff. There are obstacles still in the way of such an enactment, especially a shortage of votes in the Senate. In any case a McKinley tariff is a curable evil, as we have already seen, while a fifty-cent dollar is not.

ONE ISSUE DISPOSED OF.

CONVENTIONS for the choice of delegates to the Republican national convention have now been held in all the forty-five States of the Union. The platforms adopted in these conventions, particularly those held in the important States of the North, have been examined with interest for the light that they might cast upon the drift of party sentiment regarding the live questions in our politics, and particularly the currency issue. One feature, however, common to them all, has escaped notice, although it is really most significant. We refer to the entire absence of any allusion to the issue which, in one phase or another, has been visible and prominent in Republican platforms in every Presidential year since the party appeared on the national stage. The sectional question, growing out of slavery, is not so much as mentioned anywhere.

The first Republican national convention, in 1856, assembled in response to "a call addressed to the people of the United States, without regard to past political differences or divisions, who are opposed to the repeal of the Missouri compromise, to the policy of the present [Democratic] Administration, to the extension of slavery into free territory." In every Presidential campaign during the forty years from that time to this, either slavery or questions growing out of slavery—as, the reconstruction of the Union, the conferring of suffrage upon the former slaves, and the attempts to protect them in the exercise of that right—have occupied a front place in Republican platforms. The contrast between four years ago and the present year is most striking in this respect. In 1892 Benjamin Harrison was President, and aspired to a reelection. The Republican convention in his own State of Indiana was therefore naturally held early, meeting at Indianapolis on the 10th of March. During his administration a desperate attempt had been made to strengthen the existing federal election laws by the passage of what came to be known as the Force bill. This issue was put first in the platform adopted at Indianapolis, which began as follows:

"The Republicans of Indiana, in State convention assembled, believing that a continua-

tion of the Republican party in power is essential to good government and the development of the material resources of the country, hereby reaffirm our devotion to the principles of the party as set forth in the platform adopted at the national convention in 1888, and we declare: That a pure ballot and a fair count are necessary to the maintenance of our republican institutions and the liberties of our people," etc.

Throughout the North, Republican conventions imitated the example thus set by their Indiana brethren in pushing the sectional issue to a front place. Pennsylvania and Ohio adopted the same plank on the subject, avowing "belief in a free ballot and a fair count," and affirming that, "unless intelligent and patriotic sentiment accord these rights to the humblest citizen in every section of the country, it becomes the duty of the federal Government to secure them by Congressional enactment, under the authority conferred by the Constitution." The Republicans of New York "denounced the treatment of the colored people in the South as barbarous, and continued (in defiance of the laws and the federal Constitution) for the sole purpose of perpetuating Democratic control of that section"; and they proceeded to "tender to the people thus oppressed our cordial sympathy and our earnest efforts for the amelioration of their condition." Every State platform framed in the North had a plank on this question, and when the delegates chosen by such conventions assembled at Minneapolis, they adopted a platform containing this general party deliverance:

"We demand that every citizen of the United States shall be allowed to cast one free and unrestricted ballot in all public elections, and that such ballot shall be counted and returned as cast; that such laws shall be enacted and enforced as will secure to every citizen, be he rich or poor, native or foreign-born, white or black, his sovereign rights guaranteed by the Constitution. The free and honest popular ballot, the just and equal representation of all the people, as well as their just and equal protection, under the laws, are the foundation of our republican institutions; and the party will never relax its efforts until the integrity of the ballot and the purity of elections shall be fully guaranteed and protected in every State."

A Democratic Administration has been in power for four years, supported during the first two years by a Democratic Congress. That Congress repealed the federal election laws, and thus put North and South, white and black, ex-master and ex-slave, on an equality. The experiment has been tried long enough fairly to test its workings. The result is that, beginning with the platform adopted in Ohio, the State which expects to furnish the candidate this year, every Republican State convention has omitted all reference to "a pure ballot and a fair count," the "oppressed colored people in the South," and the necessity of legislation to secure every citizen "his sovereign rights." Indeed, the one reference to the subject found anywhere in the country was the protest against any attempt to reopen the question made by the Republican State convention in Texas, composed largely of

colored delegates, which adopted this pointed resolution:

"We view with satisfaction and pride the rapid growth of Republican sentiment in the South, and, relying on the force of a healthy public opinion demanding fair and honest elections, believe that further legislation on this subject by Congress is undesirable and unnecessary."

The return of the Democracy to complete control of the Government in 1893 has not brought all the benefits that were reasonably to have been expected. But the Cleveland Administration has rendered the nation one immense and enduring service by for ever eliminating the sectional issue from our politics.

THE NEW GALLERY.

LONDON, April, 1896.

THE day has gone by when the Grosvenor Gallery, or the New, which came to take its place, was the headquarters of any one special group of artists. Indeed, if a gallery were set aside for the purpose, the Independents, or Secessionists, to fill it with their work would be hard to find. The Pre-Raphaelite following has dwindled into insignificance. The Glasgow men are quite willing to scatter their forces, each sending his pictures to the exhibition most likely to accept them. Even the members of the New English Art Club have ceased to flaunt their rebellion in the face of the public, settling down to sober accomplishment. The result is, on the one hand, a fresh access of dulness in the never very gay London shows; on the other, a better chance that honestly good work will not be overshadowed by the eccentric, whether in subject or treatment.

This year's New Gallery, which has just opened its doors, is really but little more than an overflow from the Royal Academy. But there is one great difference: the best places on the line are not reserved, as at Burlington House, for the productions, however incompetent, of certain privileged men. Besides, the rooms are smaller and less crowded by a heterogeneous array of conflicting colors and designs. Much of the work that is most charming, and makes the charm most keenly felt, would simply not be seen at the Academy, where refinement of method counts for little. The work to which I refer more particularly is to be found among the landscapes. It is a curious thing that the influence of Constable and Bonington seems at last to be reaching England by the very roundabout way of France. The impression that Constable, slighted at home, made upon the Frenchmen of his time, has been pointed out again and again. He had substituted nature for the old classical convention, and, across the Channel, there were men but too ready to follow where he had led. Bonington was still more of a power. Delacroix paid eager tribute to his genius, which was as frankly acknowledged by others to whom his name was unknown. Gigoux tells how Gros, all unconsciously, called him "master" to his very face while Bonington was still a student in the great Frenchman's studio. But in England his work and Constable's made no such stir; for their own countrymen they were never masters. They and the Norwich School were promptly forgotten; and if Turner, thanks to Ruskin, was remembered, it was as a name, not an influence. Now and then artists like Mason and Fred. Walker, or North or Cecil Lawson, seemed to be endeavoring to

rescue landscape painting from the depths of ineptitude into which it was fast sinking, but in vain. And the worst of it was that the more inept the landscape, the more strenuously its painter insisted upon his adherence to the traditions of what he was pleased to call the English tradition. But many of the younger men have studied in Paris. In England the work of the Romanticists, who were the legitimate successors of Constable and Bonington, is becoming more familiarly known, and there is no question that, within the last few years, there is a marked change for the better. Indeed, I think the excellence of the landscapes the one noteworthy feature of the present collection at the New Gallery.

It is not so much that individual pictures are good, though several of them are, as that the general standard has been raised, that attention has been turned to more legitimate artistic problems. Where the object was once to crowd a canvas with as much detail as it could hold, or perhaps more, now there are a few English artists who concern themselves with the aspect of the scene they paint, with harmony of color, with rightness of values. They have learned to prize simplicity and breadth and freedom of handling above niggling and ill-considered smudging. They seek to compose a picture rather than to make a painted photograph, a literal transcript of nature.

It would be useless here to write out a list of names in order to establish the truth of my assertion. One will serve as well, and, after all, no exhibitor answers my purpose more forcibly than Mr. Edward Stott, a young man whose reputation has hardly yet spread from his fellow-artists to the general public. He has taken a simple domestic subject, quite in sympathy with English popular traditions. "The Old Gate," he calls it, and he shows three tired horses coming home after the day's work, a boy mounted upon the first, while, on the open gate, a small girl is perched, and another stands at its side. Beyond is the long, low, red-roofed barn, fowls gathering under the shadow of its wall. In the description it sounds as though this picture might be one of the characteristic water-colors of William Hunt. But Mr. Stott has not troubled to tell a silly story or to discover sham sentiment, as Hunt would have done. To him the subject has been nothing but an excuse to record a lovely effect of light. The low rays of the setting sun fall, with transfiguring glory, upon the face and jacket of the girl who stands, and, here and there, on the horse and the boy on its back; far away, to the left of the barn, stretches a tender, luminous sky. Figures and details are all enveloped in the magical atmosphere of the hour, and the artist has known how to concentrate attention upon this effect, and how to give to his impression the serenity, the feeling of completeness which is never missing from the true work of art. One will watch Mr. Stott's future career with interest. I wish there were space to speak at length of Mr. Arthur Lemon's "Campagna Romana," with the vast desolate plain sharply defined in the clear Italian atmosphere, and yet the idea of almost illimitable distance so well expressed; of Mr. Peppercorn's soft, silvery gray impressions of evening; of some half-dozen other landscapes which give genuine distinction to a not very notable show.

But the good work is not entirely confined to the landscapes. There is a fine portrait of Countess Clary Aldringen by Mr. Sargent. If it is not one of his pleasantest, the fault probably was his sitter's, not his. It is a full-length, and the tall, slight, self-conscious figure in

white evening gown has just risen from the sofa as if to give greeting to an arriving guest. The mouth is partly open in a set, acid society smile, the right arm is ready to be extended; the pose and expression are wonderfully natural and, one feels instinctively, characteristic. The white of the gown, painted with immense vigor and vivacity, tells deliciously against the pale rose of the sofa, behind which hangings fall in heavy folds. And the woman herself stands so well within the room, which is so unmistakably filled with real air, that most of the other portraits in the gallery seem no better than lay figures painted in the flat. It has not the beauty of Mr. Sargent's lovely "Lady Agnew," nor the dignity of his "Miss Rehan," nor, again, the spirit and go of his "Carmenita"; but it is a very distinguished performance, immeasurably more accomplished than the work that surrounds it.

It is a strange contrast to turn from Mr. Sargent to Sir Edward Burne Jones, whose canvases show but too plainly the infinite labor which they have cost him. To tell the truth, he is not at his best this year. In both his pictures he has been at much trouble to carry out an unpleasant color scheme, which does not help to reconcile one to the reappearance of the wan, mystic figures one knows but too well. In the first, "Aurora,"

"Day's harbinger
Comes dancing from the East."

She is merely his Psyche, his Venus, his Virgin under another name. She wears rose-gray draperies, hard and cold as the gray walls between which she winds her way; and she dances to so sad a measure, she clashes her cymbals with such wistful weariness, that one might well dread the coming of the day thus heralded. Never was there a more despairing Dawn, nor one less beautiful. "The Dream of Launcelot at the Chapel of the San Grael" also is without the loveliness of decorative design that might compensate for lack of harmony in the color.

Mr. Watts, who is always prominent at the New Gallery, has scarcely been more successful. His work, like Sir Edward Burne Jones's, always commands respect even when it borders upon failure. But allegory must sometimes prove a snare for the painter, and his figure of "Earth" is so coarse in form (which was no doubt intentional), the fruit and flowers she holds in her arms present so muddy an arrangement of reds and browns, that one cannot but wish he had thought less of his allegory, more of his picture. He has, besides, a "Time, Death, and Judgment," statuesque in its composition, but otherwise disappointing; and two little pictures of Adam and Eve, before and after the fall—a subject so hackneyed in art that a much more original conception and treatment than his would be needed to give it interest. For the rest, there is nothing to note, unless it be the fact that to M. Fernand Khnopff, as to Mr. Watts, mysticism or symbolism has proved a pitfall. His one picture, "Des Caressees," which represents a leopard-like sphinx and her lover, he has filled so chock-full of esoteric meaning that he has forgotten to find expression for it in the striking decorative arrangement which he once accustomed us to expect from him. Few are the artists strong enough to indulge in ideas.

N. N.

BARRAS'S MEMOIRS.—VI.

PARIS, May 7, 1896.

ONE of the men who owed their importance

to Barras was Réal, who played such an important part in the Empire. He was a lawyer, and did not miss one of Barras's soirées at the Luxembourg. He had made himself notorious in the case of Babeuf, the Socialist leader of the time. It is curious to notice the part which is always left to women in the Memoirs of Barras. "One day," he says, "I received a visit from a friend of mine who was also a friend of Réal's, Mademoiselle or Madame de Châtenay, for her quality of canoness gave her the right to be called Madame [the Memoirs of Madame de Châtenay have been recently published, and I shall soon have to give an account of them, as they possess real interest]. She was a person of much *esprit*, and even more erudition; a true Benedictine." She came to speak in favor of Réal, and recommended him for the office of Commissioner of the Directory in the Department of the Seine. "You, Barras, to whom France owes the finest things in the Revolution, who are the father of the most distinguished citizens and soldiers that honor our country—for did you not make Bonaparte, Hoche, Talleyrand, Fouché, etc.?—I do not answer for those whom I don't know particularly, but I do answer for Réal." There were good reasons why our canoness took so much interest in Réal, as her Memoirs will show. Barras was moved by Madame de Châtenay, and it must be remarked that he does not suggest that she employed with him the means which were employed by others, and on which he dwells with so much complacency and cynicism in his Memoirs. Réal was appointed, and "there you have one more actor," says Barras, "whom I introduced on the scene."

Barras observes, on this occasion, that the personages cited above "all put themselves forward by means of women's influence." Bonaparte was the first:

"We have seen his manoeuvres with Josephine and his marriage in order to have command of the army of Italy. Then Talleyrand; we have seen how he was helped and kept up by Madame de Staël. We now see Réal, in a secondary sphere, using the same means. . . . I will make here a sad reflection on their conduct. After having used women in the interest of their ambition, they were all ungrateful; they squeezed the lemon and threw away the peel."

Talleyrand was, says Barras, more than ungrateful, he became hostile:

"Judged by what she [Mme. de Staël] told me when I saw her again in 1814, she did not doubt that Talleyrand was the prime mover in the persecution she had to suffer. 'I had become insupportable to him,' said she laughingly, 'as Agrippina was to Nero. . . . I had given him bread literally, my dear Barras, before you made him minister on my recommendation; what had I not done for him? Remember my importunities. Well, if he could have treated me as Nero did Agrippina, he would have done so; he would do it still, and why? Because I gave him bread and made him minister.'"

One of the agents of Louis XVIII., of the Prince de Condé, of the English Government (this class of secret agents is not content with doing its work for a single person or party), was a man called Fauche-Borel, a bankrupt bookseller. He had received large sums for communicating directly or indirectly with the most important public men and bribing them in order to bring them over to the royalist cause. Fauche-Borel had persuaded the Pretender and the foreign cabinets that Barras, the General of the 9th Thermidor, of the 18th Vendémiaire, of the 18th Fructidor, was the most vulnerable. He wrote to him from Weasel, under the name of Frédéric Borelly, saying "that he had important revelations to make to

him which interested France and the Directory." He wished to have passports for Paris or to have sent to him, on the part of Barras, an agent who possessed his entire confidence. Barras showed this letter to the Directory the day he received it. The Directory judged "that it was important not to neglect this proposition, and to send an agent." Talleyrand, then Minister of Foreign Affairs, was consulted; he chose for agent of the Directory a person who saw Fauche-Borel at Weasel, but obtained no communication of any importance. The Directory decided that another should be sent with a letter from him. Barras sent a M. Guérin with the letter desired by Fauche-Borel. He said in this letter: "You can safely give the bearer all the information and all the documents which you announce to be of great interest for the Republic, the Government, and for myself in particular."

We find in the Memoirs a letter which Borelly wrote to Barras on the 17th Vendémiaire, year viii., with "letters-patent from the King appointing a commissioner for the proclamation of the monarchy." The Viscount de Barras was named High Commissioner; a month after Louis XVIII. should have taken the reins of government Barras was to receive as an indemnity "the sum of twelve millions of livres tournois—ten millions for himself and two millions which were to be divided by him between his coadjutors in the work of the restoration." Barras says that the correspondence and the letters-patent were communicated to the Directory. Fouché arrested a certain Monnier, whom Barras characterizes as the correspondent of Weasel. Barras's secretary Botot appeared before the Directory, his name having been used at Weasel; the secretary "disavowed everything." The secret register of the Directory would perhaps dispel the mystery of these negotiations. What seems clear, notwithstanding the protestations of the Memoirs, is, that Barras was open to an offer, and that he was thought to be so by his colleagues of the Directory. In his memoirs Gohier, one of the Directors, does not express any doubts on the subject. He says that there were in the Directory two traitors; that while Sieyès was working for a dictatorship—the dictatorship of Bonaparte and himself—Barras was conspiring for the monarchy. "The moment when this Director was to unfurl the royal standard was fixed, the day on which this conspiracy was to break out was marked; and if the movement failed, it was because Sieyès's movement prevented it." The allusion is to the famous 18th Brumaire, the day which witnessed the foundation of Bonaparte's power.

In volume iv. of Barras's Memoirs there are many interesting details concerning what may be called the preliminaries of the 18th Brumaire. Barras's ambiguous conduct during this period may be explained by the fact that he was carrying on a sort of double policy; he certainly knew the projects of Sieyès and Bonaparte, but he was conspiring probably also on his account. He was somewhat deceived on the subject of Bonaparte's prestige, and he seems to have been surprised when he found, after Bonaparte's return from Egypt, that, to use his own very energetic expressions, "la France se précipitait vers une existence nouvelle." The prestige of the "échappé d'Égypte" was growing every day, and Barras himself had become more and more unpopular and disregarded. When convinced that Bonaparte was the man of the day, he abandoned his own projects and cut the threads which he had thrown across the frontier in the direction of the Pretender. It was too late—Bonaparte had

seen through him; he did not like Barras any more than Barras liked him, and the reasons for this mutual dislike are obvious. Josephine was a sort of living reproach which stood between them.

On the 8th Brumaire, ten days before the *coup d'état*, Barras had at his table Moreau and Bonaparte; the conversation turned on the political situation. Barras recognized the necessity of a dictatorship; he confessed that he was himself "usé pour la circonstance," and pronounced the name of a general, Hédouville, by way of sounding Bonaparte. The effect was terrible. Bonaparte fixed an angry look on Barras and soon went away, determined to work with Sieyès only. He felt, however, some hesitation; he knew that Barras had much decision and courage, having seen him at Toulon on the 18th Vendémiaire. They saw each other any times. Talleyrand and Réal tried to induce greater harmony between them. In Barras's opinion the return of Bonaparte furnished the means of procuring an amelioration of the constitutional system; instead of a Directory of five members, it was necessary to have a single President who should have the power of dissolving the legislative chambers. Napoleon said to Barras, "It is either you or Sieyès," and seemed at times to leave him the choice. Barras did not choose; he invented difficulties, and finally it was agreed among Bonaparte's supporters that they would say to Barras's supporters, "He is with us, but wishes to show himself only after the business is done." It was also agreed that Sieyès should be amused and flattered to the end, and that Bonaparte should be made First Consul, with the addition of two other Consuls who would be merely his lieutenants.

On the 16th Brumaire the friends of Bonaparte met at the house of the President of the Ancients. It was agreed that the two Councils and the Directory should be transferred to Saint-Cloud, and that the proposition should be made by a committee of the Ancients. The details of the *coup d'état* are well known. The removal to Saint-Cloud was voted in the early morning, and General Bonaparte was charged with the necessary measures for the protection of the national representation. All the troops in Paris were placed for that object under his command. The decree of removal of the legislative chambers to Saint-Cloud was sent officially to Barras. Two of the Directors, Gohier and Moulins, went to the Luxembourg to join him; they were already abandoned, even by the troops which usually guarded the Luxembourg. Talleyrand arrived, after the departure of Gohier and Moulins; he acted the part of the Tempter: the republic was in danger, Bonaparte had no other thought but to save it. Sieyès, the two Directors who had just left Barras, understood matters; they had resigned and were going to join the Ancients at Saint-Cloud. "I open my window," says Barras; "I give a look on the Rue de Tournon and vicinity. I see soldiers going to the Tuilleries, the people accompanying them with shrieks of support and encouragement. I can no longer conceal the truth from myself. I determine my course with the resolution I have often shown in difficult times." He writes and sends in his resignation as Director. And so the curtain falls upon him. He probably did not think that it would fall for ever, and that his political career had come to an end.

Barras, after having given in his resignation, left immediately for his country-house at Grosbois. It was there that he heard the details of the *coup d'état* of Brumaire, which gave to Bonaparte a real dictatorship. "The

conspirators of the two councils divided among themselves the power and the fortune of France under various names more or less serious; some called themselves senators, some others tribunes, or even legislators. It was their way of making people believe that there still remained a national representation in France." Two days after the *coup d'état*, Bonaparte sent Fouché to Grosbois to ask Barras what place he would like to have in the Government. Barras took him over his garden and said to him: "This is the only place I now wish to occupy." He wrote to Bonaparte a letter in which he said that his determination to leave public life was irrevocable. Had there been a secret compact between Napoleon and Barras? Did Barras, as his contemporaries believed, receive three millions as the price of his resignation as Director? Why did Barras accept no post, diplomatic or military? Did he simply receive money? Did the price of his resignation remain in the hands of Talleyrand, as Barras intimates in a note? "My resignation, of which I have told the story without any reservation, involved no money offer. . . . I declare that if any sum was paid by Bonaparte for this object, it remained wholly in the possession of Talleyrand." There remains a mystery hanging over all these points; what is certain is, that Barras disappears as a political actor on the 18th Brumaire; exit Barras.

We see him after this date going from place to place, from Grosbois to Brussels, from Brussels to Provence, from there to Rome, always under the eye of Fouché's police, filled with a bitter hatred of Napoleon. The close of volume iv. is a prolonged satire on the Emperor. Barras uses his remaining strength in obscure intrigues and conspiracies; he applauds the treason of Bernadotte, of Moreau; he triumphs with the Russians and the Allies during the campaign in Russia and in the invasion of France. He ended his life during the Restoration in 1827, ignored, forgotten, in great affluence, protected by the Government of the Bourbons, who never forgot that, before the 18th Brumaire, Barras had been ready to prepare their return to France.

Correspondence.

CHRISTINA ROSSETTI'S MEMORIAL.

TO THE EDITOR OF THE NATION:

SIR: A memorial to the late Christina Rossetti, the gifted poetess whose fame is world-wide, will be placed in Christ Church, Woburn Square, which she attended for nearly twenty years.

Sir Edward Burne-Jones, who was a life-long friend, has consented to prepare the designs for a series of paintings in the reredos, and to superintend the work in its progress, if a sum sufficient be raised.

A first list of subscribers has been printed which contains the names of W. M. Rossetti, Mackenzie Bell, Sir William Jenner, the Bishop of Durham, Ada Swanwick, and others.

It is believed that there are many in America who will with pleasure contribute to the memorial, and I beg to add that donations may be sent to the Christina Rossetti Memorial Account in the Bank of England, Threadneedle Street, London, or to Yours truly,

J. J. GLENDINNING NASH,

Vicar of Christ Church, Woburn Square, and Chaplain to the Marquess of Londonderry, K.G.

92 TOWER STREET, LONDON, MAY 4, 1896.

Notes.

ZOLA's 'Rome' is on the eve of being brought out in English by Macmillan & Co., who announce also 'A Collection of Problems and Examples in Physics,' by C. P. Matthews and J. S. Shearer of Cornell.

The New Amsterdam Book Co., 156 Fifth Avenue, have in press 'Political Parties in the United States, their History and Influence,' by J. Harris Patton, M.A.

G. P. Putnam's Sons will unite in one volume Mr. David A. Wells's *North American Review* article on "The Relations Between the United States and Great Britain," ex-Minister Phelps's Brooklyn address on "The True Monroe Doctrine," and Mr. Carl Schurz's Washington address on "Arbitration," under the general title, 'The United States and Great Britain.' The same firm have nearly ready 'Abraham Lincoln,' the *Herald's* thousand-dollar prize poem by the Rev. Lyman Whitney Allen; 'A Venetian June,' by Anna Fuller; and 'Will o' the Wasp; A Sea-Yarn of the War of 1812,' by Robert Cameron Rogers.

'Ice Work, Present and Past,' by Prof. T. G. Bonney, and 'Green Gates,' a New York novel, by Mrs. K. M. C. Meredith, are announced by the Appletons.

George Bell & Sons, London (New York: Macmillan), have issued, in the Bohn Library series, a cheaper edition of T. Keane's translation from the Russian of Alexander Pushkin's 'Prose Tales,' noticed in these columns a couple of years ago.

The translation into English from Anatole Leroy-Beaulieu's third and last volume of 'The Empire of the Tears and the Russians' has appeared from the press of G. P. Putnam's Sons. This volume is devoted to the religion of Russia. It is impossible to speak with too high praise of the manner in which the author has treated this most delicate and difficult topic. A foreigner, a member of the Russian Church's great rival, he might easily have overstepped the limits of truth, delicacy, and good feeling. But, with a few trifling exceptions which might be taken by a person occupying another point of view, his statements may be accepted as fair and correct within mortal bounds of error. This volume should do much to remove divers deep-seated errors and widely spread convictions as to the Russian Church and the Government's attitude towards it and towards the dissident sects which have long existed, or are constantly springing up like the mushroom, faddish sects of our Western world. We should like to mention, in particular, as examples of the author's sympathetic comprehension and justice, his characterization, on p. 38, of the peasant and Christianity; on p. 106, of the Russian images; and on pp. 92, 109-110, of the Church music. The translator's remarkably fluent English is marred by the defects which we analyzed at length in our review of the first volume in the series, and which often render the chronology or sense chaotic.

Before the death of Prof. Herbert Tuttle of Cornell University, in the summer of 1894, it was known that prolonged ill-health had impeded the completion of his 'History of Prussia'; and the information that only a portion of the fourth volume had been written was received with sincere regret, but without surprise. This portion, however, amounted to a half of the projected volume; it was ready for the printer, and Mrs. Tuttle has done wisely in giving it to the public (Houghton, Mifflin &

Co.). The period covered—the opening campaigns of the Seven Years' War, from the seizure of Saxony to the victories of Rossbach and Leuthen—is of exceptional interest; and, in spite of the author's repugnance to any show of enthusiasm and his dread of anything approaching "fine writing," the story holds the reader. The volume is fully up to the level of its predecessors: it exhibits the historian's characteristic merits—care in attesting the facts, clearness of presentation, sanity of judgment, and sobriety of expression. Like the previous volumes, it is minutely indexed. Prof. Herbert B. Adams of Johns Hopkins University contributes, by way of preface, a sympathetic sketch of Prof. Tuttle's life and labors.

Mr. Percy Fitzgerald has been revising his 'Life of Sterne,' which is now published in two neat volumes by Downey & Co. (New York: Charles Scribner's Sons). The changes and additions are so great as to make the present edition a new book. Many documents relating to Sterne have come to light during the last twenty years, and with no advantage to his character. Indeed, the most important thing about this edition is the biographer's change of attitude towards his subject. The fresh letters and a careful study of Yorick's Journal (soon to be published) have brought Mr. Fitzgerald almost to Thackeray's estimate of Sterne. "Yorick's Journal . . . is fatally damaging; exhibiting a repulsive combination of Pharisaical utterances and lax principle. This would seem to show that Mr. Sterne was something more than the mere 'philanderer' he described himself to be. . . . It may be always fairly presumed that licentious writing is almost certain to be followed by life and practice as licentious." Mr. Fitzgerald is very well up in Sterne's love affairs, and does not consider that *Qui ne changera pas qu'en mourant*, at the end of a fond letter, means much. The people of York, who were scandalized at 'Tristram Shandy,' would have collapsed on reading the correspondence of their clergyman. Externally, the most interesting portions of Sterne's life were his visits to London and Paris. Mr. Fitzgerald's chapters on these episodes are admirable. Paris was decidedly more congenial to Sterne than Sutton. "Among the French in Paris he gave full reins to his natural spirits; and to them his peculiar temper seems to have been very acceptable. . . . 'I laugh till I also cry,' he wrote, 'and in the same tender moments cry till I laugh; I Shandy it more than ever.'" It must have been worth while to see Sterne in the full tide of hilarity. He is fortunate in finding a biographer who does him justice without wronging the public by a paradoxical defence of his behavior. Mr. Fitzgerald's book, in its supplemented and reconsidered form, will doubtless remain the standard life of witty and volatile Shandy.

The Chicago University unites with the Early English Text Society in publishing a new MS. of Lydgate's 'The Assembly of Gods.' The issue constitutes the first monograph in a series of English Studies to be published by the University, and is at the same time to be a regular issue of the English Society. The editor is Dr. O. L. Triggs, whose doctoral thesis the critical part of the work constitutes. Dr. Triggs's book on Browning and Whitman, a study in Democracy, was noticed in these columns three years ago. It is a far cry from Whitman to Lydgate, but we dare say an exhilarating one. At all events, while Dr. Triggs's earlier book, though often original, was marred by mistiness and nonsequen-

ness, the author now employs a much severer method. The poem itself, which the editor assigns (contra Dr. Schick of Heidelberg) to Lydgate's second period, is a typical mediæval allegory of 2,000 lines, and in theology, mythology, and construction is neither more nor less conventional than most. The avowed aim of the poem, to find a common ground of accord between reason and sensuality, is realized: "in the fear of death all accord—Lydgate, Reason, and Sensuality." The editor adds six chapters of critical apparatus, throwing emphasis on the last chapter, which discusses allegory as a literary genre. Somewhat miscellaneous here is the collection of materials, but these are informed by a fine feeling on the editor's part for the vital bond between literature and life.

Dr. Bloomer's 'Life and Writings of Amelia Bloomer' (Boston: Arena Publishing Co.) is a husband's unaffected memorial tribute to his wife that must command respect. Mrs. Bloomer's life was almost uneventful. She was perhaps the second woman in this country—Mrs. Swissheim antedates her by one year—to found and conduct a paper of her own (the *Lily*), and she fought out in her husband's printing-office the principle of woman's right to set type. The promotion of temperance was her chief aim in life, and she was also fairly prominent among the woman-suffrage writers and speakers; but she will be remembered by the word she unwittingly added to the English vocabulary, though she did not invent the "Bloomer" costume, was not the first to wear it, and abandoned it with the same independence with which she adopted it. She celebrated her golden-wedding anniversary in "a black satin costume en train, with gray damascene front, crêpe lace in the neck, diamond ornaments." The "costume," while she wore it, brought upon her no personal odium or annoyance, and she lived to see a race of women bicyclers far outstripping, in their approach to the male costume, her modest innovation. Her activity on behalf of the soldiers in the war was like that in the other causes (including the church) which interested her. Mrs. Bloomer came of Rhode Island stock, was born in central New York in 1818, and died in Iowa, her final home, in 1894. Her life is typical of the New England spirit, in its permanent and its migratory aspect, and her labors belong to a class, not specially interesting in themselves, which are all the time honeycombing old prejudices and abuses, and preparing the way for great statutory, institutional, and social reforms.

In turning the search-light of modern science upon the problem of woman's mental capacity, as compared with that of man, M. Jacques Loubet, in his 'La Femme devant la Science Contemporaine' (Paris: Alcan), has not disposed of the question for all time to come, but he has given a clear account of its present status. The proof that the dogma of woman's irremediable intellectual inferiority receives no support from recent biological and psycho-physiological discoveries was worth establishing. The subject has been touched upon by nearly every writer on the woman question; historically it has been very fully treated by Mrs. Eliza Burt Gamble, in 'The Evolution of Woman'; but M. Loubet's treatise belongs rather with Havelock Ellis's 'Man and Woman,' as the most comprehensive from the purely scientific point of view.

Joseph Turquan's 'Les Sœurs de Napoléon' (Paris: Librairie Illustrée; New York: Lemcke & Buechner) is an attempt to define the influence which the three princesses, Eliza, Pauline,

and Caroline, had on the fate of the Napoleonic dynasty. That influence was, according to M. Turquan, evil and destructive, and he ascribes this effect to the immoral lives of the trio. Indeed, the story smacks strongly of the *chronique scandaleuse*, though the author takes pains to assure us that this is not his fault, but the inevitable consequence of his effort to paint true portraits of the Emperor's sisters.

The third and fourth volumes of 'Discours et Opinions de Jules Ferry' (Paris: Colin & Cie.), edited and annotated by Paul Robiquet, are devoted to the speeches made by Ferry on educational questions. On these he could claim to speak with authority, having thrice held the position of Minister of Public Instruction, and having striven steadily to place education within the reach of every French citizen. The fourth volume contains, in addition, two speeches on foreign affairs, but the real interest of the volumes lies in the educational debates, especially those on the education of girls, and on compulsory lay teaching in primary schools.

The Belgian writer, Ferdinand Loise, gives us, in his 'Histoire de la Poésie mise en rapport avec la civilisation en Italie' (Paris: Thorin & Fils) the third volume of his complete work on the history of poetry. This work is practically new, having been extensively rewritten and considerably enlarged. Among the additions are the introductory part, analytical summaries of the great Italian epics, and a review of nineteenth-century literature. The passages quoted are followed by translations usually very close to the spirit of the original.

Prince Alexandre Bibesco's 'La Question du Vers français et la Tentative des Poètes décadents' reappears in superb dress (Paris: Fischbacher). It is interesting to reread this plea in favor of French verse as used by all the great poets of France, albeit the attempt of the Decadent poets has ceased to attract much attention, if any. By far the larger part of the arguments put forward by Bibesco on the one hand, and by Pichari and Anatole France on the other, turn on the question of the so-called mute *e*, which is very far from mute in verse and often emphatic in song.

Félix Hémon, whose edition of Corneille is deservedly well thought of, has collected, in 'Études Littéraires et Morales,' first series (Paris: Delagrave), a number of articles which have already appeared in reviews, and his study of the early comedies of Corneille which is prefixed to the edition above referred to. The closing article, on Brunetière and Bossuet, possesses much interest.

M. Munier-Jolain, who delivered an excellent course at the Sorbonne on eloquence at the French bar, has published his lectures in book form under the title 'La Plaidoirie dans la Langue française' (Paris: Chevalier-Marescq & Cie.). It is a distinctly valuable addition to the knowledge of this form of eloquence. The period covered is from 1400 to 1700, and the evolution of eloquence at the bar—its merits and its defects—is fully examined and clearly stated.

The exact history of the word "socialisme" has not been very well known, and much time has been spent in the search for its first appearance in the French language. In a recent study on 'L'École Saint-Simonienne' M. Georges Weill points out what he thinks may be its origin. The *Globe*, an early organ of St. Simonism, makes use constantly, he says, of the word "social"; but the term "socialisme" is found in it only once, namely, in an article in the issue of February 18, 1832. The editor, M. Joncères, declares that the poetry

of Victor Hugo merits admiration in spite of its purely personal character, and then adds: "Nous ne voulons pas sacrifier la personnalité au socialisme, pas plus que ce dernier à la personnalité." The respective words are in italics in the text, which indicates, as M. Weill thinks, that they are unusual. It will be observed that the sense of the word "socialisme," in the passage quoted, differs somewhat from that in which it is now employed.

The sixteenth volume of the admirable series of *Indici e Cataloghi*, issued by the Italian Ministry of Public Instruction, is a Galilean Bibliography embracing 2,108 works of the philosopher or pertaining to him. It precedes a speedily forthcoming analytic index to the entire collection of Galilean MSS. possessed by the Central National Library.

A quarterly periodical, *Ex-Libris*, is projected for July by the Washington Ex-Libris Society. The magazine will, of course, be illustrated. The edition will not exceed 800 copies. Subscriptions at \$1.50 (for this country, \$1.75 abroad) may be sent to the society's treasurer, Mr. W. H. Shir-Cliff.

American tourists familiar with our Summer Schools may be tempted, by the announcement of the eighth Summer Assembly of the National Home-Reading Union at Chester, England, from June 27 to July 6, to combine sight-seeing with a comparative study of institutions. As in this country, various lectures (one on "Samuel Pepys and his Music," by the organist of Chester Cathedral, others on the geology and botany of the district, on Mediæval Monastic Arrangements and on Gothic Architecture, with a local squint) are attended with neighborhood excursions, to Hawarden Castle, Llangollen, etc. The Duke of Westminster will preside.

The first woman who has received the permission of the Minister of Public Instruction to attend lectures in the University of Munich, Bavaria, is Miss Ethel Gertrude Skeat, daughter of the well-known editor of Chaucer's works. After pursuing a four years' course of study at Cambridge, Miss Skeat passed her examination in natural science with distinction, and obtained a prize in the form of a traveling stipend; during the past nine months she has been engaged in geological and paleontological researches under the direction of Prof. Zittel in the Munich paleontological collections, which are especially rich in rare fossils. Probably no objection will be made to her candidacy for an academical degree.

—One of the most curious among the many quaint and out-of-the way volumes included in the "Galatea Collection" of books about Woman, now being catalogued at the Boston Public Library, is a work consisting of two thick volumes, bound in vellum, devoted to the saintly women of the early Christian Ages who lived in solitude among woods and mountains. The title is "Le Eroine della Solitudine Sacra, ovvero Vite d'alcune delle più illustri Romite Sacre, del P. Maestro Girolamo Ercolani." It was printed in 1654 at Bologna, with four different commendations of approval, in Latin or Italian, on the part of the priesthood, as might well be the case, seeing that the author was prior of the convent of S. Agostino at Bologna. The thirty saints whose lives are recorded range in the date of their deaths from about the year 3, when the first, namely, Elizabeth, mother of John the Baptist, is reported as having died—although the worthy prior declines to name the exact day of her demise, but says that the *Martirologio Romano* places it on the 5th of November—to

the latest, "Genevieve Palatina," princess of Brabanza, who died April 2, A.D. 750. The biographies are in Italian, with many marginal comments in Latin and citations from the fathers; but the most curious characteristic is afforded by the pictures. Each of the thirty heroines of solitude is portrayed in her favorite retreat—either hut, tent, tree, or rock, according to the preference of each; some text from the Vulgate being usually inscribed. In some cases there are in the background houses or churches of the quaint Albert Dürer style of architecture, indicating that the sacred solitary, like Thoreau, stayed tolerably near home; but most of the scenes are laid in woods or deserts, and the heroines are often accompanied by angels and sometimes by saints.

—In the case of the mother of John the Baptist, she is sheltered beneath a rock, with her plump naked child beside her, while two winged and well-clad angels are present also, one of whom is feeding the cheery little boy out of a saucer with a large flat spoon. Mary Magdalen, with the usual voluptuous look and abundant tresses, kneels beneath a little shelter tent, the sheltering tree being inscribed with the rather doubtful motto *Satis nunquam amanti*. "Atanasia Antiochena" has a similar tent, with the more unequivocal device, *Casta placent superis*, and two angels tending her. A neat little hut shelters Thais of Alexandria, and a man of saintly aspect opens the door, greeting her with an air of surprise. Maria, the niece of the hermit Abraham, has a similar tent, near her aged uncle's; and while he prays, she is apparently reading from the Bible to a robust sinner of jovial look who leans against her door. Here the appropriate motto is *Qui stat videat ne cadeat*. The erring Maria of Egypt kneels before an aged hermit, in the forest. The virgin Ermelinda kneels alone in a comfortable little shanty, with door and window, like those our soldiers used to build for themselves during the civil war. Saint Genoveva appears with her deer. A rather apocryphal personage named Dimpna, daughter of the King of Ireland, in a thatched hut of unusual pattern, is being defended from an approach of soldiers by an apparent angel, the motto on her hut being *Potius mori quam fœdari*. "Giacchelina Romana" has a little roof half-way up a tree, just large enough to shelter her and her crucifix; there are steps leading to it, as with the little playhouses made for children in trees; close by, there is a river with vessels. Rose of Viterbo, a Franciscan, is preaching from a rock in the city square to a crowd of admiring men and women, with a zeal that Mrs. Howe might admire, and the motto says that she "speaks roses," *Vere rosas loquitur*. The Dominican Sibyl is praying at the door of her hut, while the Deity is looking down from a cloud. Lucia da Narni, a Dominican, appears disguised in boy's dress, but with locks of hair falling over her shoulders, with haloed saints around her, and the somewhat alarming motto: *Ex femina vir, nec vir tamen, nec femina, sed virago*. Most remarkable of all, perhaps, is Christina the Admirable, who sits poised on the top of a palm-tree resembling a giant cactus, whence she waves her hand to shepherds gazing from below; or perhaps Melania, a Roman lady, who has somehow procured for herself a little box like those which old-fashioned city watchmen had sixty years ago. It is just big enough for her to stand upright in, and her smiling face looks out from a peep-hole at the top, while admiring winged angels stand on each side of the box, and three little cherub heads,

winged but bodiless, float in the air above. A similar box has not, alas, given sufficient protection to "VViborada tedesca," a German saint, who is seen assaulted by four Hungarian soldiers, hacking at her head with large knives, having torn off the roof of her shelter. She appears resigned. It is due to most of these solitaires to say that they are usually in good physical condition, and are apt to look as defiantly and irresistibly cheerful as if they were "Salvation lasses."

—All students of Petrarch owe a debt of profound gratitude to Prof. Giovanni Mestica for the embodiment of his twenty years' labor on the text of the *Rime* in the handsome, yet modest and inexpensive, "edizione critica" just published in Florence by Barbèra. This scholarly achievement invited an exposition too full for the present work and which is to appear hereafter; but the preliminary observations are ample for an understanding of the method employed and drudgery undergone. The arrangement of the *Canzoniere* goes back to the earlier and sole authentic, in which the "sonetti e canzoni sopra vari argomenti" are intermingled with the love sonnets. The division into two parts is determined by the year of the poet's conversion (1343) and the composition of the canzone "I vo pensando." Beginning, however, with the sonnet "Tornami a mente," the concluding thirty-one pieces of the *Canzoniere* are ordered for the first time in accordance with plain figures found in the margin of the original Codice Vaticano Latino, No. 3195, indicating the poet's latest preference for this series. To be discussed hereafter are the reasons for these changes in the distribution in the light of chronology and æsthetic considerations. The codex just mentioned is partly in Petrarch's handwriting, but he manifestly revised and corrected the copyist's part, and exhibits a pretty consistent orthography, which has determined Mestica's general observance or reasoned eclecticism; but in his footnotes he restores the form he varies from, so that the text of this codex is reproduced in its entirety. He is also to be thanked for the pains he has bestowed with a free hand on the punctuation. This, as may be imagined, is often equivalent to a commentary; witness the note on page 299 justifying the parentheses—"oh, che spero?"—in line eleven of the sonnet "Rapido fiume."

—The next precious document to be examined and used in connection with the foregoing is the Codice Vaticano Latino, No. 1396, containing the *Trionfi* in addition to the *Canzoniere*, and consisting of eighteen sheets, autographic rough drafts. This has already been reproduced in print and in facsimile, but has been gleaned anew by Mestica, and the variant readings are duly incorporated in the footnotes—an enormous boon to those who would verify the editor's statement that with Petrarch the art of writing was the art of after-thought (*arte dei pentimenti*). Moreover, he has gathered in an appendix the poems not included in the *Rime*, with some not Petrarch's but addressed to him, copied in his own hand. But we have no space to indicate the minuteness with which this codex has been made completely available, nor in like manner seven other codices, which, with sundry printed editions from 1501 to 1820, have been screened for the notes. Mestica calls Marsand's *Rime* of 1819-20 the modern Vulgate, and has brought it into the comparison as an aid to those who possess or have access to this widely diffused edition. He has borrowed, with or without

modifications, some of Marsand's "arguments" prefixed to the pieces of the *Canzoniere*, but has composed some for himself, and the whole of those for the *Trionfi*. Well may he exclaim at the end, "Ecco il vero Petrarca!" and adopt Petrarch's "Hoc placet" affixed to one of the very latest of his revisions. This admirable volume is illustrated with a frontispiece portrait of Petrarch from the codex in the Paris National Library.

TIFFANY'S PROTESTANT EPISCOPAL CHURCH.

A History of the Protestant Episcopal Church in the United States of America. By Charles C. Tiffany, D.D., Archdeacon of New York. New York: The Christian Literature Company. 1895.

DR. TIFFANY'S volume takes a high rank in the series of "American Church Histories," of which it is the last instalment up to date. It suffers most in comparison with Prof. Walker's Congregationalist volume, because there we have a development of thought, while here the considerations are almost exclusively those of ecclesiastical organization and development. It also provokes comparison with other recent histories of the Episcopal Church. It deprives Dr. Coleman's 'The Church in America' entirely of its reason for existence. It has no such relation to Dr. McConnell's 'History of the American Episcopal Church,' which, though much less careful and elaborate, has an individuality which will indefinitely prolong its life, and is, as Dr. Tiffany says in his preface, "as full of wisdom as of wit." Dr. Tiffany's has perhaps even more of wisdom, but it certainly has less of wit, either because he has less by nature, or because, more careful than Dr. McConnell of the dignities of churchmanship and of the sensibilities of churchmen, he has refrained from the publication of many things which put the church, from time to time, in an amusing or ridiculous light. At the same time, he has presented as fairly and frankly as Dr. McConnell those aspects of the church in the colonial period which were shameful in the extreme. Indeed, it may be questioned whether his more serious presentation of those aspects does not make a more painful impression than his predecessors' lighter vein, delighting more in their absurdity than grieving that such things could be.

No one can identify himself with a great institution without being sensitive to its traditions, and hence Dr. Tiffany's opening chapters on Virginia and Maryland are such that every loyal Episcopalian must read them with a heavy heart. "These colonies," he writes, "became a refuge and resort for the thriftless and profligate clergy of England, who were glad to escape from their debts and difficulties at home, and whose friends were so happy to get rid of them that they aided in securing for them assured positions and salaries on the distant continent." Many details are given in illustration of this damning generalization. Writing of the clergy in 1791, Gov. Berkeley says: "But of all other commodities, so of this, the worst are sent us." They were time-serving and indifferent; earnest and impassioned only in their zeal for their full tithes of tobacco. In Virginia the punishment of ecclesiastical offences by civil penalties was a source of much trouble and weakness. "The principle of religious toleration was wholly absent." Upon the threshold of the Revolutionary troubles Patrick Henry appeared before a legal tribunal on behalf of the vestries

and the people against the exactions of the clergy, and his eloquence, already brilliant, practically won his cause: the clergy got one penny damages. It so happened, therefore, that they entered on the Revolutionary period miserably handicapped, and we read without astonishment that of ninety-one clergymen only fifteen continued at their posts.

The early course of things in Maryland was even more unfortunate and scandalous than in Virginia, but it was relieved by the example of the commissary, Dr. Bray, "a man of noble and devoted character, who was drawn to the work by the denials and sacrifices which it involved." But even his heroic efforts could do little with such rotten or intractable material as he had at hand. It was a queer kind of quarantine when the question was not of cholera or of yellow fever, but "whether there was any minister on board, and if so what his demeanor had been upon the voyage." "No wonder," writes Dr. Hawks, a trusted historian of the church, "that such a bastard establishment as that of Maryland was odious to so many of the people; we think their dislike is evidence of their virtue"; and, but for the intervention of the Revolution, he contends that "the singular spectacle would have been presented of the extinction of a church established by law" without "a statute expressly depriving it of its character as an establishment"—this because of indirect legislation counteracting the greed of the clergy. The Episcopalian intolerance of Roman Catholics does not appear in any brighter colors than in Prof. O'Gorman's Roman Catholic history in this ecclesiastical series. "Maryland" (it is again Dr. Hawks who is quoted) "presented the picture of a province founded for the sake of freedom of religious opinion by the toil and treasure of Roman Catholics, in which, of all who called themselves Christians, none save Roman Catholics were denied toleration." Meantime, "The Roman Catholics and dissenters looked with contempt on an establishment so profligate in some of its members that even the laity sought to purify it, and yet so weak in its discipline that neither clergy nor laity could purge it of offenders."

From Maryland the narrative passes to New England. The situation there is given admirably in the words of Gardiner, the English historian: "The problem, as it presented itself to men of that generation, was not whether they were to tolerate others, but whether they were to give others an opportunity to be intolerant to themselves." In colonies actuated by this principle the Episcopalians stood little chance of life and growth. The sea change which the Puritan temper suffered in crossing the Atlantic as affecting "our dear mother, the Church of England," is left quite as inexplicable as it has always been. Apart from the smaller numbers, the scandals of the clergy were much less numerous than in the South. Dr. Tiffany does not, with Dr. McConnell, credit the difference to the example of the Puritan clergy, but that example probably had much to do with it. At their best, however, the Episcopalian colonies were a feeble folk; at the close of the Revolution there were but four Episcopal ministers in Massachusetts, and only six in all New England.

The Rhode Island section is one of the most interesting in the book, made so by the Bishop Berkeley episode and by the semi-civilization of Narragansett County, which had all the brilliant and superficial aspects of a Southern community—its slaves, its lavish hospitality, its festive cheer. At Providence, one of the baser sort came in, but he was "forced out of

the church in time of service by an extraordinary gust of wind," and afterward "hall" out of the pulpit" by his people for breaking open the church door, and other irregularities. In New Hampshire and Maine the beginnings were extremely weak and slow. In Connecticut the dramatic incident was the simultaneous secession of the entire faculty of Yale College and one other Congregationalist minister from the Congregational to the Episcopal Church. It is true the faculty consisted in 1722 of the President and one tutor, but we have the authority of President Woolsey for believing that "greater alarm would scarcely be awakened now if the theological faculty of the college were to declare for the Church of Rome, avow their belief in transubstantiation, and pray to the Virgin Mary."

In the New York chapter (where the name of Jacob Leisler, the anti-Jacobin Revolutionist, is spelled "Leslie" every time), there are interesting details concerning the building of the first Trinity Church. Six pounds towards the steeple was contributed by Jews. Three hundred pounds which had been raised for the redemption of slaves in Algeria, and had not been spent because the slaves had escaped or died, was obtained from the town authorities, and the wardens were granted a commission for all "Welfts, Wrecks, and Drift-Whales." In New York the general conditions were much more favorable to the Episcopalians than in New England, and they succeeded before long in laying deep the foundations of that supremacy in the city which they still enjoy, thanks in good part to the enormous appreciation of lands given to Trinity Church in 1705—"the Queen's farm, a tract of land extending all along the river from the present site of St. Paul's Chapel to Christopher Street." The interest of the New Jersey origins centres in the personality of Thomas Talbot, a zealous missionary whose labors were as unselfish as they were incessant. He was an ardent advocate of American local bishoprics, and there is a rumor that he procured consecration for himself as Bishop of New Jersey. Dr. Tiffany agrees with the best authorities in discrediting this rumor, which is engraved upon Talbot's mural monument in St. Mary's Church in Burlington. But it is impossible to follow the course of Dr. Tiffany's narrative through all the colonies. In Georgia we encounter John Wesley at a time when he was a High Churchman of the extreme altitude and endowed with a plentiful lack of common sense. Dr. Tiffany is very kind to his melancholy failure, and not a little blind to Whitefield's horrible complicity in the introduction of slavery into the colony and in the partial support by slave-labor of the Orphanage whose founding was, we are told, "by far the most interesting and valuable act of Whitefield in Georgia."

Having concluded his survey of the colonial period, Dr. Tiffany sums up the history and its lessons in an effective manner. The disabilities were immense: thriftless or too thrifty and profligate clergymen, the lack of native ministers made compulsory by the necessity of their going to England for ordination, the lack of episcopal oversight and discipline. The attempts to procure bishops are recited, and the reasons operative against them are stated fairly; nowhere more so than in the words of the original Adams: "There is no power less than Parliament which can create bishops in America. But if Parliament can erect dioceses and appoint bishops, they may introduce the whole hierarchy, establish tithes, establish religion, forbid dissenters, make schism heresy, impose penalties extending to life and limb as

well as to liberty and property." It was the alliance of Church and State that handicapped the colonial Church in this particular, and indeed at almost every point. Entirely free from State control, it would have had a much more honorable career, a much more conspicuous success.

Dr. Tiffany's book is divided into two nearly equal parts: the colonial part extends to p. 289, and the part covering the period 1785-1895 to p. 560. In the second part we have first an elaborate study of the endeavors to organize the church simultaneously with the organization of the national Government. In these endeavors Dr. White of Philadelphia was the most active and controlling spirit, and yet the final outcome was not a little different from his original anticipations. Evidently the church was much less sensitive to traditional authority than it is now, so radical the changes that were suggested in the prayer-book and in the government of the church, some of which, and not the least important, were finally adopted. The story of the struggle for episcopal consecration is retold through all the weary length of its amusing, strange, and sometimes sordid complications. It was certainly a queer performance for Seabury, an ardent loyalist, on British half-pay till his death in 1796, to obtain consecration from the Scotch non-juring bishops when the English bishops would not accommodate him. Evidently this action of the non-jurors forced the hand of the Anglicans, and it is interesting to note how narrowly the American sect escaped the loss of any foreign consecration whatsoever. The party was considerable who thought it could be dispensed with altogether, and, if it had been from necessity, the damage would perhaps have been repaired without much difficulty. But oh the difference to those whose hearts are stayed on the unbroken line of apostolical succession!

The organization of the church was not the signal for any sudden access of prosperity. The period from 1789 to 1811 is set down as "A Period of Suspended Animation." But the next twenty years were "A Period of Aroused Self-Consciousness and Aggression." Next came "A Period of Internal Conflict," the conflict incidental to the differences of High Church and Low and to the "Memorial" of Dr. Muhlenberg, looking to an extension of episcopal functions and a more elastic use of the church service. As between High Church and Low, Dr. Tiffany sails with an even keel. It would be difficult to say to which he more inclines. A more generous appreciation could not be had of either party from the most eager partisan. But when in the concluding part, 1865-1895, "A Period of Positive Advance," the Broad Church is described, the appreciation has a warmth of feeling which we cannot err in taking as an indication of the writer's individual position. The impression made by this description is confirmed by the beautiful and effective characterizations of Dr. Washburn and Phillips Brooks. These characterizations are two of many in the book that are extremely well conceived. Dr. Muhlenberg's "Memorial Movement" is called "a movement more significant than any other which has appeared in the Church's history," and the slow but sure appropriation by the church of the memorial ideas is heartily applauded.

In the treatment of the relations of the church to the nation during the war, Dr. Tiffany is more the ecclesiastical politician than he is anywhere else. "The Episcopal Church as an organization had from the beginning determined to keep aloof from party politics."

But the slavery question was not a question of party politics. It was a great moral question divisive of the political parties. As much as possible is made of the apologetic resolution passed by the General Convention of 1862, promising the prayers of the church to the Government in its deadly peril. Concerning slavery the church as such was always silent, while individual clergymen were not wanting in downright opposition. A pathetic circumstance was the calling of the roll of all the bishops in the general conventions during the war, none answering from the South.

In the later history there are many interesting details on which we cannot touch. What we miss is any indication of influence upon the church, for good or ill, of the wonderful expansion of natural and critical science which has synchronized with the expansion of the church since 1865. Dr. Tiffany reserves for his climax a hopeful prophecy of the good times coming under the aegis of the "Quadrilateral" of the Lambeth conference. Judging from the action of the last General Convention, it would appear that the disposition of the Episcopalians to give up something of doctrine and observance, in order to gather the other sheep into their own fold, abates as time goes on.

RECENT FICTION.

A Lady of Quality. By Frances Hodgson Burnett. Charles Scribner's Sons.

Strangers at Lisconnel. By Jane Barlow. Dodd, Mead & Co.

Earth's Enigmas. By C. G. D. Roberts. Lamson, Wolfe & Co.

The Gold Fish of Gran Chimú. By Charles F. Lummis. Lamson, Wolfe & Co.

MRS. BURNETT shows bold confidence in a widespread ignorance of Queen Anne literature by announcing that her 'Lady of Quality' is "a most curious history, as related by Mr. Isaac Bickerstaff, but not presented to the World of Fashion through the pages of the *Tatler*." The history is most curious, and there is no denying that several of its incidents may have come within Dick Steele's experience. Mrs. Burnett's assurance of her public's insensibility to literary motive, manner, and style lies in the word *as*. If Mr. Bickerstaff ever related this history, he showed commendable discretion in withholding it from a paper the general purpose of which was "to recommend truth, innocence, honor, and virtue as the chief ornaments of life." If he ever related it *as* Mrs. Burnett has written it down, it must have been on a night when, foreseeing that he should not go home at all, he sent word apologetically early in the evening, winding up,

"I am, dear Prue, a little in drink, but at all times Y^r Faithful Husband,
RICH^d STEELE."

The evidence against the Bickerstaff myth is strong, and one may fairly assume that 'The Lady of Quality' is a contemporary creation by a novelist not finical about matter fit for publication, scornful of the probabilities of character and logic of events, and vainly imagining that the eighteenth-century *cachet* is given by calling women "sluts" and "wenches," men "rakes" and "wild dogs," and by peppering the pages with "odzooks," "forsooth," and somewhat archaic adjectives such as "beauteous" and "roystering."

The Lady Clorinda Wildairs is introduced at birth, bawling at her dead mother. She is the ninth unwelcome daughter of a terrible Sir

Geoffrey and his inconveniently prolific wife. Why ninth it is impossible to guess, since the number is not proverbially fateful, and since six of the sisters already in the churchyard lie, having therefore nothing to do with the tale. For six years Clorinda lived between the kitchen and stable, during which time she learned to ride, to kick, and to curse with great volubility and precision. She made her first meeting with her father memorable by falling on him with a hunting-crop and "language which would have done credit to Doll Lightfoot herself." Charmed by her spirit and phrases, Sir Geoffrey took her education under his personal supervision, with the result that at fifteen modesty was unknown to her and decency a word without meaning. Mrs. Burnett says that at this age she "was as worldly and familiar with the devices of intrigue as she would be at forty," and, further, that she was "no more ignorant than if she had been in with some gay young springald of a lad." Eighteenth-century springalds must have been very knowing boys if to measure them by Clorinda is no slander. These points being borne in mind, we see no reason why Clorinda, being unchaste, should not, to suit her interests, assume the loftiest virtue, and, much assisted in the enterprise by the beauty to the mere indication of which pages of superlatives are devoted, should not marry in succession a perfectly noble and virtuous earl and an unspeakably magnificent duke. It would be just like her, too, and like nobody else, to murder an inconvenient lover with her favorite implement of battle, a hunting-crop, to tuck him tidily under a sofa, and, in a splendor of jewels and brocade, to sit on him, so to speak, while, with inimitable self-possession, she received the whole world of fashion, including that benevolent censor, Mr. Addison.

In all this there is no inconsistency, and, though it is a pity, it might be true. But what is not true, what is grossly false to fact and, as fiction, weak, sentimental, and ridiculous, is the subsequent development of Clorinda. This development is supposed to justify the preceding narration and to point the moral. Such use of a scandalous tale marks, even more significantly than do the artificial manner and extravagant style, the wide, wide difference between Mr. Bickerstaff and Mrs. Burnett; it points to the amazing conclusion that Mrs. Burnett is not conscious of having exposed vice, but believes that, from the beginning, she is seriously occupied in delineating the progress of a possibly faulty mortal towards the glory of a full-blown angel. Such moral obliquity is too sad a subject to dwell upon, and the only relief is in the thought that even the feeblest minded reader may be saved from infection by the human instinct to reject a miracle to which the narrator has failed to give an air of veracity or even plausibility. The most serious result of the publication of 'A Lady of Quality' that need be anticipated is a deluge of publications from lady novelists all solemnly declaring that, in order to live long and happily and to achieve an epitaph recording superlative nobility and purity, it is quite imperative for a woman to commit every sin mentioned in the decalogue.

Hunger is doubtless painful to Ryans, Finegans, and Raffertys who carouse on a spoonful of tea and exchange jokes over the last potato, but it doesn't appear so, and that is one of the reasons why people may read 'Strangers at Lisconnel' at night and face destiny with some degree of cheerfulness next morning. All writers of Irish fiction emphasize the cheerfulness and wit of the peasantry, but Jane Bar-

low has a predominant talent for showing these qualities as God-given compensations for centuries of struggle with dire poverty. It would almost seem that it is more by their unconsciously heroic philosophy than by their irrepressible combativeness that Irish peasants have been saved from perishing of despair. Miss Barlow's work is as natural and free from effort for literary effect as fiction can be without falling flat and dull. The incidents that enliven the changeless routine of life at Lisconnel are the passing by or temporary sojourn of a thieving tinker, a visionary scholar, a soldier, an idiot or "quare one." These incidents are less valuable for themselves than as a means of bringing out character and encouraging conversation in Lisconnel. The most noticeable points of character are kindness, family affection, and loyalty, and an inextinguishable interest in the neighbors, while the conversation is full of wit and plentifully seasoned with wisdom. The Irish have always been fortunate in writers of song and story capable of expressing the heart of the people, and never more so than in the case of Jane Barlow, whose work is both a profound and sympathetic study of Irish human nature and a notable contribution to fiction in the English language.

In the silent Canadian forests and sea-born Tantramar marshes one might hope, if anywhere, to be rid of 'Earth's Enigmas,' but it is just in these lonely, lovely places that Mr. Roberts has found riddles plentiful and profound: why unconsidered trifles are mile stones of destiny; why gratified ambition turns out Dead Sea fruit; why the happiness of young love is smitten in an instant by tragedy; why superstitions are often justified by facts, and why no man can always believe his own eyes or any evidence of his senses. Fortunately Mr. Roberts has not attempted to analyze the inscrutable or to explain the inexplicable. His tales are objective, tales of moral and physical courage, of accident from floods and high tides, of fights for life with wild beasts, and of terror, of supernatural omens and portents. His questions are matters of inference, and it is possible to read the tales without suspecting any far-reaching speculation. The incidents and scenes fit each other admirably, and the characterization is strong, clear, and interesting. Sometimes the beauties and wonders of nature are overwrought, but the defect is excused when we remember that a poet of nature is struggling with the limitations of a plain prose tale. Much more surprising than decorative excursions are the vivid presentation of rough and primitive people, and a vigorous directness at critical moments which we are accustomed to find only in very accomplished writers of prose fiction.

The incidents narrated in 'The Gold Fish of Gran Chimú' occupy a very short space of time, and are novel and touching. The moment chosen is that when independent seekers for buried treasure in the dust and mould of Chimú are expecting an order to desist, or else to go on at a price which shall benefit only the Peruvian Congress. "It's a fool's law, a thief's law—but if they pass it there it is. When I'm in a country I obey its laws, crazy though they be." So spoke the scientific American mummy-miner, and ordered his slaves to dig for all they were worth until it was known for certain that the obnoxious law had passed. "This law is meant to rob our few scholars of their collections; if one were to find even the *Pez Grande*, it would rob him even of that. There is no remedy;

either to find it before the law shall pass or not at all." Sighed Don Beltran, the only gentleman of Peru who deigned to work, and himself descended into the pit in pursuit of the fabulous treasure which would redeem his fallen fortunes and scatter his enemies. Such integrity deserves reward and gets it, but not until the law-respecting scientist has shown his skill in the manly art of self-defence, and Don Beltran sounded the depths of despair. An entertaining sequence of incidents is as much as should be expected in a tale of strange adventure; here we have that, and, besides, the unexpected—the display of a great many emotions and passions and intellectual qualities. The spirit throughout is alert and gay, and the sympathy with delicately strung natures charming; even the literal translation of a foreign idiom (a very dangerous experiment) adds to the grace and naturalness of Mr. Lummis's tale.

BRUCE'S ECONOMIC HISTORY OF VIRGINIA.—I.

Economic History of Virginia in the Seventeenth Century: An Inquiry into the Material Condition of the People, based upon Original and Contemporaneous Records. By Philip Alexander Bruce. Macmillan & Co. 1896. Map. 8vo, pp. xix, 634, 647.

VIRGINIA has not been fortunate in her historians. Among the earlier writers, Stith and Girardin possess merit, and the latter enjoyed the assistance of Jefferson. Among the later, Brown's 'Genesis of the United States' takes a high rank because of its original documents. Apart from these examples, the faults of superficial investigation, partially concealed by rhetoric or rhapsody, have marked the so-called histories, making a dreary and unprofitable field for the student unable to revert to the original records. It was in a questioning mood that we took up the volumes of Mr. Bruce, for they deal with the earliest periods of Virginia history—the first settlements and ninety years subsequent; periods which have been rendered hazy by tradition and surrounded by a halo of romance. As we read on, it soon became evident that the writer possessed and had applied unusual capabilities for performing his task. He is a Virginian, of keen observation, and not terrified by the drudgery of original investigation. Manuscript as well as printed authorities have been carefully studied, and this labor has resulted in what must be regarded as the best record of the early economic development of a colony, the best history of the early agricultural growth of any State in the Union. As a mere history it would stand high; as a description of the economic system of Virginia it possesses even greater merits, explaining, as it does, by this method Virginia's peculiar place in the colonial system of the seventeenth century. Even more truly is it an essential contribution to our national history; for in early Virginia, devoted to the culture of a single commercial crop, and drifting into the employment of slave labor only, are to be found the germs of that institution which determined the political and commercial position of the South in the Union until overthrown by the civil war.

Lest this judgment be considered too high, it may be well to point out a few instances where the author's enthusiasm for his subject has carried him into excess of statement. The question of the trustworthiness of Captain John Smith may be regarded as an open one. He is one of the first, and,

indeed, most interesting writers on the condition of the early settlement; but it seems to us that Mr. Bruce accepts too implicitly the early chroniclers. Virginia, as described by them, is a very garden spot, with boundless agricultural possibilities. But these men were sent out by a company which was formed for profit, and it was their interest to paint as pleasing a picture as they knew how. Their letters and pamphlets are to be taken with allowance, and rather as "circulars of information for intending emigrants" than as scientific records of actual conditions. It is not till they mistake the caterpillar for the silkworm (i., 368) that Mr. Bruce offers a warning against the exaggeration of the early notions. Even after eighty years of planting, the settled parts of the colony "bore the aspect of a wilderness."

Another excess of Mr. Bruce is in the multitude of detail with which he surrounds each division of his subject. This is an amiable excess, and it may truly be said that the author is never overwhelmed by his facts to the obscuring of his narrative. The wide research and admirable combination of material prove what he can do; but the reader is at times repelled by a too minute regard for what is incidental to the subject. This has involved a danger of losing the sense of relative importance of matter. Individual instances are heaped up in the case of secondary as well as of primary topics. In this direction Mr. Bruce's labors have been so exhaustive as to leave little for those who may work over the same territory.

In the large number of topics covered by Mr. Bruce, two easily lead in interest, the culture of tobacco and the system of labor. Had the soil of Virginia, easily obtained by barter or force from the Indians, been as generally fertile as the early settlers represented it, and had the planters enjoyed favorable markets, we might have looked for a varied agriculture. Having satisfied their own immediate needs for food, they had few markets for grain, while it was soon found that in tobacco they had a staple export at once profitable and easily marketed. The Indian had cultivated the plant with success, and John Rolfe, who married Pocahontas, was the first colonist to attempt its growth. Within four years the plant had become one of the great crops of the colony, and in 1617 was cultivated even in the streets and market-places of Jamestown. It was soon the only crop, the measure of value and medium of exchange, an object of legislative solicitude, and a monopolizer of colonial effort. The "right" of planting was discussed. The number of stalks to the family, the distance between stalks and number of leaves to the stalk, the size of hogheads, and the mode of inspecting the dried leaves, were some of the details regulated by law in an attempt to restrict the product and improve its quality. The culture influenced the taking up of the land whose fertility it exhausted, and sustained the entire social system of the settlements, together with their external relations.

This concentration of effort upon a single commodity led to important results. The planter, seeking his own gain, increased his production to such an extent that the marketable crop was generally in excess of what English consumption required, and he was obliged to look elsewhere for a sale of the excess. On the other hand, no effort of King or Parliament to create a market could keep pace with the increasing production. The importation into England of Spanish leaf, a better article than the Virginian, was restricted or pro-

hibited; the planting of tobacco in England was rigorously forbidden. Two policies, however, prevented an equilibrium in this trade. The King must have his customs, and to secure that the planter was enjoined from disposing of his tobacco in any market other than the English. The merchant marine must be encouraged, and for that the planter must ship in English vessels. It was, then, not to a free market that the Virginian brought his goods; he was not free to choose his market or his carrier, or to fix his price. That was all done for him by law and by custom, by tariff regulations, and by agents or factors acting at a distance and too irresponsible to feel the full sense of duty to their clients. Lastly, with his production regulated by colonial laws, his sales hampered by English policy, the planter could be made to suffer for his loyalty, as when he proclaimed the son of the beheaded Charles, and could be made to pay for the extravagances of the King or his representative in the colony, or for the profit of the merchant who held a lien on his future crops. All competition except among the planters themselves was destroyed.

Such a system was too oppressive, and led to evasion and smuggling, the natural protests against arbitrary laws so contrary to real interest. In 1663 the loss to the English customs on tobacco shipped to Holland was estimated to be ten thousand pounds sterling a year, and every enforcement of the customs and navigation laws brought a threat of ruin to the planter. The price of his product sank to less than a penny a pound, and Maryland competed on such terms as to place him at a disadvantage, rendering nugatory all efforts to restrict production. The prices fluctuated widely from year to year, and no forecast of market could be made. Beginning with 1680 a crisis was reached, and, in the general desperation, riots were fostered, resulting in the destruction of plants in the vain hope of affecting prices. Later the value of tobacco did increase, and the planter secured some advantage. Year after year passed with nothing to depend upon save this lottery of tobacco-culture. Throughout the century the authorities sought by rewards and threats to induce some diversity of crops, such as hemp, flax, the vine, or silk. Liberal bounties were offered and skilled workers specially imported to serve as pioneers and teachers. All was in vain. The planter preferred to live miserably by tobacco rather than in comfort by any other means, and was rich or poor according to the price of this staple. In its consequences there could be no better illustration of the evils of state interference with economic law than the attitude of Parliament, merchant, and planter towards the tobacco plant.

German Songs of To-day. Edited, with an introduction and literary notes, by Alexander Tille, Lecturer on the German Language and Literature in the University of Glasgow. Macmillan & Co. 1896.

It is the purpose of this volume, as stated in the preface, "to provide American students of German literature with a representative selection from the lyrics of the New Empire." In the rapid evolution of natural science and the interest in social problems, the editor recognizes the two mental factors which determine the character of modern German lyrics and distinguish them from the romantic poetry prior to 1870. It is, of course, absurd to maintain that any segment of the circle of human interests is insusceptible of poetic

treatment, for this proposition, as Pater has said, is "always liable to be discredited by the facts of artistic production." This volume, however, contains no "facts" tending to discredit such a proposition with regard to science and sociology. Indeed, it would seem that our so-called modern tendencies have been peculiarly unfortunate in the quality of their exponents, and it is the ungracious duty of responsible criticism to condemn the present collection of songs as depressing and unwholesome, in no true sense representative, and altogether repugnant to lovers of the high-minded muse whose function heretofore has been to elevate, to purify, and to delight.

Probably no collection of poems was ever brought together which did not, both by sins of omission and of commission, offend those most familiar with the field covered. This book will not prove an exception. Many a lyric gem and many an honored name will be missed. None of the poems is to be found here which have endeared the fine-grained and entirely modern poet Ferdinand von Saar to the hearts of his countrymen, nor is there any example of the strong and simple verse of Johanna Ambrosius, a modern among moderns, whose name is now known in every German home. On the other hand, there are poems here which, for various reasons, we think ought not to have been included. There are some strong poems, but they are painful; clever ones which are cold; pretty ones but feeble; and others, although of excellent workmanship, are most unpleasantly flavored. Some are not poems at all, but merely versified documents. What place, for instance, in a book of songs have the rhymed aphorisms of Nietzsche and his German editor, Fritz Koegel? Their presence is explained, but not excused, by the fact that Mr. Tille has charge of the English edition of Nietzsche's works.

In this circumstance we have the explanation, also, of the unrefreshing atmosphere which pervades most of the book. Under the pretentious heading "Modern Life," our attention is directed to drunkenness, disease, and death. The voice of the "under-paid and over-worked" is heard again, shriller and less touching, more sociological and less poetic, but as dreary and hopeless as when it sang the "Song of the Shirt." "Modern Love" is presented to us largely as an affair of the senses, and some even of the more delicate love lyrics seem to be accompanied by a significant wink. Otto Hartleben displays a marked distaste for men who never got drunk at midnight nor yielded to the solicitations of dark eyes. But we look in vain for some dim reflection of the playful grace of Goethe's "Morgenklagen" or Philine's song, which alone can rescue the frankly erotic lyric from repulsive mediocrity. The third rubric is "Modern Thought." Modern thought seems to consist for the most part of pessimistic sentiments of a strongly anti-Christian tendency. Indeed, the hatred which some of these young poets manifest towards God and the institutions founded in his name is extreme. Here, too, we miss the saving charm: there is none of that fierce indignation at God's injustice which leads to the defiant outbursts of Omar Khayyám their Promethean dignity. These are rather the utterances of young and unformed minds, boasting of their intellectual strength.

That this collection does represent certain phases of German life and thought during the last twenty-five years cannot be denied. These tendencies, however, do not characterize the period. They are aberrations, ending sometimes in imbecility, of which in our own day

examples are not lacking, or correcting themselves in the sobering process of the years. To select the poems of hot-headed youths and middle-aged gentlemen with diseased wits as representative, is to wrong literature much as some of our American cities wrong municipal government by electing incompetent and semi-criminal men to represent the body of just citizens. It is encouraging to hear from many lands the protest against an opinion which, by reason of insistent iteration, has been gaining ground, that our end of the century is distinguished from other times by its materialism, pessimism, and hot clamoring for "a freer life of love." These things are neither new nor specifically representative; degeneration is not endemic, and Germany still has poets who can give utterance to her nobler and truer aspirations.

Mr. Tille's introduction is ingenious and thoughtful, and he has made an honest effort to render justice to the uplifting tendencies in German thought. Accordingly the book contains some genuine poetry, but most of it was written by men of the last generation. Fontane's "Die Brück' am Tay" is a spirited poem which thrills with the terror of that great disaster, and haunts the imagination with its weird rush. Two or three pretty love lyrics reveal the grace of a day which is not yet dead, and now and then is heard an earnest voice which speaks for decency and duty. But the sad feature of the volume is that its compiler seems to feel no repugnance for the age of which he presents a lyric portrait so unlovely, nor does he seem to be conscious that the life of the new Empire could have had any better exponents. One would think that a scholar who considers Arno Holz the greatest lyrical genius the Empire has yet produced, would have preferred to edit the poems of another time or people. Goethe, who judged his countrymen with sober objectivity, advised:

"Freunde, treibet nur alles mit Ernst und Liebe; die beiden
Stehen dem Deutschen so schön, den, ach! so vieles
entstellt."

It is the German in his disfigurement to whom Mr. Tille has introduced us.

Lectures on the Council of Trent, delivered at Oxford, 1892-'93, by James Anthony Froude. Charles Scribner's Sons. 1896.

THE fruits of Mr. Froude's Oxford professorship are now being given to the public. The present lectures, although the earliest of the three courses which he was allowed to complete, are the last to see the light. There are thirteen of them, twelve intended for the usual academic audience and the last for the general lecture-hearing public. In fact, this distinction might as well have passed without mention, for Mr. Froude's manner is never academic. Even more than in the case of the lectures on Erasmus, one is led to wonder just what serious students could do with these. Seven of the twelve lectures do not touch the Council at all, but are a review of the general conditions of Europe and of the course of events leading up to the eventual proclamation of the Council. It is in general reviews of this sort that Mr. Froude is always at his best. His strength is not in the careful weighing of historical evidence, nor in the detail of a continuous narrative, but rather in the skill with which he presents one side of a great question, and groups in this presentation all the aspects of a given time which favor his view. Any one familiar with

his method might almost have predicted just what he would say here. It is the well-known touch-and-go process, without reference to authority, without pretence of non-partisanship, but, after all, with great steadiness in the underlying purpose.

On the whole, one must admit that the point of view is in the main sound and clear. The estimate of the dangers to Europe from the overgrown Catholic system is at all events supported by so vast an array of facts that it no longer needs apology. One-sided this presentation doubtless is, but it is a side that has at least a right to be boldly and strongly stated. If there be something grotesque in the idea of Mr. Froude as a teacher of youth in historical method, it ought to be remembered that his academic honors were a matter of very late adoption, and that the standards of academic appointment (at the English universities) in the field of history have seldom been very exacting.

The most vivid impression one gets from those lectures which treat of the Council itself is that of the deep-seated opposition between the strict curial party and the numerous interests of the Church as represented elsewhere. For instance, the ancient antagonism between the Curia and the episcopate—an opposition never to be overcome and never even dogmatically disposed of until the Vatican Council—is emphasized here at every point. Further, the national interest, especially as represented by Charles V., is given credit for all it deserves in its efforts, ineffectual though they were, to keep the curial party from its greatest extravagances. Charles is plainly the author's hero, and this not merely for the sake of the causes he is promoting, but for the qualities of the man himself. He is the one person in the great drama of the Council who seems to estimate justly the multitudinous forces of European politics and feeling. He, above all others, demands the Council, and he keeps his hand upon it, through his representatives, both at the Council itself and at the Curia. His failure to influence it was, perhaps, as much as anything else the cause of that break-down in his working powers which drove him from the stage just when a strong hand seemed most sorely needed.

The volume on the Council can hardly attain the popularity of that on Erasmus, since it lacks the element of unity, and does not make up for it by any amplitude of detail which might commend it to the student seeking information as to the tangled diplomacy of the late Reformation period.

Military Letters and Essays. By Capt. F. N. Maude, R. E.—*Cavalry Studies from Two Great Wars.* [International Military Series. Edited by Capt. A. L. Wagner, U. S. A.] Kansas City: Hudson-Kimberly Co. 8vo, pp. 303, 267.

CAPT. WAGNER is doing a service to military students in making use of his opportunities as instructor at the Leavenworth Infantry and Cavalry School of the Army to edit and republish papers on the art of war which have attracted serious attention in Europe and in this country. Of the two volumes named above, the first is a series of papers written by Capt. Maude, late of the Royal Engineers, for the benefit of officers of the Bengal service when he was on duty in India. As a whole, his papers were intended to be critiques upon the actual condition of the art of war in tactics and in weapons, with special inquiries whether the assumed lessons of the

Franco-German war are those which it in fact should teach, and whether the General Staff of Germany agree with the English authorities in respect to such teaching.

Captain Maude knows his own mind, and his handling of his topics is that of a man with strong mental grasp of his subject who has reached clear ideas about it, and is dead in earnest in warning his countrymen that they are running after theories which the best military brains of the Continent have repudiated. This is especially his contention as to the current notion in English military circles that the war of 1870 established the superior value of extended-order fighting (practically skirmishing) over that of the line in two ranks in which the line officers can retain personal control of movements by that direct command and discipline which is lost when the soldier is released from the duty of keeping his place and his gait. Our own civil war had shown the disadvantages of attack in deep and narrow columns, and the absolute necessity of a more extended formation; but it was a common criticism among our officers who saw the fighting in the Franco-German war that, in many instances, the advancing lines became practically disorganized and more nearly a mob than a military unit. They lost the mobility of a body by seeking too much the mobility of the individual. In short, they had carried our extended order to an absurd and self-destructive extreme. In the desire to avoid the heavy losses of a too compact formation under fire, they had sacrificed the ability to handle troops with that unity of will and of action which is the soul of military power.

Captain Maude shows by his own examination of the French and German manoeuvres, especially the latter, that the German staff had recognized the error, and is using a modified system of field tactics which keeps the advancing line much better in hand, and puts it nearly upon the system which our most intelligent officers had developed in 1864-5. He has illustrated his argument by widely varied studies, both of examples in the battles of 1870 and of recent field manoeuvres on a large scale. He gives most interesting notes, also, of his observation at these manoeuvres of the actual changes brought about by the use of smokeless powder. He finds that it does not, as was anticipated, conceal the combatants' positions, for the vivid flash of the artillery and of the musketry punctuates the setting of the lines more exactly, for an alert observer, than any smoke puff could do. No one pretending to keep abreast of progress in military studies can afford to neglect these essays. They are both able and bright, always put upon the true point of discussion, and as stimulating when one differs from the author as when one agrees with him.

The second volume, the *Cavalry Studies*, is made up of three elaborate papers: The French Cavalry in 1870, by Lieutenant-Colonel (now General) Bonie of the French Dragoons, translated by Lieutenant C. F. Thompson of the Seventh Hussars; The German Cavalry at Vionville and Mars-la-Tour, by Major Kaehler of the German General Staff, translated by Lieutenant Reichmann of the Ninth Infantry, U. S. A.; and The Operations of the Cavalry in the Gettysburg Campaign, by Lieutenant-Colonel George B. Davis, U. S. A. The French and German papers are peculiarly valuable because they deal with the same war and with the same engagements, so as to give vivid pictures from the opposed points of view, but with, in the main, concurring criticism upon the unreadiness and the antiquated methods of

the Second Empire. Colonel Davis's paper is a republication of his excellent essay to show, in connection with the others, how far our own cavalry had learned from experience, by 1863, the lessons the French studied bitterly seven years afterward.

We wish that Capt. Wagner had had enough faith in the success which his enterprise richly deserves to give the volumes more complete and attractive form from the standpoint of book-making. To issue such books without an index is a sin against the class of readers who will gain most profit from them, and who will long for an easy mode of reference to each criticism and to each fact, each incident of each field, and each organization and officer whose movements and whose conduct point the argument. Then some maps for the first volume are a necessity. The four in the second are admirable, and if a similar number of good ones had been inserted in the first, its value would have been multiplied. If only a single good topographical map of the vicinity of Aldershot had been given to illustrate Capt. Maude's excellent description of the sham battle of the English troops there, it would have been a boon to the reader and made the reading much more profitable. We would fain believe it would have made the publication more profitable also.

Russian Politics. By Herbert M. Thompson, M.A. Henry Holt & Co.

MR. THOMPSON is a member of the English Society of Friends of Russian Freedom, of which there is a branch in this country, and of which he furnishes the circular and an appeal in an appendix. To those who are acquainted with the views, objects, and methods of this society, this suggestion sufficiently indicates the tone of the book—in a measure. We say "in a measure," because, on the whole, the author is inclined to stop short of offensively partisan denunciations. Nevertheless, had he exercised a little more reserve in that particular, had he not seized upon opportunities for strong expression on matters where much more information is needed than is at the command of a foreigner who has neither visited nor studied Russia, his book would have been much stronger and more valuable. We assume, from the internal evidence, that he has not been in Russia, and that his information has been obtained exclusively from the books which he quotes and from one of the Russian exiles now established in England. It would have been more fair to give the other side a hearing in court before passing a final, condemnatory verdict, or to have refrained from comment altogether, and rested the case on the evidence quoted. One point must be mentioned, to the author's honor: he gives the source of his information in every case, and the hints thus afforded to the reader who desires to study any special phase of the question in greater detail are very useful. The volume is, in fact, a compilation, and one of the best compilations which we have seen for a long time. There is nothing abrupt or scrappy about it. Its five maps, which show the ethnographical distribution of the population, the natural agricultural zones, the Jewish pale of settlement, the genealogy of the imperial family, Russia before the time of Peter the Great, and the final partition of Poland, are of great value and interest to any one who studies Russian topics.

But Mr. Thompson makes mistakes which are incompatible with a profound knowledge of Russian history and with personal knowledge of the country. On p. 20, for example,

he says: "The middle of the thirteenth century saw their [the Tatar] invading hosts devastating with fire and sword as far north as Novgorod." The Tatars never got to "Lord Novgorod the Great," and that haughty republic remained unconquered until the time of Ivan the Terrible, when that Tsar humiliated it, three centuries after the date here mentioned. On p. 88 we read: "The building of the Kremlin at Moscow was begun under Ivan III. The Kremlin takes the place, in the chief Russian cities, that the Acropolis did in those of ancient Greece; but as Russia is a flat land, the Kremlin could not be stationed, as the Acropolis used to be, crowning a hill and overlooking the city." Russia is, on the whole, a flat country; but Moscow is built on a series of undulating hills, of which the one crowned by the Kremlin, as it overlooks the city, is the highest. The Kremlin of Nishni-Novgorod, also, is on a hill. It would be well, in a second edition, to correct such errors as Stephen Navoraki, for Yavoraki; General Orenteln, for Drenteln; Biren and the Duke of Courland, for Biren, Duke of Courland; Schluseburg, for Schlus-selburg—errors which have, probably, their origin in the American version, as well as *The Christa*, for *the Christ's*. The description of the Russian church as "that woodenly formal pietism," and so forth, is neither true nor kind; and the reader's mind involuntarily reverts to the law which prevents the accession to the throne of England of a Roman Catholic when he meets this sentence: "According to a barbarous custom which still obtains, a princess marrying the heir to the Russian throne undergoes 'conversion' to the Greek communion, and is very often rechristened by another name." Such a remark, on the part of an Englishman, is decidedly indiscreet—it lays him open to retort, and it contains an untruth: no one who belongs to a Christian church and has received baptism therein is ever "re-christened" on entering the Russian Church, though the future Empresses do receive names which their subjects can master, after saints whose festivals can be celebrated, for the enjoyment and repose of the people. The author makes one good point, in his discussion of the peasant. He says: "The average consumption of alcohol in Russia is less per head than in western European countries, which seems to dispose of the idea that the Russian peasant spends his substance in riotous living, and ruins himself by excessive drinking."

The authorities which our author quotes are of very varied quality, and from each he draws what he requires to enforce his argument—and, generally, only that. Such a book must, of necessity, present a one-sided view of matters; but its interest is undeniable. One wonders whether an Englishman or an American would relish or respect a book on his own country made up on the same principle, and whether the printing and reading world would not breathe a sigh of relief if only those people who really know Russia were permitted to write and dogmatize about it, or compile tomes from other tomes about it!

Southern Quakers and Slavery: A Study in Institutional History. By Stephen B. Weeks, Ph.D. [Johns Hopkins University Studies in Historical and Political Science.] Baltimore. 1896.

THE title of Dr. Weeks's book has the merit of understatement. He has really prepared, with great industry, a summary account of Quaker settlements at the South, their rise and de-

cline, in connection with their relations to slavery and a consequent migration to the Northwest. It is only on p. 198 that the title recurs, as the heading of the ninth chapter. The proverbial dryness of Quaker annals has been felt and expressed by this investigator, but he has contrived to make his narrative anything but dull, and the work as a whole, with its map, is a valuable contribution to our religious and political history. That the Southern Quakers, as soon as they had completely divorced themselves from slaveholding (which was not till after the Revolution), were in a delicate position may be inferred. They threw their weight in favor of modifying the statutes directed against emancipation, and evaded them in a manner by assigning their own freedmen to a committee which held them till it could transport them to the North. In a society, however, whose normal condition was one of war between the dominant and the subject race, the Quakers, as men of peace, had no proper place. If they remained, they had to contrive a *modus vivendi* with the institution which they detested (pp. 242, 297), and whose growing power, both State and national, forbade them to expect any enlargement of their own denomination by accessions from the North. "There was found to be but one effective protest against the system—migration." Their material inducement to remain after the country north of the Ohio was fairly thrown open to settlement was much diminished, and in the end a great movement from the seaboard to that fertile region took place in the wake of the freedmen already dispatched thither. Dr. Weeks traces these shiftings with certainty and particularity. What follows belongs to the history of the "Underground Railway," for in Indiana and Ohio the newcomers were at liberty to speed the fugitive on his way to Canada, and this liberty they used while braving the terrors of the constitutional power which was on the side of the oppressor. In Georgia and South Carolina the Quaker societies have quite gone out of sight; in Virginia they reckon but a few hundreds; in North Carolina they still count for something, though this State was foremost in the migration.

"The largest and most progressive meetings found in North Carolina to-day are not among the representatives of the native stock, but among those who came in from the North during the eighteenth century. . . . Most of these new settlers were from Pennsylvania, but some had delayed a few years in Maryland; some were from New Jersey, and some from Nantucket. . . . [Their] motive was distinctly economic. Their movement is parallel to that of the Scotch-Irish" (pp. 95, 96).

Among these, from Pennsylvania, was the family from which sprang Samuel M. Janney, the historian, most prolific of Southern Quaker writers; from Nantucket, the stock of Levi Coffin, whose active aid to fugitives after he removed to Cincinnati is related in his Reminiscences; from New Jersey, the kinsmen of Benjamin Lundy. The manumission societies formed in North Carolina from 1816 to 1835 were supported though not controlled by Quakers. Some of those in North Carolina were organized by Charles Osborn, others (as also in Virginia) by Lundy. Osborn was a native of North Carolina, who removed near the end of the last century to Tennessee, where he began his anti-slavery labors. These, though not to be despised, do not entitle him to Dr. Weeks's excessive praise as "one of the greatest of the anti-slavery agitators." His main service was in paving the way, by his *Philanthropist*, for Lundy, upon whose appearance Osborn fades into the background. Nor was the latter "the

first man in America to proclaim the doctrine of immediate and unconditional emancipation." That high honor belongs to the Rev. George Bourne, and he an Englishman.

Dr. Weeks would probably have dwelt more upon Lundy's labors had our Jerseyman been a Southern Quaker. It would have been interesting to note, in connection with the certificates (in 1802) from South River, Va., to "Concord Monthly Meeting, Northwest Territory [Ohio]," that it was precisely to this meeting that Benjamin Lundy was dismissed in 1809 from Hardwick and Mendham Meeting, N. J., instead of to Westland, Pennsylvania, as first contemplated; Westland being a stopping-place for the Ohio migration. Dr. Weeks enables us to perceive that Lundy's new associations were with Friends fresh from the pit of slavery, and hence calculated to arouse his interest in the subject and to ground him in his abhorrence of the system. We may also remark that Thomas Lundy removed in 1796 from Ringwood Monthly Meeting, N. J., to Westfield, N. C. Dr. Weeks records migrations from this monthly meeting to Ohio, though no Lundy is among them; but the name occurs on the list from Mount Pleasant.

Theoretical Chemistry. By Walter Nernst, Ph.D. Translated by Charles Skeele Palmer, Ph.D. Macmillan. Pp. xxvi+697.

KNOWLEDGE of the general laws and conditions of chemical change has made enormous advances, the last few years, through the systematic study of the interrelation of physical and chemical phenomena; and Physical Chemistry, practically a new branch of science, is the result. Hence the "Theoretical Chemistry" of to-day is a very different thing from that of only ten years ago. Not only are its bounds much extended, but the point of view is largely new, and one from which a more comprehensive survey and wider generalizations are possible.

Dr. Nernst's work, in the original, met with a most hearty reception in Germany and among those who keep in touch with German science, to whom the author's reputation as a brilliant worker in his chosen field was well known. It gives a clear and critical account of the achievements and principles of physical chemistry. Without aiming at such a complete record of data as is given in Ostwald's 'Lehrbuch,' Dr. Nernst has endeavored to present a thorough description of those results which possess the most general significance or give promise of attaining it, and of those hypotheses which have thus far proved of value. Hence a great mass of material which now has only historical interest is omitted. The Rule of Avogadro, "which seems to be an almost inexhaustible 'horn of plenty' for the molecular theory," and the Doctrine of Energy, are fittingly emphasized as the most important foundations in the theoretical discussion of chemical phenomena.

The subject is divided into four "books," whose titles will indicate in a rough way the scope of theoretical chemistry at the present day. Book I. is on "The Universal Properties of Matter," and has chapters on the gaseous, the liquid, the solid states of aggregation, the physical mixture, and dilute solutions; Book II., on "Atom and Molecule," deals with the theories of atomic and molecular constitution of matter, the determination of molecular weights, the constitution and structure of the molecule, dissociation of gases, electrolytic dissociation, etc.; Book III., on "The Transformation of Matter," includes chemical statics and

kinetics; and Book IV., on "The Transformations of Energy," discusses thermo-, electro-, and photo-chemistry. The work is an exceedingly successful presentation of a difficult subject, and is characterized by thorough mastery and marked independence of treatment. It is full of suggestiveness and stimulus to the student of chemistry.

On account of its sterling value we were prepared to welcome a translation which should render it accessible to English-speaking chemists whose German is weak or wanting; but we must confess to a feeling of great disappointment when we opened the volume before us. It is a pity that the translation should not have fallen to a more competent hand. The translator's knowledge of the two languages involved in the transaction unfortunately appears hardly adequate to the task he set himself. In a treatise dealing with such abstruse subjects, and one not merely to be read but studied, clearness and accuracy of statement are of the first importance. While the German of Dr. Nernst offers little ground for criticism in these respects, Dr. Palmer's translation is faulty to a degree which makes the book hard reading and tries the patience of the student to the limit. In his preface the translator says: "Regarding the translation, I have been guided solely by the aim to combine fidelity to the original with clearness in good English." "Fidelity to the original," according to Dr. Palmer's method, consists in painstaking, literal rendering of the German, sentence by sentence, phrase by phrase; a method which, as every student of German knows, cannot result in "good" and idiomatic English. We note also that he intimates some uncertainty of his qualifications as a translator in adding: "I am very largely indebted to the assistance of . . . in the attempt to make the sound German speak good English. The translation is submitted to the [hoffentlich] kindly criticism of both colleagues and students."

No criticism is really kindly which fails to point out defects. And it is in no unkindly spirit that we call attention to the shortcomings of this translation, but in the discharge of the simple duty which the reviewer owes to the public. The melancholy truth of the strictures which have been made on this translation is abundantly demonstrated by the following examples:

"If one can diminish at pleasure the adaptable volume of a definite amount of a simple gas, by increasing the external pressure, the pressure, exerted by the gas on the surrounding walls, grows continually with the diminution of volume; if one works at a temperature sufficiently reduced, there suddenly comes a point at which, by diminishing the volume, the pressure experiences no increase, but remains constant." (Page 47.)

"The question whether a well-defined chemical substance represents an element or a compound of several different elements, and in the latter case to what extent each element is contained in unit weight of the substance, this is a problem of a purely experimental nature," etc. (Page 151.)

"The fact that the molecule consists of one atom, in the case of only a few elements, where the atomic and molecular weights are identical with each other, such not being the case for all the elements, this occasions only passing doubts," etc. (Page 153.)

"Suppose that we believe, not only as has been emphasized in accordance with experience thus far, that the mutual saturation capacity is almost unlimited; but also, inasmuch as all ponderable matter attracts other matter mutually, without regard to its properties, so let us regard every two lines of force, called valences (from different atoms), under suitable circumstances, as showing only mutual action, irrespective of whichever atoms they radiate

from; then it is very probable that the intensity of this action from its nature," etc. (Page 241.)

These specimens, taken almost at random, show in what measure Dr. Palmer has succeeded in his attempt "to make the sound German speak good English." They are almost worthy of a place beside the illustrations of "School English" which have recently been offered to the readers of the *Nation*.

Dr. Nernst's meaning can undoubtedly be extracted from such passages as the above by a devoted student; in other instances, however, the reader is misled by greater and more subtle obscurity, or actual mistranslation. For example: "For supposing that . . . some genius had gained an insight into the kinetic gas theory, a little before the gas laws themselves were discovered (*vor ihrer Entdeckung wenigstens zum Theil vorausgesehen hätte*); even then, as a matter of fact, the way . . . had to be levelled down by much painstaking endeavor (*in Wirklichkeit aber haben viele mühevollen Forschungen den Weg ebnen müssen*)." (Page 385.) "This ratio of the relative quantities will remain constant, even if one should wait seventeen (!) years (*dieses Mengenverhältniss blieb constant, auch als man 17 Jahre wartete*)." (Page 376.) The translator's exclamation-point is pertinent.

We add a few further illustrations of the infelicitous expressions and renderings with which the book abounds. On page 238 we are told, in regard to certain changes of affinity, that "we usually are entirely ignorant as to the whereabouts of the cause." On page 267, "This [support] sits on a heavy tripod base." On page 457 is "a pendulum which is well muffled." On page 237 "we go into a region . . . which can only be reached by a leap of a bold phantasy." *Bellebig* is sometimes "casual," sometimes "arbitrary," and again "selected." *Auftrieb* becomes "resistance"; *passiren* (traverse) is "pass by"; *mattegeschliffen* is "smoothly ground"; *zu Stande kommen*, "come to a pause"; *Sperrflüssigkeit*, "packing liquid"; *wird aber wohl nirgends leichter gemacht*, "can be easily made now or never." We find also, "nature laws," "knife-pointful," "mass-points," "play-space" (of the molecules), and "heat-toning" (*Wärmetönung*) for thermal value.

With the publisher rests the real responsibility for the appearance of so unsatisfactory a translation. It cannot be too often repeated that, for the sake of his reputation, and for the protection of the public on whom that reputation depends, a publisher should exercise at least as much caution in the acceptance of a translation as of an original work. The translation of such a treatise as this of Nernst's must of course be the work of one who possesses a thorough mastery of the subject; but the expert should also be known to have the ability to reproduce the matter of the original in clear and idiomatic English. This is obvious enough, but in the present instance it has been strangely neglected.

The Journal of Captain William Pote, Jr., during his Captivity in the French and Indian War, from May, 1745, to August, 1747. Dodd, Mead & Co. 1896. 8vo, pp. xxxvii, 223. Portraits and maps.

A CONTRIBUTION of some importance has been made to the original sources of our colonial history through the publication of this journal, found in manuscript by Mr. J. F. Hurst in a book store in Geneva, Switzerland. The author, Capt. Wm. Pote, jr., of Falmouth, Maine,

was taken prisoner near Annapolis Royal in Nova Scotia, which was then beleaguered by a large force of French and Indians, and was carried to Quebec, where he remained for two years in close confinement. Considering the circumstances under which the first and most interesting half—giving a description of the incidents of the march through the Maine wilderness—was written, it is a remarkable production, showing considerable literary power as well as quaint humor. The most important passage for historical purposes is the detailed account of the fight in Tatmagouche Bay, by which Capt. David Donahew turned back a force of several hundred French and Indians who were on their way to relieve Louisburg. This exploit, of which little notice has been taken by the historians, certainly hastened the fall of that place, if it was not the occasion of it. Mr. Parkman refers to the dismay of the governor and garrison at the non-arrival of M. Marin's troops, but does not mention the cause of his failure. An account of the fight, however, is given in the official report of the governor, printed in the appendix to 'A Half-Century of Conflict.'

The latter half of the journal, narrating the incidents of the writer's prison life, is largely taken up with the names of the new prisoners brought in and of those who died. The largest number confined at one time was 206, and the deaths were 77. There were also marriages and births among the captives, and occasionally the monotony of their prison-life was broken by some notable incident, as the following entry shows:

"13th this Day as we was at dinner Came Into our Room J^{ns} Simson a man y^e have been in this place about 2 Years and one Susanah Boillison y^e was taken with Cap^t Salter, these 2 have desired m^e Norton to marry them Several times, But having no permission from y^e General, he always Refused y^e therefore they came and Stood in y^e middle of y^e Room hand in hand before y^e minister as he Sat at dinner and Declar^d they took Each other as man and wife In y^e Presence of God and us witnesses after which they had a Certificate drawn and we all Sign^d it Viz 13 y^e minister on y^e top and all y^e Rest of us under him, this was y^e first time I Ever Saw y^e like Encouragement and permission Given, for whoring."

There are numerous notes, explanatory of names of persons and places, as well as an historical introduction by Mr. V. H. Paltaita. We have detected a slight error in his account of Gov. Mascarene. The commander of his regiment, raised not "for service in the West Indies," but for the expedition against Port Royal, was not Col. Wanton, but Col. Shadrach Walton of New Hampshire. Accompanying the volume is an admirable reproduction of the manuscript map in the Lenox Library, made in 1749 at Gov. Shirley's request, by the surveyor Charles Morris, "of the northern English Colonies, together with the French neighboring Settlements." There are also a route-map, plans, facsimiles and portraits, and an excellent index. Of the beauty of the mechanical execution of this product of the De Vinne Press it is hard to speak in too high praise.

Pierres Gravées des Collections Marlborough et d'Orléans, etc., réunies et rééditées avec un texte nouveau par Salomon Reinach. Paris: Firmin-Didot et Cie. 1895.

THIS is the fourth volume of the now famous "Bibliothèque des Monuments Figurés Grecs et Romains." The archaeological world is deeply indebted to M. Reinach for his careful republication and reëditing of all the volumes

in this series, and the latest especially will be a boon to a rapidly increasing audience. It surprises us to find that M. Reinach has been able to cram so much into so small a space, and to fix a price that puts the volume within the reach of most students who are interested in the subject. The old folio volumes were out of print, and were for the most part inaccessible to students in America. Besides that, the accompanying texts were mostly unscientific and antiquated, and could be used with safety only by those who knew well the ground they were treading. All this has been materially changed, thanks to the tireless work of M. Reinach, who has compressed the thirteen volumes (mostly folio) into the compass of one large octavo volume consisting of xv and 195 pages and 137 plates, while the cost is only thirty francs.

The reduction in the size of the old plates has not impaired the value of the original engravings for purposes of study and comparison. M. Reinach has really written a new text to these old plates; he has eliminated the stuff and padding (or, in other words, the greater part) of the original texts, and has cited the literature relating to individual gems. Indeed, the 195 pages of this volume are of far more value than the entire texts of the original thirteen volumes. We can go even farther and assert that the original volumes are now relegated to oblivion, because completely superseded by this modest publication.

And yet, in spite of all that can be said, we must warn the student that it is not safe to make unquestioning use of these plates, in which a strong element of caricature, untrustworthiness, and misrepresentation is always present. Methods of study and teaching have changed since the olden days of unquestioning faith when these plates were regarded as real boons. Nowadays true archaeological research must needs be done in the presence of the originals or of casts from the originals; lacking which, photographs from the casts of gems give us the only other safe means of studying art. All engravings and mere outlines involve error and misrepresentation, involve a loss of details, of type, and an obscuring of the motive subject.

The plates of this volume need further sifting and elimination, and, in spite of the debt we owe to M. Reinach, we see clearly that the definitive publication of antique gems has not yet been made. It is a fascinating subject that calls aloud for a devoted worker.

The Number Concept; Its Origin and Development. By Levi Leonard Conant. Macmillan. 1896.

This volume is made up of tables of the numerals of a great many (perhaps 500) different languages, with a slight connective commentary, drawing attention to the signification and composition of the words. The shortcomings of the work are numerous and regrettable, though by no means fatal; its merits are few and simple, but considerable.

The title is a misnomer, and the author shows that his own number-concept is in a low stage of development. Numerals are not themselves concepts at all, nor do they signify concepts. They are simply a scale of vocables, which we use very much as we use a foot-rule. We apply them to a multitude, and mark how far on the scale that multitude will go. In explaining this, we explain what the number-concept really is: it is the intelligent conception of the purpose and method of the system of numerals. It is entirely unnecessary that this should, in the form of a concept, or intellectual product,

be in the minds of those who use numerals. It is sufficient that they should know by experience that counting is somehow useful, that it aids bargaining, etc., and that they should be habituated to the use of a series of words in counting. The continual use of the word "concept," instead of speaking of "words" or "terms" and their "significations," is a German way of speaking, very inferior, both in logical accuracy and in perspicuity, to our English idiom. At any rate, the real subject of this book is numerals and their modes of formation.

Very little is said of the number-concept (which is really of very late development), nor of the idea which the tribes mentioned may entertain in regard to number in general; and what little is said is not worthy of criticism. Not only does the author fail to discriminate the number-concept from the use of numerals, but he also falls into a confusion of thought which must greatly embarrass his mathematical pedagogy, namely, a confusion between *number*, in the sense of the result of counting, and *multitude*. He tells us that all tribes "show some familiarity with the number-concept." Yet he mentions Bolivian tribes which are said to have no numerals whatever. Still, he says they show "a conception" of the difference between *one* and *many*. In another place, he says that the "number concept" of ordinary people is imperfect, in that they have little sense of the different degrees of multitudinousness of high numbers. On the contrary, this has nothing to do with the accuracy of their "number concept," or of their power of applying numerals to the purpose for which they were invented. It is true that to the mind trained in certain branches of applied mathematics the word "trillion" carries associations of rigid statistical uniformity which the word "million" lacks. Such a mind may be said to attach different conceptions to the two words; and the distinction is useful to such a mind. But this has nothing to do with the use of numbers as numbers. The person considered will put all that out of his mind when he has any definite numbers to deal with, and will perform his arithmetical calculations just like anybody else. A system of numerals is an apparatus for counting. Those numerous tribes which have names only for *one*, *two*, and *three*, which express four by *two twos*, five by *two and three*, etc., evidently did not count at the time their language was formed, and probably do not count now. They, like all men, recognize pairs and triplets by their configurations, fours as pairs of pairs, etc. The so-called numerals of such tribes are, properly speaking, not numerals at all. When a tribe has a numeral system based upon *five*, *ten*, or *twenty*, the evidence is that they possess the art of counting. They are quite prepared to count indefinitely as soon as they can count at all, provided they have the power, possessed by most savages, of unconsciously coining a name as soon as they need it. The limits of their numeral words mark the limits of their need of such words.

From a philological point of view, the execution of the book is slovenly. The author copies the various transcriptions of the writings from which he has compiled the lists, without explanation, and omitting all diacritical marks. We do not know whether *c* is to be pronounced *k* or *sh* or *tsh* or *th* or *dh*, whether *g* represents the German guttural *ch* or the velar *k*, whether *x* stands for *ks*, for *h*, or for the Arabic *ghain*, whether *j* has the English, French, German or Spanish sound, etc. When we remember that the English word

fox, pronounced by a Cherokee, and transliterated according to a recognized system, but with the diacritical marks removed, appears as *kwagisi*, we see that, for the purposes of comparison of languages, this book presents nothing but an imperfect list of references. There is little notice of Semitic numerals, none of the Egyptian, and scarcely any of the Babylonian. There is no mention of the so-called Chaldean names for the Arabic figures found in Latin twelfth-century works. There is no classification by races; but North American and African languages, the furthest remote from one another in their spirit of any of the tongues of men, are shovelled in together. Of many minor faults we take no notice.

The merits of the work are that it exhibits all the modes of formation of numerals, that it shows the universality of the bases 5, 10, 20, and the non-existence of any true binary scale or any use of 6 or 11 as a base, that it affords evidence that many tribes do not count, and consequently have no proper numerical system, and that there are the greatest differences in the arithmetical capacity of races equally barbarous.

Hunting and Fishing in Florida, including a Key to the Water Birds, etc. By Charles B. Cory. Boston: Published by the Author. 1896. Sm. 4to, pp. 302.

FLORIDA is so peculiar in its geographical position and climatic conditions that it may be said to have a fauna and flora of its own. Naturalists have only gradually waked up to this fact, with the result that during the past twenty-five years almost every writer of any scientific pretensions who has studied the subject has had to describe some new species or subspecies. A formal systematic treatise on the land vertebrates, for example, would reflect an extraordinary assemblage of nearctic and neotropical characteristics, with a *fauna* on the whole different from either. Florida, in fine, is almost as much Antillean as North American. Mr. Cory in this work first formally distinguishes the peninsular cougar, rehabilitates Rafinesque's wildcat, and adopts the particular subspecies of various recent specialists among the rodents and insectivores. The general trend of variation among both birds and mammals is toward darker coloration and smaller size, though in the latter respect peripheral parts, such as the beaks and feet of birds, may not be proportionately reduced, but rather the reverse. The Florida red bat, for example, may be distinguished as *Atalapha borealis peninsularis*, and we doubt not that the small deer of the peninsula is equally entitled to recognition as *Cariacus* (or *Damelaphus*) *fraterculus*.

The birds have been subjected to such searching scrutiny of late years that perhaps no new forms remain to be discovered, excepting strays from the insular offing. The latter half of the present work is devoted to a systematic treatise upon the waders and swimmers. Mr. Cory is nothing if not orthodox in nomenclature; he lays firm hold of the horns of the A. O. U. altar, observes the code punctiliously, and would as soon be out of the world as out of the fashion of a "Key" to the species he describes. The birds are also very fully illustrated by means of process plates. These portraits are as a rule elegant and effective; but they vary in these respects according to the better or worse taxidermy of the particular specimens which were shot with the camera. The text in each case is a formal diagnosis.

which emphasizes differential characters in thick type, with brief notes on habitats, habits, and the like.

Aside from this, and from the mammalian chapter, as well as from a similar one on the snakes of Florida, the other half of the book is of the outing class, in the nature of personal narrative of hunting and fishing; but it also includes a considerable account of the Seminole Indians. The author is a keen sportsman as well as a good naturalist, and some of these sketches, such as that on tarpon-fishing, make very attractive reading. One good point is scored in discriminating clearly between the crocodile and alligator; and in this respect we may recall the fact that it is not many years since it was declared that there were no crocodiles in Florida, because there could not be any—the *Alligatoridae* being an American, and the *Crocodylidae* an old-world, type of emydosaurs. This part of the work is as fully illustrated as the ornithological portion, chiefly with hunting scenes, pictures of large game killed, and portraits of Indians. The

book is a handsome one in all its appointments, and will fully sustain the author's reputation for readability, reliability, and good sense. At least one of his previous works is not less magnificent than the great Audubon folios themselves; and Mr. Cory is one of the singularly fortunate naturalists whose private means are adequate to any desired gratification of luxurious tastes.

NOW READY

GEORGE GISSING'S GREATEST STORY

THE UNCLASSSED

By GEORGE GISSING

Author of "Eve's Ransom," "Sleeping Fires," etc.

The *Literary World* says of Mr. Gissing: "Not only can he write well, but he is also able to read men and women as if they were books. Blessed with gifts of an uncommon sort, he may be expected to forge past several of the authors who at present beat him in popularity as easily as he triumphs over them in merit."

JUST PUBLISHED BY
HARVARD UNIVERSITY.

Buddhism in Translations.

By Henry Clarke Warren
OF CAMBRIDGE, MASS.

XX + 520 pages, 8vo, buckram, by mail, \$1.20 net.

To be had of the Publication Agent of Harvard University, Cambridge, Mass., or of Messrs. Ginn & Co., Boston, Chicago, London, and New York.

The Buddhist doctrines concerning Karma, reincarnation, Nirvana, etc., are here treated in a systematic and scholarly way, at first hand from the original sources. An account of the monastic order is also given, together with the picturesque legends of the life of Buddha. Of importance to students of the history of religions.

The above forms Volume III. of the
Harvard Oriental Series,

Edited by C. R. LANMAN,
Professor of Sanskrit in Harvard University.

"Harvard University has deserved well of the Old World in instituting an Oriental Series, which, if it goes on as it has begun, must prove a solid contribution to scholarship."—*London Academy*.

RECENTLY PUBLISHED IN FRENCH.

The French Language

WITH OR WITHOUT A TEACHER
By ALFRED SARDOU.

In three parts, with a Chart. The author is not for the first time in the field of French teaching before the American public. His previous efforts have been crowned with marked favor and success, and, it is hoped, this entirely new system will be found highly practical, and a trial of it will convince students and teachers that the learning and teaching French with accuracy, rapidity, practical aim, and success remains no longer an unsolved problem.

The Nation.

NEW YORK, THURSDAY, MAY 28, 1896.

The Week.

The results of the Democratic State conventions held on Wednesday of last week were rather queer. The Iowa Democrats went for the free coinage of silver by about two to one. Those of South Dakota, an adjoining State, went against it by about the same majority. On the Atlantic seaboard two conventions were held. That of South Carolina went for free coinage and that of New Hampshire against it. The battle in all four States was on this question exclusively. Endorsement of the Cleveland Administration or condemnation of it turned on the silver question. Seventeen States have now held conventions and have elected 338 delegates, of whom 172 are either instructed or are known to be in favor of free coinage, and 166 against it. This majority of six for free coinage is likely to be increased and to become decisive, unless their opponents show plainly that they do not intend to be bound by such a decision. If they make it clearly understood that they cannot be drawn or driven into the policy of repudiation, and that the money needed for legitimate campaign expenses cannot be obtained, they may be able to prevent the adoption of such a policy; but without some determined action of this kind the Chicago convention will run upon a fatal rock. The party is worm-eaten by Populism. Tillman, Altgeld, Boies, Morgan, Harris, and Bryan are Populists, with hardly any disguise. If they control the convention, the party may as well haul down its own flag and hoist that of Weaver and Peffer in its place.

The organ of the Manufacturers' Club of Philadelphia says that a convention will meet at Detroit this week whose object will be to "take the tariff question out of politics," and that it will be asked to adopt as a leading principle that "the tariff levied on all goods from any foreign country into the United States shall in all cases be an amount fully equal to the difference in the cost of producing said goods in any foreign country and the cost of producing such goods in the United States." The *Manufacturer* finds several objections to this plan, notwithstanding the fact that it is in accord with the last national Republican platform, which says that "on all imports coming into competition with the products of American labor there should be levied duties equal to the difference between wages abroad and at home." The only difference between the platform and the Detroit proposal is in the use of the words "cost of producing" instead of "wages." The *Manufacturer* points out the fact, of-

ten referred to by the wicked free-traders, that the cost of producing particular goods varies in different places in this country, and wants to know whether the highest cost shall be taken as the basis of the tariff, and, if so, how the tariff-makers are to ascertain which manufacturer's costs are the highest. We would venture to add that it is very easy for a manufacturer to add to his cost of production, and that any one dissatisfied with the tariff could raise his expenses to any desired figure. Again, the *Manufacturer* wants to know how we could learn what the foreigner's cost of production is. "What if he should make a false report?" it asks. Of course our people would never make false reports on such a question, not even our suffering sugar-refiners. How would you prevent undervaluation? it asks. Indeed, the objections to this plan are too numerous to mention, the most formidable of all being the fact that one Congress cannot bind future ones to let the tariff question alone. In other words, the freedom of the people to deal with this question from time to time cannot be impaired. We have had attempts before this time to commit Congress to a particular tariff policy, and their complete failure, as, for example, in 1883, when Congress appointed a commission, composed of the most noted protectionists in the land, to frame a tariff, and then rejected their bill before it was three months old.

The imbecility of the Senate of the United States as now constituted was shown up to some purpose by Senator Sherman in debate last week. Mr. Sherman has been himself a glaring illustration of this during a large part of the present session, but that fact detracts nothing from his picture of the general situation. The subject under discussion was an amendment to the fortification bill offered by Senator Gorman, providing for the issue of certificates of indebtedness to run three years and drawing 3 per cent. interest, to meet the deficiencies of revenue caused by this and other appropriations of the present Congress. Mr. Sherman objected to an increase of the public debt in time of peace, and insisted that it was the duty of Congress to vote additional taxes to meet the additional expenditures. He referred to the Dingley bill that had passed the House and had been killed in the Senate by the substitution of a free-silver amendment. The Dingley bill, he said, did not meet his entire approval. It did not go far enough. If it had passed, there would probably still be a deficiency. He would vote for a tax on tea or on coffee or on anything to get the Government out of the mire in which it was embedded. He would "take the last shirt off the backs of the people of the United States rather than violate the

public faith of the Government." He insisted that the Senate should not increase appropriations without providing the money to meet them, and he added:

"When appropriation bills come to us from the House of Representatives, they are uniformly increased here, and large additions are made to them in many details. We have no right to do this. We have no right to impose obligations on the people of the United States unless we also impose upon them the burden of taxation so as to meet those obligations."

He hoped that the President would refuse to spend a dollar beyond the current receipts of the Government. If he were himself President, he would disregard all appropriations of Congress that were in excess of the regular income.

There is a difficulty in the way of applying this remedy. It would be easy for a President to say: "I have no money to meet this appropriation. The Treasury is empty; fill it and I will pay your bills." But such is not the case. By reason of a law passed while Mr. Sherman was Secretary of the Treasury, and at his instance, the greenbacks which have been redeemed are considered, not as notes paid and *functi officio*, but as Government assets, and the law expressly requires that they be paid out again. It does not prescribe any limit of time within which they must be paid, but it means obviously that they cannot be hoarded and kept back when there are lawful appropriations of Congress awaiting payment. There is now more than \$100,000,000 of greenbacks in the Treasury which have been redeemed and which the law says shall be paid out again. Mr. Sherman ought to have gone one step farther and offered a bill to retire and cancel these redeemed notes and all others received in the Treasury by the same process. Such a measure would be helpful in many ways. Such a measure would not only prevent Congress from spending more money than it provides taxes for, but it would uplift public and private credit by giving assurance that a false system of finance had been definitively abandoned.

Editorially the *Tribune* continues to be in a state of great hilarity over the anxiety of business men to know what kind of a President the Republicans are going to elect. The joke is really too killing. You dear distressed bankers and merchants and investors, it expostulates with shaking sides, don't you see how mirth-provoking you are? But its news columns sponge out every word of its editorial page. It has to report "crazy Populist finance" as "likely to pass in the Senate," has to record the votes of twelve Republican Senators in favor of a bill to break down the only law which now stands between us and a 50-cent dollar, and to print the passion-

ate cry of Senator Sherman, thanking God that the President of the United States, no matter what Senate or House might do, would veto any such legislation. How truly diverting it is, under these circumstances, with the threats of such repudiating measures hanging over the country, with the certainty that there will be an enormous crop of them in the next Congress—what a capital joke it is that men should want some assurance that the next President will stand as firmly against the lunatics as the present one does! Every day, in fact, makes it more and more necessary that the next President should be known of all men to be of strong convictions and unflinching courage on every financial question; yet every day makes it more and more certain that the man whom the Republicans are "sure to elect" has neither convictions nor courage. "Crazy Populist Finance"—but no word from McKinley. Repudiation and panic predicted even by Lodge—but McKinley nobly dumb. That is the situation which gives such exquisite point to the *Tribune's* quips.

Some people are wondering at the strange flagging of interest in Cuba on the part of Congress, and are attributing it to unworthy motives. They say the whole excitement of two months ago was artificial and insincere, a mere bit of spread-eagleism, and ask, if Congressmen were so dead in earnest, why they have not kept the welkin a-ringing. But the real reason for the sudden chilling of enthusiasm has been strangely overlooked. The Cuban patriots have issued bonds, have asked the American people to subscribe to them as "a practical manifestation of sympathy," but have committed the enormous, the incredible blunder of making these bonds payable in *gold*. This shows an incomprehensible blindness to American sensitiveness. The American people is furiously determined to have the best money in the world, glorious as the flag, untarnished as the national honor, sacred, miraculous, paradisiacal money—but it is not gold. We know what to think of any man or nation that says gold. No friend of the people or of liberty will ever utter that word. The Cubans should have made their bonds payable in the mystic, wonderful McKinley money. Their choice of gold bonds makes all honest Americans and a silver Congress doubt if they are really patriots at all.

The *Horsa* filibustering case was decided at Washington on Monday, and the decision is not primarily against the Cubans nor in favor of Spain. It is simply an interpretation and application of municipal law—known as the neutrality laws. Those laws are meant for the protection of our own government and people. They do not relate, by direct intent, to our duty under international law, but are meant to prevent our citizens, or aliens under our

jurisdiction, from involving us in war with other countries. Such acts as those of which the captain of the *Horsa* was confessedly guilty tend inevitably to embroil us in war if we permit them, and it is therefore of great importance that our highest court has declared them illegal and punishable. Otherwise, the power of declaring war would be lodged, not in the hands of President and Congress, but in those of filibusters. The principal point of the decision is the clear definition of what is meant, in the neutrality laws, by "a military expedition." The lower courts have held conflicting opinions, but now, of course, will be bound by the definition of the Supreme Court, which undoubtedly would cover the case of the men recently tried before Judge Brown in this city and acquitted.

The decision of the Supreme Court in the sugar-bounty cases, while it does not touch the question of the constitutionality of bounties, reverses the decision of Mr. Bowler, the Comptroller of the Treasury, and requires the payment of the money appropriated by Congress. The court holds that if Congress has made promises and induced people to incur expense which they would not otherwise have incurred, and has then actually appropriated the money to indemnify the parties, the payment cannot be stopped by an administrative officer on the ground of unconstitutionality. The Government has a right to make good a loss which private parties have incurred in good faith, relying on its promises; and this independently of the constitutionality of bounties. This was the governing consideration of the Congress that made the appropriation in question—the same Congress that passed the Wilson bill. The Government often makes appropriations to indemnify individuals who have done or suffered acts in reliance on its good faith, although in a legal point of view the payment is equivalent to a gratuity. In other words, the practice of equity is not denied to the Government by the Constitution. It would be a very queer sort of government if the case were otherwise. It would be a very odd state of things if an inferior officer of the Treasury could set up his opinions and rulings against the deliberate acts of Congress and the President. Although the question of the constitutionality of bounties *per se* was not decided, the drift of the decision is toward the affirmation of it—that is, toward affirming the power of Congress to do what it pleases with the public money. Apparently the remedy for profligate, or mistaken, or dishonest appropriations is not in the courts, but in the people. This view is not in conflict with other decisions of the court in cases where State legislatures are restrained from voting bounties to private individuals by provisions in the State constitutions.

The Supreme Court at Washington rendered a decision of much importance on May 19, in the case of the Illinois Central Railroad, Plaintiff in Error, vs. the State of Illinois. The decision is one relating to interstate commerce, and it denies the right of a State to detain unnecessarily, or turn out of its course, a train of cars destined to another State as part of a through line. The bridge of the Illinois Central across the Ohio River is three and a half miles north and east of the Cairo station. It was built at that place many years ago, the nature of the ground designating it as the most advantageous for the purpose. The through trains from Chicago to New Orleans stop at the junction three and a half miles from Cairo, and run a special car and locomotive to that city for the conveyance of passengers and baggage. The city sought to compel the company to run the through trains to the Cairo station, which would require an unnecessary journey of seven miles, and the State Supreme Court sustained this contention, under a law of Illinois which says that "all regular passenger trains shall stop a sufficient length of time at the railroad stations of county seats to receive and let off passengers with safety"; Cairo being a county seat. The counsel for the company, Judge Pentress, submitted a very remarkable brief of ninety-six pages, in which the whole question of the constitutional control by Congress of commerce "among the several States" was argued. He maintained that this power was necessarily exclusive, that such commerce was indivisible, that the railroad in question had authority from Congress and the State of Illinois to form a continuous line of communication with other States, and that it could not be compelled, under the police power of the State, to turn aside from its established through line to run to a county seat for which it provided adequate means of transportation for passengers and baggage. All these contentions were sustained by the Supreme Court of the United States in an opinion delivered by Justice Gray. The full opinion has not been published. There was no dissenting opinion.

Mr. Lyman, doubtless at Platt's instigation, deceived Gov. Morton into believing that there was not time to examine the liquor agents competitively, under the Raines bill, and that, if examined at all, they must be examined simply non-competitively, and he appointed for this purpose, out of his own head, a heterogeneous crowd of politicians—of course, like all this class, mostly ignorant and shiftless, and often dissolute. This was done in spite of the constitutional provision that the examinations must be competitive, "in so far as practicable." There was no reason in the world for thinking that the examination of these people was not practicable. The non-competitive examination was simply an evasion of the fundamental law, at which Gov. Morton ought not to

have connived. But the Lyman appointees cannot pass even the non-competitive pass examination. Fourteen out of the twenty-seven were rejected on Friday at Albany, for simple ignorance. One of them was a brother of "Jake" Worth, the Brooklyn Boss, and one was E. S. Mellen, the Brooklyn auditor. There is an auditor for you! We wonder what such a man was to audit. None of these rejected fellows can present themselves again for a year. So no time at all has been saved; the Governor, Lyman, and Platt have brought discredit on themselves, and the true character of the creatures whom they were trying to quarter on the public treasury has been revealed.

The main value of such occurrences lies, after all, in the fact that they slowly diffuse through the barrooms, gambling-houses, and other haunts of vice the novel idea that public offices are established for the benefit of the people, and are not, in the eye of the law, rewards or "plums" for working "Boys," or for ne'er-do-weels or drunken fellows or defaulters. This idea makes slow progress, but every such examination as has taken place at Albany helps to spread it. The Boys curse and fume, and want to be "patriotic" and go to war with somebody, but they will gradually cease to look on the public service as a refuge or almshouse. Some time ago a superintendent of the mint in San Francisco, La Grange by name, proved so inefficient as to let his chief subordinate pick and steal without discovery, and had himself to resign in consequence. Instead of turning his attention to some honest business, with which he was familiar, on the Pacific Coast, he started for New York, and on his arrival here had no difficulty in getting an eminent mint man, Mr. Leech, to recommend him to the Mayor as a Fire Commissioner. For what? Because he was familiar with the business of extinguishing fires? Because he enjoyed the confidence of the fire-insurance companies? Because he was an old resident of the city and familiar with its wants? Not a bit of it. Simply because he "was a brave soldier with a splendid record."

Ecclesiastical politics has had little chance to catch the eye of the public, fully intent as that eye is upon the worldly article, yet the various church conventions recently in session have, as usual, shown more than once that they could teach the politicians not a few tricks of their own trade. The Presbyterians elected their Moderator at Saratoga on Thursday by as pretty a mixing of oil and water as is often seen in gatherings of the ungodly—a "combine" of the sound and the unsound in the faith cutting out the prize from under the very guns of the conservatives. The latter are dolorously predicting a reopening of the Briggs controversy, with all the renewal of grief

which that implies; but a weary public will hope for better things. Out in Cleveland the Methodist balloting for bishops had many of the characteristics of profane nominating conventions. There were dark horses, "throwing" of votes, tantalizing running up of one candidate within sight of the promised land, only to drop him hard on the next ballot, and so forth. The action of this Methodist Conference on the subject of forbidden amusements was instructive. At present the discipline forbids card-playing, dancing, theatre-going, and other sins of the kind. Several city ministers admitted that these prohibitions were a dead letter, and tended, so far as they were known, to alienate young people from the church. But still, it was powerfully argued, we cannot afford to let down our standards, or to appear to; and even if we cannot enforce the discipline, do not let us, in the name of consistency, alter it an iota. This view carried the day by a large majority, and the dead-letter laws remain dead but inviolate.

The customary return, under the corrupt-practices act, has been published in Great Britain, showing all expenses which were incurred in the Parliamentary election of 1895, and the exhibit furnishes many interesting facts for American consideration. In the first place, it is to be noted that the total expenditure falls more than a third short of the maximum total allowed by the law. There were 1,181 candidates, and the law permitted them to spend £1,025,207. They actually spent only £617,996, or but a little more than three-fifths. This has been the case in nearly or quite every election which has been held during the twenty-four years since the law was enacted, though previous to its enactment it was quite generally thought that the maximum had been made too low. The average expenditure was about £546 for each candidate, or less than \$2,700, and about three shillings and eight pence, or 66 cents, for each vote polled. Of course, the total of expenditures for individual candidates varies according to the size of the constituency. The largest amount permitted in any district does not exceed \$6,000, which is a mere trifle compared with what is spent in many American districts. Mr. Lodge made a return in Massachusetts after the election in 1892 in which he admitted an expenditure of \$12,000. In only four of the ten American laws are limits placed to expenditures—those of California, Missouri, Minnesota, and Ohio—and in none of these States is the law enforced with the rigor characteristic of Great Britain.

The chief item of expenditure in the British returns is invariably that for the printing of campaign literature, and it is an interesting fact that, with few exceptions, the candidate spending most for this purpose succeeded in the election. The amounts spent ranged from \$420 to over

\$2,500, and in all cases were returned by items under the requirements of the law, the expenditures being entirely legitimate. The British voter is thus subjected to a tremendous "campaign of education," fully equal if not superior to that of our most exciting Presidential elections. Our principal items of expenditure, in those States in which returns are required, are for "flags," "banners," "torches," "uniforms," "bands," and "transparencies." All these uses of money are forbidden under the British act, and if a candidate were to return \$2,000 as expended for "flags," as a Massachusetts candidate did, he would lose his seat. They were forbidden in England because bribery of voters was disguised beneath them, and there is little doubt that they are made to serve a like purpose here, for the \$2,000 item in the Massachusetts return was part of a total expenditure of \$11,000 in a single congressional district. Moreover they are not in the least "educational." When a man spends more to gain a seat in Congress than the entire salary of the office for its term, it is not unreasonable to suspect that he concealed under his flag item some expenditures which he would not care to make public. Some of our laws are nearly as strict in their other requirements as the British act, but none of them is enforced to the letter as that act is, for want of a vigilant and determined public sentiment behind the law.

The furious obstruction offered by the Irish in the Commons on Thursday night, when the agricultural-rating bill was in committee, may have been due to a desire to placate the Liberals, or may mean nothing more than the force of old habit. It is to be noted, however, as the Irish then found out, that the new rules of the House make the old kind of open instruction increasingly difficult if not impossible. The thing has now to be done with finer art. One must have the resources and appearance of burly honesty of Sir William Harcourt to be successful in debating and amending a measure out of time, in a way not to be called down by the Speaker. Mr. Lowther himself, now Tory Chairman of Committee, who brought the rebellious Irishmen to book on Thursday, is an adept in the art of obstruction within the rules, and gave some fine displays of it in the last Parliament when the home-rule bill was pending. Mr. Balfour, however, will be able to invoke closure more successfully than Mr. Gladstone was—at least if Speaker Peel's ruling is adopted by Speaker Gully. The former held that closure could but rarely and dubiously be applied by a ministry with a majority of only 40 behind it; a majority of 150 is entitled to a swifter putting of the main question. Still, even a majority of that size cannot "jam" things through in the Commons, and the agricultural bill will no doubt be a much longer time in passing than the Government anticipate.

PLATFORMS.

THERE is a disposition among some people to minimize the importance of McKinley's silver record, in view of the fact that the platform on which he will stand will be made by others. He seeks to confirm this impression himself by declaring that the reason he does not speak about the currency is that he does not wish to forestall the platform, and his friends give us to understand he will be bound by the platform. We dislike to dispel pleasant illusions, but business men ought to understand that this reliance on the platform as a substitute for the man, or as a supplement to the man, has no foundation in the history of the instrument which passes under that name. The platform, in fact, has shared the fate of the whole nominating system. It has become an instrumentality for getting votes, with little or no reference to the real affairs of the country. It does not any longer foreshadow, in the least, the future policy of the party adopting it. It has sunk into the rank of pure, undiluted humbug. Let us give some illustrations of our meaning.

In 1872, the Republican platform denounced "repudiation of the public debt in any form or disguise as a national crime." When Congress met (it had a large Republican majority in 1874), it passed an inflation bill indefinitely postponing a return to specie payments. President Grant vetoed it.

In 1876, the Republican platform "solemnly pledged its faith to make provision, at the earliest practicable period, for the redemption of the United States notes in coin," and said that "commercial prosperity, public morals, and national credit" demanded "a continuous and steady progress to specie payments."

In 1878-79, a bill to repeal the resumption act would have passed both houses of Congress if President Hayes had not made known that he would veto it.

In 1888, the Republican platform "favored the use of both gold and silver as money," and denounced silver demonetization, but nothing more. In 1890, without the least warning, the Sherman act, providing for the purchase of \$54,000,000 worth of silver bullion a year, was passed by both houses, and President Harrison signed it.

In the same year the Republicans gave through their platform "uncompromising" adherence to the policy of protection, and said it must be maintained. But they proposed to reduce the revenue by the abolition of the tobacco tax, the tax on spirits used in the arts, and import duties on articles which could not be produced at home. If further reduction were necessary, they suggested the abolition also of the whole internal revenue. In 1890, Congress passed the McKinley bill, without any notice, the provisions of which were so monstrous that in 1892 the whole country rose against it and inflicted on its authors a crushing defeat.

In 1892, the Democratic convention denounced the McKinley bill and the Sherman silver act, and adopted a "straddle" plank regarding gold and silver. As soon as Congress met, it went to work to pass a seigniorage bill, which President Cleveland vetoed, and to prepare a free coinage bill, which did not pass because it was known he would veto it; and without the smallest notice passed a rigid income-tax bill, aimed at people earning over \$4,000 a year. All remonstrances were treated with contempt, or answered with the simple assertion that "it was sure to pass." The history of the efforts of the President to get the Sherman act repealed, the panic, and the scorn of Congress for Wall Street, in which the members were freely operating, and the judgment of the Supreme Court, are still fresh in the public memory.

It will be seen from all this that the platform is no longer a political programme which either party intends to follow. It is a manifesto issued for the purpose of getting votes at the election, and, after the election, does not receive the smallest attention. Another illustration of the uselessness of paying any attention to it was furnished by the Republican party in this State last year. Its platform might have been drawn by Mugwumps, for it promised nearly everything they demand, but the policy pursued by the Republican Legislature was almost an exact copy of that pursued by the Democratic Legislature under Croker, of which this very platform complained, more particularly in the matter of indifference to intelligent public opinion.

The platform on which McKinley will be nominated will probably be an ingenious attempt to deceive both the friends of gold and the friends of silver as to the policy to be pursued by the coming Administration. But even if it comes out in an apparently satisfactory manner for the gold standard, we warn the friends of sound money against supposing that it will afford any guarantee as to the legislation of Congress. It will not receive any notice whatever after election. It will be used to influence votes at the election, and there will be the end of it. If we had trusted to platforms since 1870, this country would now be a financial chaos. We have been saved by a succession of Presidents of strong character and measurable financial knowledge. The only exception was President Harrison, who was as weak as Sherman, and, like him, sought salvation for the country in dodges.

All the tendencies of American politics since the war show that our reliance in future must be substantially the same. Congress and the Legislatures are going rapidly down hill, and are likely to be worse before they are better. They are clearly incompetent to govern a great commercial country, and we must rely, until some change occurs, on putting vigorous men of known character and opinions in the Presidential chair, not to legislate, but to prevent mischief. A move-

ment has been made to do away with the President as a source of help, and it is said McKinley is in it himself, by insisting that Congress must be allowed to settle the financial question itself, and that the Presidential veto must not be allowed to prevent the success of its schemes. Every one knows what this means. For such a programme a person of McKinley's character and instruction is just the man, and we warn business men to look out for it. In matters of finance, until the silver and paper crazes subside and national sanity is completely restored, the President must be our main reliance, but it must be a President whose opinions have always been on the side of rationality, and with whose firmness we and the whole world are familiar. Nothing in the present canvass is more ridiculous than the proposal that the business world should accept, in lieu of the candidate's own record, "certificates" of soundness from chance politicians and "bankers" of whom we never heard before. One would suppose the Presidential chair was a butler's place, and that anybody would do for it whom Smith, the leather man, or Jones, the exchange dealer, said was a good man. To be President of the United States a man ought to be as well known as Gladstone, or Bismarck, or Lincoln, or Seward. If any obscure body will do, why do not the managers advertise and sell the place to the person who promises most, as the Pretorian Guard used to sell the imperial purple?

TWO RAILROAD CASES.

THE Supreme Court at Washington recently disposed of two railroad cases of great importance, the first involving a novel attempt to make use of the powers of the Interstate Commerce Commission to help on protection; the other involving the powers of the Commission generally.

In 1889 the Interstate Commerce Commission, of its own motion and without any hearing, made an order providing, among other things, that all imports shipped from abroad to any point in the United States should be taken "on the inland tariff." Subsequently the New York Board of Trade and Transportation complained that certain railroad companies were violating this order in the fact that, whereas they charged the regular rates on property delivered to them at New York, Philadelphia, and other ports for transportation to Chicago and other inland points, they charged much lower rates if similar property came to them from Europe on through bills of lading, to be carried first by steamships and then by rail. As a matter of fact, and as appears from the opinions of the judges, this is the universal custom with all the great railroads in the country; the ocean rates from Liverpool and other European ports, which are fixed entirely by competition, govern the whole question, and every American railroad taking such im-

ports has to transport them at a much lower rate across this continent than it needs to do in the case of articles of domestic production. The railroad that does not do this loses the business.

The order consequently began to have very serious results. In the case of the Illinois Central it deprived that company (the Supreme Court says) "of a valuable part of its traffic (to say nothing of its necessary effect in increasing the charges to be finally paid by the consumers)"; the Pennsylvania Railroad was in no better plight, while it appears that competent evidence had been adduced that, if the order were to be generally enforced, "the result would be that it would effectually close every steamship line sailing to and from Baltimore and Philadelphia." The Texas and Pacific Railway, which forwards imports to San Francisco via New Orleans, determined to contest the matter, and, after a long fight, it has won a complete victory. The case is reported in volume 16 of the Supreme Court Reporter No. 22 (Texas and P. Ry. Co. vs. Interstate Commerce Commission).

The only clauses in the interstate-commerce act which could possibly justify such an interference with the business of the railroads are those which provide that all charges must be "reasonable and just"; that there must be no unjust discrimination in the case of similar services "under substantially similar circumstances and conditions"; that there shall not be any "undue or unreasonable preference or advantage" in any case; and that no more shall be charged "under substantially similar circumstances and conditions" for a shorter than for a longer haul over the same line in the same direction, "the shorter being within the longer distance." The case is so clear that, notwithstanding the dissent of Judges Harlan and Brown and Chief-Justice Fuller, we may probably consider the question settled for ever; the most remarkable thing about it is the way that the tariff was dragged into it. In fact, it looks very much as if the order had been promulgated for the express purpose of making a test case to get a decision that the interstate-commerce act was designed to reinforce the tariff and help keep out foreign manufactures.

If a railroad must charge the same on an article (imported to Chicago from Germany) between New York and Chicago as it does on every article of domestic manufacture sent from New York to Chicago, the cost of importation being by so much increased, in many cases, as already stated, the result would be a virtual prohibition of the import. This was the object of the Commission. If it costs a dollar a yard to deliver an article made in Germany to the purchaser in Chicago, while the same article costs a dollar and five cents manufactured in New York or in Philadelphia, it is clear that the article will be imported by the Chicago consumer from abroad; if the railroad rate on the imported article can be made prohibitive,

then Chicago consumers will have to buy the domestic article. This, says the Commission, is protection reinforced by the interstate-commerce act. So it is, with a vengeance. But it is also the grossest discrimination against railroads and consumers, and thus, says the Supreme Court, the Commission "seems to create the very mischief which it was one of the objects of the act to remedy." Reinforcing protection it declares not to have been the object of the act.

The other case (Cincinnati, N. O. and T. P. Ry. vs. Interstate Commerce Com., 22 Sup. Ct. Reporter No. 700) is chiefly important because it lays down for the first time the principles as to railroad rates in general which the Supreme Court holds universally applicable. The case was one of unjust discrimination. It appeared that the railroad charged more for a shorter than a longer haul under similar circumstances and conditions. The Supreme Court, in upholding the decision of the Commission that this was improper, declared that, subject to the restrictions in the act, common carriers are free, as they always have been, "to make special contracts looking to the increase of their business, to classify their traffic, to adjust and apportion their rates so as to meet the necessities of commerce, and generally to manage their important interests upon the same principles which are regarded as sound and adopted in other trades and pursuits."

Taking these in connection with the other transportation cases which have come before the court in the last twenty years, it is evident that we have in the Commerce Commission a body clothed with no power to fix rates at discretion, but merely a semi-judicial board armed with special powers to prevent injustice where a plain case is made out by the facts proved. Its grotesque attempt to prohibit foreign commerce for the sake of protection, under the guise of an order prohibiting discrimination, has come to nothing, just as all previous attempts of every State commission to "run" the railroads have come to nothing. This case is also a curious illustration of the way in which, through the action of the courts, the very laws framed to curtail liberty often prove in the end a means of strengthening it. The interstate-commerce act, designed by many if not most of its framers to stop the railroads from managing their business in their own way, turns out, as it is explained by the courts, to be a weapon which the railroads can themselves use to prevent oppression of the whole community by the Commission.

THE INSPECTRIX.

OF the whole number of the inspectors of the public schools appointed by the Mayor of New York, under the new law, about a fifth are women, most of them being reappointments. Many of them are ladies well known in public charitable and phi-

lanthropic work, of different sorts. They serve without pay, hold office for five years, and their duties are to examine every school at least once a quarter, with regard to attendance, teaching, discipline, and also "cleanliness, safety, warming, ventilation, and comfort," and to report to the Board of Education any matter requiring attention.

This employment of ladies in the schools (and by ladies we mean not women conspicuous in fashionable life, but women who have been brought up in an atmosphere of intelligence and good breeding, who live in houses marked by cleanliness, order, and taste, whose associations are with people of the same sort, who show in the small field of their own households the capacity for good management of persons and property which is the key to all successful government), is of very recent growth, but we believe it has been, so far as tried, eminently successful. The former trustees did not like it for two reasons: first, because no man likes to have work committed to his care and discretion supervised by some one else, especially by a woman; and, second, because they know very well that the inspectrix was appointed because they themselves did the work badly. But the system of trustees who do not perform their trust, supervised by inspectors who have no control of them, has been swept away; the inspectors' duties are now very like those of the board of visitors which every well-managed college has, but the details covered are vastly more numerous.

In schools there are peculiar reasons why a woman is likely to do some of this work better than men, and why men really need their aid. Many of these will occur to any one who enters a public school even for the first time; half the children are girls, most of the teachers are themselves women, and these facts lead every day to questions on which a man has little or no knowledge, and as to which, in his own household, he is only too thankful to have the benefit of a woman's judgment. In fact, the most painful and distressing situation in domestic life in which a man can be placed is notoriously that of having suddenly thrust upon him, by the death or desertion of his wife, the sole management and education of a number of small children of both sexes. A public-school system with only men in charge would produce much the same kind of difficulty, but on a vast scale. The women teachers do not answer the purpose of inspectors, for they are part of the system to be inspected.

There is, moreover, one department of school administration which is peculiarly adapted for women's care, because it corresponds closely to what comes under their jurisdiction in their own households, and that is what may be called the housekeeping of the schools--the supervision of their comfort, cleanliness, and decency. No one who has not actually

gone over a school in the poorer parts of the city has any idea of the depths of slovenliness to which this housekeeping has descended. Ring the bell, and a dirty janitor emerges in his shirt sleeves from his subterranean lair, squirting tobacco juice as he comes. He is evidently a shiftless hanger-on of some ward politician, who has found a quiet place for him here at the public crib. Examine the rooms, and you will find some so dark as to suggest inevitable injury to the children's eyes; look at the chairs, and you may find some of the wrong size for the desks, so that the children are forced to sit on them in great bodily discomfort; ask the explanation of a pool of water standing in the yard, you will be told that there has been a leak in the water-pipe for several months; look into the sanitary arrangements, and they will be found not sanitary. Everywhere there is that peculiar sort of untidiness, and mustiness, and slouch which is anathema to every good woman. The condition of these poorer school-houses before the coming of the inspectrix was a training in slovenliness and disorder for every unfortunate generation of scholars that went through them. Her work thus far has mainly been to look out for matters of this kind. There will never be a time when they will not need looking after, and they are quite as important as teaching.

For ourselves we could wish that the inspectrix might invade other spheres of activity hitherto exclusively reserved to man. There is not a public building in the city which would not be the better for a report from her. Every one knows what women have done for the interior conditions of the prisons and hospitals; every one knows that it was in great part through women's taking the matter up that an interest was aroused in clean streets, of which we are now reaping the benefit in Col. Waring's administration. Oh that there could be an inspectrix for the Tombs, and for the court-house, and for the city hall, and the registry of deeds, and the police courts. Of what use have the presentments of male grand juries proved? There is not a heeler employed in them but would be frightened if he knew his building was to be inspected by some of the ladies appointed on Wednesday week.

The shocking condition of our municipal housekeeping is partly owing to Tammany, but partly also to the fact that man, left to himself, is not an over-clean or orderly animal, or one that is fond of giving much attention to the details of comfort and cleanliness. He does not perceive the fact in his domestic life, because he has a domestic inspectrix who spends a large part of the day in looking after his house. In the management of public institutions he flatters himself he can get on without her. But it is a mistake.

It really looks as if in some fields the lady inspector might accomplish some of

the work which we once fondly hoped the "gentleman" and "scholar" in politics would do. She has one great advantage over him, that she does not take up the work for a living, but because she has an interest in it for its own sake, and leisure to attend to it. Her function is merely to see and report and actually shame men into correcting abuses. She cannot be reduced to silence by taking away her salary, for she has none; she cannot be "read out of the party," because she does not belong to any. Her warnings must be listened to here as elsewhere.

"THE YELLOW TERROR."

THIS is the name given by a French economist, not to the fever or the literature of the color mentioned, but to the spectre of Japanese commercial competition. It is a bogey which has for some time been looming large before the timid eyes of bimetallists and protectionists. Their doctrines are for the most part supported by arguments *in terrorem*, and it is natural, therefore, that, finding the horrors of a scarcity of money failing them, and the awfulness of foreign goods given away losing its power over the imagination, they should cast about for a new raw-head-and-bloody-bones to frighten people with. They think they have found it in the growth of Japanese industry. In Parliament and Reichstag alike, in Congress and in party convention, bimetallists driven into a corner and protectionists put to their trumps always fall back on the Yellow Terror. The historic question, conclusive against the anti-slavery agitation, "Do you want your daughter to marry a nigger?" has now to give way to the equally pertinent and unanswerable inquiry, "Do you want your daughter to play on a Japanese piano?"

The Colorado Republicans, for example, came out strong on Oriental competition. Free trade was ruining us, the gold standard was cutting all values in two, and if you didn't believe either assertion to be true, how were you going to get away from the deadly competition of "the Far East"? By jumbling three discordant propositions in one plank every doubter must be convinced. But facts are the most convincing things after all, and a long report by the British Vice-Consul at Tokio, Mr. Longford, which has just been published by the Foreign Office, and which sets forth at length the facts about Japanese industry and foreign commerce, is better worth studying than all the bimetallic orations and resolutions on the subject that were ever printed.

That Japan has greatly expanded her manufacturing and her export trade since 1872 is beyond question. The principal industry to exhibit a marked advance is the cotton manufacture. In 1888, Japan had 24 cotton factories with 114,000 spindles; last year she reckoned 58 factories and 883,000 spindles. On the cheaper grades of goods Japanese manufacturers are able

to compete closely with British and American exporters in the Chinese and Indian markets. But even the miraculous Japanese have not yet learned of McKinley how to sell without buying. Their increased cotton-goods productions and exports have led directly to largely increased imports on that very account. The machinery to manufacture the goods and the ships to market them have been bought abroad. Moreover, the imports of raw cotton have risen enormously; from India alone Japan took 72,000,000 pounds of cotton in 1895. This, by the way, is of itself a hard nut for the bimetallists to crack. Indian cotton, they have told us, raised on a bimetallic standard, can be sold in gold-standard countries for twice its price, and no wonder the poor American cotton-grower is ruined. But why on earth is the Indian cotton-grower selling 72,000,000 pounds of cotton in bimetallic Japan for half the sum he could get in Liverpool? We fear a fallacy is lurking somewhere, and not very mysteriously lurking either, in this bimetallic argument.

Another bimetallic assertion fares hard at the hands of Consul Longford's facts. This is that gold countries cannot trade successfully with silver countries. You see, as President Walker has carefully explained, there is no fixed "par of exchange" in such cases, and how under heaven are you going to buy or sell goods without a par of exchange? One side or the other is sure to find itself getting cheated, and the trade will stop, of course, right there. But somehow gold-standard English and German and American manufacturers go right on selling to Japan and taking her produce in exchange, pitifully ignorant that the want of a par of exchange inevitably prevents any such operation. Of the whole foreign trade of Japan in 1895—\$140,000,000—Great Britain's share was \$53,000,000, the United States had \$34,000,000, Germany \$8,000,000. The individual merchants engaged in the business are, of course, losing money, but as they are not aware of it, the fatal nature of the lack of a par of exchange is as yet concealed from them. The foolish fellows actually think they have a par of exchange in the gold in which all their bills are payable.

The actual competition of Japan in the great lines of manufacture is not at all formidable up to the present, Mr. Longford concludes. In but few branches can the Japanese undersell the foreign product, quality for quality, and even the Japanese consumer prefers, as a general thing, the imported to the domestic article. But how about the future? Are not Japanese cheap coal and cheap labor, combined with Japanese inventiveness, to prove a real Yellow Terror to industrial Europe and America? Mr. Longford does not appear to be frightened. He points out some of the changes already observable which are sure to equalize conditions. "Wages in all classes of labor

have risen, and, while the capitalists are putting money into industries which promote a demand from Europe for manufactures, the lower classes have a higher standard of living than they ever had before." The simple truth is that unstable equilibrium in international trade relations cannot long endure. Differences infallibly adjust themselves. Inventions cannot be monopolized, or a low cost of production kept the exclusive property of one nation dealing with others. The principle that tends to equalize various trades and professions and industries, in respect of their rewards, works among competing nations. Most absurd of all is it to suppose that the alert Japanese are going to put up with less wages or a lower standard of living than they need to, with their natural earning power shown to them to be what it is. The Irish home-rule question "in a nutshell" has been defined to be "a quick-witted nation governed by a stupid people." In like manner we may say that there is and will be no Yellow Terror unless the quick-witted Japanese become as stupid as the bimetallists who talk about them.

HOW ITALY IS GOVERNED.

ROME, May 10, 1896.

If it were possible to state in a word the essential element of government in Italy—that which is really the secret spring of official action from the highest to the lowest functions of government—that word would be "Camorra." We take it for granted that Italy is governed constitutionally because it has popular representation and a Parliament, but in point of fact there is not a stage of government in which the decisive agency in the conduct of affairs is not the power of the "Camorra," or what corresponds (as nearly as the Italian nature permits) to our "Ring." Beginning with the communal councils, in which the most minute affairs of the population are decided, there is scarcely a measure passed in which the main motive of decision is not the personal and pecuniary interests of the councillors. A relative who has been for many years in the provincial and communal councils in central Italy in which he held a large amount of real estate, assured me that it was the constant practice of the councillors to pass measures for the improvement of their personal property as measures of public utility—roads to open their estates as roads of public necessity, etc., etc.; and of course it is understood that the privilege is always in favor of the richer and to the loss of the poorer of the population. Put in terms of strict logic and honesty, it means that government, so far as taxation and financial expedients go, is a limited system of robbery. An intelligent and independent Italian once said to me, "Every Italian has in his constitution something of the Camorrist"; and he was from Piedmont, where the evil is at its minimum. In the little book by Prof. Villari, 'La Sicilia e il Socialismo,' recently published, I see the following singular declaration, and who knows Villari knows that he always speaks the strict verity:

"A Sicilian, who is also a competent teacher, said to me one day: 'In the little commune where I was born, the party in power does not pay the *dazio consumo* (the tax on all food that comes into the town or village). Some days ago

a certain man refused at the gates to pay, because he was a friend of the assessor of finance. Not being known to the customs officer, he was accompanied to the communal palace, where he was recognized and did not pay. The Opposition does not protest, because, when it is in power, it does the same. And the poor, unfortunately, always pay. My family is not partisan, does not aspire to power, is loved by all, and so never pays. But what shall I do when, arriving at the gates, they say to me, 'Pass, you are known'; must I pay perforce?' Officers of the army, to whom I told the fact at table, said to me that often, and not alone in Sicily, they had repeatedly been obliged to insist on paying: 'You are a major and have the right not to pay.' 'You are a commander and ought not to pay.' It is an ancient custom, and the tax-gatherer thinks it must continue. The gentleman who comes from his farm and brings a hare or a turkey in his carriage, does not pay—that is understood; the poor peasant pays for his bread."

In the provincial councils the construction of roads, when not made simply for the benefit of a great proprietor, becomes the subject of bribery, just as much as if it were in New York city, the contract being given nominally to the lowest bidder, but only nominally. In the great cities the collusion is worse. When the city of Rome proposed to construct the great embankments on both banks of the Tiber for the restraining of the floods, a building company offered to take the contract for sixty millions of francs, and the city refused, pretending to make economies by giving it out in lots; and when it had spent more than one hundred millions and had become bankrupt, the royal Government had to finish the work. In Milan, Turin, and some other cities of the north these things are measurably avoided, so the system is not always in fault; but the further south you go, the stronger the Camorra. In Naples no measure is passed without paying its contribution to the corruption fund.

In Parliament it takes another form. It is impossible to organize political parties in the Chamber of Deputies because there is always a very large proportion of the Deputies who will vote according to the appropriations made by the Ministry for expenditure in their electoral colleges, on highroads, railroads, endowment of local universities, ports even where no shipping exists, and so through all the demands of a population accustomed to be provided for at the public expense; which, after all, comes to paying all round, only much more for the waste and the Camorra. A gentleman of my acquaintance who owned a large estate in the district of which Acquapendente is the chief town, and who had constructed an admirable road through it, covering half the distance between the town and the nearest railway station, offered the municipality the use of his road if it would construct one to connect with it, in default of which, communication was carried on by circuitous and very much longer roads. The municipality refused the offer, saying that they would make the Government build a railroad, and they would spend nothing for a carriage road. But for the financial disaster which stopped all the new railways, it is probable that the Acquapendente road would have been built ere this, though for the exclusive use of a small town without commerce or industry, and which, like so many other Italian railways, would never pay the working expenses.

The organization of political parties, even on the most elementary principles of political economy, is therefore impossible, for there is always a body of Deputies, numbering probably from 100 to 150, who will vote for any ministry that promises local expenditure. The railway ring alone devours the public reve-

nue to the amount of many millions (before the crisis and practical bankruptcy it was 200 millions annually, excess of expenditure above the receipts); and local expenditure apart from that controlled by Parliament adds much to this, from other works. Milan, again, is greatly interested in manufactures, and a partial system of high protection is established for the benefit of Milan, though the country at large is strongly interested in free trade.

It might be supposed that the Camorra must finish at the elective body of the Parliament, but in fact the throne is surrounded by a ring which no interest of the country, however sacred, has ever succeeded in breaking. This, which is known as the "palace Camorra," occupies itself with the composition of the Ministry and the secret direction of foreign affairs. It is composed of court favorites of both sexes, superior officers of the army possessing the personal confidence of the King, members of the diplomatic body, Senators, etc., and its action is immediately upon the sovereign, owing to which ministerial crises are directed, and appointment of the higher functionaries, especially in the army, is controlled. This ring is thoroughly French in its political sympathies, and has always been hostile to the Triple Alliance and to Crispi. From its pressure on the sovereign no ministry has ever been able to escape, and the latest instance of its overruling the constitutional powers was the refusal to permit the late Ministry to recall Baratieri from Africa when it was so clearly seen that he was losing all power of direction of the campaign.

Baratieri belonged to a group of political personages, Deputies and others, himself being a Deputy, and the ring at the palace had need of his influence in certain contingencies, so that what glory and consequent influence were to be got out of the war were to be gained by him as one of its number. He belonged to the Zanardelli group, and, when that chief attempted to form a ministry, had been the candidate for Minister of Foreign Affairs. The *Gazzetta del Popolo*, the leading journal of Piedmont, and the most independent and honest journal in Italy, said in its leading article on the African question: "It is said, and with too much justice, that the Abyssinian campaign has been carried on more with a view to Parliamentary and journalistic results than from true military motives. Most sacred truth! If Baratieri had not been a Deputy and of the group of Zanardelli, even designated as the Minister of Foreign Affairs, he would have been recalled long ago, and Italy would not now be mourning Amba Alagi and Abba Carima [as the battle of Adua is now called]." But if, being Deputy, he had not been one of the ring which serves the purposes of secret political combinations (one of the most important of these being to combat and paralyze the operations of the party which regards the Triple Alliance and the agreement with England as the vital interests of the country, and which has lately been led by Crispi), he would have found no support against the demand of the Ministry for his recall. As it was, it was simply the pressure of the "palace Camorra" which induced the King to refuse to allow him to be recalled.

All these things are now matters of general public knowledge, and the effect on the popularity of the King can easily be imagined. He is digging the grave of the monarchy more effectually than all the republicans in the kingdom. The professed republicans who have succeeded to Mazzini, Bertani, Alberto Mario,

and their contemporaries and associates are, with two or three exceptions, the blindest instruments in the hands of French intriguers, and France has very few friends in Italy besides them and the "palace Camorra" (with which they are also leagued by a common animosity to Crispi); so that, by a strange combination, the republicanism of France is the worst damper on that of Italy, and the momentary safeguard of the throne. So thoroughly is this condition of things known in the country that I have heard it openly said by old publicists of various political connections, that it is only the abdication of the King that can save the throne. The country begins, in view of the disasters of Abyssinia, to revolt at being governed by irresponsible and irreconcilable intriguers composing the "palace Camorra."

X.

REVENUE MEASURES IN JAPAN.

TOKYO, April 25, 1896.

REMARKABLE as has been the political movement in Japan during the last session of Parliament, the actual legislative work of the session has been more remarkable still. At no time during the past six years have measures affecting particularly the finances of the country been proposed or passed that could compare either in interest or in influence with those of the session which has just closed. Had financial bills of similar importance been under consideration in the Congress of the United States, the whole country would have been in a state of excitement; the newspapers would have vied with each other in giving details concerning the progress and probabilities of the measures, and the whole machinery of business would have been disturbed. Here in Japan, on the contrary, the public excitement and disturbance to business may be said to have been nil. One or two taxation measures were, indeed, upon consideration, opposed by certain semi-public bodies, as for instance the Tokyo Chamber of Commerce; but the opposition was half-hearted and the objections offered of an indifferent character.

This quiet acceptance by the public of measures so important cannot be ascribed particularly to any habit of submission or any other race characteristic of the Japanese people. It was seen from the opening of the session that something had to be done to devise means for permanently increasing the revenue of the Government. In the opinion of the executive, as well as of all the political parties, the expenses of the war were not to be met, except incidentally, out of the indemnity. The interest on the public debt that had augmented so rapidly during and immediately after the war had to be provided for. It was also a matter of general agreement that the army and navy were to be strengthened, and provision for this purpose had to be made at once. Lastly, the conquest of Formosa proved far more burdensome than was anticipated; and, furthermore, it was seen that the organization of the Government of the island would for some years be a drain upon the treasury rather than a resource to it. These items of increased expenditure were all inevitable features of the budgets of the coming years, and no difference of opinion existed that taxes must be devised to produce a larger revenue. If it be remembered that in Japan financial measures of importance to the nation generally originate with the Government, the Houses for the most part concerning themselves merely with criticising or modifying the bills as introduced, we have an

explanation of the small excitement manifested. It was a general sentiment that the measures proposed by the Government were designed to secure as large a revenue as possible with as little friction as was compatible with existing circumstances.

The total annual revenue of the Japanese Government may be roughly put at 97,000,000 yen. The expenditure during the past few years has been less than this, at least by 6 or 7 million yen, a sum which has been employed for the most part in redeeming outstanding public obligations. The expenditure for the coming fiscal year is estimated at 152,000,000 yen, or in round numbers 62,000,000 yen above the ordinary expenditure of past years. About 40,000,000 yen of this increase, however, will be paid out of the indemnity, leaving an excess of about 14 or 15 million yen to be met by increased taxation or by the issue of bonds. The actual normal expenditure after the next fiscal year will, it is estimated, reach a figure between 120 and 130 million yen, and therefore the financial question before the last Parliament was how to devise by methods of taxation an annual increase of revenue over and above the present figure, amounting to something over 25,000,000 yen. It was impossible to augment the land-tax, as that was felt to be high enough, and any attempt in that direction would have met with the direct opposition of Parliament. What was proposed by the Government and accepted by both houses was practically the establishment of two new taxes and the increase of two old ones. The new ones are the registration and trade taxes, the others are the taxes on saké and tobacco.

To explain these four taxes properly in all their bearings would require a volume, as they have to do with conditions of production and trade that are to some extent peculiar to Japan. It is to be noted, too, that an adequate translation of the acts has not yet appeared, and until this is done various minor points concerning them must remain obscure to foreigners. At this stage, therefore, a simple outline must suffice.

The registration tax is to be levied on the registration of all lands, buildings, professions of nearly every description, companies, mines, successions, public bonds, marriages, divorces, and other legal functions specified in the act. The rate is in every case stated in the act. On buildings and lands it varies between 2 10 per cent. to 3-10 per cent. of the market value, on companies from 2-100 per cent. to 3-10 per cent. of the capital. In the case of professions, the tax takes the form of a license fee, amounting, for instance, in the case of lawyers, to 20 yen for the first registration and 10 yen for renewals. The tax is heaviest on mines. For trial operations the tax is 50 yen, for active working 100 yen, and for the sale or purchase of mining rights 50 yen. As certain registry taxes have been in existence in Japan for many years, the old ones are in every case superseded by the new law. There is also a list of exemptions, comprising especially those who work for daily wages, servants, etc. The law goes into operation from the 1st of April of the present year. The estimated proceeds of this tax are 6,800,000 yen.

The trade tax is even more complicated than the preceding. It is assessed on every kind of trade, manufacture, wholesale or retail business, and includes, besides, banking operations, insurance companies, money-lending, transportation, printing, photography, hotels, restaurants, brokerage, warehousing, and other forms of industrial enterprise. The system of assessing the tax is necessarily minute and intri-

cate, but whether it will prove simpler in practice than it now seems, remains to be seen. The tax is generally proportioned to the amount of business done. In the case of merchants the rate is 5-100 per cent. on the proceeds of sales for wholesale transactions, and 15-100 per cent. for retail transactions, together with 4 per cent. of the rent of the premises, and 1 yen per employee. In the case of banking, insurance, money-lending, warehousing, etc., the rate is 2 10 per cent. of the capital plus 4 per cent. of the rent of the premises and 1 yen per employee. In the case of manufactures and photography the tax is assessed at the rate of 15-100 per cent. of the capital, plus 4 per cent. of the rent of the premises, 1 yen per business employee, and 30 sen per hand. There is a small list of exemptions, comprising (1) those engaged in certain Government businesses, (2) those engaged in wholesale and retail business during the first year of their enterprise, and (3) those engaged in banking, insurance, manufactures, etc., during the first three years of their enterprise. There are minute provisions for appraising the rent of premises and for computing the proceeds of sales. The law goes into effect on the 1st of January, 1897. The estimated yield of the tax is 7,550,000 yen.

The two remaining taxes are not new taxes, and were intended to be merely augmentations of existing ones, yet both are so reorganized under the new law that they can scarcely be recognized as old friends in their new garb. The saké tax bill is long and complicated, partly because there are so many varieties of this article made, and partly because the conditions under which it is produced are so peculiar. The capital point of the new system is that ordinary saké—the kind consumed by the great mass of people—is to be taxed at the rate of seven yen per koku, instead of four yen per koku, as heretofore (the koku is equal to nearly forty gallons). The tax on other kinds of saké is raised in about the same proportion. The estimated yield according to the new rate is 9,200,000 yen in round numbers, an increase of nearly double the old yield. The new system goes into operation on the 1st of October next.

The new law regarding tobacco is an innovation in Japan, and introduces something like a revolution in her system of raising revenue. Until now the tobacco tax has been in the main a copy of the American system. The tax has been assessed in the form of a stamp-tax, with the stamp affixed to the package for sale. The only difference between the two systems has been that in Japan the value of the stamp has varied with the price of the article, whereas in the United States the tax is a fixed amount per pound independent of the price. This system has been very successful in America, but in Japan there was this difficulty, that a very large amount (I believe fully one-half) of the tobacco never came into the hands of the manufacturer, but was used by the agricultural classes for home consumption without paying any tax. For this reason the revenue from tobacco has fallen far short of what it would be in America, where the cultivation of tobacco is localized and the great mass of farmers buy their tobacco from the "store." The problem of the Japanese Government was to make all consumers of tobacco pay the tax, and at the same time not to cause too much interference with the industry.

For this purpose the Government proposed to make the business of buying and selling the leaf tobacco a Government monopoly. According to the new law, all growers of tobacco

are to send in notice to the proper officials, by the end of April, of the area devoted to the cultivation of the leaf. The Government reserves the right of limiting this area if necessary. The grower is not to keep back any of this amount for his own use or for sale, unless he intends it for exportation, in which latter case he has full liberty to sell it to others under proper safeguards. By this means the Government hopes to get possession of all the tobacco raised for consumption in the country. The commodity is to be stored in Government warehouses and sold to manufacturers at fixed prices, the difference between the purchase and selling price representing the profits of the monopoly to the State. As already explained, it is not so much intended that the price paid the farmer or demanded from the manufacturer shall be very different from the present range of prices, as that the Government shall collect the tax from *all* consumers and incidentally absorb the profits of the middleman. The new system will not come into force until the 1st of January, 1898—a date not too remote, as the Government will find it necessary to establish a large amount of machinery, especially warehouses, to effect the monopoly. The estimated yield of the new system is over 10,000,000 yen, or more than twice the proceeds of the present tax.

These are the four measures that the Government has resorted to for increasing the revenue. The total receipts from these four taxes are estimated at more than 33,000,000 yen, but as the taxes to be repealed as soon as the new measures come into force amount to about 7,000,000 yen, the net increase is estimated at 26,000,000 yen. This estimate is not excessive. It is probable that as soon as the new system is in working order the proceeds will be somewhat more than this, and, with the growth of Japan, industrially and commercially, the amount will be considerably larger. For the next two years, however, the benefit to the Treasury will be small, partly because all the new taxes do not go immediately into force, partly because the new system, especially the tobacco monopoly, will require in the first instance a certain outlay from the Treasury, and partly because any new tax system requires time to be organized efficiently.

It would not be difficult to offer criticisms on the kind of taxes selected by the Government for the sake of increasing the revenue. Nothing is so tempting as to carp at the weak points of any tax or system of taxes, and nothing is so chimerical as to attempt to satisfy all classes in a community. One or two points may, however, be noted. In the first place, it is doubtful whether more time could not have been spent profitably in the discussion of four such important measures, or at least whether two of the measures could not have been postponed for consideration to the next session of Parliament. In the second place, it is questionable whether difficulties will not result from the peculiar method of imposing the trade tax. A similar tax is imposed in other countries, notably France, without recourse to the necessity of inspecting the books and accounts of any business firm or company. A system of assessment that turns wholly upon certain obvious outward characteristics (though the Japanese trade tax contains in part such features) is preferable, if it can in fairness be carried out. Lastly, it is a matter of doubt whether the tobacco monopoly was a necessity. It is likely that the Government knew what it was about when it instituted a monopoly; yet it seems reasonable to suppose that a moderate

increase in the rate of the tobacco tax might have proved, within a few million yen, as productive of revenue without subjecting the tobacco industry to the great amount of official supervision which the new system demands. But these are rather incidental criticisms than vital objections. If the Government shows a disposition to administer the new system of taxes with as much impartiality and as little needless interference as possible, it will no doubt achieve as much success as any government does at present in a matter so unpopular, yet so indispensable to the nation's welfare.

G. D.

Correspondence.

JOHN COLTER.

TO THE EDITOR OF THE NATION:

SIR: The interest which always attaches to the personal history of the pioneers in American exploration is my apology for presenting the following facts concerning one of the most noted of those early characters. In a recent work* I gave a summary of what was then known concerning the adventures of John Colter, the discoverer of the Yellowstone Wonderland, and endeavored to unravel the mystery in which was buried too deeply the history of a very notable performance. Since the publication of this work I have come across two new references to Colter, both prior to the year 1820, one in an obscure chapter of an old work on Louisiana, and the other in a letter from Thomas Biddle to Gen. Atkinson, treating of the Indian trade. While this new information happily confirms the theory already worked out as to the scope and purpose of Colter's wanderings, it goes far towards filling the blanks in the existing record, and in one respect adds an original leaf to the laurel of Colter's fame.

As hitherto understood, the biography of John Colter may be very briefly stated. He was a private in the expedition of Lewis and Clark. On the return of the expedition from the Pacific, Colter secured his discharge at the site of the Mandan villages, and went back up the river with two companions to hunt and trap. In 1807 he made a long journey through what is now Northwestern Wyoming, and while on this journey discovered the peculiar volcanic country which exists near the headwaters of the Yellowstone. In the following summer he commenced trapping, with a companion named Potts, on the headwaters of the Missouri. Here they were attacked by the Blackfeet, Potts was slain, and Colter, by running the gauntlet, escaped, though by the narrowest margin and with incredible suffering and exertion. In 1810 he returned to St. Louis. He saw much of Clark, Brackenridge, Bradbury, and others, told of his adventures, was evidently believed by the more discerning, but was ridiculed by the great mass of his listeners, who derisively christened the scene of his exploits "Colter's Hell." In 1811 Colter moved some distance up the Missouri, married, and made his exit from history.

It now appears that Colter did not remain continuously in the upper country from 1806 to 1810. In the spring of 1807 he set out for St. Louis and descended the Missouri as far as to the mouth of the Platte. Here he was met by a party under Manuel Lisa, the celebrated trader, who induced him to return to the upper rivers. When the expedition arrived in the

Yellowstone country, the Blackfeet Indians were encountered. Lisa was agreeably disappointed to find them not hostile, as he feared they might be on account of their experience with Capt. Lewis the previous year. But it seems that they were so sensible of the provocation under which Capt. Lewis had acted that they had not cherished the loss of their two brethren at his hands as a cause for revenge, and were ready for friendly intercourse with the whites.

When Lisa reached the mouth of the Big-horn, he set up a trading post and dispatched Colter to visit the neighboring tribes and bring them in to trade. Colter set out with a "thirty-pound pack," and travelled several hundred miles, part of the time alone, and part of the time with Indians. While in company with a party of Crow, they were attacked by the Blackfeet. Colter, in self-defence, fought with the Crow, distinguishing himself greatly. The Blackfeet were defeated with loss, but not until they had seen a white man fighting on the side of their hereditary foes.

Next year Colter and Potts, while trapping on the Upper Missouri, were surprised by a party of Blackfeet who still seemed not disposed to hostility. But difficulty soon arose, a fight ensued, Potts and two Indians were killed, and Colter made his escape.

These two encounters in which the Blackfeet suffered so signally, and, more particularly, the unfortunate appearance of especial friendship on the part of the whites for the Crow nation, as evidenced by the location of a trading-post in the country of that tribe, and by the presence of one of their number in the fighting ranks of the Crow, determined irrevocably the future attitude of the Blackfeet toward the whites. Whenever thereafter they met, it was always on terms of instant and deadly hostility.

It thus appears that the adventures of John Colter, which have hitherto seemed decidedly of the romantic and fictitious order, were the result of a definite purpose of trade with the Indians. His "route in 1807" was a simple business enterprise. His terrible experience with the Blackfeet was no fiction. His fame as discoverer of the Yellowstone Wonderland rests on a secure basis. But, with these claims to the remembrance of posterity, he must henceforth share the burden, so long borne by the great explorer Capt. Meriwether Lewis, of having been in part the cause of that malignant and lasting enmity of the Blackfeet towards the whites which, for upwards of three-score years, played so important a part in the history of the far West.

HIRAM M. CHITTENDEN.

IN MEMORY OF GEORGE STEPHENS.

TO THE EDITOR OF THE NATION:

SIR: A committee has been formed, with Sir Edmund Monson, British Ambassador to Austria, as chairman, and the Rev. C. A. Moore, late Chaplain of H.B.M.'s Legation in Denmark, as secretary, to establish a memorial to Prof. George Stephens, for many years in charge of the Department of English at the University of Copenhagen, but better known through his writings on runology. The memorial is to take the appropriate form of "a small Endowment Fund bearing his name, for the benefit of St. Alban's Church, Copenhagen, towards the founding and maintenance of which Prof. Stephens labored long and zealously."

* 'The Yellowstone National Park,' 1893.

Prof. Stephens had not a few friends in this country who have enjoyed his hospitality at the villa on Bianco Lunos Allée, and they will undoubtedly be glad to learn of this opportunity to express their regard. Subscriptions may be sent to the Rev. C. A. Moore, Gustav Adolf Strasse 6, Dresden, Saxony.—Yours respectfully,
DANIEL KILHAM DODGE.
CHAMPAIGN, ILL., May 28, 1896.

Notes.

STONE & KIMBALL have transferred their entire business from Chicago to No. 139 Fifth Avenue, New York; the *Chap-book* alone having been left behind as the property of Mr. H. S. Stone, formerly a member of the above corporation. They have nearly ready 'The Purple East,' poems principally about Armenia, by William Watson; 'The Yankees of the East,' a book of letters on Japan, by William E. Curtis, in two volumes with illustrations; 'The Thlinkets of Northern Alaska,' by Francis Knapp and Rheta Louise Childs, illustrated; 'Six Conversations and Some Correspondence,' by Clyde Fitch; 'Wives in Exile,' a society novel by William Sharp; 'In a Dike Shanty,' by Maria Louise Pool; 'An Adventurer of the North,' by Gilbert Parker; 'The Island of Dr. Moreau,' by H. G. Wells; and 'Miss Armstrong's and Other Circumstances,' short stories by John Davidson.

Edward Arnold announces for June first 'George's Mother,' a novel by Stephen Crane.

A popular Life of Edison, by E. C. Kenyon, is promised by Thomas Whittaker.

Macmillan's latest announcements are 'A History of Elementary Mathematics,' by Dr. Florian Cajori of Colorado College; a textbook of selections from Chaucer by Prof. Hiram Corson of Cornell; Leibnitz's 'Critique of Locke,' translated by Alfred G. Langley; an 'Introduction to Public Finance,' by Prof. Carl C. Plehn of the University of California; and 'Embarrassments,' short stories by Henry James.

'The Continent of America: Its Discovery and Baptism,' including an attempt to establish the landfall of Columbus on Watling's Island, by John Boyd Thacher, is an expensive work about to be issued in a limited edition by Wm. Evarts Benjamin, 10 West 22d St., N. Y.

T. Y. Crowell & Co. will soon issue 'Camilla,' a novel of society life in Stockholm, from the Swedish of Richert von Koch; 'The Victory of Ezry Gardner,' a Nantucket idyl by Miss Imogen Clark; and 'The Social Meaning of Religious Experiences,' by Dr. Herron.

From D. C. Heath & Co. we are to have 'The Problem of Elementary Composition,' by Elizabeth H. Spalding, and 'Select Poems of Robert Burns,' edited by Andrew J. George.

Houghton, Mifflin & Co. propose a Riverside School Library embracing a series of fifty books pertinent to the name of the series. Franklin's Autobiography, Andersen's Tales, the 'Vicar of Wakefield,' and 'Uncle Tom's Cabin,' among others, will enter into this collection.

The first complete illustrated edition of Marryat's works in Danish is about to be published at Copenhagen. The translator is P. Jerndorff-Jessen, and the translation will be revised, to avoid possible technical mistakes, by a prominent Danish naval officer. This precaution would be an admirable one in the case of many original works treating of the sea,

whose authors have less practical experience than the author of 'Peter Simple.'

What Mr. David Hannay has given us in his 'Don Emilio Castelar' (F. Warne & Co.) is a vivacious and cynical sketch of Spanish politics since the revolution of 1868, with Castelar only occasionally appearing as the *deus ex machina*, or, more frequently, the god run over and crushed flat by the machine. Of Castelar on his oratorical or his literary side, little or nothing is said; his personality is left almost wholly in the shadow. Of his political theories and political career, even, no formal account or summation is given. His name, in short, has simply furnished Mr. Hannay a peg upon which to hang his lively description of Spanish political methods and changes. This seems a little misleading, in a series specifically devoted to "Public Men of To-day"; but, after all, we think the author has chosen wisely. His long residence in Spain, and intimate acquaintance with the Spanish political character from the inside, make what he writes here of much more value than a perfunctory but more personal account of Castelar could possibly have been. For the light his incisive comments throw upon the present situation of Spain, his book makes an especial appeal to present-day readers.

'Studies in Plant Form, with some suggestions for their Application in Design,' by A. E. V. Lilley and W. Midgley (Scribners), is likely to prove a useful volume to many interested in ornamental designing. Not that the book itself is particularly good or the "suggestions" particularly valuable. The general remarks on the "principles of design" are slight, and the "concise accounts of the technical requirements of the different processes" are, though sensible, altogether too concise; but, as the authors remark in the preface, "it is seldom that the plant most suitable for a particular design is in season when it is wanted, and it is often . . . difficult (sometimes impossible) to find a drawing of the ornamental sides of many plants." They therefore conceived the idea of giving a series of somewhat simplified and decorative drawings of plant forms, supplemented by some very good and clear photographs from nature. The designs which the authors have formed from this material are not always extremely successful, but the material itself is most valuable.

Curtis & Co. of Boston, publishers of the "Copley Prints," recently noticed by us, send us a well printed little pamphlet by Ernest Fenollosa on the 'Mural Paintings in the Boston Public Library.' We heartily agree with Mr. Fenollosa's estimate of the importance, in forming a national school of art, of this effort towards monumental painting, and he says so much that we believe to be true, and so much more that we should like to believe to be true, that it seems ungracious to quarrel with his enthusiasm; but we cannot help the feeling that a greater reticence of language would have carried greater conviction. The implied comparison of Mr. Sargent to Michelangelo would assuredly strike that admirable modern painter himself as excessive, and a certain tropical luxuriance of phrase disguises the soundness of much of the criticism. Still, the criticism is sound and suggestive, and we recommend a reading of the pamphlet to any one who may have been tempted to think of "mere decoration" as of an inferior kind of art.

The *Portfolio* for April (Macmillan) is a rarity in that its interest is not only contemporaneous but American. We do not remember an instance, heretofore, of an American

artist, resident in America, who has received the honors of an elaborate monograph in an important foreign publication. Certainly no American artist deserves such homage more than Mr. John Lafarge, who has now received it. The text, by Cecilia Waern, is well written, and is illuminated by a liberal quantity of Mr. Lafarge's own charming prose. It makes no attempt "to assign him a set rank"—it will be many years before that can be done—but is wisely confined to an account of his "development, ideals, and aims, together with a few hints as to temperament and gifts that constitute his artistic personality." By a singular oversight the date of his birth (1835) has been entirely omitted. The illustrations are numerous and well executed, and give an adequate idea of the range of Mr. Lafarge's production, if not of its quality. Whether in paint or in glass, color is such an essential element of his art that he suffers more than most painters from any form of reproduction. We regret that something more was not given us in illustration of his admirable landscape painting, some of which will, we think, finally hold the highest rank in his completed work.

M. Auguste Brachet's 'Historical Grammar of the French Language' (Oxford: Clarendon Press; New York: Macmillan) is practically a new work, not only as enlarged, but as having been rewritten in great part by Mr. Paget Toynbee, whose competence is well known to scholars. The book, in fact, has been brought up to date, and the results of the most recent researches embodied in it. The whole of Book I., which treats of Phonetics, and forms more than half of the volume, is entirely original. Books II. and III. have also been so largely rewritten that Brachet's own share is greatly diminished, and his Introduction alone is retained nearly in full. Division into paragraphs and the addition of two very full indices, one of subjects and one of words, facilitate the use of the book for reference purposes.

'Devant le Siècle' (Paris: Colin & Cie.) is the last *recueil* of articles by the Vicomte de Vogüé, and contains some noteworthy pages. The study of Heredia's "Trophées," that on Taine, and that on Montégut have distinct value. The article on Canrobert is touching as well. "Premier Septembre" is a realistic account of so much of the war as the writer saw, interspersed with sound advice to his compatriots.

M. George L. Fonsegrive studies contemporary literature from the Christian standpoint, and is not ashamed to say so. Another recommendation is that he speaks intelligently on the subjects he treats, and his articles, originally published in *La Quinzaine* and now issued collectively under the title 'Les Livres et les Idées—1894-95' (Paris: Lecoq), are worth reading. It is really ideas more than the books themselves which he discusses. The following may be noticed more particularly: "Le Bilan de la Science," "Le Sentiment religieux dans le Roman," and "L'Éducation morale."

The fourth and concluding volume of Amédée Roux's history of Italian literature has just appeared (Paris: Plon & Cie.). It covers the period from 1883 to 1896. The lack of an index, so very common a defect in French books, diminishes the practical value of this work.

On May 14, 1796, Dr. Edward Jenner first performed the operation of vaccination, and in celebration of the centennial anniversary of this beneficent discovery the Imperial Board of Health in Berlin has issued a memorial entitled 'Smallpox and Preventive Vaccination' ('Blattern und Schutzpockenimpfung'). Vaccination was made compulsory in Bavaria as

early as August 26, 1807, but did not become generally obligatory in Germany before the enactment of the "Reichs-Impfgesetz" of April 8, 1874, the necessity of which was proved by the epidemic of smallpox that had raged a short time before in all the principal German cities except Munich, whose inhabitants remained comparatively free from the scourge. In 1895 the mortality from smallpox in Bavaria amounted to the fraction 0.017 of every 100,000 inhabitants; in other words, there were only seven cases and a single death. It is also shown that, with proper precautions as regards the purity of the vaccine matter, there is not the slightest danger of infection or of any injury whatever to the patient. The publication of these statistics is the answer of the Board of Health to the recent attempts in the Imperial Diet to abolish the law making vaccination and revaccination obligatory.

Members of the Faculty of the University of Göttingen have, in more than one way, in recent years shown their active interest in the advancement of woman. The articles on "Die Deutsche Frauenbewegung" by Prof. Gustav Cohn of the department of political science (*Rundschau*, March-May) furnish new evidence that the spirit of progress has found an abode in that famous seat of learning. The historical portions of Prof. Cohn's treatise are, on the whole, critical and philosophical rather than statistical (full statistics on the subject may be found in the work of Frau Lina Morgenstern, Berlin, 1895, and elsewhere), but he gives in broad outlines an interesting account of the movement during the last thirty years from the standpoint of a conservative and hopeful sympathizer.

The *Scottish Geographical Magazine* for May contains a timely article, by Capt. Maunsell, on Turkish Armenia and Kurdistan. Though mainly topographical, it gives interesting descriptions of scenery and of the people and their homes—for example, of an Armenian mountain-village which is occupied through the winter (many are deserted for the plains at this season), and whose street is covered so that the village has one common roof. "The interior is like a rabbit warren, and it is difficult for the uninitiated to grope about and escape being knocked down in the semi-darkness by cattle being driven in and out." Each house contains, in addition to the oven, a great vat for storing water in winter to prevent its being frozen. The author emphasises the importance, geographical and strategical, of the Armenian plateau with relation to the great lines of communication between Europe and Asia. There is also an interesting account of the Falkland Islands, the people, and their great industry, sheep-raising. In a population of 1,900 there is not one who is receiving aid from the poor-fund, and the average amount to the credit of the 250 depositors in the savings bank is \$650.

A most adventurous journey is described in the *Geographical Journal* for May. Mr. St. George Littledale, accompanied by his wife and nephew, starting from Yarkand early in January, 1895, crossed Tibet from north to south, coming within forty-eight miles of Lhasa. Here he was compelled to turn westward, and entered India through Kashmir. Some idea of the nature of the country traversed is given by the fact that from April 26 to October 16 they never descended lower than 15,000 feet, and for four weeks of that time had camped over 17,000 feet. At times the thermometer was ten degrees below zero in the tent, and the hair was frozen to the pillow. For seventy-five days they did not see a man.

Considering the inaccessibility of Lhasa to Europeans—nothing would induce the Lama Government to admit Mr. Littledale and his party—it is strange to read of the supplies which they received from this place, viz., scented soap, Wille's Bristol bird's-eye tobacco, and groceries wrapped in a queer old print of a London church. This may be a relic of the visit of Manning, the correspondent of Charles Lamb, the only Englishman who has succeeded in reaching Lhasa. The *Journal*, it may be added, incorrectly ascribes this exploit to George Bogle. Mr. Littledale made a rough, but remarkably accurate, route survey of 1,700 miles, much of it through absolutely unexplored country, discovering among other things a mountain chain with peaks 20,000 feet high. He brought back between sixty and seventy plants, found at a height of about 16,000 feet; and ten, including a "striking grass" and a fungus, are probably new to science.

The fourteenth annual report of the Dante Society of Cambridge, Mass., has for its chief accompanying paper some illustrations of the 'Divine Comedy,' extracted by Prof. Norton from the Chronicle of Fra Salimbene (composed 1283-'87), in the original Latin. These are largely concerned with historical personages, but also with incidents like the earthquake alluded to in *Inf.* xxiii., 37-42, in the fright caused by which Salimbene's mother left him in his cradle and hurried off with his two sisters. Resenting this in after years as a slight on his sex ("because she ought to have had a greater concern for me, a man-child, than for the girls"), he was assured that she picked them up as being larger and more portable.

The Woman's Education Association of Boston has established for the current year several scholarships for work in the summer schools, to be chiefly offered for the course in Physical Geography given by Prof. W. M. Davis of Harvard University. The sum at disposal is not large, and contributions are desired. They may be sent to Mrs. R. H. Richards, Institute of Technology, Boston, Mass. A circular issued by the Association enumerates summer courses for 1896 in eight colleges and universities, all at the East, save one (Chicago).

—Prof. Edward Channing of Harvard University has written for the Cambridge Historical Series the volume on 'The United States of America, 1765-1865' (Macmillan). In spite of a pervading impression of slowness, the book is one which may be read with some interest and considerable profit, although any attempt to give, within the narrow limits of three hundred pages, a clear and well-proportioned account of the history of the United States for a hundred years can never be quite successful unless accompanied by great skill in condensation and an unusually interesting style. Unlike most writers of similar manuals, Prof. Channing has apparently chosen to restrict himself to a presentation and discussion of leading events and important situations only, rather than to crowd his pages with facts; but while his selection shows, in general, a sure sense of the relative importance of things, he does not indicate many new points of view, nor are his comments very profound. As a history the book is of somewhat unequal merit. Much the best portion is that covering the period from 1765 to the beginning of Jefferson's first administration in 1801, which is "based on the author's own reading of the original sources"; the treatment is technical, however, rather than broad, and the discussion of the

relations between the colonies and the mother country lays at least due emphasis upon the merely legal aspects of the points at issue. For the period subsequent to 1801 the author freely acknowledges special indebtedness to other writers; this part of the work, therefore, presents few points calling for comment, beyond noting that the theory of nullification is summarily dismissed as "ridiculous," and that Prof. Channing has written a very readable account of the slavery controversy without leaving the impression that he regards the struggle as one of very profound significance. We have noted but few *errata*, and none of them serious. Georgia ceded its Western lands in 1802, not in 1801 (p. 111). The Ordinance of 1787 provided for the eventual formation of five, not six (p. 114) States out of the territory northwest of the Ohio River. Washington's proclamation of neutrality was issued in 1793, not in 1794 (p. 148); and Foot's resolution in regard to the public lands was introduced in December, 1829, not "in 1830" (p. 215). The statement (p. 125) that the eleventh amendment to the Constitution "limited the power of the Supreme Court," is hardly adequate. The volume is equipped with maps and a good index, and there is a useful select bibliography.

—At the "World's Congress of Librarians," held during the World's Fair at Chicago, in 1893, it was proposed to form a union of the principal libraries of Europe and America for the purpose of publishing facsimiles of the rarest and most valuable manuscripts. The cost of reproduction was to be borne by the associated libraries, and the facsimiles were to be distributed among them. It was furthermore agreed that the enterprise should be under the direction of W. N. Du Rieu, the librarian of the University of Leyden in Holland, and that the publisher should be A. W. Sijthoff of the same city. Owing to financial difficulties, this plan was not carried into effect, and the enterprising Leyden publisher has now undertaken to reproduce these facsimiles at his own expense under the editorial superintendence of Du Rieu. The first series will consist of six Greek and six Latin manuscripts, among which may be mentioned the *Æschylus* of the Laurentian Library of Florence, the *Dioscorides* of Vienna, the *Plato* of Oxford, the *Lucretius* of Leyden, and both the Florentine manuscripts of *Tacitus*. The first volume issued will be the manuscript of the first eight books of the *Sep-tuagint*, written in the fifth century, and formerly the property of the French councillor Claude Sarrau (deceased in 1851), and therefore known as the *Codex Sarraavianus*. It consists of 153 leaves, of which 130 are in Leyden, 22 in Paris, and 1 in St. Petersburg. A successful reproduction of these widely scattered fragments will bring them together in a single volume, and thus render the whole codex again available by scholars. The directors of European libraries are, as a rule, exceedingly liberal in placing their manuscripts at the disposal of the libraries of other countries for the promotion of special researches. The State Library of Munich has even permitted unique manuscripts to be sent to the United States for this purpose. But such a stretch of generosity is attended with great risks and might result in irreparable loss. Nearly every large library has among its manuscript treasures a limited number of so called *kimelia* (jewels), which are never lent, but belong to the category known in France as "manuscrits non-touristes." As the Leyden publisher announces, it is to the "reproduction des manuscrits grecs et latins non-touristes" that particular atten-

tion will be given. Excellent facsimiles of several *kimelia*, such as the Demosthenes in Paris, the Nibelungen in Munich, the Anglo-Saxon manuscript in Vercelli, the Psalter in Utrecht, and the 'Imitatio Christi' in Brussels, already exist and have met with unqualified praise. It is to be hoped that the new enterprise will be fully appreciated by scholars and receive the support of libraries and universities in this country. It is hardly necessary to insist upon the value of these facsimiles not only for the purposes of collation in editing texts, but also for imparting class-room instruction in paleography.

—Herr Wilhelm Bode, the well-known conservator of the Museum of Berlin, tells in *Pan* the story of how he formed the collection of Italian bronzes which is one of the glories of that gallery. With great modesty he attributes most of his *trouvailles* to chance and to good luck, but it is easy to see that his own unwearied activity, and his sureness of taste and keenness of scent as a connoisseur, have been more valuable to him than any luck. His first purchases date from a journey which he made into Italy at a time when he was only an attaché of the Museum. He had been commissioned to bring back some casts, but he convinced himself very soon that, with a little perseverance and good fortune, he could at almost the same cost obtain originals. It was thus that he bought the famous busts of the Palazzo Strozzi, Michelangelo's "St. John," a "Cavalier" of Riccio's, which he found at Venice, a "St. John" of Donatello's, and other most valuable works. Herr Bode tells his tale not without humor, and some of the stories of his ruses and tricks as a collector are most amusing. He was once paying a visit to Frederic Spitzer, who lived then in narrow lodgings in the Rue de Rivoli, when the Baron Adolphe de Rothschild was announced. Bode took refuge in a sort of lumber-room, and found there on the floor a great study of a head for a statue of Ludovico di Gonzaga, which he studied at his leisure. "When Spitzer came back," Bode says, "he told me with a smile that connoisseurs themselves had their moments of error, and that he had let himself be taken in when he bought that study. I concealed my surprise, and some weeks after I profited by his avowal and bought the sculpture very cheap through an agent." The famous Spanish statue, the "Madonna in Tears," which is one of the finest pieces in the Berlin Museum, was acquired by methods even less direct and frank.

—The Impressionists hold the Luxembourg in force, awaiting there the time of their triumphal march to the Louvre. The Caillebotte collection has just been accepted by the Conseil d'État. M. Gustave Caillebotte was himself an Impressionist painter, and in the course of the last thirty years had gathered together sixty-six canvases, works of his school, and at his death bequeathed them to the nation. At first there were some difficulties raised as to the legacy. M. Caillebotte had prescribed that his entire collection should go into the Museum; the directors of the Beaux-Arts, however, wished that certain pictures of minor value should be removed from it. A newspaper discussion arose upon this point, together with false rumors that the gift would be declined. In reality there was only a misunderstanding, and a very slight one at that, and the authorities of the Museum and the Caillebotte heirs are now entirely agreed. Forty pictures, instead of sixty-six, go to the Luxembourg. These canvases

have been chosen by the Conservator of the Museum and by the artists interested. Of Manet, there are two pictures; of Degas, seven pastels; of Cézanne, one painting; of Claude Monet, eight; of Renoir, six; of Sisley, six; of Pissarro, eight; there are also two of Millet's drawings. When one remembers the twenty years of insult and of obloquy through which the Impressionist school has struggled to its present position, and when one remembers also how recent is the time when Claude Monet had to fight almost desperately to win a place at the Luxembourg for Édouard Manet's "Olympia," one can see how substantial the present triumph is. The Caillebotte collection will be hung in a new gallery which is to be built upon the garden terrace, and which will open from the vestibule of sculpture.

—From 1871 to 1877 the late Viscount de Gontaut-Biron represented the French republic at Berlin; and, under the catching title 'An Ambassador of the Vanquished,' his friend and sometime chief, the Duke de Broglie, has described De Gontaut's experiences and the relations between France and Germany during the six years that followed the peace of Frankfurt. The book is based, as the title-page declares, upon the Ambassador's diaries and memoranda; but this material is obviously supplemented by De Broglie's personal knowledge of the events narrated. De Broglie was the leader of the French royalists; from May, 1873, to May, 1874, he was at the head of President MacMahon's cabinet, and, during the greater part of the year, he held the portfolio of Foreign Affairs. Incidentally his narrative throws light on the attempted restoration of the Bourbons in the person of "Henry V." The most interesting chapter, however, is that devoted to the "crisis of 1875," when it was feared that Germany intended to provoke a fresh war and crush France before her military power was restored. It seems clear that Moltke and the military party in Prussia favored this course. It is admitted, even by De Broglie, that King William was opposed to it. What is disputed is the attitude of Bismarck. He has always maintained that he had no idea of provoking a war. De Gontaut, however, distrusted him, and intimated, as De Broglie tells us, the measures which secured the intervention of the Russian diplomacy. According to De Broglie, the peril was a real one, and the Ambassador's prompt and shrewd action saved his country. The animosity which Bismarck henceforth displayed against De Gontaut is depicted as the natural resentment of a violent man against the antagonist who has foiled him. The German side of the story is that Bismarck, deeply resenting the unnecessary interference of Russia, resented also the French suspicion which had invoked the interference; and if he held De Gontaut chiefly responsible, it appears from De Broglie's testimony that he was not in error. The volume is translated and annotated by Albert D. Vandam, and published by Macmillan. The character of the translation may be illustrated by a few random excerpts. We read of De Gontaut's "rapid advance into a midst which lent itself so little to it" (p. 24); of "scruples which prevented part of the Royalists to adhere" to a project (p. 72); of "dissentiments" between Bismarck and Von Arnim (p. 75); and of "the severe appreciations enumerated in the course of the Bazine trial with regard to the conduct of the Prussian generals during the war" (p. 146). For the notes which Mr. Vandam has inserted no cause appears except that, like

Mercutio, but with less reason, he "loves to hear himself talk."

THE COURTSHIPS OF QUEEN ELIZABETH.

The Courtships of Queen Elizabeth: A History of the Various Negotiations for her Marriage. By Martin A. S. Hume, F.R. Hist. S., Editor of the Calendar of Spanish State Papers of Elizabeth (Public Record Office). London: Unwin; New York: Macmillan. 1896. Illustrated. Pp. vi, 348.

THE history of royal loves and marriages is not angelic or august. True love has seldom run in the course marked out for it by statesmanship or diplomacy, and scandals have been the natural result. Royalty has a claim on our pity and our charitable allowance, since it is generally deprived of conjugal affection, which to the rest of us is the nurse of virtue. Even George IV., had the law allowed him to marry Mrs. Fitzherbert, who seems to have been in every way worthy of love, might have been made a better man. State policy compelled him, in her stead, to take a bride the first sight of whom made him call for brandy. In England every proposal of a dotation for one of the royal family calls forth angry protests from the democracy; a vote for one would almost cost a Radical member of Parliament his political life. Yet so long as the Royal Marriage Act prevents the members of the royal family from marrying whom they please, equity will surely entitle them to dotation. Why do not the Radicals move to repeal the Royal Marriage Act, and restore to the members of the royal family their natural liberty of choice? Princes and princesses would then have no need of marriage portions from the public. They might take their choice among the Rothschilds, Hirsches, Vanderbilts, and Jay Goulds.

In making a special study of the courtships of Elizabeth, Mr. Martin A. S. Hume has had the aid of the Spanish state papers of the reign at the Record Office, of the calendar of which he is the editor, and which could not fail to throw new light upon the subject. The history which he lays before us is a singular mixture of the action of coquetry with that of diplomacy. We are inclined to think that there was in it rather more of coquetry and less of diplomacy than Mr. Hume supposes. When Elizabeth tries to draw Philip II. into a positive offer for her hand, in order, as Mr. Hume says, that she may have the satisfaction of saying that she refused him, coquetry surely predominates over policy. Mr. Hume truly depicts Elizabeth's vanity as perfectly insatiable, so that only those who would consent to pander to it could hope for a continuance of her favor, and such a foible was not likely to observe diplomatic limits. It is pretty evident, also, that sex was strong in her, and that Shakespeare's lines describing her as passing on "in maiden meditation, fancy-free," which Mr. Hume takes for his motto, are more beautiful than true. Still, the diplomatic significance of the biddings and chaffings for her hand was unquestionably great. They helped her council to maintain the balance between France and Spain, whose conjunction might have been fatal to the Protestant realm. To credit them, as Mr. Hume does, with "the making of modern England," seems to us, we confess, going too far; but they undoubtedly did much to ward off danger. We cannot help thinking, however, that the England of Walsingham, Drake, and Sydney would, without

any royal courtships, have managed somehow to save itself.

One dark episode, at all events, in the history there is which had in it nothing diplomatic. Most readers will learn from this treatise for the first time that the modesty of Elizabeth received a shock in her early youth from scandalous treatment undergone at the hands of Lord Seymour, to whose care and that of his wife, Catherine Parr, the Queen Dowager, she was for a time consigned. This in some measure prepares us for her extremely immodest flirtation with the handsome and unprincipled Leicester. That the flirtation went beyond extreme immodesty Elizabeth, when she supposed herself to be dying, positively denied, and her denial may be believed. But it is certain that she openly received Leicester's addresses, knowing that he was already married to Amy Robsart. Here we will let Mr. Hume speak:

"Shortly afterwards, in September, 1560, Cecil took the Bishop (Quadrà) aside and complained bitterly of Dudley, who, he said, was trying to turn him out of his place; and then, after exacting many pledges of secrecy, said that the Queen was conducting herself in such a way that he (Cecil) thought of retiring, as he clearly foresaw the ruin of the realm through the Queen's intimacy with Dudley, whom she meant to marry. He begged the Bishop to remonstrate with the Queen, and ended by saying that Dudley was thinking of killing his wife, 'who was said to be ill, although she was quite well.' 'The next day,' writes the Bishop, 'as she was returning from hunting, the Queen told me that Robert's wife was dead, or nearly so, and asked me not to say anything about it. Certainly this business is most shameful and scandalous; and, withal, I am not sure whether she will marry the man at once or even at all, as I do not think she has her mind sufficiently fixed. Cecil says she wishes to do as her father did.' In a postscript of the same letter the writer gives the news of poor Amy Robsart's death. 'She broke her neck—she must have fallen down a staircase,' said the Queen. Henceforward Dudley was free, and the marriage negotiations had another factor to be taken into account."

Before this the Bishop had learned, from a quarter deemed by him trustworthy, that Leicester meant to poison his wife. He afterwards adhered to the opinion that she had been murdered; so, pretty evidently, did Burleigh; and the belief was so rife that preachers in the pulpit impugned the honor of the Queen. Elizabeth might have been made to believe that Leicester's wife was dying, though she ought to have repelled with disgust addresses made to her by the husband of a dying wife. But when the dark prediction was fulfilled by Amy's sudden and violent death, it seems impossible that she should not have divined the truth. Yet she continued her flirtation with Leicester, and, had he been of princely rank, would evidently have made him her husband.

That Leicester's wife was murdered it is hardly possible to doubt. An accidental death could not have been predicted. The hypothesis of suicide has not a shadow either of evidence or of probability in its favor, while it is directly contradicted by the verdict of "misadventure." There was, of course, a studious show of fair inquiry; but we know what Leicester's influence was and what juries were in those days. Why did not Leicester himself go to the spot and institute the investigation in person? Why, but because the villain dared not look on the face of his murdered wife? That he was a villain all the world believed. He had an Italian "physician" at his side. His second wife accused him of practising on her life. Twice Mr. Hume implicates him in an assassination plot. He was ready to sell his country and its religion to Spain for Spanish support

in his matrimonial scheme of ambition, though he afterwards affected to be the patron of the Protestant party. The Catholic morality was dead. The new Protestant morality, though it was gaining ground among the people, had not yet extended itself to the courts, even to those which had broken with the Papacy. Elizabeth had no scruple in instigating Sir Amyas Paulet to make away with Mary Queen of Scots. Nor had she or her councillors any scruple in renewing their connection with Catherine de Médicis, and negotiating with her for a marriage with one of her sons, after the massacre of St. Bartholomew.

Philip II., his son Don Carlos, the Austrian Archduke Ferdinand, the Scotch Earl of Arran, Eric King of Sweden, Charles IX. of France, the French Princes Anjou and Alençon—the diplomatic flirtations or semi-flirtations with all these (the amour with Leicester still going on and helping to defeat the other plans), form about as tangled a skein as it was ever the lot of a historian to unwind. For the accomplishment we must refer to Mr. Hume's pages. A spider's web would be as easy to analyze. The most amusing of the courtships, as well as that which came nearest to bearing fruit, was the courtship of the Duc d'Alençon. The Queen's age was double that of her suitor, but he affected to be dying with love of her, so that courtiers said he would have a good voyage across the Channel if he did not swell the waves with his tears. He was deeply pitted with smallpox, and his figure was far from imposing, yet the Queen seems almost to have had serious thoughts of him. She gave him the pet name of her "frog"; she responded to his burning love-letters, and bade him address her as his wife. She flattered his hopes with "nouvelles démonstrations, accompagnées de baisers, privautés, caresses, et mignardises ordinaires aux amants." At his death she wrote to his excellent mother that if a picture of her heart could be seen, there would be seen a body without a soul. This ended the series of courtships, as well it might, the Queen being now fifty, though her vanity exacted from her courtiers the language of love as the condition of her favor to the end.

It was fortunate for England that of the negotiations for a Spanish, an Austrian, and a French marriage, none took effect. Any one of those connections would have thrown a heavy weight into the scale of Catholicism and reaction. The best policy, if there was to be marriage, was probably that indicated by the nomination of the Scotch Earl of Arran. Had there been a Scotch Protestant up to the mark—which the Earl by no means was—the marriage would have united the two kingdoms, and the island realm might then have bid defiance to its foes. But the only Scotchman who was personally a fit mate for the Queen of England would have been excluded, even when he was unmarried, by the bar sinister on his birth.

The nation earnestly desired that the Queen should marry, both to put a stop to scandals and to secure the succession. Parliament gave expression to the wish. Elizabeth's refusal to marry, if the best husband offered her was Alençon, we can well understand. Her steadfast refusal to name a successor it is not so easy to explain. She left the country to the chances of a disputed succession and a civil war. It is difficult to imagine any motive other than unwillingness to part with power. Pity, at all events, Elizabeth deserves, as a woman undoubtedly of warm temperament and strongly inclined to marriage, yet debarred from it by her position. There is no diffi-

culty in understanding the melancholy which clouded her last days. We need not resort to the pathetic fable about Essex and the ring, or to the more refined hypothesis that she was saddened by the departure of her era—a notion belonging rather to modern philosophy than to Tudor times, to which *fin-de-siècle* fancies were unknown. Elizabeth was a woman; she had dallied with love all her days; and now the end had come and she had missed her happiness.

BRUCE'S ECONOMIC HISTORY OF VIRGINIA.—II.

Economic History of Virginia in the Seventeenth Century: An Inquiry into the Material Condition of the People, based upon Original and Contemporaneous Records. By Philip Alexander Bruce. Macmillan & Co. 1896. Map. 8vo, pp. xix, 634, 647.

IN an agricultural colony poor in capital and growing but a single commercial crop, and one thought to require extensive cultivation, the question of the source of an adequate supply of labor was of great importance. Land was practically unlimited in quantity, but even the land must be cleared of the forest—an arduous task—before the first plant could be laid down. A few years under tobacco exhausted the natural fertility of the soil; fertilizers were too difficult to obtain, and, even when had, proved noxious to the flavor of the tobacco. It was cheaper to move on to a fresh piece of land and begin anew the culture. From the origin of the settlement labor was in demand to clear the forests, and all through the century the labor question was prominently before the planter.

This question was solved, as far as was possible, in two ways: by the employment of servants and the purchase of slaves. The one led easily to the other, and the introduction and general use of negro slaves were followed by consequences which have colored the entire current of our national history. The account of the "servants" given by Mr. Bruce is adequate, very satisfactory, and in many points novel. It is, further, especially notable as an instance of his well-balanced and fearless treatment of a controverted topic. More than thirty years ago the Virginia "cavaliers" were written of in terms of derision, and it was charged that the very scum of England was, in the seventeenth century, dumped perforce into the colony. The poor, the incapable, and the felon were alike regarded as fair "colonial goods," and were shipped as merchandise to be sold to the highest bidder in America for a term of years. Such a conception of the early colonizing methods was an exaggeration upon its face, but it was seriously accepted as historically true, and the display of authorities in its support seemed to be conclusive. That felons were sometimes transported to the colonies is true. Nor is it strange, when it is remembered that the law of the day punished about three hundred crimes with death. One who was condemned to suffer the extreme penalty was a felon; but he might have sinned under mitigating circumstances, and, by a judge inclined to mercy, exile to Virginia was offered in lieu of the gallows. But the policy of the Virginia Company was always against receiving criminals, and, after its dissolution, it was by the act of individual merchants, and not as a settled policy of state, that convicts were introduced. The result was a mere sprinkling of this undesirable class. By far the larger part of the immigration consisted of

those who had left England because of extreme poverty, or by reason of political disturbances and rebellion in Ireland and Scotland, or those who voluntarily indentured themselves to secure transportation. Still another source of emigrants from England, admirably described by Mr. Bruce, was abduction. In 1680 it was estimated that upwards of ten thousand persons were annually "spirited away" and sent out of England, leaving no trace. As this horrid business involved the kidnapping of a large number of mere children, the press gang becomes respectable beside it.

Once in the colony, the servant was bound to his master for the term of his articles. As the majority of them were still young, a service of from three to seven years would cover the cost of transportation. Their treatment was good, their food better than that given to laborers in England, and they enjoyed the distinction of being esteemed the very best of imported merchandise; a constant demand for servants maintaining the market. After the expiration of service they became members of the community, and their descendants were the equals of those of a full citizen of the colony. That this system was a makeshift, and attended with evils difficult to counteract, the extensive legislation on servants proves. Runaways were common, and the neighboring wilderness made them easy. To maintain the ascendancy of the master, cruelty was authorized, such as branding; but it does not appear that this was often applied or ever carried to excess. It was natural that some friction between master and servant should exist in a system of partial slavery; but this stage was gradually displaced by one of full slavery, where the control of the master was absolute during the life of the slave, and not for a few years only. In the first half of the seventeenth century, servants greatly outnumbered the slaves; but the latter increased more rapidly in proportion, and at the beginning of the eighteenth century the number of slaves was nearly as large as that of servants. The improved economic condition of England must account for the smaller movement of servants.

A Dutch vessel in 1619 brought the first negroes to Virginia, but for seventy years the means of obtaining Africans were limited. As a slave was a laborer for life, and by breeding could supply his successors, he was regarded as a cheaper workman than the white servant, who could be held for a few years, and at the expiration of his term was reasonably certain to leave. The importation of this human merchandise rose gradually from very small numbers to about five hundred a year, when the ability of the planters to purchase was crippled by the troubles of Bacon's rebellion. In the last decade of the century the Royal African Company was the agency of supply; and it is not a little significant that, in the last ten years of the century, the African had almost entirely supplanted the white servant as the basis of head-rights to land. At the same time the Virginian-born slave had become so much the more desirable as to command a better price than the newly imported negro. The slave, or "servant" as he was called, was classed as personal property until the end of the century, when he became by law real estate, except when in the hands of a merchant. But the introduction of the negro amounted to a revolution, for he could not amalgamate with the whites, and, even if freed, retained his peculiar place in the social system, though admitted to certain political privileges if he owned land. In food, clothing, and medical

attendance, the slave was believed to be less costly than the white.

On this point we find a serious difficulty in accepting Mr. Bruce's conclusions. He questions the wastefulness of slave labor, "not only in the colonial period, but in the period between the Revolution and the war between the States"; and attributes this waste to the staple grown, tobacco. Large farms and fresh fields were demanded for the successful growth of the plant. He says:

"If the culture of tobacco were very profitable, the tendency to enlarge each estate would be just as strong to-day in Virginia, with labor emancipated, as it was during the existence of slavery. That institution only promoted the extension of the plantation by cheapening labor to the lowest point, which to that degree increased the owner's returns from his crops, enabling him to invest a greater sum each year in land. . . . If for every servant brought into the Colony between 1675 and 1700 a negro had been substituted, the accumulation of wealth by the planters would, during this period, have been more rapid than it was, not on account of their ability to raise a larger quantity of tobacco for sale, which would have been undesirable, as the supply throughout the century was even larger than the demand, but on account of that curtailment in the cost of production which would have followed from the employment of laborers bound for life and not for a term of years."

This is hardly a correct application of an economic principle. The same conditions applied to cotton and to rice as to tobacco; yet the returns are greater, and the actual cost of culture less, under free labor and with small farms than in the palmiest days of slavery. It is a pity that Mr. Bruce could not have proved his point by comparing the yield of tobacco on two farms, the one employing servants and the second slaves, other conditions being nearly equal. The intelligence of the servant must have been to his advantage; and a century later the farmers of Virginia, using slaves, could not produce the cereal crops in competition with Pennsylvania, using free or artied labor. The slave has proved to be the costliest of labor. He works under compulsion, and therefore works ill; he enjoys none of the fruits of his labor, and therefore has no inducement to work well; he shares in none of the betterments of a saving of labor, and therefore he has no call to improve. Paint the plantation system in as rosy colors as you please, there is ever the shiftless, wasteful, and improvident economic background. That slave labor in early Virginia was a step, perhaps a necessary step, in the development of tobacco-culture, need not be questioned. It was as necessary as the white or indentured servant, and, had it been a temporary expedient, the injury to society and agriculture would have been easily overcome on its disappearance. But it became not merely a permanent feature, but the sole form of labor; and that, in the long run, meant ruin to the planter and the reduction of the land to infertility. The economic blunder of slavery was nearly as great, and quite as lasting, as the social blunder. Adam Smith vindicated the virtues of free labor as against slave labor with as much force as he vindicated free commerce against the mercantile system.

So much has been said of staple and slave as to forbid any lingering on other subjects treated by Mr. Bruce. The money system of the colony, the manufactures of the plantation, the rudiments of commerce, the relative value of the estates and the town life, are a few of the general topics of his chapters; and on every point he is full, accurate, and free from bias. It is a pleasure to meet with so

satisfying a work, whether regarded as a history or as an exemplification of political economy, and it is destined to rank high as a product of careful and untiring investigation, of enthusiasm tempered by discretion and scholarship. A very full index increases the usefulness of the work.

The Diary of a Japanese Convert. By KANZI UCHIMURA. Fleming H. Revell Co. 1895.

THE relations of Christendom and heathendom have not produced another book, from the heathen side, so interesting and valuable as this, which we can now recall. After some introductory matter, we have a journal covering a period extending from 1877 to 1888, and, what is of much greater interest and importance, the deliberate comment on this journal of the mature man. The preliminary account of the author's parentage and early training is instructive and also entertaining, because it is enlivened by those humorous touches which give the book throughout much of its fascination. "Amidst solemn instructions" of his father "about duty and high ambition," he "discerned words of emulation for study and industry with an opulent harem in view." His superstitious relations to the various gods were serious enough in their day, whatever occasions they furnish him for present laughter. Entering a new Government college, he was forced against his will and conscience by the senior class to make the Christian confession. But the proof of the pudding in the eating was extremely satisfactory. "One God and not many was indeed a glad tidings to my little soul. . . . Monotheism made me a new man. I resumed my beans and eggs." Straightway all his superstitious fears vanished into thin air. The enforced adhesion to Christianity was followed in a few months by an emotional conversion and admission to the Methodist Church. A little company of students formed a church organization and cultivated their piety with mutual emulation. But, remaining on their knees for an hour, they found "synovitis" ensuing, and "the general cry was for short prayers," especially as their leader went to sleep in his devotions, with his head bowed on the flour-barrel that answered for a pulpit, and was awakened with difficulty. Another experiment was tried—giving up the meetings to debate, so that they might sharpen their weapons against sceptical attacks on Christianity. The first meeting ended in something very like a row, and the former methods were resumed. Sometimes there were insinuations in the prayers, "not to be heard, of course, by our Father in Heaven," but only by the other devotees. In the whole business there was much immaturity and foolishness; also much junketing and jollity. At the close of the college course virtue had its reward, the Christians making all the class speeches and getting all the prizes but one.

Resolved to "disperse the heathen as we do street-dogs," with much friction and misunderstanding an independent native church was founded by the young graduates. The Methodists wanted back the money they had given, and it was paid. The depleted treasury was filled up by the heroic sacrifices of the young converts, and the finished church was soon out of debt. A great gathering of Christians in 1883 suggests a chapter on Sentimental Christianity. It was said to be a Pentecostal time, but young Uchimura could not obtain the "gifts of the spirit," however he might beat his breast and focus his mental vision on his deceitful heart, as he had been told he must do

by a fiery Methodist exhorter. Nevertheless, his feet slid in due time.

"With the daily and weekly increase of friends and acquaintances among the believers, my religion was fast inclining towards sentimentalism. Fresh from my country church, with childish innocence and credulity I plunged into the Turkish-bath society of metropolitan Christianity, to be lulled and shampooed by hymns sung by maidens, and sermons that offended nobody."

More or less laxity among the converts, especially in their sexual relations, was the inevitable result of the demand for a numerical increase of converts and of the emotional excitements resorted to in order to draw them in and keep up their nervous tension. A Life of John Howard, and Charles Loring Brace's 'Gesta Christi,' gave Uchimura a timely check upon his downward course, and, hoping to find in Christian civilization the practical realization of his new and loftier ideals, he crossed the Pacific Ocean and landed in California.

From this point onward Mr. Uchimura's book has a peculiar value, far in excess of that of the preceding matter. To that useful gift which enables us to see ourselves as others see us, few of our foreign visitors have contributed so much. He was very much astonished at the familiar every-day use of Scriptural and religious language by Americans. When a railroad car stopped with a jerk, there was an outburst of such language, and on every similar occasion. A misfortune befell one of his friends: "He was pick-pocketed of a purse that contained a five-dollar gold piece." Later he lost his new silk umbrella on a Fall River steamer. "I felt the misfortune so keenly that only once in my life I prayed for the damnation of that execrable devil who could steal a shelter from a homeless stranger at the time of his dire necessities." The use of keys and other devices in America to prevent robbery was in strange contrast with the simple confidence of his Japanese experience. In no respect did Christendom seem to him so much like heathendom as in its intense race prejudices, and especially towards those whom the people of the North "had bought with their own blood." A still greater anomaly was the anti-Chinese sentiment. This point is elaborated with much force and eloquence. Pugilism, lotteries, intemperance, lynching, political corruption, and religious jealousies—all these confounded Uchimura, and determined him never to defend Christianity again by holding up the morality of Europe and America.

In Pennsylvania he entered an asylum for idiots as an attendant. The Superintendent, whose favorite hymn was Dr. Furness's

"Slowly by God's hand unfurled,"

pronounced the Unitarians "the narrowest and driest of sects." Nevertheless, his wife was one of them, and Mr. Uchimura could not resist the beauty of her life. Henceforth his religious sympathies must include such as she. "I believe," he says, "an orthodoxy that cannot be reconciled with such a Unitarianism as hers is not worthy to be called orthodox or straight-doctrined. The true liberality, as I take it, is allowance and forbearance of all honest beliefs with an unflinching conviction in one's own faith."

The next step was to a New England college. A great missionary meeting stirs Uchimura to some caustic observations: "The show is worth seeing in all respects." "Converted heathen are made good use of as circus men make use of tamed rhinoceroses." But he advises "the circus men to be more considerate in this matter. On the one hand, they spoil the

tamed rhinoceroses, and also induce the untamed ones to simulate the tamed, for that they find the easiest way of getting things good for their rhinoceros flesh." He does not believe in "pity" as a missionary motive, but holds that the effort based on it "might be withdrawn without much detriment to the sender or the sent." While at the college he embraced the orthodox scheme of redemption as he had never done before. Apparently, the influence of the good president had much to do with this, for, going to a theological seminary, he found theology "the driest and most worthless of all studies," while the laughing and jesting of the students over the most serious problems was to him simply shocking. He resolved that such a course could fit neither a Christian nor a heathen to be a good missionary, and he went back to Japan.

In conclusion, he expresses his faith in missionary enterprise while laying his finger here and there on many a festering sore: "Though we despise godless science, yet scienceless evangelization we do not put much value upon. I believe faith is wholly compatible with common sense, and all zealous and successful missionaries have had this sense in abundance." This is one of many pungent sayings that our missionaries should con and inwardly digest.

England's Wealth Ireland's Poverty. By Thomas Lough, M.P. London: T. Fisher Unwin; New York: Putnam. 1896.

THIS book treats of the financial relations between England and Ireland, a matter which for the last two years has been under investigation by a Royal Commission, though no report has yet been made. Mr. Lough has exceptional qualifications for dealing impartially and freshly with a matter hitherto usually left to officials and professional statisticians. He is Irish-born, but not a Catholic, a wholesale merchant in London, Member of Parliament for an English constituency, and actively engaged in London municipal affairs. His personal acquaintance with Ireland, where he has a summer residence, has enabled him to expose and correct many current official fallacies and misrepresentations.

Mr. Lough has made a dry and technical subject pleasant reading and easy of comprehension. Admirable diagrams, in addition to unavoidable tables of figures, give graphic representations of the relative changes in population, taxation, pauperism, trade, etc., in each decade of the century. We are shown the fulfilment of Grattan's words: "Rely on it that Ireland, like every enslaved country, will ultimately be compelled to pay for her own subjugation. Robbery and taxes ever follow conquest; the nation that loses her liberty loses her revenues." The revenue from Ireland paid into the imperial exchequer is from eight to nine million pounds yearly, and the British Treasury maintains that this is spent for the benefit of Ireland. But all expenditure occurs at the pleasure of the British majority; Irish members are in a minority, and cannot control it. Ireland's revenue is largely spent for British purposes, or is wastefully spent in Ireland according to ignorant British notions of what Ireland ought to want. Since the Union, the unbroken course in fiscal matters has been an increase per head of Irish taxation and a decrease of British.

As an example of how the Irish taxes are spent, we find that the military and police together amount to one armed man for every twenty peasants. The police force under British management has increased continuously

in numbers and in cost, while population and crime have diminished; the cost of this "secondary army" is as much as the whole taxation of the country was ninety years ago. The total cost of the police force in Scotland (under local management) is only as much as that of the police pensioners in Ireland. Here is Mr. Lough's picture of the police arrangements in the village of Killshandra, a village of 800 inhabitants, once prosperous, now decayed, and "about as neglected a place as you could find in a civilized country":

"In this village is a barrack containing ten men. This costs £1,000 a year; in Great Britain one policeman would be sufficient for two such villages. But it will be said there is more crime in Ireland. This, however, is a question of fact, and statistics show that, out of every 100,000 people, there are 59.7 in prison in England, 69.6 in Scotland, and only 58.4 in Ireland. In the neighborhood of this village there has been no serious crime for the last half century, and during that time the population of the district has fallen to half, but the number of the police steadily increases. The members of the force are the only prosperous people in the place. They are well fed and clothed and their duties are exceedingly light. They collect agricultural statistics; prepare small cases for the petty sessions. Two await the arrival of every train, and two others watch with interest its departure. They have bicycles, dogs, and a boat for fishing."

This extravagant and unnecessary expenditure extends into every branch of government. The Lord Lieutenant and his household cost about £40,000 a year. The smallest details of local government are controlled by the Imperial Parliament; even the county road authorities are practically appointed by the British Government, not by the ratepayers whose money they spend. The assessment for rates is made by an imperial instead of a local authority, as in the rest of the United Kingdom. The same extravagance appears in the civil establishments. There are "boards" for every conceivable purpose, with from three to five highly paid Commissioners at their head. In England one chief suffices, and he is responsible to Parliament, and can explain or defend his action there, while Irish Commissioners are in most cases under the Treasury, and unamenable to public opinion. With all this waste of the revenue it is difficult to get money for such objects as education and the development of the resources of the country. The simple conclusion, Mr. Lough points out, is that "Ireland is a nation starved in the midst of plenty." We strongly recommend any one interested in the Irish question to read this interesting book.

A History of the Warfare of Science with Theology in Christendom. By Andrew Dickson White. 2 vols. D. Appleton & Co. 1896.

MR. WHITE's book, a development of his 'Warfare of Science,' is a conscientious summary of the body of learning to which it relates, accumulated during long years of research. He puts the whole in a narrative form by taking a number of the chief departments of science, natural history, chemistry, astronomy, geography, geology, therapeutics, hygiene, and philology, and telling the story which shows how each one had to be freed, by the patient toil and sacrifices of generations of students and martyrs, from the shackles of theologic and theocratic error; how the constant struggle of the Christian Church through centuries was to stifle knowledge, and how only within the lifetime of those now living has it at length yielded the field. The book is produced as a

sort of *Festschrift*, or tribute to Cornell University, one of the first institutions in the world dedicated primarily to pure science—a foundation which at once proved the means of fanning into a cheerful but harmless glow, for the benefit of a few local and belated friends of bigotry, the dying flames of theologic hate.

Perhaps the most remarkable chapter in the book is the first, in which Mr. White gives an account of the substitution for the original theologic view of the universe, as created by acts such as might be attributed to a human being endowed with superhuman power, of the theory of evolution, ending with natural selection, and the triumph of the Darwinian explanation of the origin of species. The account is not only instructive, but in part entertaining. Darwin's 'Origin of Species' was published in 1859, and was received by the religious world with a chorus of disapproval at once fierce and grotesque. The doctrine, they said, of evolution of the higher from the lower type was untrue, contrary to religion, and absurd on its face. The Bishop of Oxford declared that Darwin had tried to "limit God's glory in creation," and that natural selection was "absolutely incompatible with the Word of God." A clerical reviewer suggested that it would have been more modest in Darwin "had he given some slight reason for dissenting from the views generally entertained." A distinguished clergyman, vice-president of an institution founded for the pious purpose of combating "dangerous" science, declared Darwinism "an attempt to dethrone God." Mgr. Ségur declared of his teachings that "they come from hell," and the Pope said that they were opposed "even to Reason herself." At Cambridge, Whewell, himself a scientific man, refused to allow a copy of the book to be placed in the library; at the American college at Beirut "nearly all the younger professors were dismissed for adhering to Darwin's views"; Dr. Woodrow, for professing belief in them, was turned out of the Presbyterian seminary at Columbia, and Dr. Winchell had to leave Vanderbilt University. And all this took place in the latter half of the nineteenth century.

Considerable additions would be needed to make Mr. White's narrative complete. The whole subject of government, for instance, as a branch of study, has been emancipated from theological conceptions within very recent times. The book is mainly confined to natural science; but the subject of interest and usury is gone into, which is not a question of natural science at all. On the whole, these volumes must be consulted chiefly for facts, not exposition. No attempt is made to explain the process by which modern conceptions of science and modern methods of investigation have driven theology off. Among the facts collected, Mr. White does not fail to notice the curious evidence tending to show that many of the great modern discoveries of science seem to have suggested themselves to the Greeks, and then to have lain dormant for centuries, to be brought to notice again only after Greek, Roman, and mediæval civilization had in turn been swept away. Curiously enough, the same thing is true of political science. Aristotle is its father, but, after he had classified governments under the three heads which still roughly answer our purpose, substantially nothing was done until the seventeenth century.

The only criticism which we shall venture to offer of a work which is a monument of industry, is that Mr. White seems to us to make a mistake in thinking that he is called upon to

offer any suggestions as to the reconciliation to be effected now between science and religion. That is the task which the persecuted followers of truth were compelled to undertake for many centuries at the peril of their lives. Galileo was called upon to justify science; Grotius was called upon to defend toleration of the pursuit of knowledge. But that day has gone by. It is science which is established now, and, if there is to be a reconciliation, it is religious truth which must justify itself. Science proves, Mr. White tells us, the ascent of man, not his fall. To say that the Bible is a "revelation" of the ascent of man, as he also does, is to indulge in a metaphor which, in his mouth, tends to confuse rather than enlighten.

Books and their Makers during the Middle Ages: A Study of the Conditions of the Production and Distribution of Literature from the Fall of the Roman Empire to the Close of the Seventeenth Century. By George Haven Putnam, A.M. G. P. Putnam's Sons. 1896. Vol. I., A. D. 476-1600. 8vo, pp. xxvii, 459.

THIS continuation of Mr. Putnam's book on 'Authors and their Public in Ancient Times' begins with a description of the production of books after the downfall of the Western Empire. It is full of curious information concerning book-making arts in monasteries, which were first made a clerical duty in Italy by Cassiodorus and S. Benedict, during the sixth century. The rule of S. Ferreol, written about this time, says, "He who does not turn up the earth with the plough, ought to write parchment with the fingers." Nuns were also required to copy, and some were in distinction as illuminators. "Scriptoria" were soon established in Germany, France, Holland, and Ireland. England seems to have been slow to practise book-making arts, for it was at the close of the seventh century before the monasteries at Wearmouth and Yarrow became centres of a transient literary activity. Then followed the establishment of libraries outside of monasteries, the education of copyists who were not ecclesiastics, and the distinct business of selling manuscript books. When the early Italian universities drew many pupils to them, dealers in books, *stationarii* and *librarii*, flocked around their courts. In the thirteenth century there were enough of them in some of the larger cities to give names to the districts in which they made their sales. Ave Maria Lane, Pater Noster Row, Amen Corner, in London, indicate that these early booksellers made petty book sales as well as big ones, and that they had dealings with common people as often as with scholars. In the Latin Quarter of Paris as well as in the vicinity of Italian universities, the booksellers were kept under restraint, which compelled some of the number to seek for buyers in places where trade was more free.

Just before the invention of typography, the copyists of Bruges, Ghent, and Antwerp, aided by illuminators and decorative book-printers, had organized corporations for the better practice of their trades. Book-making in its highest achievements was deservedly rated as one of the fine arts, for it had enlisted the services of famous painters. The desire for a fine book like the "Grimani" breviary or the "Hereford Missal" was as common among men of wealth and taste as the desire for fine pictures. But books like these, usually made to order for princes and nobles, could not be considered subjects of trade. A trade in cheap books was maintained, not only in the small shops of

cities, but at markets and annual fairs. Beginning with the sale of devotional pictures and little books of colored pictures, some with and some without explanatory text, soon to be engraved on wood and printed from the block, a way was being paved for the invention of printing from types. To these humble forerunners of the type-printed book our author gives too little consideration.

His notice of the invention of typography is obviously intended to be complete and impartial. He follows Humphreys in the belief that Koster was the printer of the first book edition of the 'Biblia Pauperum,' and also the printer of the 'Speculum Humane Salvationis.' No diligent student of the invention of typography can accept Humphreys as an authority. He was a zealous compiler and a praiseworthy maker of fine books of facsimiles, but not an original investigator or exact thinker, careless in the sifting of evidence and inexact as to dates and facts. It is a surprise, too, to note in Mr. Putnam's book the omission of the names and works of recent authors who have been diligent investigators of this subject. Nearly three hundred books are specified as the mines from which he derives information, but one does not see in this long list the names of Holtrop or Hessels, Weigel, Zestermann, or Van der Linde. The information furnished by these authors is of importance, and should have been utilized.

The first printers were not scholars, nor even the professional book-makers attached to the universities. They seem to have been mechanics and traders who took up the new art as a more expeditious and profitable method of book-making. They imitated as closely as they could the style or form of letters most used by scribes, and followed their leadership in issuing the books that promised to be most saleable. These books, classical or theological, and in the Latin language, soon overstocked the market, and the prices of printed books fell rapidly. There was some opposition to printing by the copyists and engravers, but only from those of the lower class. Scribes, and the collectors of fine manuscript books during the last half of the fifteenth century, however, had great contempt for all forms of printed books. Many librarians boasted that they did not have one on their shelves. This dislike was most general in Italy. At first the clergy looked with tolerance or indifference on the spread of printing. When printers found that the market for the classics and dogmatic theology was being overstocked, they began to print books in the vernacular that were saleable to common people. This provoked the censure and restraint of the Church. There was also no small complaint on the part of printers against each other, caused by the piratical reprinting of books. The interference of the law was frequently solicited. In this restraint our author traces the origin of copyright law, a subject in which he is at home.

The services rendered to the world by printer-publishers like Aldus, the Étiennees, Froben, and others, are described by Mr. Putnam with clearness and force. Yet they were exceptions. Much bad printing was done at the beginning of the sixteenth century. In the introduction to his 'Adagia' Erasmus writes as follows:

"Formerly there was devoted to the correctness of a literary manuscript as much care and attention as to the writing of a notarial instrument. Such care and precision was held to be a sacred duty. Later, the copying of manuscripts was entrusted to ignorant monks, and even to women. But how much more serious is the evil that can be brought about by a careless printer, and yet to this matter the law

gives no heed. A dealer who sells English stuffs under the guise of Venetian is punished, but the printer who, in place of correct texts, misleads and abuses the reader with pages the contents of which are an actual trial and torment, escapes unharmed. It is for this reason that Germany is plagued with so many books that are deformed (i. e., untrustworthy). The authorities will supervise, with arbitrary regulations, the proper methods for the baking of bread, but concern themselves not at all as to the correctness of the work of the printers, although the influence of bad typography is far more injurious than that of bad bread."

Evolution and Man's Place in Nature. By Henry C. Calderwood. Macmillan. 1895. 8vo, pp. 349.

We have here a discussion and summary of the biological additions to our knowledge of man, together with a revision, in the light of modern evolution, of man as recognized by metaphysicians and theologians. Prof. Calderwood's writings are always interesting and thought-inspiring, even if not at all times convincing. His present subject enlists his greatest earnestness and vigor. The book will be less favorably regarded by scientists than by those interested in harmonizing evolution, in its recent developments, with theology or philosophy. The review of the development and status of the physical man is fair, though marked by occasional indefiniteness or indi-

rectness, due in part, at least, to Mr. Calderwood's lack of familiarity with the facts on which the reasoning is based. In dealing with his own observations this might not have been the case; but when stating that Darwin or another has said this or that, he raises a question whether he fully understood his authority—whether the latter interpreted the facts rightly, or may not have had incorrect ideas of discoveries by another who in turn might have mistaken. Our author is skilful, but his references in support of his position have not the force of personal observation, and they at times weaken the argument so that when impossibility of determination is announced to be a consequent, the impression given is more of a dearth of information than of insurmountability to science.

In the metaphysical portions the work is more satisfactory. The position of the author, and in some degree the lines of discussion, may be suggested by stating his belief that animal intelligence is not rational, that instinct is a matter of structure and belongs to sensory apparatus, and that he recognizes a power, beyond scientific observation, which is ever in operation and which has manifested itself at the most impressive periods of the world's history—first at the appearance of organic life, again on the appearance of mind, and again on the advent of rational life; a first

cause; an eternal personality, related to the spiritual life of rational souls as to no other known type of existence. This raises the question whether the origin of our world was one of the less impressive periods, or a manifestation of a different power.

H. WILLIAMS, 25 EAST 10TH ST., N. Y., dealer in Magazines and other Periodicals. Sets, volumes, or single numbers.

Complete Index to Little's Living Age, to the end of 1895. E. ROTH, 1135 Pine St., Phila.

The Nation.

NEW YORK, THURSDAY, JUNE 4, 1896.

The Week.

WITHIN one month of the close of the fiscal year, the Treasury shows a deficit of \$27,000,000. The receipts are greater by \$14,000,000 than in the corresponding months of 1894-5, and the expenditures \$7,000,000 less; but the deficit has been creeping up month by month, and it will doubtless amount to \$30,000,000 by June 30. Meanwhile the gold holdings are subject to drain again, no less than \$17,000,000 gold having been drawn out in the month of May alone. But do these figures have any sobering effect on Congress? Only to drive it into more reckless waste of the public money on ships and fortifications and a swollen river-and-harbor bill. The latter is being passed over the President's veto with a shout. What has he got to do with spending the people's money? That is the perquisite of Congress, he will find out. If he has to issue bonds to pay the Government's debts and to preserve the gold standard, why, let him. That's his affair. We'll curse him roundly for doing it, but as for economy and moderation in appropriations, why, what on earth are we here for?

The river-and-harbor bill which the President has vetoed is the most shameless debauch with public money that we can recall, and it comes at a time when the Treasury is subsisting on borrowed money. No words can be too severe to characterize such profligacy. One of the inevitable effects must be to impair confidence in our credit abroad, already weakened to a disastrous extent by the silver craze. It is perfectly plain that the money to meet this extravagant appropriation must be taken from the proceeds of the last bond sale, and hence that another one will be necessary. Senator Sherman justified the veto in advance when he said that Congress was piling up expenditures without revenue, and that the President ought to refuse to pay out more money than the Treasury's current income. If Congress passes the bill over the veto, Mr. Cleveland may follow Mr. Sherman's advice in this particular. He would certainly be sustained by public opinion, regardless of party divisions, if he should do so. One paragraph in the veto message contains a general truth little calculated to propitiate members of Congress who voted for the bill, viz.:

"I believe no greater danger confronts us, as a nation, than the unhappy decadence among our people of genuine and trustworthy love and affection for our government as the embodiment of the highest and best aspirations of humanity, and not as the giver of gifts, and because its mission is the enforcement of exact

justice and equality, and not the allowance of unfair favoritism."

The passage of the bill over the veto has been consummated in the House. It is to be hoped that the people will keep a list of the yeas and nays, and severely remember the men who have recorded themselves in the affirmative.

In view of all the other extravagances of the present Congress, those actually accomplished and those contemplated, the report of the committee on the Nicaragua Canal ought not to occasion surprise. They recommend the project, of course. It is true that a committee of Government engineers, after a personal examination of the route and the country and the work already done, reported against going on with the canal at present, saying that the data were insufficient, that the canal company's figures were erroneous, if not intentionally false, and that it was not yet proved that the canal was practicable from the engineering standpoint. The House committee, without any later information and without personal examination of anything except the company's light literature, decides that the canal is practicable on the present plan, that it can be built for \$82,000,000 (making allowance for \$100,000,000 as an outside figure), and that it is wise for the Government to guarantee the company's securities to the latter amount, or even \$150,000,000 if necessary. This is a sum three times as large as the Government guaranteed for all the Pacific railroads taken together. It is to be spent in making a canal subject to a foreign jurisdiction, and exposed, in case of war, to seizure by any naval power that can first reach it and is strong enough to hold it or destroy it. If such a scheme can pass Congress, what may we not expect? The present river-and-harbor bill is a trifle in comparison with it. The latter has at least the advantage that the money will be spent in our own country.

A measure has just passed the United States Senate which takes away from the Administration its power, under the resumption law of 1875, to issue bonds for the protection of the Treasury reserve. The bond-issue power was indeed an essential and indispensable part of that legislation. The Congress of 1875 fully appreciated that the maintenance of resumption and the future protection of the national credit might, in an easily imagined exigency, depend entirely on this bond-issue power unquestionably possessed and unhesitatingly used by the executive. This is why Senator Sherman and Senator Gray, Republican and Democrat, united the other day in declaring to the Senate that its action on the Butler bill "marks a crisis in the history of the

country and in the history of the Senate." Both understood, as all other intelligent citizens do, that this bond-issue power, bravely and promptly exercised by Mr. Cleveland on four critical occasions, is all that has stood since 1893 between the United States Treasury and repudiation. With Congress in such a mood—for the passage of this bill in the Senate has all along been assumed as probable—and with a recollection of the catastrophe four times so narrowly averted, every business man and every citizen has a right to ask, with fear and trembling, what attitude the next Administration can be depended on to take in such another crisis.

Senator Sherman has again exposed his insincerity on the question of raising revenue. While the "filled-cheese bill" was before the Senate, Mr. Dubois offered an amendment providing for an additional tax of 75 cents a barrel on beer. He pointed out the well-known fact that such a tax would bring in \$25,000,000 a year—almost enough to meet the deficiency in the revenue—and would not affect anybody except those "gentlemen who have accumulated large fortunes in the manufacture of beer," as the price of a glass of beer would not be increased. Mr. Sherman not only opposed the amendment, but he deprecated the idea of any further impost on beer, on the ground that it already "has a pretty heavy tax on it for an article which is very useful and comfortable," and he said that he did not know whether he would vote for a larger tax under any circumstances, "because I think that the consumers of beer already pay a very large sum." This is the ridiculous end of the Ohio Senator's professed anxiety of a few months ago to vote for a tax on tea, coffee, or anything else in order to raise more revenue.

Nothing could show more conclusively the universal appreciation that the financial question is the most important one now before the people than the split of the Prohibition party on this issue. Here is an organization which was formed for the sole purpose of putting an end to the traffic in intoxicating liquors; yet when it holds its national convention, the one thing which interests the delegates is whether the party shall favor or oppose the free coinage of silver. A long controversy shows that a small majority are against the 16-to-1 doctrine, and then the minority bolt and start a new organization for the promotion of an object which is dearer to them than any consideration affecting the liquor traffic. Prohibitionists have been called men of one idea, who could think of nothing but their hobby. The fact that Prohibitionists now put the currency above everything else shows how absurd it is to suppose that the approach-

ing campaign can be fought on any other issue.

The nearer we get to the St. Louis convention, the more pronounced becomes the support of McKinley by the silver Republicans of the West, on the ground that his record and his character show that he is not and will not be a gold-standard man. The *Dry Goods Economist* of this city recently sent a circular to representatives of the trade throughout the country, pointing out that the financial issue is the most important one, that "McKinley's record is that of a persistent panderer to the unsettlement of our financial system," that all merchants who favor the maintenance of the gold standard should place themselves on record, and asking dry-goods men to let it know whether they favor such maintenance. The head of a dry-goods company in Topeka, Kan., has furnished to the *Journal* of that city, an earnest free-coinage and McKinley newspaper, a copy of his reply to this circular. He writes that the officers of his corporation are for McKinley, "first, last, and all the time," for the reason, among others, that "he is not an extremist on the money question," and that "we especially admire in Mr. McKinley that quality which enables him, notwithstanding the pressure of his enemies, to keep his views on silver coinage to himself until such time as he thinks it wise to express them." The President of the company says that it has twelve employees, eight of whom are Republicans, two Democrats, and two Populists. Seven of the Republicans are warmly in favor of McKinley, and one of the Democrats expects to vote for him, while the Populists "hope for a chance to vote for an out-an-out free-silver man." The letter concludes: "But one of the entire twelve approves of the gold standard, nor do we." Evidently somebody is going to be terribly cheated in this business. Who is it going to be—the Eastern sound-money men, who claim that McKinley is for the gold standard; or the Western silverites, who support him enthusiastically because they believe that he is not?

The *Tribune* complains with great justice of people who "have bombarded Mr. McKinley with questions which they know, and he knows, and they know that he knows, have no other earthly purpose than to entrap and misrepresent him." And it intimates that these questions relate to "all subjects under discussion in the civilized world, beginning with the Mosaic cosmogony and coming down to coinage." But it is absurd to suggest even that the Major cannot protect himself against such people. He can easily cut off a man who begins by asking him about the Mosaic cosmogony, and the nebular hypothesis, etc., by simply saying that such things have no relation to the election, and that he has not made up his mind about them. He can, in fact, safely treat such ques-

tioners as impostors, just as much as if he were not a candidate. The only genuine persons who go to him are the gold-standard men. Surely, he must have been visited by some, who simply said, waiving the Mosaic-cosmogony matter, that all they wished to know was which standard he favored—gold or silver. Is it conceivable that he was not visited by some such inquirers? Now what did he say to them? This is all we want to know. What he thinks about all other subjects of human interest is a matter of comparative indifference to us. Of course we should like to know how such a mind as Major McKinley's works on any subject, as we should like to know how Gladstone's, or Bismarck's, or Darwin's, or Goethe's worked; but we acknowledge that this is not the time to discover how it works on subjects in general. We only ask how it works on one. Is this unreasonable? Is it impertinent? Are we to die in ignorance? How a man of ordinary sensibility can see millions surging round his window in search of information on one subject only, and yet deny it, passes our comprehension.

The Georgia Bankers' Association held their annual meeting at Augusta a few days since, and, after finishing the business that brought them together, were entertained at a banquet. Ex-Senator Walsh, who is the editor of the *Augusta Chronicle*, and a silver-man, was present and was called on for a speech. Mr. Walsh made a brief response, in which he said that he would become an advocate of the gold standard in case anybody could demonstrate two propositions to him: first, "that the volume of primary money does not control, in a great measure, the commodities that seek to be exchanged for it"; second, "that the universal law of supply and demand, which governs the price of all articles that enter into commerce, does not govern the price of money." If both these propositions were conceded to be true, there would still be something more needed to make a logical conclusion. The first and fundamental contention of the "gold-bugs" is that the free coinage of silver would not add anything to the volume of money, but merely substitute silver for gold. They say that all history proves this, and that even if an increased volume of money were desirable, it would not be brought about by such a substitution. They deny, also, that a rise of general prices would be for the advantage of the great mass of mankind. They point to the fact that, although prices of most things have fallen since 1873, wages have risen, and that consequently the working classes are better off, since they receive more dollars and can buy more goods with each dollar. For these reasons, no logical end or argumentative purpose is reached, even if one concedes Mr. Walsh's contention. He wishes us to take three things for granted, although not even mentioned by him, viz.:

that the free coinage of silver will give us a larger quantity of money than we now have, that a larger quantity is desirable, and that a general rise of prices would be advantageous to mankind. Those are the things which Mr. Walsh should have demonstrated before he put his proposition to the Georgia bankers.

Had the Republican convention building in St. Louis been too badly damaged by the late tornado to be made ready by June 16, the national committee would have had an opportunity to do a sensible thing. It was not at all necessary that the convention should be put off simply because there was not another building in the city capable of seating 6,000 to 8,000 people. All that was and is needed is seating capacity for the 1,000 delegates. There must be many halls in St. Louis large enough to accommodate the convention proper with ease. The chance to get rid so easily of the thousands of interlopers that hinder and attempt to direct the work of national conventions, ought to have been accepted with joy. They are a more intolerable nuisance with every year, and make the appearance even of deliberation and debate more and more farcical. The committee should have been thankful to seize the occasion to shut out the mob, and hold the convention according to programme and under infinitely better conditions than can possibly be enjoyed in the great auditorium.

A thousand and one candidates for the Vice-Presidency are reported as being under grave consideration by the McKinleyites, but the man they would undoubtedly prefer is Speaker Reed. The bait they are dangling before him is that he would be just the kind of czar needed to regenerate the Senate. With him in the chair, it is said, the dreary twaddle of the Stewarts and Morgans and Peffers would be brought abruptly to an end, the Senate's business would march like magic, and an applauding country would rise up to bless the bold Reed. But no man is less likely to be deceived by this fancy picture than the Speaker himself. He knows that the most czar-like presiding officer, backed by no matter how frantic popular cheers, could do nothing to make the Senate a body for the dispatch of public business unless a majority of the members were willing to stand by him. But whenever a majority are ready to change the rules and act like rational human beings bent on something besides floods of talk, the presiding officer becomes of little moment. It is a mistake to suppose that the Senate will ever be regenerated by the Vice-President; its help cometh not from the Chair. The Chair has no power in the Senate. When a few more of the old fellows die or are displaced, when a few more younger men, impatient and infinitely weary of the sham tradition of senatorial courtesy, take their places, we may hope for a

change. There are some grateful signs of such a coming change; but it must be wrought by the Senate itself, not by its chairman.

The *World* publishes a number of telegrams from members of the Democratic national committee in response to an inquiry whether they are in favor of abrogating the two-thirds rule at the Chicago convention. The point of the inquiry lies in the fact that any number of delegates more than one-third can prevent any nomination if they are dissatisfied with the platform. Chairman Harrity says:

"In my judgment temporary conditions will not justify the abrogation of any well-established rule that has been found to work satisfactorily in the past. The two-thirds rule as applied to candidates ought, in my opinion, to be continued. It has usually been the case that candidates who obtained the support of the majority of the delegates to the Democratic national convention were able to command the other votes necessary to give them the required number under the two-thirds rule."

The word "usually" is well chosen. It has *usually* been the case, but not always. A conspicuous exception is found in the Charleston convention of 1860, when Senator Douglas had a majority of the votes, but never could get two-thirds. The difficulty here was over the platform, which endorsed the doctrine of "squatter sovereignty," or the right of the first settlers of a Territory to have slavery or to reject it—the Southerners contending that no power could prevent them from carrying slaves thither and holding them as long as the Territorial governments continued. Upon this question the convention finally split, one faction adjourning to Baltimore, where Douglas was finally nominated, and the other to Richmond, where John C. Breckinridge was nominated. If the difficulty at Charleston had been merely a personal one, means would have been found to overcome it. What made it insurmountable was the impossibility of agreeing upon a platform. This is exactly the difficulty looming up at Chicago. Chairman Harrity was wise as a serpent when he said "usually." Of fifteen answers received to the *World's* interrogatory three are in favor of abrogating the two-thirds rule, eight are against it, and four are non-committal.

The gold-standard Democrats of Chicago hoisted their flag on Thursday last to some purpose. About 500 of them, all representative men, including Franklin MacVeagh, ex-Mayors Cregier and Hopkins, and Judge Moran, met at the Palmer House, elected a county central committee, and took steps to send a contesting delegation to the national convention. What was more to the purpose, the speakers at the meeting declared that they would not support any candidate for the Presidency who was in favor of the unrestricted coinage of silver, and that they would vote for a Republican in preference

if he were nominated on a sound-money platform. These declarations were received with loud cheers, and the resolution to form an organization independent of the Altgeld-Populist concern was adopted by unanimous vote. This movement in Illinois will have a powerful effect in the surrounding States, where the influence of Chicago is at all times very great. It will stiffen the backs of the sound-money Democrats of Indiana, Iowa, and Nebraska especially—those of Wisconsin need no stiffening—and will not be without its influence in the East and South.

Oregon has, during the past ten years, gone for the Republicans in every Presidential year, but elected that Democratic-Populist politician, Penneyer, Governor twice in intermediate years—in 1886 and 1890. In 1894 the Republicans chose the Governor for the first time since 1882, and no doubt has been felt this year that they would carry through their candidate for Supreme Court Judge and get a good majority of the Legislature which will choose a United States Senator to succeed Mr. Mitchell. The interest of the contest centred about the silver question. The sound-money men were beaten in the Republican State convention, which rejected their proposed plank and substituted the "straddle" of the national platform in 1892, and the silverites, in one of the two congressional districts, nominated a free-coinage Republican, who appears to have been successful, while the Republican majority in the Legislature is expected to reelect Mr. Mitchell on his free-coinage record. The influence of this election can hardly fail to be unfavorable to the cause of sound money in each of the great parties.

Commissioner Lyman of the Excise Department has bowed to the inevitable, and has requested the State Civil-Service Commission to place his "special confidential agents" on the list of competitive places. The position of Comptroller Roberts, sustained by the opinion of ex-Judge Danforth and others, that if the agents were appointed in any other way they could never hope to be paid by the State, was the cause of this surrender. It is final, and, taken in connection with a similar surrender by Mr. Aldridge, should convince the Platt machine that the Constitution is too strong for them, and that they cannot get possession of the public service of the State in defiance of its provisions. We should have been glad to have Mr. Lyman carry the matter into the courts in order to get a ruling on the meaning of the word "practicable" in the Constitution, for it was upon that that Mr. Lyman based his hope.

Church finances, not fine points of doctrine, constituted the burning question this year before the Presbyterians in Assembly at Saratoga. The new \$1,750,000

Presbyterian house in Fifth Avenue has mightily stirred up the plain Presbyterians of the West, especially in view of heavy mission debts reported, and it looked at one time as if the sale of the building would be ordered and a return made to humbler quarters. But finally the whole matter was referred to a committee of business men, who are to report next year. Two Assemblies have already endorsed the new Presbyterian building as a wise business investment, but the returns have not come up to expectations, and the Western jealousy of Eastern luxury, which is as observable in religious as in secular politics, may yet lead to an abandonment of the whole ambitious project. The committee on church unity, appointed some years ago to negotiate terms of union with the Episcopal Church, made a final and rather melancholy report, and begged to be discharged from further hopeless labors. "With all her conscious weaknesses and imperfections," says the report, "the Presbyterian Church must insist"—well, that it is as good as the Episcopal, any day. This recalls the address to the Queen which the judges drew up at the opening of the new Law Courts. "Conscious as we are of our own infirmities," the first draft of it began. Objection was made to this as a little too abject, when Lord Bowen suggested that it should read, "Conscious as we are of each other's infirmities." That is the kind of consciousness the Presbyterians really have—an acute consciousness of the weaknesses and imperfections of the Episcopalians.

The use to which the Tories propose to put their big inherited surplus shows a strict intention to make their charity begin at home. The landlords are to get a good slice of it, through the new agricultural rating bill, and the church schools their share by means of the education bill. Meanwhile foreign glory is to be got dirt cheap, the British taxpayer having nothing (as yet) to pay on that score. The Egyptians are to pay for being protected on the Sudan frontier, though they did not dream they were in danger nor ask to be protected. It is now known that the orders to advance toward Dongola came straight from Rome, Cairo being left wholly in ignorance till the last moment. Some Indian troops have since been sent to Suakim, as it is thought they can endure the climate better than the English. Some one asked in the Commons who was going to foot the bill for this transfer of soldiers. He learned that it was customary to charge such items up to the Indian budget, and the Government proposed to do so now. The Egyptian fellahs and the Indian ryots will never know why their taxes are heavier this year, and we fear that even Secretary Curzon would be unable to make it clear to them how they happily illustrate the beauties of imperial federation.

THE PROSPECT AT CHICAGO.

SENATOR BRICE is quoted as predicting a majority of 100 for the free coinage of silver at the Chicago convention. He thinks that the Republicans at St. Louis will adopt a gold platform, that McKinley will endorse it, that there will then be a bolt, but not a serious one, of delegates under the lead of Teller. He thinks that there will be no bolt at Chicago, but such an abstention of Democratic voters in the coming election that the party will be crushed. He has no doubt that the Republicans, in that event, will carry all the Western States from Ohio to the Dakotas inclusive. These views are attributed to Mr. Brice by a morning newspaper. Whether he is correctly reported or not, these opinions are held privately by so large a number of influential Democrats that they may be considered common property. Another opinion, a sort of corollary of the preceding ones, is that the silver question will overtop everything else in the campaign, no matter how strenuously the Republicans may seek to push the tariff to the front. McKinleyism, as that phrase is commonly understood, will be swallowed up, even though McKinley be the Republican candidate. It will be submerged by the money question.

The result of the Democratic primaries in Kentucky can hardly be taken otherwise than as the defeat of the sound-money men at Chicago. Last year they carried the State, under the lead of Secretary Carlisle, by a sufficient, but not large majority. Now the silverites have recovered their lost ground, and the gold-standard men, by losing that State, have probably lost the national convention also. The only question is whether the silverites will have a two-thirds majority at Chicago or not. This is not very important now, since the split in the party will be too wide and deep to be healed this year, if ever. The *Louisville Courier-Journal*, commenting on the action of its party friends, says that "they have spit upon the fathers of the party whose name and organization they claim, have proclaimed Jefferson an ignoramus, Jackson a conspirator, Benton a knave, and Cleveland a traitor. For the faith handed down through a hundred years of glorious party history, they have substituted a fad rejected by every intelligent civilization on the globe, and for the exponents of that faith they have substituted such apostles of Populism as Stewart, such exhorters of socialism as Tillman, such evangelists of anarchism as Altgeld." It adds that Saturday's work makes Kentucky a Republican State for years to come; that although Bradley had lost the popularity which gave him the office of Governor last year, any Republican can now carry the State "over a party which binds itself to the corpse of free-silverism."

The events of the Democratic campaign make it clear that although the party repealed the Sherman act in 1893, its heart was not in that fight. It was "brought up

to the bull-ring" by main strength. It required all the force that Mr. Cleveland could use, aided by Carlisle, Wilson, Gorman, Hill, Voorhees, Mills, and other leaders of varying views and tendencies as to other matters, and goaded by a financial panic of the first magnitude, to accomplish the result. It was a great victory for the country, but it was achieved over the heads and against the feelings of the Democrats of the West and South. A majority of them were for cheap and nasty money all the time. They are now under no duress or restraint. Mr. Cleveland no longer holds them by the back of the neck. They feel free to go their own way—that is, to the bad—and they are going thither with all possible speed. They will not only lose the Presidency, but a lot of Southern States which they have hitherto counted upon as surely Democratic—Delaware, Maryland, and Kentucky certainly; West Virginia, Tennessee, and Missouri probably—while their only possible gains to offset these losses will be the small Rocky Mountain States, and these are by no means certain.

The Republican voter who is going to leave his party on account of free silver, except in the silver-producing region, has not yet been heard from. On the other hand, the Democrats of education, substance, and training all over the country—in South Carolina and Texas as well as in New York and Illinois—who will never vote to debase the standard of value, are legion. One man of this type is Mr. W. W. Baldwin of Burlington, Iowa, who writes to the *Des Moines Leader* in reply to Gov. Boies's contention that free silver would give us the Mexican standard and bring us Mexican prices within thirty days. "No civilized nation," says Mr. Baldwin, "has ever yet taken such a plunge as is here proposed, namely, to reduce the value of its currency one-half at a single stroke, but I agree that it would be felt inside of thirty days." Then he pictures the consequences:

"We had a touch of the feeling in May, 1893, from the mere suspicion that the Treasury Department might break down in its effort to prevent this fall to the silver or Mexican basis, which Gov. Boies desires to see accomplished. Thirty days were not required to spread the feeling. It closed banks and business houses and factories; it ruined the prosperous and industrious by thousands; it sent out into the streets and upon the road—other thousands to beg or starve because there was no work. It was the panic. Its influence did not cease in thirty days. It is yet with us. It is a factor in the 50-cent wheat and the 17-cent corn. The immediate panic is over, but the panic prices linger. What strange sentiment is this, that leads us to invite a repetition of that silver panic? What an hallucination to imagine that revival of the threat to reduce our money to the silver basis, with its menace to all values and to all business, will lead to an improvement in the prices of farm products! Gov. Boies is many years my senior in years; but I am many years his senior as a member of the Democratic party and in devotion to its principles. I claim, therefore, the right, as a Democrat, to protest against this strange doctrine of destruction and degradation."

The men of Mr. Baldwin's type abound in all the Northern States. They give to the Democratic party all the character that it possesses. They contribute ideas

to the party councils and money to its campaigns without the hope or desire of personal reward. Cut them off, and the party becomes a derelict, like a ship without captain, crew, rudder, or sails. This seems to be the destiny of the party which claims descent from Jackson, Benton, and the other "go'd-bugs" and anti-paper-money men of the thirties and forties, when, in fact, the party took its rise.

While we had hoped for something better as the result of the labors, the example, and the influence of the present Administration upon the party which elected it, and from the feeling of pride which is due to good work unselfishly performed, we can still find satisfaction in the prospect that all the cheap-money men, repudiators, Populists, anarchists, and Coxeyites are ranging themselves under one banner where they can all be raked by one fire.

EX-SENATOR HENDERSON ON
McKINLEY.

ONE of the ablest and most respected Republicans of the day, ex-Senator Henderson of Missouri, in a long interview exhibiting sound notions about the currency, protests that he does not see why Mr. McKinley should be held responsible for "views expressed by him on questions of currency and coinage between 1873 and 1884." The answer is that Mr. McKinley's views on currency and coinage expressed between 1873 and 1884 have been fully confirmed by him, as late as September, 1894, and he refuses to say whether he holds them still or not. So that, by an inference based on all human experience, we are commenting on the views on these subjects which he holds at this hour. What a man said two years ago and refuses to withdraw now, he would, according to all rules of evidence, if he spoke, still say.

Mr. Henderson deplors Mr. McKinley's talk about silver between 1873 and 1884, but says Mr. Carlisle and Mr. Blaine and others prominent in public life talked the same way. But they talked wrong. Mr. Carlisle is not a candidate for the Presidency, nor is any of the others. We opposed Mr. Blaine for this reason, among others. It is no consolation to the nation to learn that the man whom it is about to put in its chief office had partners in his errors during ten years of his blundering and perversity. We do not blame Mr. McKinley for talking as wildly about currency as many other men did at the time. We simply say that it is dangerous to make him President. If he were not a candidate for the Presidency, all discussion of his financial views would be idle.

Mr. Henderson then proceeds to give an explanation of Mr. McKinley's aberrations. It appears, according to him, that all the foolish things McKinley said about silver were not said for silver, but for the tariff. At any rate, says he:

"No declaration of his, at this later period, has been found that is not now susceptible

when critically examined, of construction favorable to the single gold standard and absolutely against free coinage. All the quoted declarations, to the effect that he "favored silver to the extent that it could be maintained on a parity with gold," mean nothing, in the light of subsequent history."

Now what is this extract from a speech of his delivered at Findlay, O., September 27, 1894?

"The Democratic party has been in control of every branch of the government since the 4th day of March, 1893. Its legislative branch has been in session for more than twelve months, yet it has given us no silver legislation whatever, except to strike down the Sherman law at its special session called for that purpose, and in response to the urgent recommendation of a Democratic President. The party that struck silver down, and gave it the severest blow it ever had, cannot be relied upon to give that metal honorable treatment."

This is his deliberate view expressed one year after the repeal of the Sherman act, which had delivered the country from a terrible panic, caused by the firm belief of all classes and conditions that a continuance of the purchases of silver under the act would end in placing us within a few weeks on a silver basis. Either he shared this belief or he did not. If he did not, he is clearly unfit to be President for want of intelligence. If he did, he is unfit to be President on account of his hypocrisy in 1894. It is to be remembered that while the country was waiting in great anxiety for the repeal, McKinley never said a word in its favor. His only utterance on that momentous occasion was a declaration that

"The silver product of the country, one of the most important we have, should not be discriminated against, but some plan should be devised for its utilization as a money which will insure, not the displacement of gold, but the safe and full use of both, as exchanges among the people."

He knew very well, or did not know, that, as we stood, the maintenance of silver at a par with gold depended on the ability of the Government to pay gold for all presented silver, and he knew, or did not know, that persistent purchases of silver would bring about the silver standard quite as effectively as free coinage. So that saying he was opposed to free coinage but in favor of continued purchases of silver, is like saying that he was in favor of tweedledum, but had set his face like flint against tweedledee. We must in charity suppose that when he talked about "not discriminating against the silver product of the country," he had not the least idea what he meant, but knew that it would be taken by the silver-men to mean something pleasant.

Mr. Henderson's explanation, as we have said, of McKinley's aberrations about silver, is that they were due to a combination with the silver-men to enable him to get his tariff bill through both houses, and did not express his real sentiments about the metal; that "he said no more in favor of silver than was necessary to enable him to hold the combination" together. This is substantially a confession

that McKinley, while a member of Congress, was willing to assist in debasing the currency, if not in bringing on national bankruptcy, by agreement with the silverites, in order to procure the passage of a very high tariff. This sounds like a plea for pardon or indulgence for McKinley as a deluded but innocent member of the House; but, odd as it may seem, Mr. Henderson produces it as a reason why we should make him President of the United States. Any such combination was utterly disreputable. In the case of a man who had a clearer understanding of what he was doing, we should call it treason. It was the basest act a man could commit against the Government, short of levying war against it. But we have no proof whatever that he repents or even regrets it. We have many reasons for believing not only that he would do it again if he had a chance, but that he means to do it again the first chance he gets. Everything that has appeared in the McKinley newspapers and interviews goes to show their desire to treat the currency as subordinate to the tariff. Many articles to this effect have appeared in the *New York Tribune*. We may therefore fairly expect that one of the first acts of the next Congress will be to pass a high tariff bill by any means in its power, with McKinley's hearty approval. One of these means, and the only absolutely necessary one, will be another combination with the silverites. Without such a combination, such a bill cannot get through the Senate. The silverites know this and McKinley knows it, so that the situation next year will be exactly the same as in 1890, except that the coinage question will be much more dangerous and alarming. A high-tariff bill will get a majority on condition that the Republicans will "do something for silver." Quotations from the St. Louis platform at this juncture about "sound money" will have no more effect than the evening breeze. The agreement, whatever it is, will be carried out. They will "do something for silver."

Why do we think so? We think so because all the evidence within our reach shows that there are few or no real gold-men in the West. The best Republican organs in that region, such as the *Detroit Tribune*, show that the public mind there is not made up about the currency question. The Western men are still enamoured of the idea of keeping gold and silver on an equality, this keeping of gold from leaving the country, can be accomplished by some legislation of our own; and such legislation will be tried, and they will have in McKinley a President who will favor the idea. Another reason for thinking so is that exertions are evidently being made already to procure the adoption of a "sound-money" platform simply at St.

Louis, in the hope that some, like Mr. Henderson, will interpret "sound money" as meaning gold; others as meaning silver and gold in equal proportions; others as silver in some shape or other. In the use of such ambiguous phrases McKinley himself is past master, and the platform is already being manufactured. It is all but certain that the platform will contain some such "straddle," because there is an apparent determination not to speak of the "gold standard" at all, for fear of offending the West. There will be no gold-standard plank if the silver-men can help it, and they rely on bringing the poor gold-standard men into line by showing them the Democratic party, East and West, going "hell bent" for silver, leaving the Republican ranks the only place for a man to stand in with a ray of hope.

The probabilities are that the gold-men will be much affected by this reasoning. They will not insist on the mention of the gold standard, "ipseissimis verbis." They will be content with the phrase "sound money," and trust in Providence. The situation of business men at the East is already pretty desperate. Their business and credit are going to ruin before their eyes, and they will take a tariff and McKinley sooner than nothing. Things cannot be worse with them, and they may be better. For thirty years the Republican party, when bent on financial folly, has been stopped in its mad career by a firm, resolute, and well-informed President. One only has "wobbled," and that was Gen. Harrison. They are now, apparently, about to have one of the greatest wobblers in the country just where they want him. No more vetoes, Congress omnipotent, and a "combination" the order of the day. The prospect is glorious, but the end is certain.

A BISHOP AMONG THE PROPHETS.

PROFESSOR HUXLEY's death extinguished a vast amount of clerical envy, of which he, living, had been the object, and the hearty tributes paid his memory in many a pulpit and religious paper last July showed what a distance had been travelled since his famous set-to with Bishop Wilberforce. But another Bishop spoke at Leeds the other day in favor of the Huxley Memorial Fund, and his words are almost of themselves a memorial to Huxley. It was Dr. Boyd Carpenter, Bishop of Ripon, and his address before the Leeds meeting betrayed the frankest acceptance of the spirit in which Huxley labored and the ends for which he strove. Dr. Carpenter did not content himself with praising Huxley's energy, his unflinching application, his powers of lucid exposition, and all that, but went to the core of the matter in saying, "I am here as a friend of knowledge, to do honor to one who enlarged its borders." To have done this was, in the Bishop's opinion, to have "added to the comforts, the joys, and the

assurances of life." Nor did he leave room for the suspicion of the usual mental reservations. It was an essential part of manhood "to follow truth wherever it leads us. Religious truth, in one sense, must always wait on scientific truth, and religious truth must often change its form at the bidding and on the information of scientific truth."

How simple on those terms the "reconciliation of science and religion," at which so many have toiled painfully and in vain, appears! All you have to do is to treat adjacent and mutually influencing truths in those provinces just as you would in any other—that is to say, give full credit to each so far as the evidence for each warrants, and then adjust or harmonize the two, or make one give way before the other, as the laws of thought compel you. If we could believe that Bishop Carpenter in praising Huxley spoke for Christendom, or even for the Church of England, as authoritatively as Bishop Wilberforce did in baiting him, we should think that a great many chairs and lectureships in theological seminaries "on the relations of religion and science" would at once appear even more useless than they now do. At any rate, the Bishop of Ripon's position is the only one that can be successfully maintained; it is the only one from which the reconcilers have not already been driven.

We all know the successive stages through which the controversy has gone. The first one was marked by an air of confident superiority on the part of theology towards rising science. This superiority was first amused, then indignant, then severely anathematizing. Dr. Holmes, in his *Life of Emerson*, describes the conservative theologians of the day as standing about the young lecturer, like so many puzzled pointer dogs, uncertain what the strange game might be they had flushed. Something like that was the ecclesiastical attitude forty years ago towards evolution. Nothing quite so absurd had ever been heard of. Darwin was a rare jester. What, he was in earnest—had worked seventeen years before writing a line? Well, well, it was time the Church spoke out about this science falsely so called. Whatever vain imaginings these innovators might bring forth, theology had a more sure word of prophecy. If science was dangerous and wicked instead of being, as we supposed, merely laughable, it was time to warn our students against it.

But this stage could not and did not last very long. Theological students had a way then, as they have now, of perversely reading the very books their professors put in the *Index* for them. So there soon came in a new fashion—one which must still be called the reigning fashion. It is to be generously tolerant of science, but to insist that it keep to its own sphere. Science was all very well in its place, but, like Mr. Brooke and his pamphlets in 'Middlemarch,' it would never do to go too far in that sort of thing; you must see

your danger in time and "pull up." Here came in the famous illustration which still lives to comfort many troubled hearts—the illustration of the "parallel tracks." There was the scientific train coming on under full steam, apparently bound to collide with the religious train going the other way, but lo! just as the crash was imminent you found they were on parallel tracks and could not touch each other. *Voilà tout!*

This parallel-track theory of religion and science has flourished long, but a great deal has had to be spent on it for repairs. Somehow a large number of switches have been surreptitiously built between the two tracks, and collisions have occurred in spite of the utmost care. Car-loads of Assyrian cylinders and Egyptian inscriptions have gone smashing into the Plenary Inspiration caboose; geological excursion-trains have recklessly jumped their own rails and telescoped the Mosaic-cosmogony special passing on the other track; the higher critics have unexpectedly thrown a switch, and at the same time thrown a train-load of dignified theologians into a miscellaneous and struggling heap of historians, philologists, and antiquarians. The parallel tracks have come to be, in fact, strewn with so many wrecks, and the expense and difficulty of keeping them in operation are growing yearly so great, that even some theologians are now thinking that a single track would have its advantages. The Bishop of Ripon, as we have seen, boldly declares for the single track.

Figures and levity aside, Dr. Carpenter's honest admission that much religious truth is only approximate and tentative in form, and that it must suffer change from age to age as new light comes, is one of great significance. It does not mean that science is to have everything its own way. Scientists have their own crude and passing theories which have to be abandoned. No one will be more ready than they to conceive of truth as a whole which grows slowly and by sloughing off many temporary accretions, only they insist upon considering it as a whole. They recognize no pigeon-holes in the mind for nicely assorted truths. Truth is one as reasoning is one. If theologians will only follow Bishop Carpenter's lead in going over to that position, it will prove a happy meeting-ground of science and religion.

THE PROTEST OF THE MOUNTAIN-LOVER.

WOODSTOCK, N. H., April 25, 1896.

To the American dweller in cities a summer vacation has come to be as necessary as black coffee after dinner; and New England has special inducements which tend to confirm the habit. Was it not a Boston lawyer who "could do a year's work in ten months, but not in twelve"? Is not New England flanked by two attractions which do not come close together anywhere else in the country, east of California—bold seacoast and picturesque mountains? Now

that the "cottager" has quietly appropriated almost every quarter-mile of headland from Castine to Plymouth, and is seizing the best of the beaches, the excluded New Englander may turn backward to a region where no board fence can shut out his view; in the mountains nature has provided humanity with an exhaustless store of summer delights. Of the many advantages of the Berkshires and the Green and White Mountains, one is their accessibility. To Stockbridge or Bread Loaf or Franconia is but a seven or eight hours' journey from Boston, or a night's ride from New York; the railroads now push far up into the valleys, and from the station one steps into the wilderness. The camper still finds boughs, the hunter may expect game, and the fisherman may bag the little models of trout so scorned by the old inhabitant.

As for beauty of scenery, that philosopher of pessimism who avers that the outlines of American mountains are commonplace has never known Monadnock, or Ossipee, or Mansfield, or Lafayette. The sweep of the mountains is clad in forest. The streams recall the query of the Brookline child: "Papa, how can these White Mountain farmers afford to have such beautiful brooks for their little boys?" As for roads, where is there anything more delightful than the long, lazy, winding, shaded highways, smooth of surface, diversified by "thank-you-marms," and revealing fresh views every half-mile? Nor is this paradise a backwoods. Throughout the mountains are long-established hotels; less pretentious boarding-houses abound; and the knowing still visit and keep to themselves some of the real old-fashioned farmhouses, with hollyhocks in the front yard, green peas in the garden, and a brook into which one freely may tumble unawares.

To review some of the impressions gained from earlier visits, I am making this out-of-season trip to one of the many New England mountain regions. The Pemigewasset valley is attractive at all seasons, even when the snow hangs on the upper mountain slopes. The Franconia range is beautiful in form, adorned with forests, abundant in water courses. The whole region has for many years been growing in favor as a place of summer sojourn. Already fond of it, and predisposed to find it improved, I must own to a great disappointment. The glory of the mountains is departing, and the mountain-lover mourns.

The accommodations for visitors change little. To enter into the question of summer hotels might lead to a general survey of American civilization; our question is, simply: how far do the hotels provide for the reasonable desires of one who loves mountains? Their sites are usually well chosen, on George Washington's ingenuous principle: "It cannot be supposed that those who were first on the ground failed to secure the most eligible locations." Crawford's, Jefferson Highlands, Jackson, Sugar Hill, and notably the Profile House, have the best positions in the mountains. But why plant a lumber-yard in front of the Deer Park Hotel in North Woodstock, a laundry opposite the Profile House, and a stable vis-à-vis to the Flume House? Why, in all the mountains, is there no well-made, dry, easy footpath more than half a mile long to take advantage of these superb outlooks?

Take the Mount Lafayette range as an example. I have been trying to carry out a long-delayed purpose to climb it. Here is a beautiful mountain, Alpine in its upper reaches, only 3,300 feet higher than the Franconia Notch. Hundreds of people go up 3,300 feet from Zermatt to the Schwarzsee; how many climb La-

fayette? Of course the hotels are not responsible for the snow which yesterday made the path a new, and thus held the adventurer back; but at least the snow filled up the track which Baedeker courteously calls "a steep bridle-path." No beast that was ever bridled could make his way up that steep, stony, rough watercourse, choked with fallen trees. An engineer's location, a little expenditure, a few benches, care to put all in order every year, a rest-house at the summit, would bring visitors to Franconia Notch. The principle of White Mountain hotel management was unconsciously furnished by the care-taker at the Flume House. He had no beverages, he said, except champagne and claret. The champagne and claret people climb no mountains; but why is there no consideration for the people (fifty times as numerous) who want their mountains unmixed with expensive civilization, and will pay their way modestly?

Several delightful drives had left in my mind the conviction that one of the most beautiful of all mountain roads was that from the Profile House to North Woodstock. To be sure, like all the White Mountain roads, it does not take advantage of its scenic opportunities; here are none of the rock galleries and flying-bridges which bring travellers leagues out of their way to see the Via Mala; and, considering the profit made by the hotels out of coaching, the roads about North Woodstock are very few: one goes north, two go south, none to the east, and a ridiculously steep and impracticable road to the west. One is struck by the long stretches of impenetrable forest in the White Mountains, and wishes for the powers of a Dictator of New Hampshire, to lay out a Cornice Road sweeping at the same level in and out of the recesses of the mountains, all around Lafayette, and so to Crawford's, and then a loop around the shoulders of the Presidential Range. One sees the high cottage sites, the waterfalls, the tunnels, the overhanging cliffs, the coaches spinning past.

From this vision the mountain lover awakes to find that if Franconia Notch is a fair sample, the few existing roads are likely to be ruined. Who does not remember the sylvan drive from the Profile down to the Flume? The first stretch of four miles is still as wild and beautiful as ever. Then, all at once, we plunge into Whitehouse's hideous saw-mill town, planted athwart the limpid Pemigewasset, the houses dropped down in blocks like a child's toy village—but most unclean. From the big mill comes the shriek of the saw; and a slow-moving endless chain carries edgings and débris, to cast them into the stream. A continuous fire eats into the heap as it is made, and raises vain hopes that it may some time burn the mill. Below the village the buggy plunges into an infamous stretch of road.

"If you'd seen these roads
Before they were made,
You would hold up your hands
And bless General Wade."

murmurs my companion. The highway of pleasant memories is cut down to the underlying boulders, broadened into quagmires, deepened into two feet of greasy mud, where six-horse teams struggle and flounder; then comes a dry half mile; then more "bolge," into which one plunges to plunge the authors of this profanation. The road is to be "put in order" in May, but it never can be restored to its beauty, and every rain will make it a bog again.

For the present the gangs of the conspirators against the welfare of their State have not destroyed the views; Whitehouse is said to have twenty years' work before him. You may

still sit on your piazza and possess the mountains. But as the slopes are stripped of all the large trees, the dead and gnarled trunks will stand out, a jagged horror; and the sawdust so liberally distributed in the streams is good neither for trout nor for the temper.

Yet "people must live," and no one grudges a starving land-owner's cutting a tree to buy bread. We are accustomed also to see our cities made ugly, that there may be work for the willing. The pity of this process of "uglification" is that it threatens eventually to impoverish the countryside. No one supposes that the profits on the heavy investments in the upper Pemigewasset are more than \$100,000 a year; and when the forests are stripped there will be no more work; the mill villages will go to ruin, and the summer visitor will flee. If the same capital were invested in making the country attractive to people of moderate means, in building roads, paths, outlooks, and inns, 3,000 additional visitors might be drawn, who would leave with somebody a profit of thirty dollars each, and the profit would increase from year to year. Self-interest is not an effective motive in the White Mountains.

Here at Woodstock our roads are safe and the countryside unspoiled. Four miles north is the village of North Woodstock, intended by nature to be the centre of a summer community. The village is not made attractive; no good paths or drives lead to the neighboring mountains and waterfalls; the best road for driving is ruined. The town is so helpless that it lets the lumbermen destroy its most valuable asset—the road to the Profile House—without even a hearty grumble. If the people had a coal seam, nobody could prevent their working it; as it is only a beautiful combination of mountain, valley, hill, and plain, they let their heritage slip away.

ALBERT BUSHNELL HART.

AN IMPENITENT REPUBLICAN.

ITALY, May 16, 1896.

ANOTHER of Italy's grand old heroes has passed away at Mentone. A Milanese, like Carlo Cattaneo and Giuseppe Ferrari, Enrico Cernuschi was the arm, as Cattaneo was the head, of that first great uprising of March, 1848, which shook the Austrian dominion to its foundations and would have succeeded in expelling the foreigners from Italian soil but for the timidity of the moderate faction, the letting "I dare not" wait upon "I would" policy of Carlo Alberto and his counsellors. Before even Cattaneo could bring himself to decide on calling the unarmed populace to attack the 16,000 Austrians armed to the teeth within the city, Cernuschi unsheathed his sword in Broletto, shouting, "War! war!" He dictated three decrees to the Governor, O'Donnell, and stood over him till he signed them; transported the city government from unsafe to safe quarters, improvised barricades in the twinkling of an eye, became the idol of the people and the nightmare of the aristocracy. Appointed member of the council of war, he insisted on opening the dispatches which friends of the enemy tried to smuggle through as private messages, refused all offers of armistice, and fought till the end of the third day, when the last Austrian quitted Milan.

One of Cernuschi's expedients during the Milanese revolution will always be remembered in his native city. The insurgents were in possession of the suburbs and followed up the foe, harassing them in their flight. In order to keep up communications with the inte-

rior, Cernuschi organized the *Martinitti*, the orphan children dressed in the garb of their asylum, and hence easily recognized and allowed to cross the barricades and pass the gates, which they did with such dexterity and courage that he always remembered them, last year sent them \$20,000, and has left them other \$40,000 in his will. As he vehemently opposed the humble dedication of the city to Charles Albert, and refused to call on the people to desist from the pursuit of the foe, the members of the provisional government first calumniated, then arrested him for pretended participation in a demonstration, and in a public proclamation "trusted that the trials initiated would reveal who among the rioters were merely misled by others who had been bribed with Austrian gold." After four days of detention in one of the bolzas, the criminal tribunal found that "he had fallen under suspicion, owing to an unfortunate combination of circumstances," and he was released clear of all charge. One of the many proclamations that he issued and signed shows the moral tone of the lion-hearted youth. The people were hot upon spies and the wretched police agents who had sent so many patriots to the Spielberg.

"No! fellow-citizens," he wrote, "let our victory be stainless. Let us not demean ourselves by taking vengeance on the satellites whom their fugitive masters have abandoned in our hands. It is true that for thirty years they have been the scourge of our families. But be you generous as you have been valorous."

Save in fair fight not a drop of blood was shed.

Cernuschi opposed the *fusion* as inopportune, calculated to give the Pope and the King of Naples and Duke of Tuscany the excuse they wanted for withdrawing their troops from the "Holy War," now transformed to a struggle for the annexation of a province. When even hope was lost, he still fought on vigorously to the very last, sped to Switzerland to secure a quantity of muskets, then, refusing to recognize the capitulation, did his best to persuade Grifflini to hold the line of the Adda, and was with Garibaldi fighting against desperate odds until he also was compelled to quit Italian soil. He then went to Tuscany and thence to Rome, where again he taught the defenders the "art of barricades." He had been one of the opponents of the watchword *L'Italia farà da sé*, and would have had Italy accept the assistance of republican France against the Austrians in Lombardy; hence, the conduct of the French Assembly in supporting the fugitive Pope and assailing Rome came upon him as a bitter disillusion which augmented his determination to resist invasion to the uttermost. But when all chance of saving Rome was over, to prevent useless bloodshed, instead of accepting either of Mazzini's proposals to the Assembly to resist to the uttermost, or to carry the war into the provinces, he put the following motion: "The Assembly desists from a defence that has become impossible and remains at its post." After summoning Garibaldi and the other military chiefs, who all confirmed the "impossibility" of further resistance, as the French were in possession of the city, the Assembly decreed the cessation of hostilities—unanimously but for one vote, Mazzini's, who bitterly reproached Cernuschi.

Cernuschi remained when most of the other leaders had quitted Rome. The French commanders, attributing the scornfully hostile attitude of the entire Roman population towards themselves to his influence, arrested him on the charge of exciting the Romans against the

French, of leading them to sack and destroy the Villa Medici, the Farnese Palace, etc., and shut him up in the Castle of St. Angelo, and, after six months' detention, summoned him before a council of war. Refusing counsel, he made a magnificent defence, or, rather, a defence of Italy and of Italians, who "had defended, and would ever defend, native soil against all foreign invaders. You call me, you call them anarchists—the word is in vogue just now; but you simply do not know us. For myself, I am a man of order, a practical man, as the English say; *un homme sérieux*, as the French have it." The verdict of the military judges absolved him from all charges, but, the public prosecutor appealing, he was detained another six months in prison, again tried, found innocent, and sent in a French man-of-war to Toulon. His letters during and after his imprisonment to Cattaneo and to Bertani are some of the most original and amusing that I have ever read.

Head of a large family of orphan brothers and sisters, as their fortune had been diminished during the revolution, and Henry's portion sequestrated by the Austrians, he set to work as an engineer; later he entered the *Crédit Foncier*, associating with the anti-imperial republican Parisians. From the first he marked his antipathy to communists and socialists, but took vast interest in the social progress of the working-classes, and founded a coöperative society for the sale of meat. A Milanese exile put \$20,000 into the concern, which failed entirely, as most coöperative slaughter houses and butchers' stores have failed, even in England. The very first moment he became possessed of such a sum he insisted on refunding the \$20,000 to his friend Marquis Arconati.

When in 1859 the Franco-Sardinian war against Austria was proclaimed, he denounced it as immoral and fatal to Italy's future. Cavour, who had a special hatred of all Lombard republicans, especially federalists, denounced him in Parliament, and in his memorable reply Cernuschi gave him a Roland for his Oliver. He took no part in the war of 1866, and affirmed in 1867 that he would never assist monarchy to take possession of Rome. When in 1870 the appeal to universal suffrage was made in France, he gave the republicans \$20,000 for their propaganda, and for this was expelled from France by the Emperor. After the fall of the Empire he returned to Paris, and, as a protest against the proclamation of "One Italy, with Rome for its capital under Victor Emanuel and his successors," he renounced his Italian citizenship and was naturalized a subject of the French Republic. Bertani reproached him bitterly, but kept his affection and esteem for him to the last. During the German siege, he was the providence of the Parisians, spent freely of his wealth (large even then), and, when the Communists got the upper hand, remained there, doing his utmost to save the hostages and restrain violence, and came near losing his life for his attempt to save Deputy Chaudet.

For some years he travelled in China, Japan, and Egypt, bringing home vast treasures of antiquity. His magnificent villa in Avenue Velasquez, Parc Monceau, was open to all his countrymen, moderates or liberals. The Ambassador Reissmann was a frequent guest, but Cernuschi never set foot in the official residence of the Italian King's ambassador. Regarded as one of the greatest financiers and economists of the day, he was intrusted with various financial operations and made an immense fortune, but never was a single accusa-

tion of indelicacy, still less of dishonest speculation, brought against him. As an economist, his campaign in favor of bimetallicism will long be remembered in England and the United States. In 1884 he visited Italy, avoiding Milan and Rome, "preferring to retain the memory of the scenes of his youthful exploits and vanished hopes intact." At Mantua he was welcomed by Achille Sacchi, Garibaldi's "fighting doctor," visited Orsini's prison and the art treasures contained in the city. At Bologna, Giosuè Carducci, and Frati, the head librarian, were his clerics, and to the museums and libraries of the city he was munificent. Just after his return to Paris the Italian press attacked him violently on monetary, economical, and political questions, and one noted moderate paper called him "an out-and-out bad Italian," which led to the publication of a generous vindictory letter signed by Carducci, Frati, Giovanni Castellani, the celebrated patriot and antiquarian, and Prof. Tullio Martello. When, in 1890 during Crispi's first ministry, the general elections took place, he sent 100,000 lire to the republican association for propaganda and for the expenses of republican candidates, and never in this classic land of calumny and vituperation were attacks as virulent or as unjust made. The Government might spend hundreds of thousands of public money, use threats, promises, bestow rank and office to insure the success of its candidates, but a republican must not give money of his own for the spread of a principle which was dearer than his life.

It was in the spring of the following year that I went to Paris by appointment to visit Cernuschi in his beautiful Italian villa, with the medallions of Aristotle and Leonardo da Vinci over the entrance. With visions of the youthful hero in memory, I was hardly prepared for the austere, venerable aspect of the grand old man, with his long, thick, silver hair; but the bright liquid eyes, the peculiar sweetness of the full parted lips, were there as in his youth. "Welcome to the widow of the staunch federal republican whose dauntless courage, blameless life, and stern adhesion to his principles to the end make him an example to his countrymen," he said. The object of my visit was to lay before him the sorrowful fact that neither Bertani, Mario, nor myself had been able to find an editor or a band of the "master's" pupils to publish Cattaneo's letters and political writings which three successive deaths had left on my helpless hands. He offered at once to pay an editor, on condition that during his lifetime I should keep his name a secret, which (with the exception of three friends named) I agreed to do. Two volumes have appeared and pleased "the vanished eye." The third and last is in course of preparation. The details of that interview are too fresh in memory to be narrated to day, when his remains are journeying from Mentone, not to Milan, but to Paris, there to be cremated and to remain, how long, O Italy, how long?

J. W. M.

THE ROYAL ACADEMY.

LONDON, May 6, 1896.

If fidelity to tradition were always a virtue, the Royal Academy would be beyond reproach. Year after year, it perseveres in maintaining its reputation for mediocrity; year after year it covers its walls with the regulation number of inept or incompetent canvases, relieved here and there by the genuine work of an artist, which seems the more

marvellous or charming because of the contrast. Change is the last thing expected of so conservative a body. Indeed, so little is the slightest variation looked for, in either the Academy's policy or the quality of its exhibition, that this spring almost a sensation has been created by the action of the hanging committee in rejecting two men who, for some time past, have been the most honored of outside exhibitors. But two years since, Mr. Tuke's was the principal picture bought for the Chantrey collection; a conspicuous place on the line, hitherto, has always been found for Mr. Furse's portraits. And now, both Mr. Furse and Mr. Tuke are among the rejected, and the reported reason is the failure of each, in the eyes of the committee, to come up to his own standard of merit—the Academy suddenly showing a misjudged paternal concern for the progress of individual contributors.

This, and other vagaries of the hanging committee, whose one endeavor, evidently, has been to produce as many discords as possible in the given space, have made most talk among artists and art critics. And really, it is well that there should be something to talk about, for the pictures themselves are no great stimulus to enthusiasm or discussion. It may be that the Academy wears a gayer aspect than usual. Here and there is a faint reflection of the light that shines from the walls of the Champ-de-Mars Salon: two, at least, of the younger associates, Mr. Solomon and Mr. Hacker, do their best to out-dazzle everything in their vicinity—the one, with an iridescent Venus, the other with a theatrical nun choosing between the cloister and the world, while, apparently, the lime-light is well turned on from the wings. Here and there, too, are signs of a bewildered realization that sham symbolism or mysticism is just now in fashion, and very amazing and disastrous are the results. But technical fireworks and scrupulous adherence to fashion are not guarantees of good work, and the pictures of distinction are, as they ever must be, those which bid least clamorously for a day's notoriety.

A special and largely sentimental interest is attached to the "Clytie" of Sir Frederick Leighton. He was working upon it immediately before his death, and it is a pleasure to find that his last canvas is one of the best he has shown for many years. The goddess, her golden green drapery falling about her, her arms outstretched in prayer, is kneeling by a small altar, in the strong glow of the setting sun; for background there is a vague brown hillside and a tremendous overhanging canopy of golden cloud; and perhaps because, according to Sir Frederick Leighton's method, the painting is still unfinished, it has more of the breadth and freshness and vigor of his sketches, less of the waxiness and characterless smoothness and polish of his pictures. With something of the same sentimental interest one turns to the work of the new President, Sir John E. Millais, whom one always remembers as the great master he once was. He has two or three portraits which can be passed in silence, and a picture called "A Forerunner," presumably John the Baptist, which is repellent in its muddy color, prosaic in its treatment; but, at least, the slim brown figure, with the leopard skin around his loins, makes an effective silhouette against the shadows of a little wood, and is so well placed in the composition that it recalls some of the artist's earlier and nobler performances.

However, it is more encouraging to consider the work of the younger men—work which de-

pend upon no sentimental issue for its importance. The recent elections have made so great a difference that now, curiously enough, most of the notable contributions come actually from within the academic ranks. If I except two very lovely studies of sea and sand—exquisite color fantasies—by Mr. William Stott, the most striking pictures are by Academicians or Associates. You have but to look to the portraits to find Mr. Sargent supreme, though Mr. Sargent, it must be admitted, is far from being at his best. His "Mr. Chamberlain" is, no doubt, the *clou*—to borrow the French word—of the Academy. But this is due rather to South Africa than to the painter. The pose is commonplace, even photographic. The Colonial Minister stands by his desk; his left hand, which grasps a bundle of papers, resting upon it. The long expanse of immaculate frock coat, the orchid in the buttonhole, the high light on the trousers knees, all divide attention with the head, which, one cannot but think, failed to appeal to Mr. Sargent, so perfunctory is his rendering of it. On the other hand, in the "Portrait of a Lady," he shows one of the really beautiful women he seems, as a rule, so reluctant to paint. It is a full length, and the figure, in white evening gown and a cape of vivid cherry falling from the shoulders, stands in front of a dark, deep-toned Japanese screen. The arrangement is very simple, recalling the "Countess Clary Aldringen" in the New Gallery; but the face has charm and elegance, the pose distinction, and the whole figure is brushed in with spirit and the gayety of the painter sure of his effect. There is nothing to compare to this among the portraits, which, I should add, are of more than usual insignificance. There are two or three exceptions—for one, Mr. Orchardson's large "Provost of Glasgow," a masterpiece in the refined rendering of accessories, of an embroidered table-cloth, an Eastern carpet, but with a white head that detaches itself and fairly leaps at you from the subdued background; possibly in the place which the picture is designed to fill the light may remedy the fault which now seems so glaring. M. Benjamin Constant is represented, but he brings with him only the more accomplished commonplace of the Champ-Élysées. There is a strange pale-brown portrait of Mr. Alfred Gilbert, the sculptor, by Mr. Watts. Mr. Lavery, Mr. Greiffenhagen, Mr. Loudan contribute, but they make, for them, an indifferent showing—the result partly of the bad hanging.

When it comes to the subject pictures, honor lies with Mr. Abbey, who unquestionably has achieved a well-deserved success with his "Richard Duke of Gloucester and the Lady Anne," a marked advance upon any and all of the paintings he has as yet exhibited. The scene chosen is the second in the first act of "Richard III.," and, as reminder, the quotation,

"Was ever woman in this humour woo'd,
Was ever woman in this humour won!"

is printed in the catalogue. Across the background the funeral procession stretches—at one end the catafalque rich in heraldic ornament, at the other a sea of faces as far as eye can reach. The black cloaks of the figures, broken by the narrow strip of red lining in their hoods and the red staves of their inverted halberds, present a strong, stirring arrangement of color, repeated in the long black train of the Lady Anne and the red robes of Gloucester, where they stand in front of the procession. It is evident that Mr. Abbey has learned much while at work on the Galahad series, for he seems, in the composition and grouping, to

understand decorative limitations and requirements more fully than ever before. That he meant to treat the scene decoratively is clear, since he has made no attempt to introduce light or atmosphere, but has carried it out with a certain flatness appropriate to mural decoration. It therefore seems to me a mistake to have treated the two principal figures realistically and dramatically. Their realism is inconsistent with the general scheme; they break the harmony of the design. But, despite this defect, the picture will make one look forward more keenly to the second portion of the Galahad series.

If there were space, I should like to speak in detail also of the "Pandora," by Mr. Waterhouse; a charming little "Sirens," by Mr. Swan; an old-masterish arrangement of the nude by Mr. Watts, the "Infancy of Jupiter"; Mr. Greiffenhagen's "Judgment of Paris." These all have merit, and are a welcome relief from the conscientious naturalism of men like Mr. Stanhope Forbes and Mr. Frank Bramley, who waste their knowledge in accurate records of farm-yard incidents, not beautiful in themselves, though the artist who aimed at being something more than a human camera could give them beauty.

It is Mr. Clausen, another of the newer Associates, who excels in landscape. Instead of the midsummer brilliancy which has so often inspired him, this year he has found a motive in the gray melancholy of early dawn, "Bird-Scaring, March." It is a difficult effect to render, for sad and cold as is the gray light, it can be tender and soft as well. Mr. Clausen has managed to suggest both the coldness and the tenderness; pale mists lie lightly on his chilled fields and distant hills, and envelop, as with phantom foliage, the lonely trees that rise, in ghostly shadows, from the grayness. One pale rift of yellow light shows in the east. In the foreground stands the little human scarecrow, cold and sad as the hour, but with something of tragedy in his Millet-like pose that redeems his ragged ugliness and brings him into sympathy with the scene. There is no other landscape quite so subtle and dignified as this. But Mr. Arthur Lemon here, as at the New Gallery, has delightful and quite individual impressions of Italian landscape. There is a very stately "Pastoral" by Mr. Alfred East, who, in it, strives less obviously and more successfully to be poetic than in his wont. Mr. Alfred Parsons, Mr. David Murray, Mr. North, the contemporary of Fred. Walker and Pinwell, and Mr. La Thangue, all contribute intelligent and legitimately impressive work. Among the marines, Mr. Alexander Harrison's "Great Mirror" would probably be conspicuous, had not an irresponsible hanging committee seen fit to sky it. Mr. Bridgman's "Pharaoh's Captives" has not been much more fairly treated. It is easy to understand why distinguished foreigners so seldom seek to exhibit at Burlington House.

I have not left myself space to say how good the sculpture is. Mr. Alfred Gilbert again proves himself the master in a jewel-like statuette of "St. George," in aluminium, touched with gold and ivory. It is a perfect little piece of modelling; the metal being used for the armor, the ivory for face and hands, to produce an admirable effect of color. Mr. Harry Bates, an Associate, has his equestrian statue of Lord Roberts, a commission for Calcutta. It is so large that it was found necessary to erect it in the court-yard, much to its advantage. The figure sits well upon the horse and is full of dignity, while the pedestal is decorated with a very spirited bas-relief,

representing artillery and cavalry in action. One regrets that the monument must go from London, a city so unfortunate, always, in the statues set up in its streets and parks. A series of little colored bas-reliefs by Mr. George Frampton, and a casket in silver and enamel by Mr. and Mrs. Dawson, are treated with that fine feeling for decorative beauty that distinguishes the work of many of the younger sculptors.

Water colors and black-and-white receive the scant courtesy which is their accustomed portion. Mr. E. A. Walton, one of the Glasgow men, introduces an unexpected romantic note in the water color room, with a couple of fantastic studies of heads, one of which he frankly calls "Romance." And in the black-and-white room Mr. Abbey makes an appearance—the first step, it is to be hoped, toward his championship of the illustrator's art in the Academy, which has so persistently disdained it.

Correspondence.

THE SUGAR BOUNTY AND THE COMPTROLLER.

TO THE EDITOR OF THE NATION:

SIR: A paragraph in your last issue about the bounty decision conveys an erroneous impression as to the position of the Comptroller with regard to it. The Comptroller is not, in any sense, an inferior officer, but has been, since Hamilton's time in practice and since 1868 by express statute, the superior of the Secretary and of all the Cabinet officers in rulings on claims and matters of account. Moreover, he never rejected the claim, but referred it to the Court of Claims to advise him as to its constitutionality, also under a statute of 1868. He expressed his own opinion on the matter merely as explanation of delaying the claim in this way, but carefully avoided deciding it.

The trouble about the current newspaper view of the case is its tendency to scare Comptrollers in future out of exercising their statutory power to refer doubtful constitutional questions to the court—a thing constantly done by the Comptrollers of the State and city of New York. It is idle to talk about the constitutional decisions of the President in signing appropriation bills. He cannot examine the constitutionality of a hundredth part of the stuff that is dumped on him at the close of a session. The Comptroller is the man provided by Congress to decide whether claims shall be paid without litigation or referred to the courts.

JUSTICE.

WASHINGTON, D. C., May 30, 1896.

SOUTHERN PAUPERS AND RACES.

TO THE EDITOR OF THE NATION:

SIR: In this county of DeKalb, Georgia, with a population of nearly 80,000 (the blacks and whites being about equal), there are at present in the one poor-house of the county but five inmates—one man and four women—all white. Besides this, about twenty-seven people, mostly white, receive out-of-door relief. During the past three years eight has been the largest number of inmates at one time, of whom two were black. In ten half-years' residence here I have seen but one tramp and no white beggar; nor black, for that matter, unless one counts the willingness of nearly the whole race to accept gifts, and to expect them for slight

service, or none, as allied to begging. It is, however, essentially different, for the asking is always from some colored person one knows, and some service in return is usually implied, and, indeed, often generally rendered. The number of foreigners in the whole population is not much greater than the number of paupers, and they are mostly Jews.

The white people in this county are quite poor compared with the North or West, and the blacks are ten times poorer than the whites. Nearly all are engaged in agriculture. Here is an opportunity for sociological study presented nowhere else in the world. The semi-tropical climate and the presence of the blacks, lately slaves, have made our South in many ways more different from the North than England is. The cost of living here is, I believe, less than in any other highly civilized country.

T. B. BROOKS.

BAKERIDGE, GA., May 25, 1896.

A LESSENING OF DIFFICULTIES.

TO THE EDITOR OF THE NATION:

SIR: There has recently come to my notice an instance of plagiarism which has not been exposed, so far as I know, or received the censure that it deserves because of its boldness and magnitude, as well as because of the circumstances under which it occurred. The theft to which I wish to call public attention through the columns of the *Nation* is to be found in a monograph entitled 'Public Lands and Agrarian Laws of the Roman Republic,' by Andrew Stephenson, Ph.D., Professor of History in Wesleyan University. This monograph is one of the series of Johns Hopkins Studies in Historical and Political Science, and it was published in Baltimore in 1891.

According to the author's own statement, he has "earnestly endeavored to lessen the difficulties" which surround Roman agrarian legislation, and his reason for writing the work "is found in the fact that agrarian movements have borne more or less upon every point in Roman constitutional history, and a proper knowledge of the former is necessary to a just interpretation of the latter." A book which appears under such auspices and with such a purpose should have particular value. It should contribute to our information upon the subject: failing this, it should at least be original in treatment and accurate in statement. Consequently, one is surprised to find that a third of the book is merely a translation, almost verbatim, from a treatise on the same subject published in Paris in 1846, and entitled "Des lois agraires chez les romains," by M. A.-P.-L. Macé—of whom, it should be said, not the slightest mention is made anywhere in the course of the work.

The indebtedness of Prof. Stephenson begins in his preface, and it extends through an aggregate of thirty pages, found in various sections of the book. The closeness with which he follows M. Macé may be seen from the following passages:

"The other peoples, admitted merely to the *Jus Italicum*, did not enjoy the civil or political rights of Roman citizens, nor any of the privileges of Latin allies: at best they kept some souvenirs of their departed independence in their interior administration, but otherwise were considered as subjects of Rome." (Stephenson, p. 53.)

"Mais les autres peuples, soumis seulement au *Jus Italicum*, n'avaient aucun des droits civils ou politiques des citoyens romains, aucun des privilèges des alliés latins; tout au plus, leur avait-on laissé quelques souvenirs de leur ancienne indépendance dans l'administration intérieure. Pour tout le reste,

ils étaient considérés comme les sujets de Rome." (Macé, p. 263.)

Further, an interesting comparison may be made between an expression of M. Macé (p. 279), "le 7 des calendes de juillet," and Prof. Stephenson's translation of the same (p. 63), "the 7th of the calends of July." This seems to be a rather unusual rendering of the Latin "vii kalendas sextiles," which is cited in a foot note to substantiate his statement. It affords an excellent illustration of Prof. Stephenson's methods. Apparently his researches did not extend much beyond M. Macé's book so long as that was available; in his blind following of M. Macé he out-Livys one of Livy's worst faults.

With such passages in mind, the earnestness of Prof. Stephenson's attempt to "lessen the difficulties" of his subject, and also his ability to accomplish this task, may reasonably be questioned. His monograph, as it stands, is little more than juvenile in character. Plagiarism is but one of its faults—the most reprehensible fault. As a compilation, it does not have the merit of being smoothly and skilfully made. The book might have been valuable and useful, but the result of Prof. Stephenson's work is quite otherwise.

THORNTON JENKINS.

CAMBRIDGE, MASS., May 29, 1896.

A HARD CASE.

TO THE EDITOR OF THE NATION:

SIR: Last June I read in your columns an advertisement from Brown University, which announced that a prize of \$300 would be given for the best essay written upon one of several stated subjects. It was further stated that the competing theses must be "placed in the hands of the President of Brown University on or before May 1st, 1896."

I have accordingly been investigating one of the given subjects during the past winter. The thesis which I wrote upon it I sent by express to Providence on the morning of Friday, May 1, and was assured that it would be delivered there on the same day.

On Monday, May 4, the thesis was returned to me with a note from President Andrews saying, "Your manuscript arrived only this morning, too late to be available in the competition, according to our advertisement." Inquiry at the express office showed that the package reached Providence at 3:50 P. M. on Friday, and was taken to the college that afternoon, but was not then delivered because the college office was closed. It was, however, delivered on the morning of Saturday, May 2, and a receipt obtained for it.

I sent this statement to President Andrews. He made no offer to accept the thesis, but sent me the following answer: "Upon inquiry I find that the expressman brought your manuscript to my college office between 6 and 7 P. M. on May 1st. Our business office hours close at 6." A. L. CROCKER.

CAMBRIDGE, May 30, 1896.

Notes.

BURROWS BROTHERS Co., Cleveland, name August for the date of issue of the first volume of their proposed republication of the *Jesuit Relations*, as already announced by us. There will be but 750 sets printed, direct from the type, and subscriptions must include the entire series. The rate of publication will be one

volume monthly. The *Relations* will be set partly from careful transcripts and partly from originals, and the original pagination, though not observed, will be noted throughout. French compositors will be employed upon the French text, and special punches have been cut for some peculiar phonetic type of the original. The translation will be as literal as possible, and will be the work of John Cutler Covert, assisted by Mary Sifton Pepper and others. Mr. Reuben Gold Thwaites, Secretary of the State Historical Society of Wisconsin, will have editorial direction. The volumes will number some sixty, at \$3.50 each.

'Child Observations,' made on a very large scale by the students of the State Normal School at Worcester, Mass., and edited by Ellen M. Haskell, is announced by D. C. Heath & Co.

D Appleton & Co. will publish immediately 'Maggie,' by Stephen Crane, and in the autumn his 'Little Regiment.'

'The Way They Loved at Grimpat: Village Idyll,' by E. Rentoul Esler, is in the press of Henry Holt & Co.

A translation of Gabriele D'Annunzio's 'Episcopo and Company,' by Myrta Leonora Jones, will be published by Herbert S. Stone & Co., Chicago.

John Murphy & Co., Baltimore, have in preparation for the fall 'The Ambassador of Christ,' by Cardinal Gibbons.

The Boston Museum of Fine Arts is about to issue a new edition of Mr. Robinson's 'Catalogue of Casts from Greek and Roman Sculpture,' thoroughly revised by the author. Many of the descriptions have been entirely rewritten, to embody the results of recent investigations, and thirty-six new numbers are included, as well as a second index, arranged according to the places in which the originals of the casts are at present exhibited. The book will be published by Houghton, Mifflin & Co.

A new Danish translation of the 'Heimskringla' is announced. The translator is Dr. Winkel Horn, who is at present engaged on a translation of Saxo, and who is known to English readers through his *History of Scandinavian Literature*. The work will be accompanied by a number of illustrations by the Norwegian artist, Louis Moe.

Mr. H. W. Lucy's "diaries" of Parliament are now extended by his 'Diary of the Home Rule Parliament, 1892-1895' (Cassell). We find here the same humor, grateful condensation, compressed information, with swift limning of dramatic scenes and historic moments, that rendered famous the volumes which preceded this one. For its incidental records of bills and votes and sittings, the book is handy for reference. Mr. Lucy's personal affection for Lord Randolph Churchill inclines him to make that fallen meteor the hero of the volume—though he was most decidedly a *Hamlet* left out of the play in the Parliament covered.

In both the plan and the execution of Mr. W. T. Brewster's 'Studies in Structure and Style' (Macmillan) we find much to praise and nothing of any account to blame. The volume is intended to furnish supplementary work to the English studies of the freshman year—work in the analysis of English prose. Froude, Stevenson, John Morley, Arnold, Bryce, Ruskin, and Newman are the authors studied in extracts; and for the most part they are represented in their perspicacious rather than their brilliant moods. Mr. Brewster's studies are practical, and adapted to the needs of his audience. Logical structure a freshman can be brought to analyze, and with endless good to himself. Of style the more obvious anal-

lences, those particularly of fresh and definite diction, he can be led to see; but Mr. Brewster evidently knows the nature of the freshman, and refrains from trying to persuade him of refinements. Not the least merit of the book is the absence from the text of a swarm of reference-figures, those goats of the student soul. But even this kind of book ought to be indexed.

For students there is much important matter in the 'Biological Lectures Delivered at the Marine Biological Laboratory of Wood's Holl in the Summer Session of 1893' (Boston: Ginn & Co.). It treats, in lines more or less special, but in some degree comparative, of evolution, influence of surroundings, fertilization of the ovum, the cell, development, morphology, and kindred subjects. The different authors of the various chapters, ten in all, rank high as authorities in their particular departments, and these writings fix the present status of science in regard to their specialties, thus furnishing points of departure for the determination of advances and rates of progress. The essays are monographical, and consequently are of especial importance to those studying the same or related subjects, while to biologists in general they are welcome as works of reference. Aside from their direct stimulus to thought, they indirectly incite to research through an evident lack of agreement in the conclusions accepted. A reader, after perusal, is likely to decide from this that there is something unsettled in the foundations of our scientific beliefs.

The 'Biological Lectures and Addresses' delivered by the late Arthur Milnes Marshall, M.A., M.D., and edited by C. F. Marshall, M.D. (London: David Nutt; New York: Macmillan), are mainly summaries from various special researches arranged for popular lectures. Each of the thirteen is complete in itself. All of them relate to biology; yet through such topics as the modern study of zoology, animal pedigrees, the cell theory, death, embryology as an aid to anatomy, the recapitulation theory, and the like, they include a considerable amount of variety. The author was an investigator, and, in preparing his material, has evidently made studies of his subjects, canvassing the fields thoroughly and verifying whenever necessary to a proper understanding. His essays, consequently, have the vitality and enthusiasm of records of original work, though they are comparatively free from the technicalities or the confusion of detail. Their subjects being those claiming most attention at the present, they form attractive reviews, and at the same time are well adapted for entertaining those who have given little thought to such things. Outlines of theories, methods, accomplishments, purposes, and needs in science fill the book with attractive reading-matter.

'Mlle. Huguette' (Paris: Colin & Cie.) is one of those books written especially for young girls, and *blanc* enough to satisfy the longing of Sarcy's soul—a perfectly justifiable longing, by the way. It has also the advantage of having been written by Gabriel Franay, whose 'Mon Chevalier' was crowned by the French Academy. There, however, the advantages stop, for the book is somewhat too sentimental, somewhat too *blanc* and too young girlish. The heroine is a very self-conscious young person who would fain be considered artless, guileless, and all the rest of it, but who is very full of her importance, her looks and a sham belief (which she does not really entertain for a moment) that she is old and doomed to be an old maid.

In 'Une Cour et un Aventurier au 18e siècle: le baron de Ripperda' (Paris: Leroux),

M. Gabriel Syveton has given the fruit of much research and reading concerning this minister of Philip V. of Spain, who negotiated the double marriage of the Infanta of Spain and the Archduchess of Austria. Ripperda is proved to have been an active agent rather than a great patriot. The whole question, however, has always been beset with obscurity and difficulties, most of which have been cleared away by M. Syveton, who has ransacked archives and official files with such success as to unearth the "very secret" treaty negotiated by Ripperda.

M. René Doumic, who is steadily gaining ground as a critic, has brought out his sixth volume in this line of work. It is called 'Études sur la littérature française' (Paris: Perrin & Cie.), is announced as the first of a series, and is composed of articles contributed to the *Revue des Deux Mondes*. These articles are reviews of books serving as a theme for the development of M. Doumic's ideas. The more noteworthy papers are those on "L'Opéra et la Tragédie," in which another cause of the decadence of the latter form is stated and discussed, and "Diderot," an author whose claims to fame and influence are heavily discounted by the critic.

It may be worth while, although a little late, to mention that a very interesting correspondence between Auguste Comte and Gustave d'Eichthal, carried on during a long visit which the latter made to Germany in the years 1824-1825, has been printed in the *Revue Occidentale*. These letters between the great Positivist teacher and a young disciple only twenty years of age, and full of an ardent enthusiasm (which rises even to the point of passion) for Comte's general ideas and for sociology, form a valuable contribution to the biography of Auguste Comte and to the history of Positivism. The date of the number of the review—the conventional date—is March 1 of the present year. Perhaps it will not seem so very long ago if the real date is given, which is 5. *Aristotele*, 108.

In the just issued report of the State Geologist for New Jersey for 1895, popular interest pertains to the sections on the development of artesian wells in the southern part of the State, and on forest areas and forest fires. Mr. C. C. Vermeule's report of progress on forestry in northern New Jersey confirms the well established fact of an equilibrium between cutting and repair in that section, and uses this fact (observable for a long period) to impugn the common belief that deforesting has caused the drying-up of once navigable, or more navigable, streams. Mr. Vermeule shows that temperature (through its effect on evaporation) is a much more important factor, and that since 1870 we have been in a generally droughty period. Even the great floods of recent years have had their match at earlier periods. All we can say is, that "heavier-forested catchments furnish a steadier flow, better sustained during dry periods," and suffer rather less from severe floods. Mr. Vermeule's studies have shown him that there is less disposition to destroy and waste the forests on the part of our native rural population than of "the immigrant population from countries where the control and management of forests is, on the whole, far superior to our own methods." This was naturally to be expected in the removal from such control to perfect license.

An encouraging account of the growth of the Providence Public Library, in both size and usefulness, is given in the annual report for 1895, the eighteenth, of the efficient librarian, Mr. W. E. Foster. In an appendix is an

interesting table showing the use of fiction in thirty-nine libraries, from which it appears that in eleven the percentage is over 80 per cent., in seventeen it is over 70 per cent., in eight over 60 per cent., and in three it is over 50 per cent. Several large libraries, including Boston and Worcester, do not give the amount of fiction read. The highest percentage is 89.43, the lowest 50.5, which is reported by the library of Los Angeles, with a circulation of 339,405 volumes. Next in rank are Quincy and Newton, Mass., then follow Providence, with 63 per cent., and Chicago, which, with a circulation of more than a million volumes, reports a fiction percentage of only 62.51 per cent. The library is about to be adequately housed in a new building, which will cost, when completed, \$200,000.

We have received the first number, for May, of a new monthly called *Public Libraries*, issued by the Library Bureau at Chicago. It has been projected in the interest of the smaller libraries, with a view to meeting their need for detailed information as to practical working. A first section of the tentative A. L. A. Library Primer, compiled by J. C. Dana, is the main feature of this number. News of libraries, librarians, and associations is also much in evidence. There is a column of queries and answers.

Among the various measures for increasing the number of independent occupations for women, the opening of horticultural schools for girls is obviously one of the most sensible and promising. Many of our agricultural colleges admit girls to their classes, but without very seriously attempting to turn out theoretically and practically trained gardeners. In Germany the first Gartenbauschule für Frauen was opened by Fräulein Dr. Castner at Friedenan, near Berlin, on October 1, 1894. The first class of seven members will be graduated from that institution next fall, when one of the graduates will enter as teacher a similar school recently established at Riga, in Livonia. On the 1st of October next the second institution of the kind in Germany will be opened on the estate of the Baroness von Barth-Harmating near Plauen, in Saxony. The courses of study, extending over two or three years, include not only the most varied branches of gardening and horticulture, but also such scientific and commercial instruction as is needed for the successful pursuit of the business. Two students of the first mentioned school have already established themselves on rented land and proved the profitability of the occupation. It is also said that there is a demand for thoroughly trained female horticulturists as superintendents of the gardens on large estates. The fact that these new institutions are intended for "gebildete Frauen und Mädchen" is emphasized. In January last a society for the promotion of the support of women by means of fruit-culture and gardening was formed, of which Fräulein Anna Blum of Spandau is secretary.

The Vacation School of Modern French founded at Geneva in 1892 has just published its programme for the present season. It is in two courses, from July 15 to August 30, and from October 1 to 21. Every Saturday there will be excursions to the environs, or visits in groups to the National Swiss Exposition now open, closing October 15. The official bureau of information of the *Cours de Vacances* is at 5 Quai du Mont-Blanc.

It has been finally decided that English shall be included among the official languages at the international medical congress to be held at Moscow next year. At first the choice was limited to French, German, and Russian.

In connection with the semi-centennial celebration of Cambridge, Mass., it is proposed to purchase a portion of Elmwood, the birth-place and life long home of James Russell Lowell, and make of it a Lowell Memorial Park. The tract involved has been secured till July 1 at a price of \$35,000, and a committee headed by Mrs. Louis Agassiz, and including Miss Alice Longfellow, is soliciting subscriptions in sums large and small. These may be sent to the Treasurer, Mr. William A. Bulard, First National Bank, Cambridge.

—Mr. Albert Shaw's study of the city government of St. Louis is especially opportune in the *June Century*. He had already shown in his two volumes how far British and Continental cities have advanced beyond us in the solution of the problem how to make life in a city decent and attractive. He now shows how far St. Louis has gone ahead of other American cities in the achievement of home rule, in the employment of experts in certain city offices, and in a phenomenal freedom from charges of official corruption. Particularly is St. Louis to be congratulated on having, partially at least, thrown off the shackles of ward representation. While the twenty-eight delegates to the lower branch of the Municipal Assembly are still elected from wards, the thirteen members of the upper branch, or Council, are elected from the city at large. Nothing in Mr. Shaw's article is more striking than his comment on the personal difference between the members of these two branches. Delegates elected from wards exhibit in general the familiar characteristics of their class, but gentlemen of repute and character serve in the branch elected at large, which has contained, under the present charter, "groups of men who would have done credit to any legislative body in the land." St. Louis has lately become an example to other cities in its system of garbage treatment, and avoids at the same time any offensive claim to moral superiority on this score by using a simple invention which "has now made possible, on purely commercial grounds, an advanced step in American municipal housekeeping that neither public spirit, the sanitary motive, nor yet the demands of a fastidious civilization, had sufficed to effect." There are, however, some features of the corporate life of St. Louis which prove that its citizens have not yet altogether emerged from the national stupidity and supineness in the treatment of civic affairs. They still, for instance, accept a clean sweep in offices with each change of administration as part of the providential order of human affairs, and they will make to strangers this summer such an exhibition of poles and overhead wires in their streets as no other great city in the world can show. For the rest of this number of the *Century*, we shall content ourselves with remarking the continuation of Mr. Bryce's "Impressions of South Africa."

—Readers of *Harper's* will find that the artist whom Dr. Charles Waldstein designates as "The Greatest Painter of Modern Germany" is Adolf Friedrich Menzel. Dr. Waldstein's distinction in classical fields creates a predisposition in favor of his paper, which nevertheless makes an impression of inadequacy in this modern branch of criticism. In "A Visit to Athens" Bishop Doane lends to a very trite composition the weight of a widely known name. The most successful literary effort in the number is called out by the venerable pastime of fishing. "The Ouananiche and its Canadian Environment," by E. T. D. Chambers,

is a capital paper in its line, combining with a sportsman's knowledge a skill in expression which is worthy of classical tradition. The illustrations to this article are correspondingly attractive. In *Scribner's* the redeeming feature is Henry Norman's "In the Balkans." The fascination of the Balkan Peninsula, not the "Titanic tangle" of its politics, is Mr. Norman's theme. He therefore touches lightly on the Eastern Question as such, stopping merely to give an outline of the diplomatic problems which are "the nightmare of emperors and the despair of statesmen." The reader, nevertheless, after following him from Sofia to Belgrad and from Bosnia to Rumania, will be likely to find that the numerous races and states which are crowded into the "chess-board of Europe" present a much less confused aspect to the mind, and that a more vivid impression of foreign parts is seldom received from an article. The Bay of Cattaro, Cetinje, and Prince Nicolas are subjects which naturally animate the pen. Some verses of Stevenson are included in Isabel Strong's conclusion to "Vaillima Table-Talk," but there is a falling off in quality between this and the first part. In the *Atlantic*, Gen. Francis A. Walker's plea for the "Restriction of Immigration" may be singled out as most likely to provoke thought and comment; but Dr. George Birkbeck Hill continues to edit the letters of Dante Gabriel Rossetti, and Lord Howe's commission to pacify the Colonies has fresh documentary light thrown on it by Paul Leicester Ford.

—The forty-fourth annual report of the Boston Public Library records the opening of the new building during the past year, the development of the plans and policy of the new librarian, Mr. Herbert Putnam, and a revolution in the personnel and evidently in the ideas of the board of trustees. Steps are being taken to make the work of the nine branches and thirteen delivery stations more effective. The latter are now given something of the character of branches by having on deposit in each a small supply of books, frequently changed, from which applicants may select something if their call-slips sent to the library fail to secure what they want: by telephonic communication with the main library it is proposed still further to increase their efficiency. The West End branch has lately taken possession of its new home, the old West Church, which has been remodelled sufficiently for the purpose while retaining most of its interesting features. This is the church in which James Russell Lowell, as a boy, listened to the excellent sermons of his father, Rev. Charles Lowell, and which was later perhaps equally famous as Dr. Bartol's church. What more fitting use for "abandoned" churches than this? It was to the founders and supporters of a free library that Lowell himself applied the Scripture, The teachers shall shine as the firmament, and they that turn many to righteousness as the stars forever and ever. The main building, while it provides seats for nearly four times as many readers as the old building, and seven times the floor-space in public rooms, has already been quite fully occupied by the public. Contrary to the expectations of the trustees, the remoteness of Copley Square from "down town" seems to make no difference to the frequenters of the library, while the greatly increased facilities attract multitudes who shunned the crowd and the discomforts of the old building. The most significant improvement in the present arrangement is the placing on practically open shelves nearly 200,000 volumes, which may be

consulted with almost no formalities, and which, we remark in passing, are particularly sought after for genealogical research. It is in this direction that the best "library science" is tending. It is no matter for surprise that the annual expenses of the library are increased to the extent of \$30,000 by the new building, so that some \$225,000 must now be appropriated yearly by the city. This sum, capitalized at four per cent, represents an investment of five and a half millions, which must be added to the six millions which the present plant is said to be worth, to show how distinctly Boston is still in the lead as to its provision for its free library.

—The second edition of Mr. George Haven Putnam's "The Question of Copyright" (G. P. Putnam's Sons) brings this compilation up to date. It comprises the text of our copyright act, a summary of the copyright laws at present in force in the chief countries of the world, together with a report of the legislation now pending in Great Britain, a sketch of the contest in the United States (1837-91), and papers on the development of the conception of literary property, and on the results of the American act of 1891. Mr. Putnam (who advocated the act of 1891, though himself in favor of the most liberal system of copyright) thinks the statute has worked better, on the whole, than there was reason to anticipate; that the most serious and legitimate criticisms of the law have come from the authors of France, Germany, and Italy, who cannot secure American copyright for books requiring translation; but that these might be met by an amendment requiring registration in regular course, while permitting publication of an English version later. Unless something of this sort is done, he fears the abrogation by one or more of these countries of the existing conventions with us. He favors the extension of the term of copyright, and hopes that in time the manufacturing clause may be done away with. So will most of his readers. The present copyright law fixes a period far too short to secure literary property as other property is secured—the extreme term is forty-two years—and most copyrights expire at the very time that the author would naturally desire to make them most safe, i. e., when his children begin to reap the harvest from the seed which he has sown. As to the manufacturing clause, it represents simply the triumph of brute protection over the principles recognized throughout the civilized world in dealing with all questions of property. Wherever property is recognized by municipal law, the right to transport it from country to country and enjoy its fruits is also recognized. Our law is one of the first in the history of the world to make the enjoyment of property dependent upon the place of manufacture. It is a novel application of the principle of protection, and there is no reason why, if there were anything in it, it should not be applied to all property; would it not greatly stimulate American manufactures if every coat, hat, cloak, cooking utensil, and steel rail in the country made of imported material could be owned only on proof that it had been made in the country? The authors took this monstrous provision on the principle that half a loaf is better than no bread, but the fact remains that our country, after having been for a century the great exponent of piracy, has substituted for piracy a copyright system still so barbarous that the promoters of the law which introduced it, are mainly occupied with measures to palliate the evil effects of the conditions thrust down their throats by the

labor unions and others, who were the real fathers of the manufacturing clause.

—We are reminded of the English tourists in Boston and its historic vicinity, who said they never should forgive themselves for not having visited America before all the interesting people had died, by the latest 'Journal' of M. Edmond de Goncourt. Nearly all the great names which illustrated the pages of the earlier volumes have disappeared. Alphonse Daudet seems to be almost the only one who is left. The journalist himself, if not exactly on evil days fallen, has at least fallen on less interesting days than were his former ones, and himself begins to feel that the afternoon of life is somewhat wearisome. He records scandals of much the same sort as before, but lesser ones; he has reflections such as he has given us before, and gossips only less entertainingly than he did. But the gossip is rather the worse for being so fresh. It is like hearing the next morning's talk after a ball. One touch of characteristic ingenuousness may be quoted. Under the date of September 4, 1892, M. de Goncourt writes: "*Lorrain vient déjeuner ce matin à la maison, et, confiant en moi, il se répand sur sa jeunesse.*" Then, with a most complete unconsciousness of committing any impropriety, he himself confides the whole story of M. Lorrain's youth to the gentle reader. M. Lorrain's adventures were nothing very extraordinary, yet still it may be doubted whether he has been exactly pleased at seeing them in print. The 'Journal' is appearing as a feuilleton in the *Écho de Paris*, where its publication began in April.

—The Association Française pour l'Avancement des Sciences went out of its way a little this year to hold its annual meeting at Tunis, and this fact had some influence upon the character of the papers read. M. Marcel Dubois, Professor of Colonial Geography at the Sorbonne, delivered a most interesting discourse, comparing the different systems of colonization, ancient and modern. He complained of the injustice which often results from such comparisons, in exalting the merits of the ancients, insisting strongly on the advantage which the Romans had in being able to send out to Africa colonists who were already almost as good as acclimated. The Roman colonists, too, were accustomed to the practice of irrigation of the soil, and to the sort of agriculture which is most profitable in Africa. He maintained that, on the whole, France had quite as great an interest in North Africa as Rome had, and that, just deductions being made, France had been no less successful in her work there. Commandant Rebillet then gave some interesting details on the desert tribes, and on the first results of the extension of trade towards the south, incidentally conveying much new information about the Sahara. M. de Coudray La Blanchère spoke of the rural settlements of the Romans in North Africa. Of more general interest, perhaps, was a communication of Prof. Montelius of Stockholm on the distribution of dolmens. This type of tomb, he said, is of Oriental origin, but it has been transplanted even so far as to Scandinavia. The Scandinavian dolmens date from an epoch much earlier than the twentieth century B. C., and we have in these monuments indications of an influence which the East exercised upon Europe at a very early date. If the Scandinavian dolmens were so early, the Oriental dolmens must be at least one or two thousand years earlier still. This is confirmed by the fact that the chambers in

the Egyptian pyramids are constructed exactly like dolmens, with the single difference that the stones of which they are built are cut and polished. It is not to one people alone that dolmens belong. An Aryan people was living in Scandinavia, while the dolmens of Syria could not have been built by Aryans. It was, then, a question of influence rather than of migration. Prof. Montelius spoke also of other traces of Oriental influence on the north of Europe in the times which immediately succeeded the dolmen epoch. Throughout this period, communications between the east and the north of Europe followed along the coast of Africa to the Spanish peninsula. It was evidently easier to go along the coast than to cross the sea. Only at a much more recent time did the influence of eastern civilization take another route, traversing first the Mediterranean and then the European continent.

RECENT POETRY.

It is only fair to say of the much-derided Poet Laureate of England that there is, in the preface to his new historical drama, 'England's Darling' (Macmillan), a tone of humility which certainly was not visible when he began his special duties by furnishing the music halls with a song of triumph about the marauder Jameson. He says frankly of his new work, "Would it were worthier!" and goes on to quote manfully from King Alfred's own (reported) words, "Do not blame me; for every man must say what he says, and do what he does, according to his ability." Indeed, the whole preface confirms the suggestion which we made on the appearance of his charming book, 'A Poet's Garden,' to the effect that the new laureate had best write his poetry in prose. We are compelled to see the merely official quality appearing, however, in his bold remark (p. xii): "Englishmen have never conceded unqualified admiration save to those who combined with intellectual distinction the crowning grace of moral worth," and expressed opinion that the national sentiment would never have sustained a Henri Quatre or Louis Quatorze. It is hard to see how such an assertion could be made by any one who had perused Thackeray's 'Four Georges,' for instance; nor would it be hard to gather some later illustrations from *Punch*. But some license must be allowed to a laureate—else why do laureates exist?—and his drama has at least a good subject, and may be praised on the basis recognized by that good woman who admired her pastor because he had such beautiful texts. The play is, indeed, best compared with others whose scene is laid at a period somewhat similar—as, for instance, with Sir Henry Taylor's "Edwin the Fair," to which it is certainly far inferior in interest or action, and strikingly so in the beauty and effectiveness of its lyric passages. The tribute to Lord Tennyson which follows, under the name "The Passing of Merlin," would doubtless be regarded as simple and pleasing, were there not a general disposition to make light of whatever this new functionary does.

The volume of 'New Poems,' by Christina G. Rossetti (Macmillan), will at first suggest the disappointment almost always inspired by posthumous poetry. As a rule, the poet is not seen at his best in what he has kept in reserve; the very fact that it was not brought forward often shows that it did not satisfy its author. But in this case any want of poetic satisfaction is more than balanced by the biographic interest; and in the notes, especially, we see re-

vealed the home-life of a highly gifted family, whose mixed nationality makes their intellectual work more interesting, while their wide divergence in thought makes their frank mutual criticism delightful. They do not hesitate in the least to blame or praise each other's work, and to quote the mutual compliments or condemnations; and this relation is peculiarly noble and sweet between the shy, devout, nun-like sister—for the other sister, Maria, is met but little—and the ardent and free-thinking brothers. Christina and her mother were like lovers, and interchanged valentines; her childhood was cradled in poetry, and this volume contains some seventy pages of her verse written before the age of seventeen. Her Italian poems, which appear here for the first time, are more graceful and lyrical than any of those in English, and there are, among the many *bouts-rimés* sonnets—those, namely, of which the rhymes are given and the text afterwards filled in—three sonnets with the self-same rhymes, showing how deftly she could give that number of varying solutions of a single problem (pp. 20, 21, 23). One of the Italian poems is a curiously felicitous rendering into that language of the oft-quoted Latin poem of the Emperor Hadrian, "*Animula vagula blandula*" (p. 288):

ADRIANO.

*Animuccia, varentuccia, morbiduccia,
Oste del cor, o e-uora,
Ove or farai rimora?
Palliduccia, irrididita, svestituccia,
Non più scherzante or ora.*

She also wrote an English version of this, both these being intended for a privately printed volume of these translations edited by Mr. David Johnston of Bath—to which compilation her brothers also contributed. Her English translation is the following (p. 171):

*Soul ruddiless, unbraced,
The body's friend and guest,
Whither away to-day?
Unsuppl'd, pale, diseased,
Dumb to thy wonted jest.*

The curious incapacity of the brother to adapt himself to the highly wrought religious mood of the sister is seen in his comment on her verses called "The End of the First Part" (p. 36), where he thinks it necessary to explain the line

"Must change my laughter to sad tears of guilt,"

by explaining that "this would be, for Christina, a very exaggerated phrase," and that it may possibly refer only to original sin. He apparently has never learned by experience that it is usually the most stainless souls which scourge themselves most bitterly with remorse.

One of the shorter English poems has a curious flavor of that other reclus woman of genius, Emily Dickinson (p. 183):

THE WAY OF THE WORLD.

*A boat that sails upon the sea,
Sails far and far and far away;
Who sail in her sing songs of glee
Or watch and pray.*

*A boat that drifts upon the sea,
Silent and void to sun and air;
Who sailed in her have ended glee
And watch and prayer.*

Mr. M. M. Cawein's 'Undertones' (Copeland & Day) continue to show that improvement which has been seen in his later (and too numerous) volumes. He has mainly shed the extreme imitativeness of which we have formerly complained, and has also repressed much of his turgidness; although there is still some of this to be got rid of. On the other hand, there is a growing tone of cynicism and of that baleful tendency in which his friend Mr. Howells has preceded him, to regard human love as good for early youth only. He evidently

thinks of it only as Miss Berry's Frenchman thought of a beauty past her prime, "Elle n'a qu'un quart d'heure pour l'être." Neither his technique nor his taste is quite to be trusted; thus, he rhymes *storm* with *harm*, and—which is strange for a Southerner—*moon* with *tune* (p. 10); and to describe the sunlight as "loafing" (p. 1) is certainly not to be commended. On the other hand, he has readiness and affluence of imagination, and his love of local coloring is staunch and American, so that such a poem as this shows him at his best (p. 4):

THE WOOD.

Witch hazel, dogwood, and the maple here;
And there the oak and hickory;
Linn, poplar, and the beech-tree, far and near
As the eased eye can see.

Wild ginger; wahoo, with its wan balloons;
And brakes of briars of a twilight green;
And fox-grapes plumed with sun mer; and strung moons
Of mandrake flowers between.

Deep gold-green ferns, and mosses red and gray—
Mats for what naked myth's white feet?—
And, cool and calm, a cascade far away
With even-falling beat.

Old logs, made sweet with death; rough bits of bark;
And tangled twig and knotted root;
And sunshine splashes and great pools of dark;
And many a wild-bird's flute.

Here let me sit until the Indian, Dusk,
With copper-colored feet, comes down;
Sowing the wildwood with starfire and musk,
And shadows blue and brown.

Mr. Smyth, in his recent *Life of Bayard Taylor*, concedes that his verse, except perhaps in the "Bedouin Song" and the "Song of the Camp," had no spontaneity, but was all "carefully built up by the intellect," but tells us on the opposite page—what we had not previously known—that there is still a Taylor cult, at least in New York and Pennsylvania, and names as its chief representative Mr. Clinton Scollard. Now for the first time we recognize the key to Mr. Scollard's limitations, that he has assiduously set before himself an inadequate model. With assiduous effort and the careful collection of materials, he still remains ordinarily, as did Taylor, within the zone of mediocrity, and this applies even to his "Hills of Song" (Copeland & Day). Few of our younger poets write with so much readiness and fertility as Mr. Scollard; he is cultivated, observant, conscientious, and always keeps to a certain desirable standard of good taste; he has also a wide range of material; and yet he never quite stirs the blood or makes himself essential. What we mean may be best seen by a little comparison. There is no better test of a poet than the way he deals with the ocean, the one thing unchanged and untamable, still as ever elusive, exhaustless, irresistible. This is Mr. Scollard's way of approaching it (p. 21):

THE MARINER'S GRAVE.

Beneath the grim old beacon tower
They made his last straight bed,
The gray and grizzled slope below,
And ocean wide outspread.

There might he see the ships slip in
And out across the bar,
And down the night the warning light
Fling its recurrent star.

There might he hear the harping wind
Retune its ancient strain,
And that sublime musician, sea,
Intone its joy and pain.

There might his sleep be long and deep,
From time and tide withdrawn;
Above, the sea gull's silvery wing
Until the last red dawn.

Now, we will not be so severe as to propose a comparison with a wild Berserker chant like Kipling's "The Dipsy Chanty," but there are two brief poems, briefer than Mr. Scollard's, and both meditative like his, each of which has in it a touch of thoroughly imaginative grasp, as real as the sea itself. Having quoted them in previous notices, we will not give them again; they are Prof. Roberts's "On a sailor

buried ashore" and Mr. Carman's "Child Marjorie." There would be no better way of illustrating Mr. Scollard's limitations than to print either of these short studies side by side with his. In saying this, we would again bear witness to his uniformly high workmanship as respects literary execution.

Mr. James B. Kenyon is another of the poets who are cultivated and pleasing, although but mildly inspired. The name of his new volume, "An Oaten Pipe" (Tait), is rather far-fetched, nor is the selection of contents so exclusively pastoral as to make the title convincingly appropriate. Perhaps the strongest of the poems is this sonnet on Sappho, who left fewer verses and suggested more, it would seem, than any recorded poet (p. 119):

SAPPHO.

Where is that bay-crowned head supreme in song?
The tides that darkle round the Leucadian steep
Lap her forever into deeper sleep;
About her heart of fire the cool waves long
Like cements have been wound, and voices strong
Of winds and waters o'er her pillow keep
Their bolsters lullaby. That frenzied leap
From the bear height, when sense of sharpest wrong
Ran in her blood like flame—the fears that strove
Within her stormy soul—the lyric tongue
Whose last high music ran through realms of love,
Till hushed by that sea-wind which o'er her sung
Its sudden doom—ah, all the dole thereof
No equal tears have wept, no lips have sung.

We are also led to Sappho in "Songs from the Greek," translated by Jane Sedgwick Minot (New York: Richmond), a delightful volume, taking rank with Mrs. Perry's similar book noticed some time since by us, and making with it two most acceptable contributions by American women to the rendering of minor Greek poetry. This volume includes some choruses from the dramatists and an idyl of Theocritus, but it is taken mostly from Sappho and the Anthology. The author shows care, at least in the selection of authorities, as, for instance, in the following (p. 42):

TWO FRAGMENTS BY SAPPHO.

The stars that stand about the moon
Their shining faces veil as soon
As at her full, in splendor bright,
She floods the earth with silver light.

And through green boughs of apple-trees
Cool comes the rustling of the breeze,
While from the quivering leaves down flows
A stream of sleep and soft repose.

The Greek word corresponding to "breeze" is wanting in the original text, which is imperfect. It appears from Wharton's variorum edition that previous translators, as Merivale, Symonds, and Palgrave, have used the words "water" or "stream," whereas Miss Minot, following Wharton, substitutes "breeze," which certainly seems more appropriate, although we know from Theocritus that the combination of orchards and streams was not uncommon. We cannot, however, commend the present translator for inserting "green" to characterize the boughs, for it is an addition of her own, although Frederick Tennyson takes the same liberty. In the other pretty fragments (p. 43) about the apple and the hyacinth, Miss Minot calls the apple on the bough "reddening," whereas Sappho only calls it "sweet" (*γλυκύμαλον*), and in the other half of the fragment she simply describes the fallen hyacinth as purple, whereas the original word (*πορφύρεα*) rather describes it as growing more purple or "impurpling" on the ground as it dies. Here again she has Rossetti and Sir Edwin Arnold with her, but Wharton against her. All this is holding her to that standard of strict literalness which has been demanded (since Longfellow's example) of a translator, and to which few of her predecessors have been confined; and we renew our tribute to the excellent quality of her work.

"The Pilgrim, and Other Poems" (Macmil-

lan), by "Sophie Jewett" (Ellen Burroughs), takes its name from the title-poem, but it might also have taken it from the fact that the best verses in the book have European themes. The most striking is this, on a subject which has doubtless suggested thoughts akin to poetry in many minds—the weird figures in stone which overlook the stir and tumult of Paris from their cathedral heights (p. 64):

A SMILING DEMON OF NOTRE DAME.

Quiet as are the quiet skies,
He watches where the city lies
Floating in vision clear or dim
Through sun or rain beneath his eyes;
Her songs, her laughter, and her cries
Hour after hour drift up to him.

Her days of glory or disgrace
He watches with unchanging face;
He knows what midnight crimes are done,
What horrors under summer sun;
And souls that pass in holy death
Sweep by him on the morning's breath.

Alike to holiness and sin
He feels nor alien nor akin;
Five hundred creeping mortal years
He smiles on human joy and tears,
Man made, immortal, scornful man;
Serene, grotesque, Olympian.

Mr. Charles Leonard Moore, in his "Odes" (Holt), exhibits his wonted thoughtfulness and grasp, but the very title of his volume shows that he risks himself too much upon ambitious themes and treatment. Even Lowell, in attempting the ode, had but one great and triumphant success; and the irregular and dithyrambic strain has really a more fatal facility than the ballad measure, and admits of as hopeless commonplace. Mr. Moore's best success is in his "Elegy" on Poe, which has really more of fine discrimination than any other of the numerous poetic tributes to that author, so far as we can recall them. This, for instance, comes after a delineation of "the tragic singer of the Shades," and touches with firm hand the key to his forlorn fate (p. 40):

"Viewless he went amid life's garish ill;
He could not wait till twilight owned his race,
Dusk, his new dynasties;
Wan, vacant presence and neglected guest,
Earth placed no throne for him whereon to rest.
Poppy, therefore, and every poisonous growth
Took lie, that could transport his soul away
From his wide prison—for his eyes were loth
And weary of the day.
And every steed he chartered, that did go
A little on the journey from the earth,
And joined each distance-seeking caravan;
Where'er the waves did roll, or the winds blow
O'er this world's abrupt and precipitous girth,
Swiftly his spirit ran.
Drunk with imaginations, drunk with wine,
Drowy with dreams or waking with desires,
He sat at Pleasure's feet and would not rise,
Enamored of oblivion in vain—
Pleasure, no more smooth-lipped, no more divine,
But burning with unathome fire,
With melancholy in her mighty eyes,
With proud lips curbing pain.
Long there he sat, while in a cup she gave
Most bitter drink for thirst, and the salt wave."

For some reason, hitherto unexplained, Trinity College has been more successful than other American institutions in producing good college poetry; and while none of it takes us quite back to the classic period of Præd and the "Etonian," yet the new volume of "Trinity Verse," edited by De Forest Hicks and Henry Rutgers Remsen (Hartford, Conn.), affords some excellent fooling and some very graceful verse. Under the former head may be classed "The Greco-Trojan Game" of football, in Homeric verse, by C. F. Johnson, and a parody of Rudyard Kipling, "The Marryin' of Danny Deever." This last is meritorious, as is this "L'Envoy":

Where the cliffs of Brittany
Silent watch the sounding deep,
Sunk in an enchanted sleep,
Lies a city 'neath the sea.

Thence, I have heard peasants telling,
When the moon is hanging low,
And the ocean scarce seems swelling,
In its silent ebb and flow,
Softly, sadly comes a stealing
Over all the country side,
Sound of fairy bells a-pealing
In the sainted even-tide,
And the soul which learns that music
Lives forever satisfied.

So from life's untroubled ocean,
In our golden even-time,
We shall hear with glad emotion
Echoes ringing—chime on chime;
And our hearts, those sunken cities,
Stored with thoughts of former days,
Soft shall sing us olden ditties
Of our college life and ways;
And the soul which learns that music
Never longs for newer lays.

In the little volume of thirty pages called simply 'Verses,' by May Wright Plummer (Cleveland, O.: Lemperry), there is more of the poetry of earnest thought than in many larger books. The following bit of blank verse—Cicero's supposed soliloquy on the death of Caesar—is perhaps the strongest, and has indeed some lines of remarkable strength (p. 31):

Ay, look, and look again, at him who bore
The world and flinched not, but an hour ago
In his colossal shadow you were lost:
"Down with him, down, that we may see ourselves!"
He lies there; are ye greater than before?
Beyond the door the world he carried waits
To fall upon your staggering feebleness
And loosen into chaos once again.
Free ye, indeed! From that still figure prone
Stretches a shadow that may well affray.
Living, it alternated with the sun;
Dead, it creeps on ward, licking up the light.
So have ye chilled the pulses of the world
Into stagnation. Flee, and be content!

We have before now called attention to the remarkable vigor and freshness with which the younger Canadian poets write of nature, and the manner in which they show also a feeling for the human side; their landscape almost always skilfully including something of that kindlier tie. Perhaps this is a more instinctive tendency in a colder clime, where the indoor aspect of things can never be long ignored, as compared with the larger share of dreamy outdoor indolence practicable, for instance, to Lanier. At any rate, the fact is there. Note how quickly it makes itself felt in the close of these charming verses of the spring-time, from Archibald Lampman's 'Lyrics of Earth' (Boston: Copeland & Day):

JUNE.

Long, long ago, it seems, this summer morn
That pale-browed April passed with penive tread
Through the frore woods, and from its frost-bound bed
Woke the arbutus with her silver horn;
And now May, too, is fled,
The flower-crowned month, the merry laughing May,
With rosy feet and fingers dewy wet,
Leaving the woods and all cool gardens gay
With tulips and the scented violet.

Gone are the wind-flower and the adder-tongue
And the sad drooping bellwort, and no more
The snowy trilliums crowd the forest's floor:
The purpling grasses are no longer young,
And summer's wide-set door
O'er the thronged hills and the broed panting earth
Lies in the torrent of the later bloom.
Haytime, and harvest, and the after mirth,
The slow, soft rain, the rushing thunder-plume.

Note how noiselessly the human aspects "hay-time and harvest" steal in at the end to take us from the realm of wild nature into that half-tamed world which Thoreau, in spite of all misrepresentations of him, maintained to be the best theme for literature. In this case the quiet phrase serves the same purpose as when Sir Philip Sidney flings out the glowing description of his Arcadia, and puts into it, as the centre of the whole display of delight, "there a shepherd-boy piping, as though he should never be old."

'Little Rhymes for Little People,' by Anna M. Pratt (Cleveland: Lemperry), is more successful than books of deliberate nonsense and child-talk are wont to be, and one of the poems is so odd and unexpected in its outcome as to have already won a great newspaper and school success, thus (p. 31):

A MORTIFYING MISTAKE.

I studied my tables over and over, and backward and forward too;
But I couldn't remember six times nine, and I didn't know what to do,
Till sister told me to play with my doll and not to bother my head.
"If you call her 'Fifty four' for a while, you'll learn it by heart," she said.

So I took my favorite, Mary Ann (though I thought 'twas a dreadful shame

To give such a perfectly lovely child such a perfectly horrid name),
And I called her my dear little "Fifty-four" a hundred times, till I knew
The answer of six times nine as well as the answer of two times two.

Next day Elizabeth Wigglesworth, who always acts so proud
Said "Six times nine is fifty-two," and I nearly laughed aloud!
But I wished I hadn't when teacher said, "Now, Dorothy, tell, if you can,"
For I thought of my doll, and—sakes alive!—I answered,—"Mary Ann!"

There is a tradition that Dr. S. Weir Mitchell carried in his youth a book of MS. poems to be inspected by the late Dr. O. W. Holmes, and was advised by that gentleman—speaking from his own experience—to acquire his medical reputation first and then print what he wished. He has certainly fulfilled both precepts, as his 'Collected Poems' (Century Co.) includes the substance of no less than seven volumes in verse, besides a preliminary advertisement of six novels and two books of essays. So vast a range of activity, for one still otherwise engaged in an absorbing profession, might awaken suspicion of slovenly work, and yet the dramatic studies of Dr. Mitchell are never slovenly—we cannot say quite as much for some of his shorter pieces—and we have before now, in noticing the separate volumes, conceded to him a distinct, though not absolutely controlling and dominating, power as a dramatist.

'Nymphs, Nixies, and Naiads: Legends of the Rhine,' by M. A. B. Evans, with illustrations by Wm. A. McCullough (Putname), is a little book on the plan of those *Rheinsagen* which are sold along the famous river, with versified legends from the different localities—the traditions of the Lorelei, Bishop Hatto, and the rest. It is pleasantly done, but not brilliantly, and good translations of the German ballads would on the whole be better. 'America Liberata,' by Robert H. Vickers (Chicago: Kerr), is a little book without much interest as poetry, but possessing a good deal as an epic describing the South American revolutions, of which events we need to refresh our knowledge, especially when so much attention is now attracted to the affairs of our Southern neighbors. 'The River Bend, and Other Poems,' by Tacitus Hussey (Des Moines, Iowa: Carter & Hussey), is a sort of home product with home-made illustrations. The book has, without signal merit, a genuine quality which is not unattractive, except that the shadow of Riley hangs over it, as over so much Western American poetry, and makes it seem imitative and even a little second-hand. There is at the end of the book a prose sketch called "A River Idyl" which strikes us as being more simple and enjoyable, on the whole, than any of the verses.

'Armenian Poems Rendered into English Verse,' by Alice Stone Blackwell (Boston: Roberts), is an ingenious transmutation, through two hands, of the original poetry, which is translated into prose by one person and moulded into verse by another. The poems survive this double process as well as might be expected—that is to say, not very well; but there is much of the essence of vigorous national poetry in them, even at the end, and the book will serve to renew the general sympathy with that wronged race—a sympathy which shows as yet no signs of waning. But as compared with the Rumanian ballads published in 'The Bard of the Dembovitza,' for instance, they seem neither powerful nor picturesque. The best aspect of 'Sunshine and Shadow,' by Caroline Edwards Prentiss (Putname), is in its choice of subjects. These are full of local coloring. "Summer's Calendar," for instance, comprises

poems on the ox-eyed daisy, the pond-lily, and the golden-rod; and elsewhere there are verses on violet, anemone, bluet (or Houstonia), buttercup, morning-glory, arbutus, wild-rose, Indian pipe (or ghost-flower), and even poison-ivy, which last, we believe, even Emily Dickinson has not included in her weird gallery. This alone would give to the present volume a sense of elevation above mediocrity, though the handling of these simple themes is not always as successful as their selection. The novel binding of the book, a sort of leather or leatherette, we cannot quite commend.

A charming little edition of the pretty, old French tale, 'Aucassin and Nicolette' (Boston: Copeland & Day), has the prose as translated by M. S. Henry and the verse by E. W. Thomson, and is, as always, something unique in literature. The same very enterprising firm have issued, as another volume of their delicate "Oaten Stop" series, 'Soul and Sense,' by Hannah Parker Kimball, a collection of short meditative poems, carefully finished and always with a certain amount of thought and power, but pervadingly sad. Mr. William Vincent Byers is his own publisher of 'The Glory of the Gods, and Other Odes; Sonnets and Ballads in Sequence; with a note on the relations of the Horatian Ode to the Tuscan Sonnet.' Whatever genesis he may find for the sonnet measure, he certainly tests it too severely when he offers us a volume of 166 poems in that measure; it is something which even Rossetti would not dare offer to his most enamoured readers. It does not help the matter that he tortures some of them into a lilting measure and calls them ballads.

The poems of Caroline and Alice Duer (New York: Richmond) are somewhat unequal, but deserve to be praised for this vigorous ballad, with which they open, and which is, just now, what the daily newspapers call "timely":

AN INTERNATIONAL EPISODE.

(March 15, 1889.)

We were ordered to Samoa from the coast of Panama,
And for two long months we sailed the unequal sea,
Till we made the horseshoe harbor with its curving coral bar,
Smelt the good green smell of grass and shrub and tree.

We had barely room for swinging with the tide—
There were many of us crowded in the bay:
Three Germans, and the English ship, beside
Our three—and from the *Trenton*, where she lay,
Through the sunset calms and after,
We could hear the shrill sweet laughter
Of the children's voices on the shore at play.

We all knew a storm was coming, but, dear God! no man could dream
Of the furious hell-horror of that day:
Through the roar of winds and waters we could hear
Wild voices scream—
See the rocking masts reel by us through the spray.
In the gale we drove and drifted helplessly,
With our rudder gone, our engine fires drowned,
And none might hope another hour to see;
For all the air was desperate with the sound
Of the brave ships rent asunder—
Of the shrieking souls sucked under,
"Neath the waves, where many a good man's grave was found.

About noon, upon our quarter, from the deeper gloom afar
Came the English man-of-war *Calliope*:
"We have lost our anchor, comrades, and though small the chances are,
We must steer for safety and the open sea."
Then we climbed aloft to cheer her as she passed
Through the tempest and the blackness and the foam
"Now, God speed you, though the shout should be our last,
Through the channel where the maddened breakers comb
Through the wild sea's bill and hollow
On the path we cannot follow,
To your women and your children and your home."

Oh! remember it, good brothers. We two people speak one tongue,
And your native land was mother to our land;
But the head, perhaps, is hasty when the nation's heart is young.
And we prate of things we do not understand,
But the day when we stood face to face with death,
(Upon whose face few men may look and tell),
As long as you could hear, or we had breath,
Four hundred voices cheered you out of hell.
By the will of that stern chorus,
By the motherland which bore us,
Judge if we do not love each other well.

RECENT LAW BOOKS.

THE first edition of Mr. William Edward Hall's 'Treatise on International Law' appeared in 1880; at the time of his death in November, 1894, the fourth edition was in press, and part of it had been finally revised by the author. As now published by Macmillan it contains a considerable amount of new matter not found in any of the previous editions, relating to protectorates and spheres of influence, territorial waters, jurisdiction over foreign ships, nationality, the Bering Sea controversy, and the principles of law applicable to the subjects of a neutral nation who may, before the outbreak of war, be in the service of one of the belligerents, and who may be made the object of the first hostilities, as in the case of the *Kow shing*. These and other additions enhance the value of a work which proceeds from a publicist who has been described by an eminent contemporary, also a personal friend, as "one of the most accomplished men of his generation." The son of a physician who was attached to the court of Hanover and then to the British legation at Naples, he early acquired a knowledge of modern languages and a taste for art, both of which he subsequently cultivated. He studied law and was called to the bar; but he diversified his pursuit of his profession, which perhaps was never very assiduous, by various studies and extensive travel. He had collected materials for a history of civilization and a history of the British colonies, when he was led to concentrate his attention on international law, in which he soon became an acknowledged authority.

His 'Treatise on International Law,' which was preceded in 1874 by a small volume on the 'Rights and Duties of Neutrals,' achieved immediate success. It is characteristic of the man. Without attempting the cumulative and somewhat ostentatious show of learning of Phillimore, it combines the results of deep research, discriminating thought, and clear common sense, and approaches nearer to the standard of Wheaton's 'Elements' than any other English treatise on the same subject, though it lacks the calm philosophical spirit, the judicial tone, and sometimes the absolute accuracy of that great masterpiece. In its discussion of the laws and usages of war, and of the various questions arising out of the existence of a state of war, it is especially comprehensive and thorough; and in this category we desire particularly to mention its treatment of the subject of neutrality—a subject which has, in the course of the last hundred years, acquired a definite form and attained an immense importance.

Dr. T. J. Lawrence's 'Principles of International Law' (Boston: D. C. Heath & Co.) apparently comprises the elaborated text of lectures of which the syllabus was published in 1885, under the title of 'A Handbook of Public International Law,' a manual the excellence of which was attested by its adoption by the British Admiralty for the use of officers of the royal navy. The 'Principles,' like the 'Handbook,' is divided into four parts, but it contains four more chapters than the latter, partly representing the subdivision of subjects. Some of the definitions of the 'Handbook' have been slightly condensed, and some have been amplified, but not always to advantage. For example, the 'Handbook' defines independence as the "right of a state to manage all its affairs, whether external or internal, without interference from other states"; the 'Principles' adds, "as long as it respects the corresponding right possessed by each fully sove-

reign member of the family of nations." This qualification seems to have been so expressed as to exclude the idea that a suzerain may lose its right of independence by ceasing to respect the rights of a subject state, possessed of some of the attributes of sovereignty. But, assuming this to be so, let us suppose that the aggressor is a sovereign state other than the suzerain. Is not the legal consequence of its action the same as if the state whose rights it had failed to respect were fully sovereign?

While we are of opinion that this work is a useful elementary manual, we have observed in it several apparently inadvertent statements, to two of which we will refer. In section 115 it is said that the United States "decline to recognize that any change of allegiance has taken place when an American woman marries a foreigner, though they regard a foreign woman married to an American as an American subject." The authority cited for this statement is Wharton's 'International Law Digest,' section 186. But an examination of the whole section will show that while it has not been held that the marriage of an American woman to an alien subjects her to all the disabilities of alienage, such as inability to inherit real property, it is the prevalent view that her political status follows that of her husband at least during coverture; and it is hardly to be supposed that the United States would claim a right to intervene, in behalf of the American wife of a foreigner, against the action of her husband's government. Again, in section 168, on the effect of war on treaties to which the belligerents are parties, there is a diagram in which it is said, as to treaties for regulating ordinary social and commercial intercourse: "Effect doubtful. Generally the treaty of peace deals with such matters; if not, it is best to take the stipulations as merely suspended during war." For this statement the text affords no actual authority. Two judicial decisions are cited, but they relate to rights in real property, and refer to the peculiar conditions resulting from the division of the British Empire at the close of the American Revolution. The author observes, it is true, that while "some treaties of peace expressly stipulate for the revival of postal and commercial agreements subsisting before the war," in other cases, where the treaties of peace contained no such stipulation, agreements of the kind in question "have been acted upon after the peace on the understanding that they were restored to efficiency by it"; but of such tacit revival he gives no example. Hall says that, in respect of such treaties, the simplest course is "to take them to be all annulled." This view has been so prevalent among publicists, has been so frequently recognized by governments, and has so much of the force of reason to support it, that the opposite view would seem to require substantial proof of its validity, though it may find sanction in loose expressions of some writers. The work contains an excellent statement of the distinct subjects of neutrality and neutralization; and it properly discusses certain recent aspects of the Monroe Doctrine as involving the assertion of the primacy of the United States in America.

The latest addition to the Hornbook series is a volume on the 'Interpretation and Construction of the Laws,' by H. C. Black (St. Paul: West Publishing Co.). It is designed to elucidate the cardinal modern rule that a court's chief duty is to seek out and enforce the actual meaning and will of the lawmaking power. The law is stated in the form of rules, of which there are a hundred and sixty-one, and

there is a final chapter on the interpretation of judicial decisions and the doctrine of precedents, which will be found of value. Some twenty-four hundred cases are cited, and among them we are somewhat surprised not to find *Galpeke vs. Dubuque*, decided by the Supreme Court of the United States in 1863, a very leading authority on the subject of *stare decisis*. It is much safer and far less difficult to write about decisions than it is to attempt to embody in accurate and terse language the principles of law which they embody. Mr. Black's little code of interpretation is on the whole well constructed; here and there it lacks precision and accuracy of statement. Rule 146, for instance, is as follows: "In law a precedent is an adjudged case or decision of a court of justice, considered as furnishing a rule of authority for the determination of an identical or similar case afterwards arising or a similar question of law." The first half of this is perfectly correct. A precedent is always a case, and always an adjudged case; and when such a case is examined as a precedent, it is always for the purpose of extracting from it a rule or authority for the determination of another case. But the rest of the rule is confusing. It appears that a precedent will furnish a rule in an "identical" or "similar" case, or for a "similar" question of law. The inference seems irresistible that it will not dispose of the *identical* question of law if it arises again. This is of course absurd, and not what Mr. Black intended. Rule 148 contains a definition of a *dictum*; seven lines of it are wholly superfluous. No. 149 is half rule and half comment. Nos. 150 and 151 correctly state the rule of *stare decisis*, but conclude with the statement that it does not apply in "exceptional cases" if there are "urgent reasons." This is a favorite but very bad way of saying that there are cases in which a rule of decision is not followed; but there is hardly any rule in the world governing human conduct to which there are not exceptions, and it is far better not to use a formula to characterize a particular rule which is uniformly true of nearly every rule. The exceptions to the rule and the urgency of the reasons for them must in the end be stated and explained separately. On the other hand, Rule 153 contains a very good enumeration of the considerations which bear upon the force and effect to be given to precedents. At p. 402 the fundamental differences between the principle of *res adjudicata* and *stare decisis* are pointed out with great clearness.

The subject of interpretation and construction will always be a fascinating one to minds of a logical and philosophical cast. On looking over a book such as Mr. Black's, one is struck with the multitude of problems still open to discussion, while (owing to the fact that our constitutions embody the primary principles of common right and civil liberty in the form of a written charter) in no country are the materials for a sound solution of such questions so abundant as with us. All our great constitutional conflicts for the hundred years of our existence as a nation have turned upon the meaning which the law should declare to be the true construction of a few printed words. As has often been said—in the legal forum, words are things; and wherever written constitutions as well as the rule of precedent are the supreme law, the highest questions of all, the questions on which the lives, liberty, and property of millions depend, hinge upon the meaning of words. Were it not for the enlightened manner in which courts have applied the principles of interpretation and construction to questions of public and private

right as they have arisen, the Union itself might, before now, have come to a violent end.

The fourth edition of Mr. James W. Gerard's well known treatise on 'Titles to Real Estate in the State of New York' (Baker, Voorhis & Co.) gives all the code and statute changes, with notes of decisions, since the last edition. The editor, Mr. Edgar Logan, who was one of the editors of the third edition, states in a preface that he has had great assistance from the author. Between the two editions there is an apparent difference of only twenty-two pages, but this is owing to a change of type, which masks very large and important additions. There is, we suppose, no use in protesting against the absence of a Table of Cases, the success of a standard book without one having, no doubt, convinced the author that such tables are superfluous; we always find, nevertheless, that in actually tracing a doctrine or proposition through the courts the name of a case is quite as important a clue as an index title. How many thousand cases are cited, we have no accurate means of judging. We should not be surprised at being told that there are over 15,000. At any rate, the learning packed into this volume is prodigious in amount, and makes one shudder to think what it must swell to in another fifty years. This, it must be remembered, is a real property lawyer's *vade mecum* for a single State. No one can follow its rules blindly in another jurisdiction, not because the principles of land law are not the same throughout the United States, but because of the perpetual changes in legislation.

Mr. Gerard's book is made up in large part of statutes many of which have introduced innovations peculiar to New York. Ever since the time of Lord Coke, for instance, it had been the rule that if land were devised or granted to A for life, and after his decease to his heirs and assigns for ever, A took the whole estate in fee. The rule was connected with feudal military tenures, and, once explained, a child in law could never forget it. A fee must not be in *abeyance*, because, if it were, there would be no one who could discharge the services incident to it and due to the lord; but since, as long as A is alive, no one can tell who his heirs may be, it was impossible for such a grant or devise to vest a remainder in them; *ergo*, the whole fee must vest in A. This is what must have been intended. This rule was long the law in this State; but the revisers of 1880, who seem to have been infected with the delusion that the way to make law clear and comprehensible was to sweep away all rules—the original reasons for which had ceased to exist, abolished it on the ground that the feudal system had come to an end. The consequence was not, as they hoped, a simplifying of the drawing of wills, but a new batch of decisions determining the effects and limits of the change. In other States the old rule prevails, so that the decisions here since 1880 are in Massachusetts, for example, of no authority. The same thing may be said of the rule against perpetuities, which makes it impossible to tie up property for more than a certain period. The common-law rule on the subject made the period a life or lives in being, and twenty-one years afterwards. This rule was English in origin, but was adopted generally in this country, and in those States where it still exists it is not found to produce any evil results. But it was not good enough for the revisers of 1880, who changed it to two lives, with the result that for any one in this State who wishes to provide for grandchildren, no

lawyer can safely draw a will without a careful study of the very peculiar local rules of construction which have been laid down since that time.

These are two notorious instances of the confusion which comes from even well-meant and intelligent interference by the legislatures with settled common-law rules of property. What such legislatures as we have now would do if they allowed themselves full swing in these matters, one can only guess. Fortunately, they are conscious of their own ignorance and incompetence to deal with them, and usually there are no powerful interests struggling at Albany for the enactment of new rules changing the law of property. Notwithstanding this, half the volume of judicial decisions which goes to make up the substance of such a book as Mr. Gerard's is due to mistaken and unnecessary legislation—and to nothing else. So long as we have legislatures of the present sort, it is absurd to groan over the perpetually increasing volume of decision and annotation. For the practising lawyer the field of inquiry covers all the cases—not such only as may be valuable as illustrating principles.

The third edition of Mr. D. S. Remsen's 'Manual of Intestate Succession in New York' (Baker, Voorhis & Co.), forms a convenient little book of reference of some hundred and fifty pages. The law of inheritance and distribution is, fortunately, rarely meddled with by the Legislature. Last year an attempt was made to alter it by making a man's widow one of his direct heirs, and a law was passed for this purpose in March. It aroused such an amount of indignation on the part of those who knew what confusion the change would cause, that in June the act was repealed; it was, however, in force for nearly three months, and may have given rise to questions of property yet to be disposed of by the courts. It does not seem to be noticed by Mr. Remsen.

In the second edition of his 'Law of Collateral and Direct Inheritance, Legacy, and Succession Taxes' (West Publishing Company), Mr. B. F. Dos Passos states that since 1890 this system of taxation has been introduced into Maine, Massachusetts, Ohio, Illinois, California, Connecticut, and New Jersey, to say nothing of Canada and Australia. It is evidently in a fair way to become universal. In New York, lineal heirs pay 1 per cent. and collaterals 5, and from 1885 to 1894 the State has collected by means of this tax some \$11,000,000. In England the revenue from "death duties" of one kind and another is said to amount now to more than £11,000,000 annually. Mr. Dos Passos suggests that in New York a very small increase in the inheritance-tax-rate would enable us to dispense with the personal-property tax altogether. The great recommendation of the tax is that it is easily collectible, and that the cost of collection is small. In England a new inheritance tax (imposed in 1894) of 1 per cent. on all real and personal property was strenuously opposed as increasing the heavy burdens already weighing upon land. In this country the succession tax is mainly a personal tax, and has been attacked as unconstitutional. The courts, however, have generally upheld it as being a tax on the privilege of succeeding to property. It has led to many curiosities of construction. In Massachusetts the privilege has been held to be a "commodity," while elsewhere the attempt to secure a ruling that property invested in Government bonds is exempt from it has failed; the courts holding that the person paying the tax does not pay it on the bonds, but to secure the privilege of succeeding to

them. The tax has enabled one court to decide upon the exact nature of money awarded for French spoliation claims; the ruling being that the money is a mere gratuity from Congress to the heirs, and not inherited from anybody whatever. The present edition seems very full and useful.

A new edition of Edmond Kelly's 'French Law of Marriage and Divorce,' by Oliver E. Bodington (Baker, Voorhis & Co.), is marked by an increase in bulk, though the number of cases cited is only forty-five; it is ten years since the first edition appeared. The subject is to us one of very considerable and growing importance, not merely because many Americans live in Paris, but because international marriages become more and more common every year, while the law governing the contract of marriage and the relation of husband and wife is wholly different in the two countries. American parents whose daughter marries an Englishman have a general notion of what will be their daughter's position as regards property, social and household life, etc. If their daughter becomes engaged to a Frenchman, they know little or nothing about the world into which she is going. Nevertheless they have it in their power to know in advance much more about the effects of a French than of an English marriage. The whole French law of the domestic relations—a compromise between legal arrangements handed down from the days of Justinian and innovations introduced in the interest of modern individualism and liberty of contract—is at odds with our system. To begin with, one condition of valid marriage in France is the consent of parents or other ancestors in the ascendant line; and since these may be of different sex and stand in an unequal degree of consanguinity to the person who desires their consent, elaborate rules have been formulated in order that some decision may be reached. Thus, if there are no parents, but a grandmother and a great-grandfather survive, nearness of degree prevails over considerations of sex, and the grandmother has the last word; but, if the degrees are equal, the grandfather carries the day. Fortunately for the peace of families, the number of persons of marriageable age who have great-grandparents living and capable of taking an active and intelligent interest in the matrimonial designs of their great-grandchildren is not great. Supposing the consent obtained, the whole French law affecting property rights under the marriage is utterly different from ours. An Anglo-Saxon marriage settlement deals, as Mr. Kelly clearly explains, with specifically designated property, while a French *contrat de mariage* establishes a system of law for the parties, governing not merely the determinate property which may be described in it, but various classes of property not specifically designated, either possessed at the time of the marriage or afterwards acquired.

We have nothing in our law or marriage-customs corresponding to the various *régimes* of the French code. Indeed, leaving out of view marriage settlements (which are unknown except among the well-to-do), the essential difference between the property relations of a husband and wife in France and America is that in one country the whole matter is regulated, so far as possible, in advance (*e. g.*, household expenses and expenses of education of children), while, with us, it is all left to chance. Marriage is proverbially a lottery; the French endeavor to eliminate chance as much as possible from the result, while we practically act upon the principle that provision is impossible, and each household must

fight it out for itself. Which is right? We do not know, though we have a strong suspicion that neither system could be well transplanted from the soil of which it is a growth. Mr. Kelly seems to think that the French rule of the legitimization of children by marriage after their birth is an essential feature of their system, but does not clearly explain his reason for thinking so. To our minds it is simply an enlightened and humane rule, which should be introduced everywhere, and is just as likely to produce good results in New York (it is now the law of this State by L. 1895, c. 531) as in France. With regard to breach of promise, by the way, Mr. Kelly removes a common misconception—that no such thing is known in France. It is true that a lady cannot get thumping damages for injury to her feelings, but a contract is a contract, all the world over, and if the wronged party has suffered any material damage, recovery may be had. In a recent case the would be husband recovered for money wasted on jewelry, a wedding ring, and presents of flowers and candy. The English judges who tried within a year or two to persuade themselves that breach of promise of marriage was a *tort*, had, no doubt, not heard of this judgment.

Mr. Arthur G. Sedgwick's 'Elements of Damages' (Boston: Little, Brown & Co.) is not an abridgment of the well-known text-book of similar title, but a re-examination of the subject, having different form, scope, and purpose. As the book appears in the "Student's Series," it is presumptively intended rather for study than for reference; but it will be found by no means useless by practitioners. The method adopted is to state the principles of the law of damages (so far as possible) as rules or principles of law, such as a court might lay down to a jury, and to follow these statements with the cases that illustrate them. The plan is very well carried out, and students will find the subject brought within their reach in a systematic and comprehensive exposition. The most interesting part of the book, from a scientific point of view, is that showing the relation of the modern functions of the jury to the development of the law of damages. Nothing can be more instructive than the system of concurrent jurisdiction now exercised by the court and jury, and its explanation is very succinctly given by Mr. Sedgwick.

The chief interest in Mr. Henry L. Clinton's 'Extraordinary Cases' (Harpers) is that it carries us back to a period in the administration of criminal justice in New York which already seems remote. The earlier cases in it, such as those of Polly Bodine and Henri Carnal, belong to a time when it was still common for the leaders of the bar to be retained in criminal cases, when judges took fees, when aldermen sat as side judges, when judges engaged in newspaper controversy over cases pending in their courts, and when reprieves by the Governor seem to have been as common as stays of proceedings by judges became later—indeed, when it was still to be decided whether a judge had power to grant a stay in a capital case. We have found the case of Henri Carnal the most interesting in the book, but to understand it thoroughly the reader must consult also the decisions in the reports to which Mr. Clinton refers. It lasted several years, and ended in a substantial triumph for the defence. The accused was tried and found guilty of what seems to have been a plain case of murder. Nevertheless, Mr. Clinton, who was assigned to defend him, succeeded within ten minutes in "planting an exception" in the case which took

root and throve, so that in the end it "vitiated and rendered null and void all subsequent proceedings"; through it a new trial became necessary, and on this (the former witnesses having meantime disappeared) the accused pleaded guilty to a low degree of manslaughter, was sentenced to a short term of imprisonment, at the expiration of which he married, purchased a farm in the West, settled there, and, when last heard of, was "doing well." The laity, who cannot appreciate legal points, will not enjoy the story as much as Mr. Clinton's professional brethren. The merits, for obvious reasons, are not gone into; the case, as we read it, is an exciting game between the district attorney and the counsel for the defence, in which the stakes are the life of the defendant; the district attorney tries to hang, the counsel for defence to prevent him; the judges see that the rules of the game are observed, and the question of guilt or innocence is wholly immaterial, except so far as adverse evidence encountered in the progress of the game may handicap one side or the other.

De Quincey and his Friends. By James Hogg. London: Sampson Low; New York: Scribners.

MR. JAMES HOGG, son of a more famous publisher, has here collected a mass of "personal recollections, souvenirs, and anecdotes" of De Quincey. It was a good thing to do, for although much of the volume has been printed before, the articles, which contain matter of value to the De Quincey student, have mostly escaped such biographers as Dr. Japp. Dr. Japp himself contributes an outline life, with emphasis on De Quincey's associates; for few men of his time were more sought after by distinguished pilgrims, and few were so charming to so many kinds of people. Other friends, Mr. Colin Rae-Brown, and Mr. Hogg himself, contribute recollections, the latter telling, among other things, how, but for his own youthful sanguine efforts, we should probably never have had an edition of De Quincey collected by the author. There are reprinted memories by Richard Woodhouse, Mr. John Ritchie Findlay of the *Scotsman*, the late John Hill Burton, the Rev. Francis Jacox, Mr. James Payn, the late James G. Bertram of *Tait*, Hood, Carlyle, and others. Dr. Shadworth Hodgson's essay on De Quincey is appended. There is a long poem by Dr. Moir, which has an antiquarian interest touching the name De Quincey. Finally, there is an essay "On the Supposed Scriptural Expression for Eternity," dating back to 1852 or 1853; this essay is included in the American edition, but in no English edition of "Collected Works"; Mr. Hogg has reprinted it once before in a volume on 'The Larger Hope.' We should further note that there are a few unpublished letters; also, a Latin theme written by De Quincey for one of his examiners at Worcester College.

All the contributors to the volume dwell on two things: the extreme sweetness and courtesy of De Quincey's manner, and his fragile, intellectual personal appearance. In person he reminds Mr. Rae-Brown of Cardinal Manning—the slightest of bodies serving as a stem to a gloriously intellectual head. All the writers speak of the refined face and the changing eyes, dull, filmy, almost dead in one moment, glowing and full of depths in the next. That the sweet low voice and antique courtesy could mask an urbane causticity is clear from various calm remarks of De Quincey here recorded. He speaks of Wordsworth's "usual haughty and discourteous

manners," and of his "sidling" walk (p. 97). He cannot admit that Burns is a great poet (p. 97). He refuses to dine with Thackeray because he is not, like Dickens, *benignant* (p. 194). It is interesting to know that he did not at first join with the more earnest admirers of Hawthorne and Emerson, but that he afterwards recognized the genius of the 'Scarlet Letter' (p. 234). Of his many eccentric little dicta none is more striking than the remark that "walking—a long walk—gives extraordinary depth and expression to ladies' eyes" (p. 9).

The volume is light in weight and beautifully made, but there are slips in printing, e. g., p. 93, line 9; p. 115, line 17; p. 228, line 18.

Social Rights and Duties: Addresses to Ethical Societies. By Leslie Stephen. [The Ethical Library.] London: Sonnenschein; New York: Macmillan. 2 vols.

"REALLY delightful reading," wrote Edward Fitz Gerald of an earlier volume of Mr. Stephen's, "and, I think, really settling some Questions of Criticism, as one wants to be done in all Cases, so as to have no more about and about it." But those were questions of literary criticism, where finality may make a more plausible show of being attained than in the wider and more complex themes treated in these volumes. Yet they are none the less really delightful reading, a good part of their charm consisting in the writer's frank disavowal of finality. A full and flexible and honest mind going "about and about" such subjects as Science and Politics, the Morality of Competition, Ethics and the Struggle for Existence, Punishment, Luxury, the Duties of Authors, the Vanity of Philosophizing, and the half dozen other titles of these addresses, is doubtless giving the very best that can be given in this line, whether to ethical societies or the general public. Those who know what the free play of Leslie Stephen's mind means, will ask no better treat than to see it applied to such congenial discussions. His acuteness, his fatal eye for the heart of a question, and the swift thrust of his pen right at it, his quiet humor, his tolerance, his modesty, his inveterate habit of boldly flinging into words the thing he thinks—all these are present throughout, and, in the eyes of everybody but the Scotchman who wanted to know what "Paradise Lost" "proved," more than make up for the absence of dogmatic positiveness.

These addresses are a sort of lay sermon, and show how the inherited homiletic instinct of the Stephen family survives the narrow evangelicalism which gave it birth and on which it once fed. Like a true preacher, Mr. Stephen is conscious of present questionings and present needs, and speaks to them directly. Most of the problems that have offered themselves with the greatest insistence to thinking men in the past twenty years figure in these pages, if few thoroughgoing solutions are offered. Hence the frequent reference to contemporary theories and writers. Even the late Mr. Kidd, as he may now safely be called, comes in for some of Mr. Stephen's most deft swordsmanship, the result being to cut off the head of this second-hand philosopher so neatly that he himself can scarcely be aware of his loss. Huxley's famous Romanes lecture suggests such remarks and qualifications of a rather hasty statement as Huxley himself felt bound to make, on reflection. Mr. Balfour is, of course, the man who philosophizes to prove the vanity of all philosophizing, and destroys the founda-

tions of scientific belief in order to maintain that theology is as firmly based.

Mr. Stephen's organon of knowledge, so far as he professes to employ any, may be said to be the method of careful statement. This is always half the battle with him. Nor is it the device of a logic-chopper choosing his own premises. He has the air of a man anxious simply to get at the core of a question, and brushing aside all that is merely incidental or adventitious in order to see what the real difficulty is. Perhaps the best of all the addresses here printed, for the illustration of this way of winding himself like a serpent into his subject (as it was said of Burke), is the one on Ethics and the Struggle for Existence. Most admirable and convincing is his grasp upon the truth that no theory of the facts of life, of evil and suffering, can at all alter those facts. One theory explains some of them, another some more; one theory has the advantage over another in point of completeness and likelihood; but under all theories the facts remain the same, and have their ugly implications under all.

"Does the theory of the 'struggle for existence' throw any new light upon the general problem? I am quite unable to see, for my own part, that it really makes any difference: evil exists; and the question whether evil predominates over good can only, I should say, be decided by an appeal to experience. One source of evil is the conflict of interests. Every beast preys upon others; and man, according to the old saying, is a wolf to man. All that the Darwinian or any other theory can do is, to enable us to trace the consequences of this fact in certain directions; but it neither creates the fact nor makes it more or less an essential part of the process. It 'explains' certain phenomena, in the sense of showing their connection with previous phenomena, but does not show why the phenomena should present themselves at all."

We should be glad, if space admitted, to quote other passages from these notable addresses. Some of them have previously seen the light in magazines, but the old ones are worth rereading, and the new ones have solid charms than those of novelty.

Fishes, Living and Fossil: An Outline of their Forms and Probable Relationships. By Bashford Dean, Ph.D. [Columbia University Biological Series, III.] Macmillan & Co. 1895.

THE fishes as they now are, and as they have been in the course by which they have reached their present condition, are fairly well set forth in this attempt at a concise general, and to some extent popular, presentment. The work is comparative and very comprehensive. Perhaps it might have been improved by a greater amount of text, yet an abundance of drawings obviates much explanation. It deals with forms, habits, structure, functions, embryology, affinities, genealogy, distribution, etc., and has classified lists of publications relating to its various divisions. As a whole it is to be commended, numerous particulars rendering it liable to criticism notwithstanding. The exceptions, and the remedies to be applied in a future edition, will be sufficiently evident in a few examples from the more noticeable.

Classification, being so much a matter of personal opinion, for present convenience, and liable to changes as investigation proceeds, should have less weight than some other features. We should prefer the fishes divided into four primary groups rather than two. The lampreys would stand for one; the others would be sharks and skates, chimeras, and

lung fishes and bony fishes. Mainly the descent of the fishes is traced by means of forms containing a great deal of solid matter in dermal armature or in skeleton; these forms were the most specialized, and, consequently, while best adapted for preservation as fossils, were most affected by causes which tended to the extinction of their species. More plastic forms, with less of the hard matter, did not petrify so readily, but were better prepared for adaptation such as would prevent extinction. These last retained more of the structure common to the earlier types—that is, they were less specialized. Our author treats such species or genera as "the most generalized forms," though he nowhere establishes the existence of a generalizing process. In truth, when he says more generalized he means less specialized; but the expressions are not synonymous. The Cladodont (Cladoseleche of Dean), a highly specialized type, is a good instance. This is said to be one of the most generalized of known sharks, the possible ancestor of Acanthodes, Pleuracanthus, Heterodontus, and modern sharks, of great degrees of specialization, also, in very different directions. The contention that the Cladodont changed, in its progeny, in form, armature, dentition, etc., lost a dorsal fin while acquiring an anal and fin spines, and became Acanthodes, should be supported by some kind of proof; the theory of a common ancestor is too available to be put aside for a mere suggestion of possibilities.

Regarding loss of fins, we are informed that, "should life habits require undulatory motion, paired fins must inevitably tend to disappear." The fishes cited in support of this are some that rest on the bottom, where paired fins are not needed as balancers; but in these cases it is disuse, not undulatory motion in swimming, that caused the paired fins (as also in many cases the vertical fins) to disappear. In similar manner disuse has carried away the limbs of certain lizards and of snakes. "It may now aid the mouth in admitting water to the gills" is said of the spiracle; but in certain rays that rest and feed on the bottoms this organ is greatly developed; they depend on it in breathing, not on the mouth.

"Partially true," is all that can be said of the statement that the majority of the sharks are viviparous and have a placental attachment; in a considerable number of viviparous sharks there is no such attachment. Dean says the egg of the Greenland shark is said to be spherical and relatively small and to be deposited unprotected by capsule; Günther says of the same shark that it is stated to be viviparous and to produce about four young at a birth. *Pristis* and *Pristiophorus* should change places in the arrangement; the former is the ray, the latter the shark.

Some of the figures are not up to the standard. Figure 29, named *Trygon* with a question, is *Aetobatis* of Müller and Henle. It and figure 30 are incorrect in showing the front teeth wider than the hind ones; the latter are of most recent growth, and should be the wider. Figure 173, *Bathyonius*, is entirely out of proportion; and figure 184, said to be the porcupine fish with needle-like scales, is really the swell fish with compressed, blade-like rigid spines. It should have been said that the needle-like spines of the porcupine fish are erectile, which increases the resemblance to the mammal.

Need of revision is apparent in the nomenclature; for instance, *Butrinus* stands for *Butyrinus*, *Christiceps* for *Cristiceps*, and *Læmargus* for the prior name, *Somniosus*. *Heptabranhias*, *Notidanus*, and *Heptanchus*, names

for a single genus, are used in a way to confuse the student. In the derivation of the last of these the author finds *ἄγκω*, Lat. *ango*, to press tight, to throttle. A better rendering is that of Agassiz, from *ἄγκος*, sinus, a notch, referring to the gill openings; this would give *c* instead of *ch* in *Heptanchus* and *Hexanchus*. *Heptranchias*, the earliest name, however, is most likely a Rafinesquian distortion of *ἰνρά* and *βράγχια*. Commonly, generic names are formed in the singular. Thus, *Chlamydoseleachus* was originally derived from *χλαμύς*, and *σελέχος*; Dr. Dean changes it to *Chlamydoseleche*, deriving from *σελέχη*, which he defines shark instead of sharks. Why the plural name of cartilaginous fishes in general, always so used by Aristotle, should be taken in lieu of the singular, applicable to a single shark, is not demonstrated. Günther, who previously made the mistake, may have been followed, or both authors may have been led astray by Cuvier, who similarly fixed the name *Selache* on a shark now known by the prior name *Cetorhinus*. Corrected, Dean's *Cladoseleche* becomes *Cladoseleachus*; whether it is a synonym for *Cladodus*, he has not yet fully decided.

In conclusion, it should be said that this volume has many excellent features, and will do a great deal of good.

In India. Translated from the French of André Chevrillon by William Marchant. Henry Holt & Co. 1895.

THE Kutab Minar is a fitting frontispiece to a book on India. Kutab commemorates the Moslem conqueror who reared it in 1193; Minar (the minaret) is the distinctive badge of the most energetic race among Indian populations. Confessedly the grandest work in the world of its class, it seemed to the present writer, as he climbed it after circling the globe, the most impressive pillar of any class.

M. Chevrillon, bound in buckram, brings to mind *Falstaff's* rogues who were so habited. He flits along as evanescent as those minions of the moon. His whole pilgrimage from Kandy to Kinchinjanga, as well as through the Mogul cities and many others, was compressed into less than fifty days. Nor did he dare go alone, but was personally conducted by what he calls a "boy," more commonly styled a "bearer" by Anglo-Indians. From the start he was imposed upon by this functionary, who shrewdly bargained that, on the score of conscientious scruples, he should never wait on his master at table nor carry a satchel for him. Such was the guide, philosopher, and friend who kept him in leading-strings, once well-nigh delivering him up to Nautch Delillab. His book, however, has a charm. It is never dull, and it shows India from a French point of view. Yet but few of his nation have such a savor of Anglomania. Landing at Pondicherry, the last vestige of French domination, he sheds no tears over the French downfall, feeling that the English have done a better service. Thanks to the good ends gained, he justifies the evil means, as some do African slavery, viewing it as a whip in the hand of the Almighty for scourging Africans into civilization. Thus the apple of Paris has gone to the worthiest. *Datur digniori.*

M. Chevrillon's first chapter betrays a traveler embarked on his first voyage. Everything on the steamer and the sea fills him with amazement. His emotions burst out in such hyperboles that readers laugh at him as very green and equally sentimental. His gushing pages on Red Sea heat are pointless compared with five words of the captain of whom the reviewer

had asked why that sea was named Red. His answer was because it is *red hot*. Half-a-dozen cities often taken in by Cook's tourists were beyond the range of M. Chevrillon. His sole excursion outside the beaten path of those personally conducted adventurers was to Ellora. Regarding the caves there we have a chapter. In this there is little description of what the stranger saw, but much reading of his own notions into Hindu carvings. A large section of the book is of a similar make-up, either from need of padding or from the writer's subjective cast of mind—his nature, like the dyer's hand, subdued to the Oriental element it worked in. At Benares, for example, five pages suffice for setting forth the bathing during a morning on the Ganges—a scene which, but for associations, stone stairs, and the lack of bath-houses, would strongly remind one of New Jersey beaches. But this brief relation is text for a sermon more than ten times as long of theological mysticism. The style is lively and fresh, but unless readers believe the speculator inspired, they must at length skip or fall asleep. M. Chevrillon often makes us doubt whether his own speculations are in dead earnest or are ironical jokes. What he dignifies as heavenly meditation we call earthly laziness raised to its highest power. How much is man above the jelly-fish when his prayers are made by machinery, or consist in vain repetitions of the monosyllable OM—one hundred and eight times at a beat?

Our author's Hindu ideals are vague—gelatinous, so to speak—deficient in dates and facts. He has caught the contagion, and is himself negligent of accuracy. At the gate of the Taj

Mahal garden, he says, "we pass under the arch, and the Taj appears in sight half a mile distant" (p. 169). It is no more than one-third so far. Half a mile is 2,640 feet, while the actual length of the avenue from the garden-gate to the opposite portal of the Taj, according to English engineers, is 280 feet. Again, the great wonder at Ellora he describes as "a temple cut in an isolated rocky mass which is itself 160 feet long, 100 broad," etc. (p. 228). In this mass there is no room for the real temple, which, as we read in Fergusson, the supreme authority, measures 247 feet by 150. "The isolated mass" is Isaiah's bed, too short for a man to stretch himself on it, and the covering too narrow for him to wrap himself in it.

Notwithstanding shortcomings—sometimes by reason of them—we lay down M. Chevrillon's rhapsody more reluctantly than many a better book.

BOOKS OF THE WEEK.

The Week.

THE menace of last week's vote on the Butler bond bill is the cloud which it throws over the financial policy of the Government during the next Administration. There was a majority of seven in the Senate for repudiation, and previous votes have shown about the same strength for any proposition which the silverites favor. The alarming feature of the senatorial outlook is the certainty that there will be a majority for equally wild measures in that body during the next Congress. The sound-money men will gain several seats, but the admission of Arizona, New Mexico, and Oklahoma as States will reinforce the soft-money side by six votes, leaving things as they now are—and nobody can doubt that the scheme for bringing in these three Territories will be carried through next winter. The country, therefore, must face the certainty that the upper branch of Congress will be on the wrong side of every financial question which may arise under the next President. How the lower branch will stand, nobody can tell. The House of Representatives elected next fall may be all right, while its successor, to be chosen in 1898, may be all wrong. The necessity, therefore, for the most robust independence in the executive will be even greater during the next Presidential term than during the present. He will confront a Senate with a majority of members so ignorant, reckless, or crazy that they will be capable of anything. If the Republicans carry the election next fall, their President will come in committed to the early enactment of a tariff bill which will restore prosperity. A Republican House will pass a McKinley bill fast enough, but it will be "held up" in the Senate by the Republican silverites, who will demand heavy ransom in the shape of legislation for their metal. We shall have 1890 over again, only worse, if we have a President who will make concessions to the repudiationists, as Harrison did six years ago.

Many Republican newspapers in the East are shamefully deceiving their readers as to the significance of the Oregon election. They say that the Republicans carried the Legislature and one of the congressional districts, that the party stood for sound money, and that the result is therefore a defeat of the silverites. The truth is that the Republican State convention voted down a resolution against free coinage, and adopted a "straddle" in its stead; that the Republican candidate for Congress who was successful is a 16-to-1 man; that the Republican can-

didate in the other district, who was beaten by a Populist, was a "straddler," who refused to oppose free coinage; and that the Legislature is overwhelmingly for free coinage, the only question being whether it will send to the Senate some other financial lunatic or reëlect Mr. Mitchell, who not only supports free coinage, but voted the other day for the anti-bond resolution. For a Republican organ to call such results as these a triumph for sound money, because Mitchell and the Republican free-coinage candidates in the two congressional districts call themselves by the name of that party, is a shameful attempt at deception.

The Oregon election seems to have unnerved the McKinley men completely. Not only has the Populist-Democratic combine upset the usual Republican majority there, but the Republican party in that State split on the silver question, and the gold-standard faction was the smallest of all that took part in the contest. Another fact, most surprising to the McKinleyites, is that the tariff question was not heard of in the campaign. Although Oregon is one of the largest sheep-breeding States in the Union and ought to be pining for a duty on wool, that subject was not mentioned. The silver delusion had smothered the tariff delusion completely. The news from Oregon has sent all the weak-kneed brethren running for cover. Senator Aldrich says now that it will be sufficient if the St. Louis platform pronounces against free coinage at 16 to 1, leaving the ground open for free coinage at 17 to 1, or at some other ratio, or for a reënactment of the Sherman law. A lot of nerveless Republicans on the ways and means committee oppose the taking of any vote on the bond-repudiation bill which has just come from the Senate. The whole McKinley programme depends upon making the tariff the issue and adopting a straddle at St. Louis on the silver question. If this cannot be done, McKinley is as illogical a candidate as a Methodist preacher would be in an election for Pope of Rome. If the real issue—the issue which dominates men's minds and controls their feelings—is the question, What shall be the standard of value? then the McKinley edifice, which looks so imposing now, is a house of cards which is liable to fall either before or after the St. Louis convention meets.

Suppose that a "straddle" is adopted at St. Louis. Where are any votes to be gained by that? The 16-to-1 men are not going to be satisfied with it. Senators Dubois and Teller smile when that kind of platform is mentioned. They say that the silver-men have been fooled too many times in that way. They are going to

St. Louis with an unequivocal free-coinage platform. If they do not get it adopted there, they are going to Chicago to ask the Democrats to adopt it. If they fail in that quarter, they intend to hold a convention of their own on the 22d of July and adopt a platform and nominate candidates of their own. This was the position taken by them months ago. They are now more than confirmed in it by the result of the election in Oregon. On the other hand, the supporters of the gold standard are equally in earnest. The proof of this is found in the declarations, heard on every hand from life-long Democrats, that they will vote the Republican ticket if the St. Louis platform is sound and the Chicago platform unsound on the money question. These are men who do not change their party ties lightly. It must be some consideration of overwhelming import that moves them to so strange a step. Is it supposable that this feeling is less dominant, less intense, in Republican circles?

Whatever political divisions there may be among the American people, they have but a single thought on the money question. To a man they are for "honest" money, the "soundest" currency known to men or angels. This is the great comfort which optimistic patriots may extract out of Thursday's Democratic platforms in Kentucky and Virginia. The Kentucky platform is simply ferocious in its determination to have nothing but an honest dollar. Anybody who doubts that the fifty-cent dollar which the resolutions proceed to call for is "honest," had better be prepared to meet a Kentucky gentleman in a rage. As for Virginia, the kind of money the silverites want there is so wonderful, so heavenly, that the mere thought of it sends them into raptures and rhapsodies. It is "sound money, the soundest the world has ever had or can have, the money of our Constitution, the money of the people, the money of civilization through the ages past and destined to be such for ages to come." It is a pity that this miraculous money has to be explained, farther on, as fiat rage and half-weight coin—but it is honest just the same, sound, unsullied, glorious. As to the honesty, however, there will be a chance for two inflections, as in the case of the unpractised *Iago*, in whose mouth the words "Honest, my lord?" became, "Honest! My Lord!"

The Maine Republicans nobly renewed last week, in State convention, their "unswerving loyalty to that great champion of protection and sound money, Thomas B. Reed," and hoped that the national convention would heed the demand of "the business interests of the country"

for his nomination. Another slant at McKinley was visible in the chairman's speech, when he spoke of Reed as a man whose "lips are not sealed in silence when silence is dishonor, nor opened to words that are meant to have no meaning." It must be said, however, that this description of the Speaker is true, if at all, only since the nomination has been lost to him. As long as he saw, or thought he saw, that his best chance of getting it lay in silence, McKinley himself was not more voiceless. And did ever the Ohio coiner of winged words beat Reed's fatuous message to the Home Market Club about the dawn soon coming? It is of the essence of brains and courage that they show themselves as such at all times; and the "brainy, masterful Reed" was so long content to play the part of a nerveless trimmer that it is no wonder the party forgot what manner of man he was.

We are indebted to the *Buffalo Courier* for a supplement to McKinley's record on the silver question in the shape of an important and significant vote which we had overlooked. On the 16th of January, 1878, Stanley Matthews carried through the Senate a concurrent resolution which, after quoting various laws relating to the public debt, including the act of 1870 for the refunding of the national debt, and the resumption act of 1875 authorizing the issue of bonds for the maintenance of specie payments, declared that all the bonds of the United States issued under these acts "are payable, principal and interest, at the option of the Government of the United States, in silver dollars of the coinage of the United States containing 412 1-2 grains each of standard silver"; and that such payment would "not be in violation of the public faith nor in derogation of the rights of the public creditor." On the 29th of the month the resolution came before the House, and was carried by a vote of 189 to 79, McKinley being recorded in the affirmative, while on the other side were Garfield of Ohio, Reed, Frye, and Hale of Maine, Robinson of Massachusetts, Hewitt of New York, and many other prominent sound-money men of both parties. This was, of course, a repudiation of the gold standard, and was so understood by both the advocates and the opponents of the resolution.

The latest contribution to McKinley's record is the publication of a letter written by him on the 27th of October, 1890, just before the congressional election that ended his career in the House, in which he answered inquiries about his position on various public questions put to him by the Secretary of the Stark County (O.) Farmers' Alliance. He declared himself opposed to all Trusts and combinations in the restraint of trade, favorable to regulation of railroad rates, opposed to the holding of lands by aliens, and a supporter

of a land bill in which farmers were interested; while as to the financial question—

"I am in favor of the use of all the silver product of the United States for money as circulating medium. I would have silver and gold alike."

This letter was published by the *World* on Thursday morning. Its authenticity is not questioned. Indeed, it is taken from the files of the local newspaper in Canton, which printed it in the issue of October 30, 1890. McKinley himself, according to his usual habit, refuses to say anything for publication on the subject, although he is reported as having explained to personal friends that "the letter was written at a time of great excitement, when he was making from six to ten speeches a day," and, furthermore, that "his argument in favor of silver was at that time in harmony with his party."

In the debate on the President's veto of the river and harbor bill, Senator Sherman again took the novel view that the President ought not to veto an appropriation bill, because it is always within his discretion to pay the money or not to pay it. If there is no money in the Treasury to pay it, or if for any reason his judgment is against paying it, then he ought not to pay it. Acts making appropriations are merely permissive, and for that reason ought never to be vetoed. This is an astounding doctrine, or would be so if any utterances of Mr. Sherman could astound us. His argument (on page 6603 of the *Congressional Record*) begins by quoting the first paragraph of the bill, viz.:

"That the following sums of money be, and are hereby, appropriated, to be paid out of any money in the Treasury not otherwise appropriated, to be immediately available and to be expended under the direction of the Secretary of War and the supervision of the Chief of Engineers, for the construction, completion, repair, and preservation of the public works hereinafter named."

This, says Mr. Sherman, "is merely permissive; and, in the case of every one of these appropriations, if the Secretary of the Treasury should say that he has no money for this purpose that is not otherwise appropriated, as a matter of course he is not bound to expend it, . . . or if the President of the United States should see proper to say that 'the object of the appropriation is not a wise one; I do not concur that the money ought to be expended,' that is the end of it." If the appropriation is merely permissive, the words "to be immediately available" have no meaning. If the first section is to be construed as Mr. Sherman thinks it should be, it ought to contain the words, "provided the President of the United States considers such appropriations, or any of them, wise." The Sherman construction, if correct in law, would reach by a short cut the constitutional amendment which many people favor, enabling the President to veto particular items in an appropriation bill, as the Governor of New York can do.

Another part of Mr. Sherman's contention deserves notice, and that is his insinuation that there is no money in the Treasury to meet this appropriation. Unfortunately, and in consequence of a law which Mr. Sherman was instrumental in enacting in 1878, the greenbacks which have been redeemed in gold must be "re-issued and paid out again and kept in circulation." About \$115,000,000 by legal-tender notes has been accumulated in this way. It is very easy for Mr. Sherman in the Senate and Mr. Dingley in the House to say that greenbacks so received ought not to be used for paying the current expenses of the Government. Why, then, do you not repeal the law of 1878, or at least bring in a bill for that purpose and take a vote on it? Do you fancy that people can be hoodwinked with the notion that the President is violating law or morals by paying out money which an existing statute says he shall pay out? If the committee of ways and means, in its report adverse to the Butler repudiation bill, criticises the Secretary of the Treasury for using the proceeds of bond sales for current expenses of the Government, then the committee must be in favor of letting the Government stop for want of means to go on with. Perhaps Mr. Dingley would say that if his bill were passed, there would be means to go on with. Other people might differ from him in opinion as to this, but it is a sufficient answer to say that his bill has not passed, and that the Secretary has to deal with existing facts, and not with Mr. Dingley's conjectures of what would happen if something else happened.

Senator Morgan's attempt to lash a dying Congress into fresh fury about Cuba will probably fail. The whole thing is in the hands of the President—properly so—and there it will remain. As to the particular case of the American citizens in jail in Cuba for being caught red-handed in filibustering, no one has a scintilla of evidence that the President has not acted in their behalf with prompt energy. On the contrary, it is known that his firm protest has already secured a suspension and review of their first hasty and dubiously legal sentence, and that everything possible has been done to secure them a fair and speedy civil trial, which is the extent of their rights. Morgan was vastly indignant that the court proceedings had been conducted in Spanish. Of course, the Spanish officers should have used English or Alabamese. Anyhow, a war-ship should be sent at once to Cuba to take those Americans straight out of their dungeon. No American who has violated the laws of his own country and has been captured with an armed force attacking a friendly foreign power would be left one day in jail, or even under bail, if Morgan had his way. Meanwhile, the scheme to compel Mr. Cleveland to show his hand in the Cuban business is a highly dangerous one. He may almost say

day show so many trump cards that his furibund enemies will wish they hadn't done it.

The decision of the Appellate Division of the Supreme Court at Albany on the Albany police bill is of the utmost importance. Should it be confirmed by the Court of Appeals, to which it is going, its significance for this city cannot be overrated. It not only declares the Albany police bill unconstitutional—that is a comparatively small matter—but the grounds of the decision are very far-reaching. It decides, in the first place, that an act which seeks to divide the Police Commission equally between the two leading political parties, is an attempt to place the minority on an equality with the majority, and give the majority no more power than the minority. This the judgment declares to be “in violation of the fundamental laws of a republican government”:

“The principle that the majority shall govern lies at the very basis of our government. Among the rights of the majority, as a part of its sovereign power, is the right to select officers, either directly by election, or indirectly by authorities or officers whom they have chosen by election. This power of the majority to govern, the Legislature cannot take from them. The Legislature exercises the legislative power of the people, it is their agent for that purpose, but it cannot limit or surrender any of the power or authority of its principals.”

This is a tremendous, let us hope a fatal, blow to the “bi-partisan” foolery. You may give a minority representation; you cannot give it equal power.

The act next violates the principle of local self-government:

“But it may be said that the Legislature is composed of the representatives of the people, and that, therefore, their acts are presumed to be the acts of a majority of the people, and that while this act deprives the majority of the people in one locality of their power, still it is in accordance with the will of the majority of the people of the whole State, and that thereby the principle of majority government is recognized. There would be force in that suggestion if it was not for another principle of our government, recognized by our Constitution, and if the people had not by the Constitution limited their power to override the will of a majority in any locality. The principle I refer to is the principle of local self-government. The principle of local self-government is regarded as fundamental in American political institutions. It means that local affairs shall be decided upon and regulated by local authorities, and that the citizens of the different political divisions of the State have the right to determine upon their own public concerns and select their own local officials without being controlled by the general public or the State at large. For this purpose municipal corporations are established and are invested with rights and powers of government subordinate to the general authority of the State, but exclusive within their sphere. The principle is one that runs through our entire system of government, from the road and school district up to the federal Government. The right of cities to govern themselves has been the subject of attack by arbitrary power from a very early period. In our own State, it seems to me, the subject has been placed beyond question. All through our State Constitution this principle of local self-government is recognized.”

Should this principle receive the highest judicial sanction, it will stop for ever the

incessant and nefarious legislation for this city at Albany regarding its most vital local concerns which goes on every winter at the instigation of the local Democratic or Republican boss. It would infuse new life, new activity, and a new spirit into our municipality. It will be seen that the decision bears flat-footed on our police here. Until it is reversed, our Police Board is unconstitutional, and we trust that immediate steps will be taken to apply the law.

Mayor Strong's action in extending the civil-service rules to cover about all the desirable places that are left in the municipal service will be a truly terrible blow to all Boys, in Tammany and elsewhere. There is really little left in the way of offices for them to fight for at the polls. If Abe Gruber is right about it, they are all likely to cease to manifest any interest in politics, and to leave our elections to take care of themselves. This last extension takes away all the biggest “plums” as the preceding ones took away the great mass of little “plums.” Of course the heads of departments remain, and a new Mayor can always remove them all and put his own men in their places; but these cannot change the subordinates in the departments, for they are now all within the rules and cannot be removed except for cause. All vacancies, however created, must be filled through competitive examinations. The Boys will surely think that the republic is tottering to its ruin. The mere perusal of the list of nearly seventy places, with salaries ranging from \$800 to \$5,000 each, and a grand total of \$318,000, is enough to strike a Boy dead on sight. Think of all that being put out of the reach of the Boys for all time!

The dissolution of the union between the Irish and the English Nonconformists, which has been formally announced by the organ of the English Methodists, on account of the action of the Irish members in supporting the education bill, and over which there is much jubilation among the Conservatives, shows clearly, what was always suspected, that this union, while it lasted, really rested on Gladstone's prestige. The home-rule doctrine was never held with any real heartiness by the leading English Liberals, say Lord Rosebery and Sir William Harcourt. They held it because Gladstone had got it incorporated into the Liberal creed, but it was always to them something like the Athanasian Creed to good churchmen. The mass of the English Dissenters, as we now see, clung to it because eighty-six Irish votes were a powerful assistance in getting other things they wanted and cared for more than home rule. The split can do no great harm to the home-rule cause at present, for it was already as dead as Julius Caesar, owing to the largeness of the Conservative majority and the disappearance from the political scene of

the one able Englishman who ever gave it any vitality. But it renders any reunion of the Irish with the Liberals indefinitely remote, and makes it more probable than ever that some little measure of home rule, something in the County Council line, will yet come from the Tories themselves, who, in fact, are much more like the Irish than the Liberal Dissenters, and come nearer to them on several points.

The arguments with which the Dissenters justify their separation from the Irish would make ludicrous reading if placed side by side with those by which home rule used to be advocated in the same quarter. The anti-home-rulers opposed home rule on the ground, among others, that it would not do to give home rule to such bad men as the Irish; but the home-rulers said that it was to be given as a wise political measure, and not as a reward for good behavior, and that, no matter how they behaved, unless Liberal doctrines were all wrong, it was better for both Ireland and England that the Irish should manage their own affairs. It appears now, however, that the Irish ought not to have home rule unless they agree with the English about the management of common schools. This inconsistency is perceived by some Liberal leaders like Sir Frank Lockwood and Mr. Asquith, and they laugh quietly over it, but there it is. The affair really furnishes one more argument for home rule to the Irish arsenal, for it shows once more how inevitably all parties in England, Whig and Tory, pass on Irish questions on English grounds. Nearly everything the Irish have ever asked for in a hundred years has been refused, at first at least, for an English reason. Of course there are many causes for the present obliteration of home rule—Parnell's death, Gladstone's retirement, and the Irish dissensions—but we have no doubt the one which acts most powerfully on the English mind, perhaps unconsciously, is Irish tranquillity. Public attention in England has never been seriously given to Irish questions except in periods of disturbance, and even then it is only very recently that healing measures have been substituted for coercive measures.

The deaths of Jules Simon and Léon Say, following each other so closely, will not lessen the anxiety of Frenchmen over the signs of decay in their public life. This is a phenomenon which is giving trouble in every democracy. In France, as in this country, the abler and better men have so long abstained from an active political life that they now find their public influence reduced almost to a nullity, and discover that they cannot exert effective political power even when they try to. This ought not really to surprise them, for nothing will more quickly forget and ignore you than politics when you consent for any long time to forget and ignore it.

A LESSON IN FINANCE.

THERE is in progress at the present moment an object-lesson in the value of an elastic currency so remarkable that it deserves especial mention. For several months past, the Russian Government has been pursuing what is evidently a concerted plan to reform its coinage. With this in view, gold has been drawn from all countries on which Russian exchange was favorable, and the specie has been flowing steadily into the St. Petersburg reserves. Since January 1, according to its latest published statement, the Imperial Bank of Russia has increased its stock of gold \$39,000,000. This increase of the national gold reserve has been carried out, according to economic rule as practised in every civilized modern state except our own, through reduction of the paper currency. Even the circulation of the Bank of Russia has been reduced within the same period \$25,550,000.

It happened in this Russian operation, as it did in the similar Austrian episode a few years ago, that Germany was at first the easiest gold market on which to draw. While the Bank of Russia's gold reserve was thus increasing rapidly, the gold supply of the Imperial Bank of Germany, between February 22 and April 7, decreased \$23,500,000. At this time, it will be remembered, the United States was negotiating its \$100,000,000 loan, our money markets were contracted, and gold shipments from New York had ceased. The Bank of Germany, like other national banks of European states, supplies the needed currency by its own note issues. When the outward gold movement had begun seriously to deplete the Bank's specie reserves, a very perceptible movement to contract this note circulation was adopted. From April 7 to May 26, the notes of the German Bank in outside circulation were reduced \$40,000,000. The result was at once apparent in the money market. The Berlin open-market interest rate advanced from $2\frac{1}{8}$ per cent. at April's opening to 3 per cent. at the close of May. Immediately the gold depletion ceased. The German Bank's reserves began to rise again. Week before last they had increased \$13,750,000 from their recent minimum. This restoration of the gold supply having brought the Bank's reserve once more to a safe percentage of note liabilities, the Bank's report for the next week showed once more a moderate expansion of circulation, with an accompanying decline in money rates. In other words, a simple and scientific process, applied when the circulating medium was relatively in excess, and when the percentage of reserve was running down too rapidly, has served the double purpose of restoring the currency to equilibrium and wholly preventing any doubts as to its security.

Ever since 1890, the currency inflation under the Sherman silver-purchase act had forced the foreign-exchange rates of the United States to so high a level that

this country was habitually looked to as the cheapest gold market in the world. Our own insane currency legislation drove out our gold to Europe, and it was merely a question which nation should receive the precious metal. The process of buying gold to keep our Treasury reserve intact resulted in a further heavy redemption of legal tenders, and, by this temporary retirement, an awkward sort of currency contraction was in progress which failed invariably of its object. If the currency of this nation, like that of every other great financial state, were subject to automatic contraction or expansion according to the money market's true requirements, we should long ago have checked the embarrassing gold-export movement, as surely as this season's German export was arrested. If we did not instantly check the specie export, we should at all events, on such occasions, have sustained a safe percentage of reserve to liabilities, instead of witnessing a decline in this reserve percentage, as our Treasury did in 1894, to barely 14 per cent. For a time, this year, as we have said already, the "tying up" of money incidental to the February loan served all this purpose. But meantime confidence and trade activity had flagged, first as a result of the repeated Jingo menaces at Washington, then because of doubt and suspicion respecting the leading candidate for the Presidential nomination. As the needs of trade contracted, the money rate declined, and idle paper currency again piled up in the city depositories.

Finally, exports of gold began again, and the Treasury reserve is now running once more rapidly down the scale. If we were doing business in this country on a properly elastic currency, the recourse would be as obvious as it has been in Germany. Contraction of the circulating medium would probably indeed be automatic. Bank currency would presumably be called in simply because bank loans, needed no longer in a sluggish trade, were paid off by the borrowers. Having no pretence of any such device of modern scientific financiering, our paper currency, once more far in excess of business needs, is piling up again in institution vaults, and more than \$22,000,000 gold has gone abroad since April 4. The United States, in fact, a seemingly willing victim, is providing all the gold asked by the Russian Treasury. It is hard to say whether regret at the event, or contempt for the stupid policy which makes it possible, ought in such an episode to be an intelligent American's chief sentiment.

THE PENSIONER AND HIS DOLLAR.

THE German-American Gold-Man-on-a-Gold-Platform League is doing good work in distributing leaflets, showing in what classes of the community the silver swindle is likely to work most damage. For instance, all persons living on wages and salaries, and all depositors in savings-

banks, will suffer *at once* by the introduction of a fifty-cent dollar. No matter what glorious future they may promise themselves through a rise in wages and salaries, and consequent surplus for "the bank," what stares them in the face is poverty the moment the money they are paid in becomes payable in silver instead of gold. Not only so, but their poverty will last a long time, for neither a high tariff nor a silver currency will bring a single wage-earner a day's work more than he has now. As to this the inflationists are deluded by the recollection of the good times which accompanied the inflated war currency. The war not only steadily lessened the supply of labor, through the withdrawal of the whole body of soldiers from industry, but created an artificial market in which all products as fast as they were produced and purchased were consumed and destroyed, and which therefore could never be glutted. All this is so plain that if the wage-earner could be induced to look the matter in the face, he would be no more deluded by the promise of prosperity made by the silverites than the manual laborer could be to-day by arguments—once so efficacious—that machinery would prove his ruin.

There is one class addressed by the League which will, however, be even more plainly and shockingly swindled by the silver dollar than the wage-earners—and that is the whole body of men, women, and children on the pension list. The swindle is more plain in this instance than in any other, because a pensioner is in most cases in a position in which he can be but little benefited by any exertions of his own. The \$140,000,000 divided annually among the 970,000 pensioners on the rolls will never be affected by a tariff nor by any rise in wages. The moment the silver basis comes, the 970,000 pensioners will have, not \$140,000,000, but \$70,000,000. The swindle is peculiarly shocking because it falls upon a dependent class which is supposed to have particularly meritorious claims upon the public.

No doubt in the South a great many silverites chuckle over the idea of swindling the pensioners, imagining that the whole body of them are in the North and Northwest, and that for the South to help on the good work of cheating them would be nothing but tit for tat, the South having been unduly taxed for their benefit. But this is a total mistake. Owing to immigration into the South from the North, and other causes, the Southern pension list is very large. There are 13,557 Federal pensioners in West Virginia, 8,043 in Virginia, 7,902 in Texas, 18,017 in Tennessee, 53,959 in Missouri, 3,715 in Mississippi, 12,979 in Maryland, 4,453 in Louisiana, 28,905 in Kentucky, 3,708 in Georgia, 3,217 in Florida, 8,354 in the District of Columbia, 2,730 in Delaware, 10,364 in Arkansas; and even in South Carolina there are 1,717. How many votes this list represents it would be im-

possible to say; many of them are women and children; others may be colored soldiers or their families; but it must represent a good many votes; perhaps votes enough in one or two States to turn a close election.

In the Northern States, of course, the case is much plainer. The present pension law was passed for the express purpose of getting votes. The effect of silver inflation will be to cheat every pensioner out of half the income which was to be a claim upon his gratitude. In Illinois 68,678 of them will be cheated out of \$4,863,823, in Indiana 69,850 of them will be cheated out of a little larger sum—\$10,000,000 in round numbers in the two States. In Ohio there will be 105,160 victims, and they will be "done" out of \$7,779,283. These three States might alone determine the election. Altogether in the Northern, Northwestern, and Eastern States there are nearly 800,000 victims who will be cheated out of more than \$50,000,000 a year by the silver swindle.

A campaign among these victims would be a campaign of education, no doubt, as we have said, and fortunately the Government has a list of them. There are many of them who are women and children, and many of them are negroes who live in States where their votes are of small consequence. But there are many thousands of white voters among them, and the figures given show that it is probable that in several States the pensioner may influence the result conclusively. Even where he has some other means of livelihood he is almost always a person whose pension is a considerable part of his whole income. He is open to argument, and what the German-American League want to do, as we understand their purpose, is to make the silver swindle so plain in its effects upon individuals that the operation shall of itself create a gold party once and for all. The way to do it is to bring it home, not merely to classes in the mass, but the individual in the class; to show the pensioner, the savings-bank depositor, the mill-hand, that his dollar under the new régime will be fifty cents; that his pension will be half what it now is; that his children will get fewer shoes for it, his wife and he less meat; that his rent will be higher, his coal bill larger, and that at the end of every year he will be poorer than he was at the beginning. These are the true pictures of what the political Hungry Joes have in store for him.

THE FRENCH CLAIMS VETO.

THE President's veto of the general deficiency bill is mainly based on the item for the French spoliation claims, amounting to \$1,027,314.09. He very justly says that these claims have no proper place in a deficiency bill. But the grounds of the veto are such that he would be required to withhold his approval from any bill which contained them.

The claims arise out of depredations upon American vessels by French privateers between 1791 and 1800, in the course of the Franco-English war, in which we were neutral. These claims were filed at Washington by those injured, and presented by our Government to France, and thus became the subject of negotiation between the two countries. Other matters were pending between them, however, at the same time, and, in the final settlement made, the United States abandoned those private claims, adjusting its own difficulties with France partly through this abandonment. The claimants have ever since contended that this was unjust and gave them an equitable claim on their Government for reimbursement.

The President's reply to this is, first, that the claims are not legal claims; second, that, being founded on our neutral status, they would have no standing if the fact was that this country was not a neutral, but at war with France—there being of course no redress for one belligerent as against another for depredations committed in the course of war—and that, as a matter of fact, the better opinion is that we were then at war with France; third, that it is "confidently alleged" that these claims were really abandoned because they were good for nothing, and that if they were used in obtaining our national settlement with France, this result did not make them good against the United States; fourth, that in the first quarter of the century, while they were still fresh—at a time near the period of the depredations—there was adverse action in the Senate and House, which creates a presumption against them; fifth, that bills for the relief of the claimants have been twice vetoed; sixth, that it is "now estimated" that the claims "may amount" to \$25,000,000; seventh, that none of these claims have been paid except \$1,300,000, put into the general deficiency bill in the last hours of the session of Congress, March 3, 1891; eighth, that many of the claims are those of insurers, who ought not to be paid under any circumstances.

We have endeavored to state the President's objections fairly, but must point out that he has wholly omitted to refer, except in the most indirect way, to the most important recent facts in the history of the claims. Many people in reading his message must wonder what his reference to cases "pending for examination in the Court of Claims" means; and how it was that \$1,300,000 came to be paid at all. The fact is, that after these claims had been before Congress for three-quarters of a century, and after the historical objections urged by the President had been brought up over and over again, and when, in addition to the unfavorable reports and vetoes referred to by him, forty-five reports in Congress had been made in favor of the claims, and after Marshall, Madison, Pickens, Clay, Clinton, Edward Livingston, Everett, Webster, Cush-

ing, Choate, and Sumner had recognized the claims as valid, the whole matter was finally referred to the Court of Claims for a judicial opinion as to their merits, by an act of Congress passed January 20, 1885. This act said nothing about gratuities or largess, but gave permission to such persons, or their representatives (the original claimants being all long since dead), as had "valid claims to indemnity upon the French Government arising out of illegal captures," etc., to apply to the court by petition within two years; directed the court to ascertain and determine the "validity and amount" of the claims; directed the Secretary of State to procure all accessible foreign evidence and documents; and directed the court to make reports of its findings every year—such reports, however, not to be conclusive. Under this act, the claimants presented their evidence and made their arguments, and the United States did the same on its side, and the court on May 17, 1886, in the case of *Gray vs. the United States*, decided the claims in general to be valid, using the following language:

"The result which we have reached is supported by resolutions passed in each of the thirteen original States, by twenty-four reports made to the Senate by its committees, by over twenty similar reports made to the House of Representatives, by the fact that, while three adverse reports have been made, one to the Senate and two to the House, no adverse report has been made in either body since the publication of the correspondence in 1826, and by the further facts that the Senate has passed eight bills in favor of these claimants, and the House has passed three of these, of which one is the present law—the other two having been vetoed, one by President Polk, substantially upon grounds not at this time important, the other by President Pierce for reasons which we have considered very fully in this opinion, and with which, after the most careful and painstaking consideration, we cannot agree."

It was now supposed by most persons that the matter was settled, but the unfortunate reservation of the right of Congress to disregard the finding of the court remained. The claimants went on and proved their claims, but until 1891 Congress refused to appropriate money to pay them. In that year \$1,300,000 of the claims was passed by Congress, and subsequently paid. Here the matter stands. The validity of the plaintiffs' claims as a whole has been decided in favor of the claimants by the tribunal to which the defendant referred them, and one batch of judgments has been paid by it. It now refuses to pay the rest, on the ground that the plaintiffs have no case.

The President has no doubt killed the claims for the present, but that the claimants will accept his decision as a finality is not to be expected, as there is not a single argument in it that has not been already considered by the Court of Claims and disposed of in their favor. While the result, in sending off the first claimants with their money paid, and denying all redress to the others who stand in exactly the same position, may be the part of financial wisdom at the present time, it is certainly not justice. Those who are familiar with the history of the controversy

will remain convinced that the French-claims controversy will never be settled until the Government is willing, not only to send the matter to a court, but to abide by its finding.

THE RULE OF THUMB.

THE Society of the Army of the Tennessee determined last year to erect an equestrian monument to Gen. Sherman, and a committee was appointed for the purpose of which Gen. G. M. Dodge was chairman. Conscious, apparently, of their own want of skill and experience in the matter of judging sculpture, they very properly asked four leading American sculptors—J. Q. A. Ward, Augustus St. Gaudens, Olin L. Warner, D. C. French, and a prominent architect, Bruce Price—to aid them in making a selection among the designs for which they had advertised. In this they followed the admirable example of Mr. Burnham at Chicago. He summoned the leading American artists, and asked them to make designs of exhibition buildings and divide the work among themselves. The world knows the result. In other words, he acknowledged that the men who give attention to a thing, and win fame in doing it, especially in matters of taste, are most likely to be right in their judgment about it.

We have said in "matters of taste," but this is really true in all matters. Civilization is built on, and progresses on, the idea that the men who occupy themselves with any pursuit are likely to know more about it than those who do not, and that their advice touching that pursuit is good to take. This is true of war, of literature, of science, and of art in all its branches, of small things as well as great, from arranging a dinner-table to fighting a battle. A man who arranges a dinner-table may be an ass in most things, but if he has long given his attention to this matter of arranging dinner-tables, he is a master in that field, and his word should be listened to. If everybody in the world thought he knew as much about everything as everybody else, social chaos would ensue, and we should end, in a few generations, in the woods, clothed in skins of beasts like our ancestors.

The five artists thus selected promptly complied with the request of the committee, and went to Washington, where they passed judgment on the designs there collected, selected two as of more merit than the others, and recommended that further competition between the authors of these two should be ordered. They acted without compensation, for the honor of Gen. Sherman and the credit of American sculpture. This advice was given, they say, "in the clearest way, and with every precaution to guard against misunderstanding." Far from taking it, the committee promptly proceeded to call for further competition between, it is true, the two recommended by the judges, but also between two others, one of

whom had been already specially disappointed, or not at all approved, by the judges. Worse than all, when the award was finally made, it was made, without communication with the judges, to that one of the two supplementary competitors "whose model in the first competition was not considered by the committee of experts as worthy of consideration."

The want of courtesy to the artists called on to advise would be very shocking if we were not used to it in our official life, where old and valuable public servants are often turned out of office without other notice than the appearance of their successors to take their places. But this can readily be overlooked, in view of much more serious considerations. The snub to the judges, coupled with the award, contains the assertion that the committee of the Army of the Tennessee know more about sculpture and are better judges of it than anybody in Europe or America; for this is what I say if I observe that I do not mind what Messrs. Ward, St. Gaudens, Warner, French, and Price say. I put myself on a level with Phidias and other great sculptors of antiquity whose superiority all moderns acknowledge. In the very droll letter from Mr. J. R. Dunlap, editor of the *Engineering Journal*, in defence of the committee's action, which was published in the *Evening Post* on Wednesday week, he not only put the committee before the sculptors, but put Secretary Lamont, Gen. Miles, Gen. Sherman's family, and himself before them. He gave information about the conditions of a good Sherman statue, and about sculptor Rohl-Smith, which would have put Lessing to the blush, and caused the closing of the *Beaux-Arts* as a useless institution.

Nothing much more extraordinary or discouraging has happened since the days of Vinnie Ream. Our older readers may remember that advocacy of this lady's work developed the fact that both houses of Congress swarmed with some of the best judges of painting and sculpture in the world, and that one man was exactly as good a judge of a picture as another—a fact which can be readily ascertained by frequenting any picture-gallery in the world, on a free day. Application was made here in New York some time ago to the Board of Aldermen for permission to copy one of the portraits in the City Hall—a Stuart, we believe—and the objection was made by an aldermanic connoisseur that the copy might turn out better than the original, be sold for more, and thus lower its value. This shows that there is really no kind of knowledge more widely diffused than art knowledge. Considering this, the enormous sums spent all over the world on art schools and schools of design have always puzzled us. Their promoters say it is to promote art education and art culture among the people. Bless your souls, they do not need it. They have got it. There are Mr. Dun-

lap, for instance, and Secretary Lamont. We warrant neither has frequented any of your art galleries, and yet they can both give points to Mr. St. Gaudens.

The matter has more than an art bearing; it is symptomatic of many other things. It is another indication of the struggle we have in America to assert the claims of knowledge about everything which does not yield an immediate pecuniary return. The currency question is one of them. The real masters of this question, the men who know, are the men who are daily engaged in the work of exchange. It is they who can tell what is the best measure of value, the best money for civilized men. Yet they are rarely heard from or listened to on this subject. A few years ago the late Mr. Blaine was telling an ignorant audience on the stump that we lost \$60,000,000 a year in our trade with Cuba. When you went down to Front Street, and saw the men who carried on the trade with Cuba, you found they were all making money, and when you showed them Blaine's statement, they smiled broadly. At this moment the Western world is filled with the babble of people who do not exchange at all, but insist, with furious gestures, that the exchange dealers and merchants are ignorant fools and base "gold bugs." Every farmer in the South and West, though he has never handled more than \$100 in his life, is sure that all the financiers of Europe and the Eastern States are wrong in this matter, and that he knows better than they how to provide "the soundest money the world has had, or can have—the money of the people, the money of civilization through the ages past, and destined to be such for ages to come." We thus see how much time is wasted by the human race on instruction, in study, and in practice.

POLITICAL GENTLEMEN.

MR. LECKY, in his book on Democracy, argues that gentlemen, as a class, are likely to govern other people better than such as are not gentlemen; the reason he gives being that, owing to their position, associations, training, and ambitions, they are more likely to discharge political duties with faithfulness, and to be intelligent, just, and honorable. The suggestion greatly irritates Mr. John Morley, who, in his scathing review of the book, asks, in substance, why gentlemen who idly abuse the bad times over their whiskey and soda in the club smoking-room, should be supposed to be an exceptionally good governing class. Talleyrand said: "What is democracy but an aristocracy of blackguards?" and Mr. Morley evidently at bottom thinks that Mr. Lecky is of Talleyrand's opinion. Perhaps he is not far out of the way in this suspicion.

For us the matter has a somewhat different interest from that which it has for Englishmen, because we have never lived in an atmosphere in which gentlemen, as

such, have been deemed a class specially endowed with political virtue, and the idea, held by so many people only a few years ago, that the degradation of our politics would be ameliorated by introducing gentlemen into them, has not been confirmed by experience. As a rule, instead of politics having been elevated by them, they have been degraded by politics. Some of them have no sooner seen office dangling before their eyes than they have forsworn their whole early training, thrown aside independence and principle, become blind partisans, and made ferocious war upon the causes they had been brought up to fight for. Others have, as in this city, thrown overboard all pretence of decency, made common cause with thieves and blackmailers, and assured their amazed friends that this was what "politics" really meant, and the only way in which government could be carried on. A very few have been driven out of politics because they were too good for it. The greater number have brought a good deal of discredit upon the class from which they came, and the republic would have taken no harm had their places been filled from any other.

Our experiment cannot be cited to show that there is any magical effect produced by making use of gentlemen to elevate politics or keep them pure. Are there any facts which point to a different conclusion?

To answer this or any other question about gentlemen is not easy, because the word gentleman is used in two senses very wide apart. Mr. Morley's criticism of Mr. Lecky illustrates this. When Mr. Lecky speaks of the advantages to be derived from gentlemen taking part in government, what he has in mind is either himself and his friends and acquaintances, or else an ideal gentleman, who has all the best qualities of the class and none of its defects. When, on the other hand, Mr. Morley ridicules the idea of gentlemen's being of much use in politics, he has in mind bigoted Tory squires, bad Irish landlords, and young clubmen who curse the followers of "Gladdy," and wonder how they are going to put their tailor off a few months longer.

Now, everybody has a great respect for gentlemen of the first sort, and no respect at all for gentlemen of the second. To say with emphasis that a man is a gentleman, in our language is proverbially, so far as this world goes, the highest encomium that he can receive. No epithet adds anything to it; on the contrary, it is reduced by epithets, because it implies in our usage all the highest qualities that a man can have among men. A truthful gentleman, a brave gentleman, a reliable gentleman, are pleonastic and even vulgar expressions—pleonastic because the word gentleman implies all these other qualities; vulgar because no one who is a gentleman would be capable of failing to recognize this fact. As the Roman *vir* had by the term itself the qualities which *virtus* im-

plied, so our gentleman has all the qualities which in mediæval theory or fancy went with "gentle" blood. This can be seen by the qualities left out as well as by those included. Virtues peculiar to women are not "connoted"; it has been very justly said that a woman cannot by any possibility have the feelings of a gentleman. It is a man's ideal, and it is not altogether an ideal of moral perfection by any means.

If there were in any country any numerous body of men of this sort in control of the government, the question could hardly arise whether they had qualities adapted to make their services in politics valuable. Inasmuch as they represent the ideal of a race, held up to be admired for generations by its bards, philosophers, romancers, and historians, there can hardly be too many of them in any government. A celebrated lord chancellor, asked by some one what principle he adopted in selecting judges for nomination, said, "I always pick out a gentleman; and if he knows a little law, so much the better." What he meant was that learning could be acquired, but the qualities of character which constitute our ideal must be there already. Unfortunately, however, the gentleman of actual social existence means something very different from this. It is impossible to define the word exactly, but for practical purposes it means any man who either shares in or is recognized as fitted to share in the society which is generally regarded in any community as the best. The qualifications for admission are so different at different times and in different places that it is impossible to enumerate them. In one place family alone will answer; in another mere wealth, accompanied by a very slight modicum of manners, will be enough; in all, occupation counts, but very differently in different countries. We rarely meet apothecaries or dentists in society. In Austria, however, a country governed in great measure by an aristocracy, we have known an apothecary at the head of a Spa administration, and an officer compelled to fight a duel with another apothecary—gentlemen all. In many places in England the local school-teacher is not a gentleman.

Used in this sense, the word means nothing but a certain social distinction, which is far removed from indicating with any certainty the possession of qualities specially adapted for the discharge of political trusts. On the contrary, it indicates almost nothing with regard to character. In the course of a year every one meets dozens of gentlemen who have hardly a moral quality or peculiarity in common. They may be brave or cowardly, truth-tellers or liars, faithful or unfaithful. A man may be a ruffian among his wife and daughters, treacherous, a miser, corrupt, and still pass in society for a gentleman, if he has never done anything for which this society itself looks askance at him. In fact, a gentleman remains a gentleman, no matter

what he does, until something or other happens which makes it necessary for society, as a matter of self-preservation, to eject him. Formerly, no doubt, birth was essential; but, even in those remote days, a gentleman by birth was not *ipso facto* a Colonel Newcome in character. George IV., Sheridan, Byron, and Talleyrand himself were all gentlemen. The mad King of Bavaria who bankrupted his kingdom for the sake of art, was a gentleman, though very fond of the society of those who were not. In New York, conviction of crime will rule a man out in most cases.

If what we have said is true, there can hardly be a presumption that a man recognized among his fellows as a gentleman for social purposes will therefore probably make a good legislator, cabinet minister, governor. So far as he has the qualities with which we endow our manly ideal in song and story, he is indubitably qualified. As a test of fitness, the fact that a man is a gentleman will not do, in politics, any more than it will in railroads, engineering, surgery, law, architecture, or art. The standard has the defect of having little or no intrinsic value, except for the purpose for which it is used—which is purely social.

TWO NEW GERMAN TRAGEDIES.

CAMBRIDGE, May 25, 1896.

ERNST VON WILDENBRUCH and Gerhart Hauptmann are, in a way, representatives of two extremes in contemporary German literature: Wildenbruch fiery, passionate, rhetorical. Hauptmann dreamy, brooding, visionary; Wildenbruch, an ardent monarchist, a zealous supporter of the present régime, seeing the salvation of Germany in a continued supremacy of Bismarckian principles; Hauptmann, a Democrat if not a Socialist, in deepest sympathy with the sufferings of the "disinherited," hoping for the millennium of universal brotherhood. Wildenbruch, an idealist of the straightforward, unreflective type, sunny, serene, somewhat inclined toward melodramatic effects; Hauptmann, a strange mixture of a pessimistic realism and of a mystic faith in the glory of the unseen, disdaining all that is not absolutely genuine and true. Wildenbruch the greater playwright; Hauptmann the greater poet. This contrast of artistic temper, while it marks the whole literary career of the two men, has never been brought out more conspicuously than in the two great historical dramas which have been the event of the year on the Berlin stage: Hauptmann's "Florian Geyer" and Wildenbruch's "Heinrich und Heinrichs Geschlecht."

That Wildenbruch's "Heinrich" should have easily carried off the crown of popular success, is not surprising. As a stage show it is simply overwhelming. Here we have all the brilliancy of diction, the intensity of action, the irresistible surging up to a grand climax which give eternal youth to Schiller's dramas; and, added thereto, we have the lifelikeness, the palpability, the breadth of detail, in which modern realism revels. Here we see, indeed, the gigantic figure of History herself striding over the stage, but we also see our own feelings, longings, and aspirations embodied in human forms, and recognize them as the real movers

and makers of national destinies. The subject of the drama is a struggle which, as Bismarck has said, dates back to the days when Agamemnon quarrelled with Calchas, the struggle between king and priest. The principal combatants in this struggle are Henry IV. and Gregory VII.; the prize for which it is fought out is Germany. With true dramatic instinct Wildenbruch throughout the play—which is intended for two successive evenings—maintains himself on the very height of his subject; he leaps, as it were, from catastrophe to catastrophe, leaving it to the imagination of his hearers to make its way after him through the dark glens and ravines that lead up to these shining mountain peaks.

In the beginning we see Henry as a boy, an impetuous, imperious youth, smarting under the discipline of a fanatically religious mother, burning with the desire to equal the fame of his heroic father, at last thrust into the prison walls of monastic asceticism under the tutelage of Anno, Archbishop of Cologne. Next he appears as King, in the acme of his power. He has subdued the rebellious Saxons; he enters triumphantly his faithful Worms; he is received by the citizens as the protector of civil freedom against princely tyranny and clerical arrogance; all Germany seems to rise in a grand ovation to her beloved leader. Intoxicated by his success, he resents all the more deeply the paternal admonitions of Pope Gregory about the looseness of his private life which are just then conveyed to him; he insists on being crowned Emperor at once; and, when this request is not complied with, he allows himself to be carried away by his indomitable wrath, he forces his bishops into that insulting letter by which Gregory is declared a usurper, a felon, a blasphemer, to be driven out from the sanctuary of the Church which he pollutes by his presence.

And now we are introduced to the other great character of the drama, to the opposite of this fiery, unmanageable young ruler, to Gregory, the self-possessed and self-abasing priest, the man in whose soul there seems to be no room for any passion except the passion for the cause of the Church, for the triumph of the spirit over the flesh, and who nevertheless harbors in his breast, unknown to himself, the most consuming ambition and the most colossal egotism. We see him sitting in *cathedra* in the basilica of Santa Maria Maggiore. Suppliants and criminals are brought before him. A Flemish count, who has committed murder, and who has in vain fled throughout the length and breadth of Europe in quest of delivery from the anguish of his tormented conscience, beseeches the Pope to put an end to his wretched life; Gregory, instead, holds out to him the hope of salvation through joining a crusade. A Roman noble, who in robber knight fashion has made an assault upon the Pope, and who by the clergy and the people has been condemned to death for this crime, is pardoned by Gregory—"for he has sinned, not against the Church, the holy one, but against Gregory, a poor, feeble mortal." A lay brother of St. Peter's, who, disguised as priest, has taken money from foreign pilgrims for reading mass to them, and who by the clergy and the people has been sentenced to a fine and exile, is ordered by Gregory to be thrown into the Tiber—"for he has sinned against the Church, he has cheated human souls of their salvation."

These scenes have just passed before our eyes when the messengers of King Henry, bearing the letter of libel and vilification, are admitted. Gregory is the only one who in the tumult that follows its reading remains abso-

lutely calm; he protects the messenger himself against the rage of the Romans; he forgives Henry, the man, for what he has said against Gregory, the man.

"For what he has said against the head of the Holy Church, for that let Henry be cursed! I forbid all Christians to serve thee as a King, I release them from the oath that they have sworn thee. Thou, darkness revolting against light, return to chaos! Thou, wave revolting against the ocean, return to naught! No bell shall be sounded in the city where Henry dwells, no church be opened, no sacrament be administered. Where Henry dwells, death shall dwell! Let my legates go forth and announce my message to the world!"

The climax of the whole drama is, as it should be, the Canossa catastrophe. It is here that Gregory, the victor in the political game, succumbs morally; that Henry, the vanquished, rises in his native greatness. It is here that Gregory, with all his soaring idealism, reveals himself as an inhuman monster; that Henry, with all his faults and frailties, arouses to the full the sympathy which we cannot help feeling for a bravely struggling man.

The excommunication of Henry has plunged Germany into civil war. A rival king, Rudolf of Swabia, has been proclaimed. He and the chiefs of his party have come to Canossa to obtain the papal sanction for their revolt. Gregory clearly sees that Rudolf is nothing but a figure-head, a mere tool in the hands of fanatic conspirators, totally unfit to rule an empire. He clearly feels it his duty to discountenance this revolt, to restore peace to Germany by making his peace with Henry. But the demon of ambition lurking in his breast beguiles him with a vision of world dominion: he, the servant of the servants of God, shall be the arbiter of Europe; he, the plebeian, shall see the crowns of kings roll before him in the dust. He does not discountenance Rudolf and his set; and when Henry appears before the castle, broken and humiliated, asking for absolution from the ban, Gregory remains unmoved. For three days and nights the King stands before the gate in ice and snow; for three days and nights the Pope sits in his chair, speechless, sleepless, refusing to eat or drink. At last, the intercession of Henry's mother, who, herself in the shadow of death, has come to pray for her son's salvation, softens Gregory's heart: he admits Henry to his presence. Henry appears, a king even in his misery. He bends his knee before the Pope, he confesses his guilt, he acknowledges the justice of his punishment. The reconciliation is brought about. Just then Henry's glance falls upon Rudolf and his followers standing in the background. He greets them as friends, thinking that they have come to renew their allegiance to him. But they rudely repulse him, and boast of the Pope's intention to acknowledge Rudolf as King. And Gregory does not contradict them. With fearful suddenness Henry sees what a shameful game has been played with him; and yet he masters himself, he makes one last appeal to whatever there is of true feeling in his opponent:

"God, help me against myself! Christ, Saviour, who wast thyself a king among the heavenly host and didst bow thy neck under the scourge, help me against myself! (*He turns abruptly toward Gregory.*) Once before I knelt before thee—I did it for myself. (*He falls down on his knees.*) Here, a second time, I lie before thee, for Germany lie I here! Break thy silence! Thy silence is the coffin in which the happiness of Germany is entombed! If thou didst know how unhappy this Germany is thou wouldst speak—speak! Thou, ordained by God to bring peace to the world, let me take peace with me on my way to Germany, not war, not howling civil war!"

And Gregory remains silent! From here on to the end of the drama there is nothing but revenge, and revenge on revenge. And this work of destruction does not stop until both Gregory and Henry have breathed their last. Both men die in defeat and desolation; both die inwardly unbroken—Gregory trusting in the future triumph of the Church, Henry trusting in the indestructible vitality of the German people.

A few words may be added about Hauptmann's "Florian Geyer," although it is impossible to do justice to this work except by reading and analyzing it scene by scene. The defects of Hauptmann's dramatic style are here, perhaps, more clearly visible than in any previous production of his. The lack of unity, the absence of a true hero, which were seen in "Die Weber," characterize this drama also. And, in addition to this, there is a slowness and diffuseness of movement which must be fatal to its effect as a theatrical piece. And yet it is impossible to resist the impression that here we are face to face with the creation of a great artist. Hauptmann sees things not as they appear on the stage, but as they are in life. He seems to have no thought of how his figures may affect his hearers. He simply tells what he sees, and he tells it with that wonderful directness which is the privilege of children and poets. Not a phrase which could not thus have been spoken; not an event which could not thus have taken place; not a character which would not probably have taken just this turn; and, beneath all this realism, that strange belief in a hidden life which makes us feel that all these outward happenings are only feeble manifestations of some grand mysterious central force working under their surface. This is the manner in which Hauptmann in this drama makes us live through the great German peasant revolt of the sixteenth century, its glorious beginning and its miserable end; its hopes, triumphs, excesses, massacres, failures; its noble enthusiasm, its dark fanaticism, its savagery and greed, its egotism and pettiness. And it is not too much to say that in order to understand what is implied by the word "Revolution," one could do no better than to study the details of this strangely monotonous and strangely fascinating picture of popular wrath and popular delusion.

That German literature during the last decade has entered upon a new era of genuine productivity must have been clear for some time past to every intelligent observer. That this new movement should have acquired sufficient strength to produce, only a year or two after the triumphs achieved by "Heimat" and "Die Weber," two dramas of such heroic dimensions and such extraordinary power as Hauptmann's "Florian Geyer" and Wildenbruch's "Heinrich," is nevertheless a surprise, and seems to justify the hopes of those who see in the present revolt against conventions the dawn of another epoch of classic perfection of form.

KUNO FRANCKE.

MADAME DE CHASTENAY.

PARIS, May 21, 1896.

THE period of transition between the Terror and the establishment of the Empire will always possess the greatest interest; we find in it the remaining representatives of the old régime mixing with the representatives of an entirely new social order. The émigrés are returning one by one from their exile; they are anxious to have their names struck off from the lists which marked their persons for the

guillotine and their estates for confiscation. They are no longer in fear of the guillotine, but they are still under the eye of the police; they have found a part of their estates sold as national estates, oftentimes to their ancient dependants; they try to save what still remains unsold. They are obliged to solicit the help of the men in power; they are seen in the ante-rooms of the Terrorists who made the ninth Thermidor; they present petitions to the Directors; they see a new Paris, new fortunes, new dresses, new manners—a new France. This contrast has seldom been shown in a better light than in the memoirs, recently published, of Madame de Chastenay, who belonged to a distinguished family of Burgundy. Born in Paris in 1771, she died at Châtillon-sur-Seine only on May 9, 1855. I have known a few persons who saw her in her old age, and who were habitués of her salon. She was always called Madame de Chastenay (though she had never been married), by virtue of her title of Canoness, given to her when she was only fourteen. This title was conferred only on ladies who could prove the nobility of their paternal and maternal families for a number of generations by written documents. It was in itself a mark of the highest gentility. Some of the abbesses which conferred the rank of Canonesses were so strict (for instance, the Abbey of Remiremont in Lorraine) that it would have been impossible for the ladies of the highest rank, even for the Princess of Bourbon, to become canonesses in them on account of some misalliance or of some morganatic union.

We can therefore take it for granted, without losing ourselves in genealogies without interest, that Mlle. de Chastenay was of the purest aristocratic class or set. Her father was an officer of dragoons. At the age of fourteen she was named Canoness of Épinal (her aunt was Abbess of Épinal). The proofs had been made according to rule, a paternal filiation of eight nobles d'épée, and the same number on the maternal side:

"I remember that at vespers the whole chapter [there were twenty ladies in all] came to take me from my aunt's house. I had a black gown. One of the knights of the chapter gave me his hand; the garrison band preceded us. When we arrived in the choir of the church, I knelt; the abbess said to me, 'What do you ask, my daughter?' Answer: 'The bread and the wine of Saint Goëry [the patron of the chapter], to serve God and the holy Virgin.' I had to eat some biscuit, to wet my lips in a cup; they put on me a great blue cordon, with a hanging cross, a long mantle fringed with ermine, a black veil. A Te-Deum was sung, the procession returned in the same order, and a ball began at my aunt's. I amused myself much at this ball, as well as at those which succeeded during the five days of my stay at Épinal. I had wept during the ceremony, but the dance consoled me very rapidly."

Mlle. de Chastenay was eighteen years old in 1789; she was very intelligent and quite capable of understanding all the questions which agitated the country before the Revolution. She was reading Montesquieu, Locke, Mably, and a thousand political productions of the time. "I loved liberty," she says with a rare candor. "I was, in the fullest sense of the term, a very 'exalted' person." When the election to the States-General took place, her father was elected by the nobility of the bailliwick of Châtillon in Burgundy. Mlle. de Chastenay analyzes very well the sentiments which animated the order of the nobility at the States-General. In the elections, the question at issue between the candidates was the vote per caput or the vote by order. The vote per caput implied the principle of popular representation, in which the three orders were to be merged;

the vote by order implied the political distinction of the ancient orders of the nobility, the clergy, and the Tiers-État. At Versailles the order of the nobility divided promptly. The majority was formed of the nobles who from this moment were called aristocrats—chiefly provincial nobles, who had not lived at court, and who lived on their estates. The minority was liberal; it comprised the most brilliant young men, whose families were accustomed to live at court, the leaders of fashion, the young officers who had fought in the American war. The Duke of Orleans, a prince of the blood, belonged to this minority. The members of the majority meant to maintain the privileges of their order, with the exception of the pecuniary privileges, which they were willing to sacrifice, and to preserve the prerogative of the Crown. The minority was prepared to make all needful sacrifices to work in harmony with the Tiers-État.

Mlle. de Chastenay was, like her father, an ardent admirer of the reformers. "I was," she says, "*dans le délire*." She tells us the story of the first events of the Revolution in a graphic manner. Her *délire* received great shocks when she saw an "odious multitude" take Louis XVI. back from Versailles to Paris. "Some men had loaves of bread on their pikes or their bayonets; but, what people will find difficult of belief, the heads of the murdered Guards preceded, borne in triumph, and, by a horrible refinement, they had their bloody hair *frisé* at Sèvres. The National Guard marched behind these horrible banners." Mlle. de Chastenay remained in Burgundy during the winter of 1789-1790; she returned to Paris in the spring, and found the tide of emigration in full force, and society having for its *mot d'ordre*, "The King is captive and all his acts are forced." She spent the worst times of the Terror in Rouen, and nothing can be more interesting than her narrative of the life which she led in the capital of Normandy during this terrible period. There is a realism in her account which transcends in its eloquence the declamation of many writers:

"The life which we led was of great simplicity and of profound obscurity. The art of the time was to isolate one's self. . . . We had no illusions; we said to each other, my brother and myself, when walking in the evening in the delicious vales round Rouen, that within six months we should all fall under the axe of the Revolution. Still, the flowers charmed us, we made drawings, we indulged in music, we read novels, we had our moments of pleasure; and after our violent and sudden emotions we experienced every day those movements of joy which resemble hope. The days succeeded each other. Mamma had heroic courage; and we had been forbidden to hear the horrible reading of papers. . . . A complete famine, an absolute poverty, added to the misery of the times; the *maximum* made it complete. A deputy named Siblot appeared in Rouen, and, as meat was becoming scarce, he gave orders that not a pound of it should be sold. . . . People had to form in queues at the baker's; a few pounds of rice would have been called a monopoly. . . . A ring at the door-bell caused us horrible pains and a cold sweat."

A member of the Convention named Alquier was sent to Rouen on a mission. He knew the father of Mlle. de Chastenay, and was able to protect him.

"Regicide through fear, he yet voted for the appeal to the people, and hoped thus to save his own life and not to commit a crime. I know how this mixture of acts and sentiments will seem odious to persons fortunate enough never to have sinned, perhaps because they never had occasion to do so. We were under the greatest obligations to M. Alquier. . . . We had also in the committee a very obliging protector, M. Godebin, a dyer, who was not a

bad man, but whose manners and tone, without being inspired by the great wrath of the *Père Duchesne*, were far from mild. My father, towards five o'clock in the morning, paid him short visits, and received from him rules of conduct; in no way to attract attention was the primary lesson. My father ordered, by his advice, a coat styled *carmagnole*, so as to appear on the street dressed like everybody else."

A law of April 16, 1794, directed against suspected persons and the nobles, forbade the latter to remain in Paris or in the maritime cities. Mlle. de Chastenay had to return with her father and mother to Châtillon. They had to pass round Paris by Saint Denis and Charenton; it was on the day when Mme. Elizabeth ascended the guillotine. The poor travelers met with constant and touching pity among the people in their difficult journey. "My brother having left the carriage while the postillion was mending something, they remained for a few minutes together, sad and silent; 'So you are a nobleman,' at last said the postillion. 'Yes,' answered my brother. 'Oh, God!' said the postillion with a great sigh, and remounted his horse." It was so everywhere along the road; at Châtillon they found the Terror in full force. By an unfortunate mistake, the name of M. de Chastenay had been placed, in his absence, on the list of the émigrés, and he had to hide himself. Mlle. de Chastenay was imprisoned. We learn from her what a provincial prison was in 1794. She had to live in the same room as the concierge, his wife, several children and several prisoners. Her father was arrested, taken to Dijon, and from Dijon to Paris. The 9th Thermidor saved him; he had had the good fortune to be defended before the tribunal by Réal, who was to play an important part in Mlle. de Chastenay's life. Réal was a lawyer and gave himself up to the defence of the accused. "Witty, animated, with a shining talent; good, natural, full of sensibility, he espoused my father's cause with enthusiasm." The admiration thus expressed for the man who saved her father's life was the beginning of a *liaison* which lasted nearly all her life.

Mlle. de Chastenay behaved very courageously before the municipality of Châtillon; she was set free, but the times were still very troubled. The 9th Thermidor had not put an immediate end to the Terror. "The day which followed the acquittal of my father was," she says, "marked in Paris by the apotheosis of Marat—that is to say, by the transfer of his remains to the Pantheon." Mlle. de Chastenay spent the autumn of 1794 in Dijon; she was at Châtillon in 1795, and had occasion to see there an officer of artillery, Marmont (who became Marshal Marmont). "The young officer had just come from the army of Provence, then called the army of Italy; he was accompanied by General Bonaparte, a general of artillery, who was on his way to Nantes, where he was to take command of the army of the West. M. de Marmont was his friend, but not his aide-de-camp. The General, who was then twenty-six years old, had been educated at the Military School with a cousin of M. de Marmont." General Bonaparte was accompanied by his brother Louis, who was then sixteen years old, and was himself getting his education. Mlle. de Chastenay made the acquaintance of Bonaparte; her face had struck him. She had with him a conversation which lasted four hours after dinner (people dined then at two o'clock).

"I am sorry not to have written down our conversation; there are only fragments of it in my mind. . . . I soon discovered that the General had no republican faith or maxims. I was surprised, but he was absolutely frank

on the subject. He spoke of the resistance which the Revolution had met; the resistance was not over, and success was impossible. . . . The General told me, what was true, that the mass of the army was wholly alien to the bloody events of which France had been the theatre; it ignored them completely, and he seemed to believe that the army, always in the hands of the *de facto* authority, would not interfere with parties, and would take on no special color. Bonaparte spoke of the poems of Ossian, whom he admired, of 'Paul and Virginia'; he spoke of happiness. He said that for a man it ought to consist in the highest development of his faculties.

"At the time when this conversation, memorable for me, took place, I had the intimate conviction that whoever should offer a centre to opinion would seize the helm which was in nobody's hand, would dare to call himself, and would in effect become, chief and king, and would find no obstacle, because nothing was established, and no man fixed the confidence or even the attention of all. I think that I said so, and it would be singular that I should thus have been his prophessee. I know positively that, preoccupied with this idea, I spoke of it to everybody. . . . My memory does not give me any assurance of having laid this idea before Bonaparte. However, he always remembered our conversation, and I do not think that it was because I spoke to him of Virginia and of Ossian."

Correspondence.

WASHINGTON'S LIBRARY.

TO THE EDITOR OF THE NATION:

SIR: In Ford's 'Washington,' vol. xiv., p. 286, there is some account of the Bishop Wilson Bible which Washington gave in his will to Bryan, Lord Fairfax, with a few remarks about the circumstances of its acquisition by Washington. In a search among the Washington papers in the State Department for information about the gathering of Washington's library, I found a letter from Clement Crutwell, which explains how Washington came by the Wilson Bible, and a copy of which I enclose. The Concordance mentioned in the letter is now in the Washington collection in the Boston Athenæum, a catalogue of which is now in the press. According to Mr. Ford, the Bible is now in the Library of Congress.

Very truly yours,

APPLETON P. C. GRIFFIN.

BOSTON ATHENÆUM, June 3, 1896.

WOKINGHAM BERKSHIRE May 1st 1794

SIR,—By the Will of the late Dr. Wilson Prebendary of Westminster & Rector of S. Stephens Walbrook in London I was directed to transmit to your Excellency a Copy of his Fathers Works, the Venerable Bishop of Sodor & Man; and the English Bible in which are contained the Notes of the good Bishop.—I have yet delayed to fulfill the desire of my friend that I might at the same time have the honour of requesting a place in your Library for a work of my own A Concordance, by me intended as a Companion to the Bible. That you may long enjoy the Honours you have so well deserved in a country of peace & prosperity is the fervent wish and prayer of Your Excellency's

most obedient Servant and admirer

CLEMENT CRUTWELL.

AN OBJECT-LESSON.

TO THE EDITOR OF THE NATION:

SIR: Recently I had occasion to make a remittance to a correspondent in the city of Guatemala, Central America. I sent a bank draft for \$25, drawn by a Chicago bank on a New York bank. Under date of May 16 I am advised by my correspondent in Guatemala, "Your check of \$25 realized in this money \$53, which amount is placed to your credit."

Just at this time a plain statement of facts such as the above may help some of those who are in the air theorizing to get back to terra firma and common sense. What honest man of ordinary intelligence can face the proposition

\$25 00 = \$53.00

and not realize that those who are clamoring for 16-to-1 silver are more dangerous to our country than if they were engaged in an open insurrection? A nation can stand wounds and hard raps and deprivations and come out all right, but it can't stand an unlimited amount of mind-poisoning.—Very respectfully,

A. T. H. BROWER.

CHICAGO, June 4, 1896.

Notes.

CHARLES SCRIBNER'S SONS will publish 'Sport in the Alps,' by W. A. Baillie-Grohman, with numerous illustrations from instantaneous photographs.

G. P. Putnam's Sons issue immediately 'Camping in the Canadian Rockies,' by Walter D. Wilcox, with many plate and text illustrations.

'A Cycle of Cathay,' by Dr. W. A. P. Martin; a Life of Robert Whitaker McAll, founder of the mission which bears his name; and a Life of Dr. A. J. Gordon, are in the press of Fleming H. Revell Co.

The Macmillan Co., as we must now denominate the newly incorporated firm, have in preparation a 'Kipling Birthday Book,' with decorative illustrations from the left hand of the elder Kipling; and 'Humphry Davy, Poet and Philosopher,' in the "Century Science Series."

Henry Holt & Co. will make a book of Horace Annesley Vachell's serial story, 'The Quicksands of Pactolus,' lately running in the *Overland Monthly*.

Lamson, Wolfe & Co., Boston, will bring out the lectures recently delivered in this city and elsewhere by Prince Volkonsky, under the title, 'Pictures of Russian History and Literature,' with an introduction by Prof. C. E. Norton.

'The Graduate Courses' for 1896-'97, offered by twenty-three of our leading colleges and universities, is just ready. Leach, Shewell & Sanborn are the publishers.

A coöperative volume, 'The Cambridge of Eighteen Hundred and Ninety-Six,' with the imprint of Houghton, Mifflin & Co., will be a permanent outcome of the current celebration of that Massachusetts city's fiftieth anniversary of corporate existence.

The Peter Paul Book Co., Buffalo, have nearly ready a 'Dictionary of Buffalo, Niagara Falls, Tonawanda, and Vicinity,' with maps and illustrations.

Way & Williams, Chicago, announce 'The Sonnet in England, and Other Essays,' by the late James Ashcroft Noble; a volume of essays by Mrs. Meynell, 'The Color of Life'; and 'From Cairo to the Sudan Frontier,' by H. D. Traill.

'In the Kingdom of the Shah,' by E. Treacher Collins, is a timely publication to be expected from T. Fisher Unwin.

Mr. T. Hamilton Crawford's illustrations in line and wash were not unworthy to be made the occasion of a fresh edition of Robert Louis Stevenson's "picturesque notes" of his 'Edinburgh' (Macmillan), a work having, in addition to the author's wonted charm of style, an historical value. Perhaps the style will not bear

comparison with George Borrow's in the stirring Edinburgh chapter of 'Lavengro,' where one may read of mob warfare between Old Town and New, of which even the memory has disappeared from Stevenson's annals. The volume is beautifully made. The same firm sends us two more volumes of its Dickens reprint, edited by the younger Dickens, containing (1) 'The Uncommercial Traveller' and 'A Child's History of England,' and (2) a number of pieces from *Household Words* and *All the Year Round*, chronologically arranged, excepting "The Lazy Tour of Two Idle Apprentices," written in collaboration with Wilkie Collins, which is reserved for the end, and furnishes nearly a fourth of the volume. Finally, we report further progress in Mr. Gollancz's dainty edition of Shakspeare (Dent-Macmillan), by the appearance of "Julius Caesar," "Romeo and Juliet," "Timon of Athens," and "Titus Andronicus."

The Harpers have given a handsome new dress to Mark Twain's anti-slavery tract, 'The Adventures of Huckleberry Finn,' providing it with a frontispiece portrait of the author and with some rather slight illustrations by E. W. Kemble. Its power to interest and amuse has suffered nothing in the dozen years since it first saw the light.

Messrs. Putnam have published apart from Mr. M. D. Conway's edition of Thomas Paine's Writings the 'Age of Reason' in a thin volume uniform with 'The Rights of Man.' An introduction by Mr. Conway has much curious information to impart about the fortunes of the work at the hands of editors, printers, and translators.

A little volume styled 'McKinley's Masterpieces' has been put together by R. L. Page and published, with a portrait, by the Joseph Knight Co. of Boston. The editor assures us that "No American of this age can afford not to read McKinley's speeches." There is a sense in which this may, unhappily, become a truth; but in the evil day of his candidacy it will be needful to go to the larger collection made by the aspirant himself with a view to the impending contingency, for a just appreciation of the dull, commonplace, untrained, incoherent mind of the rigger of the St. Louis convention. Still, let us quote this "masterly" definition of the "good dollars" the now silent Ohioan wanted in 1890 (June 25), speaking in his place in the House: "As good is the hands of the poor as the rich; equal dollars, equal in inherent merit, equal in purchasing power, whether they be paper dollars, or gold dollars, or silver dollars, or Treasury notes—each convertible into the other and each exchangeable for the other, because each is based upon equal value and has behind it equal security; good, not by fiat of law alone, but good because the whole commercial world recognizes its inherent and inextinguishable value."

Mr. Temple Scott's 'Book Sales of 1895' (London: Henry Stevens' Son & Stiles) challenges comparison with Elliot Stock's 'Book-Prices Current' for the same year. The new-comer is more elegant, but not, we think, more exact in its typography, is not alphabetically arranged under each sale as in the rival compilation, and only rarely names the purchaser. Its index has a certain superior convenience in that it often repeats the dates of the works catalogued. Finally, the volume, though standing as high on the shelf, is somewhat thicker and broader than 'Book-Prices Current.' The latter seems the more inclusive, but we have made no searching test of this, and are, for our own part, glad to have both.

volumes at hand, while not persuaded that the book-buying public needs the double service.

If one were to judge merely from the numerous attempts and repeated failures, the task of writing an account of the government of the United States for the use of schools would have to be set down as one of extraordinary difficulty. We had supposed that the old method of commenting upon the clauses and phrases of the Constitution *seriatim* had been long since abandoned; but Prof. Allen E. Rogers returns to it in 'Our System of Government' (Orono, Me.: The Author), and with rather unsatisfactory results. The book is really an elementary text-book of "civil government," with frequent excursions into constitutional law; but, while there is too little law for the lawyers, we fear there is a great deal too much for the schools, at the same time that the detailed information regarding the practical workings of government in the United States is comparatively slight. There is a chapter on the Constitution and administrative organization of Maine which will have some local interest and importance.

Another volume in Methuen & Co.'s series of classical translations has reached us, Cicero's 'De Natura Deorum.' The translator, Mr. Francis Brooks of University College, Bristol, is not without skill in the art. His version is close, yet idiomatic; readable, without being disfigured by the modern colloquialisms with which many recent translators, while seeking after liveliness, succeed only in bringing the classics down to their own level of mediocrity. We should have welcomed fuller notes than those which Mr. Brooks has given us, and we may repeat that a translation, to be really useful, should have, at the top of every page, references to the book and section of the original.

M. Deloche, in his 'Le Port des Anneaux dans l'antiquité romaine et dans les premières siècles du moyen âge,' by no means exhausts a subject which in those periods was concerned with public and official as well as with private life. It is, in fact, much too extensive for treatment, like his, in the "Mémoires de l'Académie," and it deserves a large volume to itself. His brochure, however, may serve to map out the ground and to show the divisions into which a fuller investigation may conveniently fall, for he has a good conception of its broader outlines and is capable of taking wide views of the field. It is in details that he breaks down, and indeed he seems better acquainted with the mediæval than with the classical part of his subject. It is suspicious when a writer refers to Plautus (*M. G.* 95), as evidence that rings were used in betrothals so early as the second century B. C., when in fact the ring there in question is supposed to be sent as a love-token by a married woman to her lover! It looks almost worse to find Terence cited as authority for Roman life without a hint of his Greek originals. And M. Deloche does not seem to understand the principle on which the ring was given in betrothals—as a symbol of *arrha*, earnest money to bind a bargain. For, to the old Roman, marriage was nothing if not a business contract. On the whole, we cannot recommend M. Deloche to any but collectors of material.

The fourth volume of Coppée's 'Mon Franc-parler' (Paris: Lemerre) contains many pages of excellent reading, notably those on Bourget, Les Parnassiens, and Alexandre Dumas.

Dr. Henri Lion's thesis for the doctorate forms a solid volume on a solid subject, 'Les Tragédies et les théories dramatiques de Voltaire' (Paris: Hachette). Naturally enough,

having read and reread the tragedies, having studied the correspondence and the criticisms, friendly or hostile, Dr. Lion ends by having a pretty high opinion of Voltaire as a dramatist, and a still higher one of him as a Force, with a capital. It is not possible to agree fully with this writer, but one is grateful to him for the conscientious piece of work he has produced, and which becomes at once indispensable to students of the drama or of Voltaire. The book is full of valuable information.

Boussod, Valadon & Co., 308 Fifth Avenue, send us the first parts of the annual "Figaro Salon," each of which is accompanied by a color print of double size. M. Philippe Gille supplies the discourse for the illustrations; his task has not been easy this year.

The Atlas of the Pacific Ocean lately issued by the Deutsche Seewarte at Hamburg follows similar works for the Atlantic and Indian Oceans, and will soon be supplemented by a sailing handbook of thorough German quality—a quality commonly regarded as too high for our run of seamen, but greatly appreciated by those of more scientific training. The charts of the winds for the opposite seasons are perhaps of the most general interest. Here we see the southeast trades persistent in the eastern south-torrid ocean, but gradually curving to join the Australian northwest monsoon of the southern summer, or extending far beyond the equator as the southeast monsoon of Asia, even as far north as the Sea of Okhotsk in the northern summer. The prevailing westerly winds of far southern latitudes maintain their considerable strength with small change the year round, but those of the high northern latitudes vary from gales in winter to moderate winds in summer. The charts of ocean currents are also prepared for the opposite seasons; these exhibit with great clearness the variation of the counter current that flows eastward north of the equator, broad and fully developed in our summer, narrow and weak in our winter. Agreeably to the theory that ascribes the equatorial counter currents to the monsoon-like deflection of the trades as they cross the equator into the summer hemisphere, a counter current appears trending along the Solomon Islands, east of New Guinea, during the summer. In this same region, the Pacific has tropical cyclones in January and February; thus repeating in both these features the habit of the Indian rather than of the Atlantic Ocean.

The liberalizing spirit of to-day asserts itself in the latest recommendation of the Council of the Senate of Cambridge University in favor of the affiliation of St. Edmund's College, Old Hall, Ware. This Roman Catholic College claims to be the oldest seat of higher education in England belonging to the Romish Church, having in 1793 become the recognized successor to the original college of Douai, France, established in the sixteenth century for the education of English priests. The curriculum of St. Edmund's College, hitherto based on the requirements for the Arts degrees at London University, will in the future be arranged so as to harmonize with the courses at the University of Cambridge.

Certain reactionary influences of college life in a university town are no less strikingly shown by the results of a recent plébiscite taken by the *Cambridge Review*, to test the feeling among resident members of this same English university, below the degree of M.A., in regard to the admission of women to Cambridge degrees. Out of 2,830 post-cards distributed for voting purposes, 2,138 were promptly returned, filled out; of this number 1,692, or

nearly 80 per cent., were against the granting of degrees to women, and only 437, or less than 21 per cent., in favor of it; four cautious spirits reported themselves as neutral on the subject.

The new Southern History Association will hold its first annual meeting at Columbian University, Washington, on June 12, at eight P. M. The programme includes an inaugural address by the President, Postmaster-General Wilson, and seven papers, limited to twenty minutes in length, with five minutes for comment. Headquarters will be at the Ebbitt House.

A confusion favored by family affiliations occurred in our notice last week of Recent Poetry, when we attributed (p. 438, middle column) 'Songs from the Greek' to Jane Sedgwick Minot in place of Jane Minot Sedgwick, to whom we tender an apology.

—Some years ago Prof. Alois Brandl (then of Göttingen, now of Berlin) startled Chaucerians by a new thesis concerning "The Squire's Tale." He maintained that this poem, hitherto regarded as one of the most spontaneous and spirited of Chaucer's works, was nothing but an allegorical account of the matrimonial infelicities of John of Gaunt's daughter Elizabeth. Though supported with much acuteness and some learning, this hypothesis was palpably untenable, and it was accordingly withdrawn by its author after it had "walked the town awhile." Since then little has been done for "The Squire's Tale," and discussion of its sources has pretty well ceased. The latest number of the "Publications" of the American Modern Language Association, however, contains an article which is likely to cause some throwing about of brains. We refer to Prof. Manly's essay on "Marco Polo and the Squire's Tale." As our readers are aware, Prof. Skeat, about twenty years ago, maintained, in his school edition of "The Squire's Tale," that Chaucer was indebted to Marco Polo's 'Travels' for his description of the Tartar court, and this contention has met with general acquiescence, though here and there a scholar has expressed himself with reserve on the subject. In his Oxford edition of Chaucer, reviewed in these columns last year, Prof. Skeat contented himself with reprinting the substance of his previous investigation. Dissatisfied with the grounds of Prof. Skeat's opinions, Prof. Manly has examined the question afresh, and his results differ widely from those of his predecessors. If Marco Polo, he argues, was Chaucer's authority for Tartar manners and politics, the English poet has treated his voucher in an extraordinary fashion, omitting or altering all that is characteristic or peculiar, and retaining only those commonplaces which he could have found as well in a dozen other accessible sources. Prof. Manly's destructive criticism seems to us altogether convincing; unless unexpected evidence is forthcoming, Marco Polo is "out of the story" henceforth. Contented Prof. Manly does not attempt. He contents himself with remarking, at the end of his excellent paper, that, in his opinion, Chaucer found the names of his characters and his *mise en scène*, as well as the outline of his plot, in the as yet undiscovered source of the tale. With this conclusion we are inclined to agree, and we await with lively interest Prof. Manly's promised article on Chaucer's "relations to certain men who had travelled widely." Unless some record-searcher makes an uncommonly lucky discovery, we seem to be at the end of our immediate information about Chaucer: all the more reason why scholars

should look sharply after those of his contemporaries with whom he may have come in contact.

—Mr. George Neilson has added to his instructive and entertaining essays on mediæval subjects an investigation into the source and extent of the widely current belief that Englishmen had tails. It appears in a reprint from the Proceedings of the Glasgow Archaeological Society, and seemingly exhausts the history of the *Caudatus Anglicus*—the reproach which for centuries was cast upon natives of Britain by their enemies and rivals in Scotland and on the Continent. Even towards the close of the sixteenth century, William Lambarde, in his *Perambulation of Kent*, is moved to indignation at the slander "so that the whole English nation is in foreign countries abroad earnestly flowted with this dishonourable note in so much that many believe as verity that we be monsters & have tails by nature, as other men have their due partes & members in usuall manner." The belief seems to have originated in the later twelfth century as a legend that when St. Augustin of Canterbury was preaching to the pagan Saxons of Dorsetshire, they not only refused to be converted, but in derision pinned fish-tails to his garments, whereupon the angry saint prayed that their children might be born with tails, and God granted the prayer. A later variant ascribes it to another Archbishop of Canterbury, Thomas Becket, the tail of whose sumpter-horse was docked to despise him. The growth and extension of the belief are followed by Mr. Neilson through the centuries with his customary research and vigor of exposition down to the time of Andrew Marvell, who illustrates the danger of episcopal indignation:

"Never shall Calvin pardoned be for Sales;
Never, for Burnet's sake, the Lauderdale;
For Becket's sake Kent always shall have tails."

—Recently published educational statistics of Germany present some points of interest as regards the relative attendance of members of the principal religious bodies at the higher institutions of learning, namely, the scientific and classical gymnasia, in which courses of study are pursued preparatory to the polytechnic school and the university. On a basis of 10,000, the proportion of pupils attending these institutions is in Prussia 27 Catholics to 50 Protestants and 333 Jews; in Saxony 22 Catholics to 40 Protestants and 357 Jews; in Bavaria 42 Catholics to 67 Protestants and 370 Jews; in Württemberg 53 Catholics to 93 Protestants and 590 Jews; in Baden 41 Catholics to 86 Protestants and 417 Jews; in Hesse 50 Catholics to 67 Protestants and 333 Jews. Thus it will be seen that, in the six largest German states, containing 87 per cent. of the entire population of the Empire, the Catholics are far behind the Protestants in their desire for higher education, and the Jews vastly superior in this respect to both the Christian organizations together. It would, therefore, be perfectly natural and just, other things being equal, that, in proportion to their numbers, Protestants should hold more positions of honor, trust, emolument, and influence in the state than Catholics, and Jews more than Protestants and Catholics combined. Indeed, this is generally true in respect to Protestants, but not in respect to Jews, who, owing to anti-Semitic prejudice, fail to receive the recognition in the civil and military service to which their culture and capacity would entitle them. Not long since an anti-Semitic orator in Berlin made it a reproach to the Jew that he

is eager to give his children every possible educational advantage and thus render it more difficult for Christians to compete with them. "Therefore down with the Jew!" was his conclusion.

—The undeniable fact that Catholics furnish proportionately fewer aspirants after higher education than Protestants is due to a variety of causes, two of which may be mentioned as perhaps the most important. The first of these is sacerdotal celibacy. The Protestant clergyman conscientiously fulfils the Scriptural injunction to "be fruitful and multiply," and is usually blessed with a numerous offspring. He belongs, also, to what has been called "the Academic Races," and his sons are expected to study, if not theology, at least one of the learned professions. Thus the Protestant parsons of Germany furnish quite a large quota of its academical citizens, and their descendants, whether clergy or laity, inherit a taste for learning, and, in most cases, pursue some course of study at the university. On the other hand, whatever may be the aptitudes and attainments of the Catholic priest in scholarship, these traits remain purely individual and are not transmitted to posterity. The second cause is the persistently hostile attitude of the ecclesiastical and political leaders of the Catholic party to the superior grades of secular education. In conventions of the Church as well as in public assemblies and in Parliament they are constantly denouncing scientific schools and universities as hotbeds of irreligion, and thus deter many sincere Catholics from patronizing such godless institutions. But who ever heard a Jewish rabbi or the elders of the synagogue indulge in vituperation of this sort?

—Raoul Rosière's '*Recherches sur la Poésie Contemporaine*' (Paris: A. Laisney) is a valuable contribution to critical literature, and must find a place on the shelves of every student of French literature. It is composed, as is usually the case at the present day, mostly of articles which have appeared in reviews and magazines, but, unlike many such articles, these are well worth collecting and preserving in book form. The two chapters on English and German influence on France in the eighteenth and nineteenth centuries would alone give value to the work. They form part of a very sound criticism of Brunetière's '*Évolution de la Poésie lyrique en France au 19^e siècle*,' and are full of information. The "*Genèse d'Hernani*," which appeared in the number of the *Revue Bleue* for April 25, and in which the sources of that famous play are investigated, excites the desire that M. Rosière would publish an edition of that play with a commentary embodying the result of his investigations. He indicates "*Amy Robsart*" as the source of the first act. This drama, founded on Sir Walter Scott's '*Kenilworth*,' was produced at the Odéon in 1828, and was a flat failure. At the time, the play was signed by Paul Foucher, Hugo's brother-in-law, but Foucher had nothing to do with it. The second act is inspired by Alarcón's "*Tejedor de Segovia*," the plot of which gave Hugo the main lines of "*Hernani*." The principal incident of the third act is drawn from another of Alarcón's plays, "*Ganar Amigos*." The fourth act is a reproduction of a portion of "*Cromwell*," famous for its preface. The fifth act is partly inspired by Shakespeare's "*Romeo and Juliet*" and partly drawn from "*Amy Robsart*." Two other chapters are also especially worthy of attention, that on "*Shakespeare sur nos Théâtres*," and that on Jean-Marie Heredia.

MORSE'S HOLMES.

Life and Letters of Oliver Wendell Holmes.
By John T. Morse, jr. 2 vols. Boston:
Houghton, Mifflin & Co. 1896.

OUR expectation of what a writer will do is shaped, perhaps unduly, by the best that he has done. Certainly when we heard that Mr. Morse would write the Life of Dr. Holmes, we recalled his Life of Lincoln, and congratulated ourselves upon another biography from the same skillful hand. In the '*Lincoln*,' however, there was a necessity for compression everywhere. In the '*Holmes*' a necessity for expansion seems to have possessed the biographer, and we have two volumes where all might have been said, and better said, in one. In the larger work Mr. Morse moved easily and as one at home; here fretfully, like a horse in an uncomfortable harness. Not only in his general manner is he somewhat deprecatory and apologetic, but of particular apologies there are not a few—some of them for the biographer's performance, and some for Dr. Holmes. One thing is sure—that no one will accuse Mr. Morse of having unduly magnified his subject. If Dr. Holmes thought more highly of himself than he ought to think, as has been sometimes charged and frequently surmised, Mr. Morse has made large atonement for his fault, for he has written of him as if beset by fears of claiming for him anything that the most grudging critic would not cheerfully allow.

In one respect the reader may justly complain that the promise of the Lincoln book is broken in the Holmes. There was no good reason why this should not have been made as coherent and symmetrical as that. In fact, it is more a series of separate essays than a continuous biography. Many things are anticipated that would better have waited for their appropriate time. The least excusable waste is that of Samuel May's pathetic letter describing the last meetings of the class of '29, which appears in vol. i., p. 78, when it should have been reserved for the concluding pages. The book lacks order and it especially lacks chronology, proper to which we have a notable instance in the case of "*The Last Leaf*." This poem is several times referred to, but its date, even proximately, is not given, and the poetry of the period is spoken of disparagingly, without an exception in favor of the poem which Mr. Morse himself sets in a higher niche of fame than "*The Chambered Nautilus*," though this was for Dr. Holmes his "one entire and perfect chrysolite."

Mr. Morse's arrangement of his matter is defective in one gross particular as well as in minor instances. In vol. ii., beginning with p. 107, we have several groups of letters—to Lowell, Motley, and others—which, interspersed with the narrative and critical portions of the book, would have given to those portions a much more important and attractive character than they now possess. For Mr. Morse does not conceal from us the fact that he has kept his best wine to the last, and served the poorer kinds along the earlier courses of the feast: "Nothing has been omitted which, by any liberality of judgment, could be supposed to have any interest; on the contrary, notes and letters are printed which would hardly have been selected if there had been an *embarras de richesses*." This is certainly not encouraging for a beginning. It is needlessly discouraging. Even the letters in the body of the book are better than this warning leads us to expect. Neither these nor the others have the charm of Lowell's bubbling effervescence.

and explosive spontaneity. They were, for the most part, written as carefully as Emerson's to Carlyle, and as if with a view to posthumous publication. But they are good letters nevertheless. The trouble is, they are related to Holmes's prose publications as "the same continued." But when Mr. Morse says, in his second paragraph, "In point of fact, Dr. Holmes had not only put the best, but absolutely all, into the volumes with which he had amused and instructed the English-reading world," he is again needlessly discouraging, and exceedingly unjust both to Dr. Holmes and to his own work. There is a great deal in these volumes that we did not have before, and much of it has a personal accent which more than confirms the pleasant impression made by the author as such; it demands for Dr. Holmes an esteem and affection which outrun all bounds reached by the public heretofore.

Dr. Holmes's interest in problems of heredity did not lead him to study carefully his own pedigree, but Mr. Morse has given us enough to show that his blood had several admirable strains allying him with people of historical and local reputation. His theological heresy was germinal in his great-grandmother, Mrs. Temperance Holmes, whose minister preached such strange and incredible things that she "refused to write after him"—i. e., to make short-hand notes of his sermons. He inherited the features of his mother's mind and disposition; it is a pity that he did not inherit those of his father's face, the beauty of which, as here reproduced, is so remarkable that the page which it adorns is the most attractive in the book and that to which the reader oftenest returns. The father wasted no ink in recording his son's arrival. The entry in his almanac is, "29, son b."

"It seemed to mean so little; meant so much."

There are some interesting fragments of an autobiography which Dr. Holmes never carried very far. They do much to justify Mr. Morse's opinion that he was more interested in theology than in anything else. His revolt from Calvinism began early and ended only with his death. He had "a kind of Indian sagacity in the discovery of contraband reading." He "always read in books rather than through them, and always with more profit from the books read in than from the books read through." For 'The Pilgrim's Progress' he has no conventional praise: "It represents the universe as a trap which catches most of the human vermin that have its bait dangled before them." In poetry his favorite reading in his youth was Pope's Homer, and he never repented of his admiration. Accounting for his poetic temper, he puts for Wordsworth's "heaven" the earth which lay about him in his infancy, the scenery of his childish years. In college the home splints were off, and he enjoyed his freedom. He recalls that once for several days his room was the seat of continuous revelry. But when his father went to college "his mother equipped him with a Dutch liquor case containing six large bottles filled with the various kinds of strong waters," from which it would appear that the former times were not in all respects better than these.

In 1833, Holmes came to New York, "seeing for the first time in his life a real city," and took ship for Europe. Pursuing his medical studies in Paris, he soon became deeply engrossed in them, but with a margin for some gayety. The descriptions of his teachers are taken from his 'Hundred Days in Europe,' and they are felicitous, that of Louis enthusiastic in its praise. Another was "a great drawer of

blood and bawler of members." The young student took himself very seriously, and did his best to enlighten his parents as to the civilizing influence of the theatre and so on, adding, not very prettily, "You must excuse these little remarks, and not waste your next letter in refuting them." There is a good deal of forcible characterization in these early letters and some anticipations of the coming humorist. Edward Irving, of Carlylean immortality and the "gift of tongues," is described as "a black, savage, saturnine, long-haired Scotchman, with a most Tyburn-looking squint to him"; the King (William IV.) "looks like a retired butcher," and his face is "probably the largest uncivilized spot in England." In general, "the crudities and yeast of youth" are more amusing than the deliberate fun.

He returns to America full of enthusiasm for the practice of his profession. "Literary parturition" taxes him too severely to be united with medicine, as if it were the common sort; so "not another hair from the locks of Poesy." But he did not find the practice of medicine what he had anticipated. The best thing about it was that he had to keep a horse and chaise—his joy, the terror of his friends. His exuberant jollity stood in the way of his success, and, more seriously, the muses whom he had forsworn. The story of his inability to divide his practice because he had but one patient is not told, and is probably mythical, nor are we informed if he ever practised after his return to Boston from Dartmouth, where he taught anatomy in 1839-40. There is much emphasis on his volume, 'Medical Essays.' The date of the volume is withheld, but the most important essay, "Contagiousness of Puerperal Fever," appeared in 1843. He was not quite sure whether he took more satisfaction in this essay or in "The Chambered Nautilus." He said:

"I think oftenest of 'The Chambered Nautilus,' which is a favorite poem of mine, though I wrote it myself. The essay only comes up at long intervals. . . . But in writing the poem I was filled with a better feeling—the highest state of mental exaltation and the most crystalline clairvoyance, as it seemed to me, that had ever been granted to me; I mean that lucid vision of one's thought, and of all forms of expression which will be at once precise and musical, which is the poet's special gift, however large or small in amount or value. There is more selfish pleasure to be had out of the poem—perhaps a nobler satisfaction from the life-saving labor."

Dr. Holmes wrote to Dr. Weir Mitchell that the wood of which academic chairs are made has a narcotic quality which occasionally renders the occupants somnolent, lethargic, and even comatose. His own case was an exception to the rule. Mr. Morse avails himself of a very picturesque bit of writing about Dr. Holmes's medical professorship by Dr. Cheever, and a careful estimate by his successor, Dr. Dwight. He liked to lecture on the "dry bones" better than on dissections, because they were dry and clean. Vivisection he accepted as a justifiable method of investigation, "odious beyond measure in its abuse," while in his heart he hated it and would run out of the room when a rabbit had to be sacrificed upon the altar of science. Perhaps the hardest thing he had to do was to withhold the best that he could give in order that the duller boys might get their share of help.

When the *Atlantic* was started in 1857, Mr. Morse tells us that Holmes's name "had scarcely been heard outside the small town of Boston." But he had then been a lyceum lecturer for many years and had had no lack of engagements. The general lack of dates is abso-

lute in this particular, nor are any of his subjects indicated except a course before the Lowell Institute on the English poets. It would be good to know how much his lectures helped his literary work when the establishment of the *Atlantic* gave him his great opportunity. His contributions to the *Atlantic* are not estimated too highly, but with a refreshing difference from the treatment of his poetry and letters. Albeit "the critic is only the mosquito of the literary world," and though "it is not worth while to discourse in his vein" (we italicise the unconscious pun), Mr. Morse proceeds to criticise the Autocrat, Professor, and Poet with considerable elaboration; and the criticism, approving Holmes's New England limitation, is much wiser than Mr. Henry James's regret of Hawthorne's "narrow plot of ground," though he grew on it such specimens as the 'Scarlet Letter' and 'The House of the Seven Gables.' No attempt is made to reverse the general impression that the "Breakfast Table" series was a descending one. As for Holmes's three novels, 'The Guardian Angel' is held to be a great improvement on 'Elsie Venner,' but 'A Mortal Antipathy' far below it, and a sign of falling power. The snake story interested him greatly in rattlesnakes not only while he was writing it, but for years after. At one time he kept one for observation and experiment until a rat was given him to kill, with unexpected results: the snake it was that died.

The treatment of the Doctor's poetry is very brief, and of all the poems he wrote hardly a dozen are mentioned for reproof or praise. But "Dr. Holmes was more anxious to be thought a poet than anything else," and Mr. Morse would have done well to avail himself of outside help at this point as in the matter of his professorship. What he claims for him is that he was "a charming singer," and his expansion of this claim, though brief, is excellent. To his occasional verse we have a single paragraph allotted, a short one at that. Dr. Holmes's interest in the Saturday Club was one of his most vivid personal traits. It was the burden of his letters to Lowell, and of those to Motley in a less degree. These letters are his best. Those to Lowell are under some constraint to make them worthy of his critical admiration; those to Motley are written with a freer hand. An early one to Lowell criticises 'Sir Launfal' with much frankness; and such a fire, kept up, would have obliged Lowell to deploy his forces in a more careful manner. There are nice appreciations of his literary companions, like this one of Emerson: "If you have seen a cat picking her footsteps in wet weather, you have seen Emerson's exquisite intelligence feeling for its phrase or epithet." Alcott, with even greater felicity, represented him as sorting the keys of his cabinets. In two groups of the letters—those to an unidentified James William Kimball and Mrs. Stowe—he is almost entirely theological. Mr. Morse thinks the battle he was fighting is now so completely won that the report of it will excite little interest, but we are not so sure of this. It would appear from these pages that Dr. Holmes's hatred of the penology of Calvinism was as intense as Theodore Parker's; and to the remarkable adumbration of it which has taken place, the exhalations of his wit and humor, as well as his more serious dealing with it, must have contributed a great deal. His pious emotions and his Unitarian affections ran parallel with much tender doubt and serious questioning. Suffering was to him a greater mystery than sin, and the sin he found himself blaming less and less and pitying more and

more, so conditioned is the will by organization and environment. He delighted in the evidences of good ethics and religion outside the Christian bounds. The Chicago Congress of Religions he hailed "as the longest stride towards the Millennium" that he had seen.

There is a good chapter on his occupations and methods of work, a trivial one on the burdens of his correspondence, and a very important one on his distaste for public affairs as evinced by his freedom from all complicity with the anti-slavery spirit into which all his great literary companions were caught up. The longest letter in the book is a painful justification of his course in reply to certain criticisms from Lowell. During the war his engagement in public matters was all that could be asked, and he was never again so indifferent as he had been before. That he had a son in the army brought the great struggle home to him sharply, and he contributed to it a few Tyrtsean odes and a strong Fourth of July oration. But if his hearty malediction upon John Quincy Adams and his metrical defence of Webster ever caused him a regret, no sign of it is here.

MORE FICTION.

Dr. Gray's Quest. By Francis H. Underwood. Boston: Lee & Shepard.

My Lady Nobody. By Maarten Maartens. Harper & Brothers.

Dolly Dillenbeck. By James L. Ford. George H. Richmond & Co.

Boss. By Odette Tyler. The Transatlantic Publishing Company.

The One Who Looked On. By F. F. Montresor. D. Appleton & Co.

Paul and Virginia of a Northern Zone. From the Danish of Holger Drachmann. Chicago: Way & Williams.

Pinks and Cherries. By C. M. Ross. Glasgow: James MacLehose & Sons; New York: Macmillan.

The Sister of a Saint, and Other Stories. By Grace Ellery Channing. Chicago and New York: Stone & Kimball.

Christian and Leah, and Other Ghetto Stories. By Leopold Kompert. Translated by Alfred S. Arnold. Macmillan.

Irralie's Bushranger. By E. W. Hornung. Charles Scribner's Sons.

Dr. Warrick's Daughters. By Rebecca Harding Davis. Harper & Brothers.

Comedies of Courtship. By Anthony Hope. Charles Scribner's Sons.

The Chronicles of Count Antonio. By Anthony Hope. D. Appleton & Co.

In the last novel of the late Francis Underwood, his wide reading, extensive knowledge of literature, law, and medicine, and a familiarity with the customs of fifty years ago, enabled him to give an elaborate frame to his story, and to show what the traveller of that period found in Boston, in rural New England, in Chester, London, Paris. The description of the dress of an East India merchant in Boston, from purplish-blue coat, canary colored waistcoat, striped seersucker trousers, to the blue clay, napless hat, perhaps does as much to carry the reader into the past as the familiar and contemporaneous mention of Chateaubriand and Lamartine. Assuredly the invasion of Daniel Webster's law office by the pretty girl client is realistic if not real, and the grateful kiss she imprints upon his cheek at parting takes its

place beside that other *baiser célèbre* that was bestowed upon the young Liszt by Beethoven.

Novel readers will be pleased to find that Mr. Maartens has relaxed his clenched fists, drawn together his wide-stretched eyelids, and smoothed his porcupine locks; has abandoned hysterics and returned to his first manner. We find in 'My Lady Nobody' the features which gave his early stories their reputation. In minute and deep-piercing observation of manners, customs, characteristics, and motives, this book, like those, stamps him a rare forager for material, providing, too, a rare garnish of wit worthy the banquet. When he mounted the socialistic platform in certain of his novels, he grew tiresome and incoherent; his preaching here is more forcible for not being in sermons, and of the 400 pages of 'My Lady Nobody' there is not one that is dull. It cannot be said that the story marches rapidly. Its attraction lies less in the development of a plot (though there is one, hinging on the laws of inheritance) than in the pictures of Dutch society and universal humanity. With a book that yields such a plentiful harvest of both feeling and satire we feel no disposition to quarrel on trifling grounds. Therefore, it is undisturbing to reflect that a woman so severely conscientious as the heroine would scarcely have lent herself to a fraud, however pious; that a sewing-girl, offered marriage by the officer who had betrayed her, would hardly have refused it. These and similar inconsistencies, after all, are not the book, nor is it on trial for absolute probability. If one is little disquieted by the improbabilities, one is perhaps most of all attracted by the irrelevancies—by the characters and scenes which do not propel the story, by the little world of beings made up of interwoven frailties and virtues; not by the laws of Dutch inheritance, but by the touches of nature shown in the soldier-parson; the land-poor baron, "denying himself a Corot" and counting it to himself for economy; the beruffled baroness, coddling a lap-dog and facing a mob; the yellow-cheeked, oily hypocrite; the invalid, making Scriptural designs in worsted work and debating what might have been the color of Leah's "tender eyes," and whether she should embroider L on Laban's table-cloth. Epigram, of course, since Maartens writes, is pricked into all the pages, and throughout runs a large brained apprehension of mortal affairs.

On page 363 of 'Dolly Dillenbeck' stands the remark that the French salon is an institution which would thrive in our artistic climate about as well as a pineapple would in Tompkins Square. In this observation is reached the high-water mark of the wit and wisdom of the book. It is a history of the rise and downfall of a very rich young man who squandered his money in cafés and gambling parlors, furnished limitless champagne to unlimited numbers of loafers and sponges, backed theatrical managers, brought out and subsequently married a successful actress, and came at last to pecuniary and cerebral grief, the former because he had not read his mother's will; the latter because he drank too much. The progress of the actress from country girlhood to metropolitan fame is the subject of the pendant portrait; another, almost as conspicuous, being that of the all-shrewd manager. The box-office side of the drama and the interior view of the café are violently insisted upon; the landscape is that blooming on Broadway between Twenty-third and Forty-second Streets. The accessory figures are the loafers and sponges. "A portrayal of certain phases of metropolitan

life and character," Mr. Ford calls it, and quite possibly it is; but its relation to literature is that of a cake-walk to the Shakespearian drama.

Miss Tyler's book also belongs to the crude period of fiction as to style. "The Boss stared dully at him, her bizarre mind growing luminous with admiration," is a specimen from its rich flora. The subject, however, is a good one, with a strongly dramatic trend, and, under all the absurdities, falsities, and ignorances, runs a vein of genuineness in the portrayal of the Virginia-plantation idea in both white and black aspect. If two recording angels sit over the shoulder, to note, the one, if the task be well done, the other, if it be worth doing, we can imagine the former dropping a salt tear over Miss Tyler's book; the latter, over Mr. Ford's, a tear both salt and bitter.

No greater artistic contrast with their work could be found than that in the story entitled 'The One Who Looked On,' where the thing told, though slight, is worth while, and where the telling is trained, yet simple and sincere. There is a glimpse of an Irish home that is excellently done, and a delightfully warm Irish heart beats in the heroine's breast. It is a plaintive little tale, sad but sane reading, with the same insight into the human machine that was shown in a former work of this writer, 'Into the Highways and Hedges,' but under conditions less tragic and formidable.

The little Danish idyl which Mr. Francis Browne introduces to the English-reading public would have smelled as sweet by some other than its present clumsy name. It is a pretty story of the Danish shore, of sand-dunes, coast-forests, sea-faring folk, and a boy-and-girl pair of lovers. To read it is to feel salt spray in the face and to breathe the fragrance of birch trees; to follow the sea in bitter earnest and to play with beetles in the woods; to make friends with rough, moody, kindly villagers, human and canine, and to watch the love of the blacksmith's bashful son and the Captain's teasing daughter through lyric childhood to dramatic culmination.

The pinks and cherries of Rome in June set a certain Norwegian Fred to thinking of his old home, and a very charming little book of reminiscence he makes. No idyl this, but a boy's recollections of his childhood in a little gossiping Norwegian town: his mother's house-keeping, his brother's kindly tyranny, his own schoolboy games and fights, and the child's remembrance of the grown-up games of life that went on around him. The local color of the town is admirably used; humor is refreshingly present; and that we may not forget it is Norway, a note of the sea sounds through the boy's memories. From cover to cover this is a particularly taking little volume.

Miss Channing's stories are for the most part of Italy, and show a nice appreciation of both the pathetic and the happy-go-lucky phases of life among the Italian peasantry. There are a tear and a smile in each story, and the execution is delicate and thoughtful. The same may be said of the Californian sketch, while that belonging to the colonial period in Massachusetts is something less spontaneous than the rest, perhaps because it touches on neither pathos nor fun.

With a deal of German clumsiness which the translator has not transformed, Kompert's Ghetto stories have a merit and interest quite unusual. They are not only of the Ghetto, but from within—a point of view not often taken in current fiction. They direct attention, at once sympathetically and candidly, to everyday life in the Jewish quarter of an old Bohemian town. As must happen when so treated,

the subject yields a return of profound significance. Although the stories are lightly constructed, they are filled with Hebrew poetry and Hebrew piety which an honest portrayal of Hebrew foibles avails not to eclipse.

A capital little story of Australian love and adventure is 'Irralie's Bushranger.' The incidents, just improbable enough to be real, are original and cleverly combined, and there is no flagging in the press and stir of the story. There is enough and not too much Australian landscape, and some extremely able personal sketches. It must be set down as one of the best small books of adventure of the year.

'Dr. Warrick's Daughters' is good reading, for its excellent workmanship were there no other reason. It is a pleasure to miss the crudities of the average novel, with its labored efforts to startle and its heedlessness of form. The author says of her heroine, "If she had lived now, she would probably have had the prevalent desire for notoriety, and mistaken it for an inspiration, and have written an indecent novel to set forth a great truth, or rushed before the public to show how feebly she could kick against Christianity, or marriage, or the Tyrant Man." This is preëminently what Mrs. Davis has not done; nor is there anything she could have taken from us that we would have parted more gladly withal. Her story besides, on the positive side, is full of interest, depicting with practised touch life in an old Pennsylvania town, and showing, as foil, the sleepy enchantment of a Louisiana plantation. The Gray and the Blue, differentiated with the skill of a minute observer, shimmer through the fabric of her story, and even so blend, light and dark, the weaknesses and virtues of her many characters. The sermon of the book, breathed not preached, is against the great god Mammon, who is made very repulsive, while yet his worshippers are seen to be sometimes men of like passions with ourselves.

Mr. Anthony Hope's novels may be roughly classified as of the Zenda and the non Zenda. We have either romance, quasi-history, or drawing-room problems worked out by sparkling talk. 'Comedies of Courtship' naturally belongs to the latter category, and abounds in the comicalities of errant affections. A few of the stories, indeed, strike a fuller note than that of comedy, and one or two stage themselves into farce so readily as to be, like all unstaged farce, rather solemn reading.

'The Chronicles of Count Antonio,' by its very name, steps into the class Zenda. It is the history of the adventures of a noble outlaw and his band, related by Ambrose the Franciscan as he learned them from other monks and from tradition. Chivalry, love, and gore are the chief of our diet, and are made to sound doubly chivalrous, loving, and gory by the employment of a semi-Scriptural manner of speech. There may be those who will find this archaic rampagiousness a trifle fatiguing; there are undoubtedly others who will delight in the wars, stratagems, spoils, and final triumph of the constant Antonio. Your Zenda knight is strictly monogamous; your un-Zenda knight never experiences a "tinge of that silent pain" which the poet says belong to those "who have longed deeply once." The one fights and woos, the other flirts and runs away; the one wins by strategy or dies a bachelor; the other makes epigrams, and she would be distinguished whom he had never loved. Over realm of poetry or carpet they ride, their mounts the differing quills of Mr. Hope's fancy, and both at their best are rare good fellows.

A PHILOSOPHIC "MR. HYDE."

The Case of Wagner: The Twilight of the Idols; Nietzsche contra Wagner. Edited by Alexander Tille. Translated by Thomas Common. [The Works of Friedrich Nietzsche. Vol. XI.] Macmillan. 1896.

AMID the motley throng of false prophets who are clamoring for the ear of the cultivated public of the day, it would hardly be possible to find a more picturesquely eccentric figure than that of Friedrich Nietzsche, whose works the enterprise of Messrs. Macmillan is for the first time rendering accessible to English readers. That a German professor should aspire to a place in international literature is sufficiently surprising; that he should do so on the strength of productions like Nietzsche's is more paradoxical than anything Nietzsche ever wrote. In fact, a Jekyll and Hyde theory alone seems to give a clue to the phenomenon. In this case Dr. Jekyll, i. e., Nietzsche the professor, was a gentle and gentlemanly savant whose precocious acquirements procured him a full professorship of Greek in the University of Bâle before he had taken his degree at Leipzig, in whom overwork, and, possibly, the reaction of a sensitive temperament against the pedantry and Philistinism of his life, had produced a nervous breakdown which compelled him to resign his chair after a dozen years of successful teaching, and who had since led the usual life of an invalid in all the health resorts of Europe. Very different is the figure of Nietzsche the writer, running amuck among the ideals of civilization, a veritable Mr. Hyde, ruthlessly trampling under foot the received standards of morality and religion, an iconoclast who shatters the established structures of science and learning, and poses as the prophet of the Aryan race, as the new "Zarathustra," who boasts that he has given mankind the deepest book which it possesses, and whose excesses of revolutionary thought grow more and more frantic until the poor Dr. Jekyll finally disappears into the "hopeless" ward of a lunatic asylum. Of course all this havoc of Mr. Hyde's was wrought on paper; he never attempted to carry out his ideas in practice, and so he escaped the judicial restraint which an ungrateful society has so often put on other "immoralists" with similar views; and hence, possibly, morality and religion do not feel a penny the worse, and survive in blissful ignorance of their virtual annihilation by Nietzsche-Hyde. But there are nowadays so many "suggestible" persons who can be hypnotized into accepting as true whatever creed is presented to them with sufficient insistence and reiteration of asseveration, that it is perhaps prudent to scrutinize the credentials of this new "Dionysiac" (and paranoiac) wisdom.

The proper preparation for the reader of Nietzsche is Nordau. It is not merely that the latter has recognized Nietzsche as a modern tendency and devoted a long and abusive chapter to him in his book on "Degeneration," but that those who have acquired the taste for Nordau will find the same qualities in Nietzsche in an exaggerated and even more piquant form. If they can imagine Nordau suddenly gifted with an accession of literary power and invective, acquiring real and wide culture, scholarship, and taste (even though of a perverse kind); if they can imagine him scintillating with epigrams and aphorisms, and refraining from quoting Lombroso and Kraft-Ebing, they may accept Nietzsche's books as the logical continuation of Nordau, and Nietzsche's fate as the appropriate and

inevitable end of such insane preachers of sanity. If they cannot do this, they will at least be forced to recognize that in Nietzsche there has come a greater, though wilder, prophet, for whom Nordau has prepared the way.

Certainly the resemblance between them is deep and far-reaching. Both are possessed by the idea of degeneration and decadence, and declaim unceasingly about the necessity of health; both, moreover, are equally vague about the diagnosis of the disease from which they see everybody suffering, and equally reluctant to fix more precisely the date when the process of degeneration may be supposed to have set in. On this point, indeed, Nietzsche supplies a valuable commentary and *reductio ad absurdum* of Nordau; for whereas the latter speaks only of the present, the former's remarks embrace the whole of history, and discover almost universal degeneracy from the very first. Hence the inference obviously is that the type from which we have "degenerated" was that of the savage or of the ape. Again, both Nietzsche and Nordau pride themselves on being physiological and psychological, although their "science" is clearly only second-hand, not to say pseudo-scientific. Both excel in vituperation and constantly substitute abuse for argument; in this respect, however, Nietzsche is *facile princeps*—chiefly on account of his greater range. Both are anti-religious, because they have no appreciation of the spiritual side of man, and so cannot understand that in the descendants of brutes a certain repression of animality is essential for full sanity of soul. Both are deficient in humor and grotesquely ignorant of the real condition of the English-speaking world, although their criticisms of Germany seem often to strike home. Lastly, to mention a point suggested by the title of the present volume, both have won notoriety by attacks upon the music of Wagner, which they unite in regarding as the incarnation of the morbid tendencies of the age. In fact, Nordau's quarrel with Nietzsche is essentially based on the fact that two of a trade do not agree, and that the latter is the better craftsman of the two. And the great difference between them is that whereas Nordau is only a journalist in pursuit of a sensation, Nietzsche was sincere, if not sane, in the advocacy of his views.

Of these views the present volume gives a fair selection. For even though it does not contain his most characteristic and suggestive works, it manages to give the reader a taste of most of the quaint fancies that pass for the "philosophy" of Friedrich Nietzsche. In addition to the amusing and frequently acute onslaught on Wagner already alluded to, we get his quasi-metaphysical "Will to Power," the queer cross between a misunderstood Darwinism and an inverted Schopenhauerism which is supposed to be the basis of Nietzsche's thought. We get further, in the "Anti-christ," his theory of the conflict between the ethics of the strong and noble few and of the weak and base many, of the deplorable triumph of the latter in Judaism, Christianity, and Buddhism, and of the necessity of reversing this crime against life by a thoroughgoing "revaluing" of all values. We are tickled by his admiration for the healthy, strong, and masterful, which, after writing down Plato, Socrates, and Christ as "degenerates," is ready to accept as historical realizations of his ideal the characters of Caesar Borgia and Napoleon, although perhaps nothing short of Bluebeard could fully satisfy it. On the other hand, we are hardly introduced as yet to the "blonde

roving beast of prey" to whose conquest and ruthless oppression of subject-races Nietzsche (with a characteristic disregard of the obvious fact that no conquests are possible without discipline and self-subordination) refers the origin of civilization, nor to the still more mysterious conception of the "overman" whom he proposes to breed from the elect of the human race—apparently by the highly scientific method of encouraging unlimited self-indulgence.

The "Twilight of the Idols" will be found full of brilliant epigrams and literary criticisms (e. g., the delicious allusion to Seneca's Spanish descent in calling him the "toreador of Virtue," and the description of Rousseau as the "return to Nature in *impuris naturalibus*"), and also of such philosophy as may be compressed into aphorisms. These aphorisms have been received with immense applause in Germany. Nietzsche never wearies his readers by following the same train of thought for more than a page at a time, though it must be admitted that the same idea crops up in a fragmentary form over and over again. But even so it may be doubted whether the aphorism is not still too lengthy and coherent a vehicle for the taste of a newspaper-reading public, and the next original German "philosopher" will doubtless outbid Nietzsche by expressing himself in headlines.

Altogether it would be surprising if Nietzschean doctrines flourished in American soil: they point to the East rather than to the West. They are Slav rather than German, and redolent of the *Liberum Veto* of the Polish nobles, from whom Nietzsche claimed descent. It is significant that he regards Russia as the state of the future (p. 201), the very state which crushed out the aristocratic anarchy of Poland. But the Anglo-Saxon peoples have long learnt to reconcile liberty with order, and though Nietzsche may strike a responsive chord in the hearts of a certain type of Prussian officers, when they dream of shaking off the restraints of an iron discipline and of looting the industrial classes they despise so heartily, we cannot believe that Nietzsche will prove to be more than a passing craze even of the Teutonic mind.

It remains to speak of the contributions of others than Nietzsche to the present volume. Mr. Tille's preface labors to graft Nietzsche's views on the Darwinian conception of the survival of the fit (as if Darwin would have ignored *à la* Nietzsche the moral, intellectual, and social qualities in the make-up of fitness!), and indulges in some absurdly pretentious criticisms of thinkers like Spencer, Huxley, and Arthur Balfour. There is no index, and for the translation not much can be said; it generally fails to reach a fluent and idiomatic English rendering, it not infrequently becomes unintelligible, and sometimes blunders. Still, it is not so bad as to destroy the enjoyment of those who know how to relish Nietzsche the writer without admitting the plenary inspiration of Nietzsche the prophet.

With the Fathers: Studies in the History of the United States. By John Bach McMaster. D. Appleton & Co. 1896.

THE essays collected in this volume have all appeared in various periodicals, and may be presumed, for the most part, to have thus received such attention from the public as they have deserved. Two of them, however, as they relate to matters of present interest, may not improperly be made the subject of criticism—one, entitled "A Century's Struggle for Silver";

the other, "The Monroe Doctrine." As to the former, the title is altogether misleading. Professor McMaster himself declares that it was not until 1878 that our "silver era" began and that the first serious struggle for bimetalism took place. Evidently, therefore, we had been engaged in some other struggle for silver during the earlier three-quarters of the century. What was the nature of this struggle? We read that a hundred years ago the currency of the country was quite heterogeneous; that a mint was established for the coinage of the precious metals into money of the United States for the purpose of displacing foreign coins; that a United States Bank and many State institutions were chartered, and furnished notes that were very generally dishonored, but that expelled specie from circulation; that silver was overrated as compared with gold and was exported; that in order to maintain a supply of small change the weight of fractional coins was decreased; and that the coinage was regulated in 1873, 1878, and 1890. It looks very much as if Prof. McMaster had been unable to resist the temptation of making use of a taking title without regard to its propriety, and we are reminded of a story of Lord Castlereagh, who, after speaking for half an hour without any of his hearers having any idea of his subject, suddenly stopped and exclaimed: "So much, then, for the Law of Nations."

This story might perhaps be thought applicable to the other essay which we selected for comment, "The Monroe Doctrine." After narrating the history of the Holy Alliance, the revolutions in Spain and Naples, the policy of Great Britain under Canning, etc., Prof. McMaster admits that the Doctrine has no place in the law of nations. "It does not need to be there. It belongs to a class of facts whose existence does not and must not depend on the consent of nations." It is not a doctrine that a weak power can proclaim. It would have been foolish for the South American governments to have announced it when threatened by the Holy Alliance, "because they could not have made it good. We alone could declare it because we alone were strong enough to support it." "Either we determine the status of Republican government and Republican institutions in the two Americas, or the nations of the Old World will do it for us." The nations of the Old World, by Jingo, shall not do it for us; and this, according to Prof. McMaster, is the Monroe Doctrine.

As he expounds it, it might as well be called the "Dog-in-the-Manger Doctrine." It makes no difference whether what is called a republic in South America is a republic or a tyranny; whether the government of England is really republican rather than monarchical; whether or no civilization would be advanced and human welfare increased by the extension of English influence; whether the peace and safety of the people of the United States would or would not be affected by such extension in South America. Such considerations are immaterial and irrelevant. No European power, according to Prof. McMaster, shall increase its power or influence on this continent, or overthrow any existing government, or establish any direct control over its policy. *Sic volo, sic jubeo*. If reasons are asked for, it is enough to say that might makes right. The American people does not choose to permit any European power to extend its influence on the American continent, and the American people is strong enough to have its own way.

Under these circumstances it would be a waste of time to inquire whether the condition of affairs when the absolute governments

of Europe were reestablishing overthrown despotisms in the early part of this century bears any analogy to the controversy between Great Britain and Venezuela. It is idle to investigate the merits of this controversy. If Great Britain should make a clear title to the lands claimed by Venezuela, it would beyond question increase her influence in those regions and tend to "control the destiny" of the Venezuelans. It is ridiculous to talk about arbitration, because justice and expediency and right and law and prescription have to be considered by arbitrators, and the Monroe Doctrine has nothing to do with these conceptions. Supposing the arbitrators found against Venezuela, and Venezuela refused to submit to the award. The Doctrine would forbid Great Britain to execute the judgment, for she could not do so without increasing her influence and power at the expense of Venezuela. It is vain to ask if such a doctrine as this is not immoral, for it is not so much a doctrine as a dogma, a settled principle which admits of no question.

Doubtless Prof. McMaster would admit that if some South American state grew more powerful than we are, it might interfere in our foreign relations as we interfere with its affairs now. And he would have to admit that the policy of Russia in subjugating Poland and in expelling the Jews from her limits is exactly as defensible as the Monroe Doctrine as he expounds it. Russia is powerful enough to do these things, she does them in the name of her own peace and safety, and that is the end of it. Such a doctrine, Prof. McMaster well says, has nothing to do with international law; and he might have added, it has no more to do with international morality.

Excursions in Libraria: Being Retrospective Reviews and Biographical Notes. By G. H. Powell. Scribners. 1896.

MR. POWELL'S excursions rather impress the reader as the work of a reformed bibliomaniac; a person who, having for years gratified the lust of the eyes after editions *asses rares*, rouses himself to read his treasures and extract their human interest. That his own collection furnishes the material for the volume constitutes a tremendous glorification of Mr. Powell's library. Crammed with curious facts as the book is, we are happy to take the author at his foreword, and read him for more liberal purposes than that of verifying references to vellum opuscula.

In an opening chapter on the philosophy of rarity, Mr. Powell reveals a few of the snares that beset the raw buyer, and then dwells on the value, "to a chastened intellectual sense," of editions, especially *principes*. A book may be rare for other reasons than difficulty of acquisition. First editions are often precious as indicating the accession of new ideas to the world. Every advance or change in human history leaves its mark in the records of bibliography. A second chapter and a third are mediæval studies. The second, rehearsing from Froissart the Gascon tragedy of young Gaston de Foix and his devilish parent, exhibits mediævalism in "the fierce chiaroscuro of blood-stained splendor" which lingered into the fourteenth century and later. The third chapter ransacks a shelf of old story-books. Here a vagrant essay on "The Hunting of the Myth," being responsible to no scientific spirit of myth-resolution, wanders from Apollodorus of Athens, with his great second-century *Bibliotheca* of wonders, to the lollipop of Uncle Remus. Better fun, even, than this is the

exposition of the famous unread 'Disciplina Clericalis' of Petrus Alfonsus. "An Improving Work," the showman calls it; but it is seasoned with a perfect salt-mine of anecdotes far from clerically in doctrine. Just here we are moved to the impious suggestion that all the world, except Mr. Powell and a few other children of the light, needs a new edition of Alfonsus, that long promised by Nyrop of Copenhagen not being forthcoming.

"The Pirate's Paradise," which is chronicled in the fourth chapter from the point of view of 1740 A.D., when Charles Lealie's 'New and Exact Account of Jamaica' had reached a third edition in Edinburgh, means the island of Jamaica. With harassing detail we learn how that spot, peopled so strangely with persons of desperate character, came to be the stronghold of a Morgan and a Teach. The three remaining chapters deal with various matters of historical gossip. "A Medley of Memoirs" suggests the extraordinary variety in autobiographical records, which are alike only in being actuated by the passionate desire of not being forgotten; a desire equally intense in the strong Cæsar and the weak Cicero, in the mysterious Sully and the frank Agrippa d'Aubigné. Collected, the host of memoir-writers furnish a back-view of history both curious and important. The chapter on "Rabelais at Home" reviews the 1710 edition of 'Lettres de François Rabelais écrites pendant son voyage en Italie'—another back view of history; the wrong side of the dark tapestry that was being woven in 1536, and thereabouts, in Rome. In his concluding chapter, on the "Wit of History," Mr. Powell writes rascally of the countless dramatic utterances that have come off in the crises of history, or, more exactly, have usually failed to come off. He knows the whole list of "Up-Guards-and-at-them!" apothegms that turn out to have been merely, "Now, gentlemen, if you please." Apropos of one of Mr. Weyman's pretty titles, he adds another to the familiar things that Richelieu on critical occasions abstained from saying: "It would be a pedantic reflection on the title of a popular novel of the day to repeat that there is no authority for '*Je couvre tout de ma robe rouge*.' Yet the original remark appears to have been, '*Je renverse tout avec ma soutane rouge*'—a different idea" (p. 245).

Mr. Powell is distinctly well-informed, and leaves one the pleasant impression that he knows even more than he tells. That he neglects to mention many modern works which discuss scientifically the matters treated by his old books, is a fault inevitable to his plan. Now and then, however, he essays to give modern references, and here he leaves much to be desired. For instance, when Dunlop's 'History of Fiction' is singled out (p. 90) as a standard reference work for the study of mediæval stories, it is strange that there should be no mention of really recent and authoritative studies like those of Reinhold Köhler. A foot-note (p. 80) refers to two modern writers on the legend of the Seven Wise Men, but there is no mention of such investigators as Comparetti and D'Ancona. It is a little strange that in a list of old Italian mythologists (p. 83) neither Giraldis nor Masuccio appears. In a moment of relapse to his bibliomania Mr. Powell thinks it sacrilegious to hunt the myth in modern editions of old authors. Accordingly, he says that such study must begin with the 'Golden Legend,' whereas, to be serious, it must begin with the much earlier works of Jacques de Vitry, edited only yesterday by Prof. Crane of Cornell. In this connection, too, we miss

the names of the 'Vitæ Patrum' and of Étienne de Bourbon.

As for style, Mr. Powell's pages so coruscate with sparks of digression that his natural fluency and good wit enjoy less than their fair chance of exhibition. To enliven a treatment unavoidably dull at places, he appeals to contemporary interests. As a translation of the *quod lupus audiens acquievit* of Petrus Alfonsus we have "Brer Wolf lay low"; and Lewis Carroll, Ibsen, Matthew Arnold, Stevenson, Shelley, George Borrow, Kipling, and Bret Harte drop in at points where one could hardly expect a modern to be squeezed in edgewise. It is all very good, however, and sometimes to the point. In closing, we note that the author thinks "Ex Librist" a term too bad to apply "even to a political opponent"; also, that books "should always have their top edges cut and gilt and their sides shaved smooth"—a dictum which must have passed securely over the heads of Mr. Powell's publishers.

Canyons of the Colorado. By J. W. Powell, Ph.D., LL.D., formerly Director of the United States Geological Survey. With many illustrations. Meadville, Pa.: Flood & Vincent. 1895.

To do full justice to this volume it should be considered from different points of view, for such is the character of its contents that they may, without injury, be divided into three parts, each of which appeals to a particular set of readers. In one, for example (and to this the lovers of adventure will naturally turn), we have an account of the descent of the river and a description of the accidents by flood and field that befell Major Powell and his companions in the course of their hazardous undertaking. In another, the geology of the vast extent of country drained by the Colorado, with its marvellous formations and gorgeous coloring, is painted in graphic language; while the third is made up of short sketches of the arts, industries, manners and customs of the different tribes of Indians that were encountered during successive expeditions to this region. With much of what is here brought together we are already familiar, though nowhere has it been given in the compact, readable shape in which it now appears.

Beginning with the geology of this district we are told that from the level of the sandy plain through which, after passing through the cañons, the river flows, the country rises by a series of gigantic steps or plateaus—hundreds and even thousands of feet in height—until the summit is reached amid the snow and ice of the Rocky Mountains. Through these plateaus the river has cut its way; and some idea of the amount of erosion that has taken place may be gathered from the fact that the Grand Cañon is only one of the numerous gorges by which this region is dissected; that it is 217 miles long, and that for much of this distance there is a vertical wall of rock, 5,000 feet high, between the bed of the stream and the level of the plateau above. In other words, the Colorado, in this part of its course, has excavated a gorge which the Blue Ridge (p. 300), if plucked up and thrown in, would not fill, and into which Mt. Washington might be toppled head first, and the dam would not force the water over its walls. Vast as is the work of erosion represented in this and other cañons, it is but a small part of that which has taken place over the entire district. To appreciate this it is necessary to bear in mind that over the whole of the 300,000 square miles of terri-

tory drained by this stream and its tributaries, an average of 6,000 feet of rock has been washed away. Or, better still, imagine (p. 393) "a rock of this size and a mile in thickness against which the clouds have hurled their storms and beat it into sands, and the rills have carried the sands into the creeks, and the creeks have carried them into the rivers, and the Colorado has carried them into the sea," and you will have an idea of the forces that have been at work over this whole area and of the immense results they have accomplished.

As a good part of this region is an arid waste, but little better than a desert, the population was necessarily small and was confined to the narrow river valleys and to the neighborhood of an occasional spring. Such as it was, however, it is of interest to the ethnologist for the reason that it was made up of tribes that belonged to different linguistic families, and because among these tribes were to be found representatives of the two extremes of Indian civilization. Thus, for example, north of the river, scattered about here and there in small bands, were the Utes—a Shoshonee tribe—who were among the lowest in point of progress of any of our American Indians; while south of the stream dwelt other Shoshonee tribes (as, e. g., the Moqui and the Navajo), whose position in the scale of development was higher, though they, perhaps, fell short in some particulars of their Pueblo neighbors. To note the characteristics of these several phases of civilization would carry us further than we care to go, and we content ourselves with saying that the differences between them may be gauged by the fact that while the Pueblos (pp. 24, 111, etc.) as early as the time of Coronado, in A. D. 1540, raised corn, beans, and squashes, and "had almost accomplished the ascent from savagery to barbarism," the Utes (pp. 62, 106, 318, etc., etc.), some three centuries later, still used stone arrowheads, knives, and hammers, and were so far from cultivating the soil that they may, in a general way, be said to have depended for a good part of their food upon the seeds, roots, and fruits that were natural to the region.

In view of such differences, any attempt at generalization, except upon the broadest possible lines, must result in failure, and it was probably for this reason that our author, instead of vainly trying to formulate modes of expression broad enough to include arts and methods that are intrinsically different, wisely confined himself to short and distinctive sketches of the condition of the tribes with which he came in contact. Of course, this plan necessitated a certain amount of repetition; but, on the other hand, it fixed the limits within which the several descriptions held good, and to this extent it eliminates a source of error and furnishes us with a model for future work in this direction. Of these sketches those of the Moqui (p. 325) and of the Zuni (p. 358) are perhaps the most satisfactory as they are certainly the most elaborate; and our object in singling them out is not so much to emphasize this fact as it is to call attention to the prominent part which the camera and the pencil can be made to play in depicting the usages of a savage people. For reasons that will readily suggest themselves, it is often difficult to convey, in words alone, an adequate idea of the customs and industries incident to a low civilization or to one with which we have but little in common. This fact Major Powell clearly apprehended, and accordingly, by way of safeguard, he has enriched his pages with a quantity of illustration that leaves little to be desired. Not only are

the finished products of the Indian's arts and industries duly represented, but we are permitted to see him at some of his daily avocations, and when engaged in the rites and ceremonies by which he hoped to bring good or avert evil. Useful as this means of communication has been found to be when applied to human agencies, it is equally serviceable when used to depict natural scenery. Indeed, but for the liberal use which our author makes of the engraver's art, we should find it difficult to enter into the feelings of enthusiasm with which he gazes upon scenes some of which (p. 381) are "too vast, too complex, too grand for verbal description."

Lucius Q. C. Lamar: His Life, Times, and Speeches. 1825-1893. By Edward Mayes. Nashville, Tenn.: Methodist Episcopal Church South. 1896.

In this enormous volume of over eight hundred pages of unusual dimensions there are materials for a good life; they are, however, swallowed up in a mass of speeches, letters, and reports, all of which are printed in full; the result is that the book cannot be read except as a labor of love. This is a pity, for Lamar's career brought him into a good many different high positions in public life. He knew and was thrown into contact with all the chief politicians of his time. He began life as an ardent Southerner, while at his death his name was a sort of symbol of reunion; his independence of character was so marked that he did what hardly a public man of his day ever dared to do—refused to obey explicit instructions from his State directing him how to vote; and he was not wanting in humor, humanity, sympathy—all the qualities which lend a charm to character.

His oratory, which was the key to success, seems to have been a genuine gift, though it hardly reached a level likely to render it permanently impressive; but it was the half sincerity of his character which endeared him to all his contemporaries. He did not belong to the modern world of cities, but to the rural community which he so long represented. His poetical temperament enabled him to see in

Mississippi and the South everything that was noble and elevating, to imagine Washington as it existed before the war a "most beautiful place" (p. 76), and to believe, long after the war had destroyed the old South, that it had been the care, patience, providence, industry, forbearance, and firmness of the Southern planter in his treatment of his slaves that had made the negroes "the finest body of agricultural and domestic laborers that the world has ever seen," and had enabled him to elevate them to such a height as to cause them to be deemed fit for admission "into the charmed circle of American freedom" (p. 60). Such a feat would certainly have made the Southern planter famous throughout the world; most remarkable of all, Lamar really believed in this wonderful reminiscence. Mississippi ought to be grateful to him. It will be a long time before the New South will produce any one capable of seeing in it what he found there.

Porphyry the Philosopher to his Wife Marcela. Translated, with introduction, by Alice Zimmern, Girton College, Cambridge. Preface by Richard Garnett, C.B., LL.D. London: George Redway. 1896.

A FRESH example of the late Greek attitude towards spiritual things is given to English readers in Miss Zimmern's pretty little book, and the translator's name guarantees the excellence of the version. Dr. Garnett's preface is vivacious, Miss Zimmern's introduction is comprehensive and painstaking; between them they contrive to put the reader in a frame of mind for inevitable disappointment, for, of the three authors represented in the book, Porphyry is easily the least interesting. The public which has formed its idea of Greek books of devotion on those of Epictetus and Marcus Aurelius, will find here a heavier touch, a greater proportion of commonplace, a more sentimental tone. These are all marks of literary degeneration, and it would have been instructive to English readers if the translator had included in her introduction a study of Porphyry's style, with an account of the fate that had befallen Greek prose in the third century. But the beauty of the Pla-

tonic ethics cannot be hid, and the sweet austerity of neo-Platonism is full of attractiveness. The quaint *motif* of Porphyry's letter to his wife is an attempt, in the spirit of Protesilaus, to induce her to substitute a philosophical for a passionate love, and

"Learn, by mortal yearning, to ascend."

A good deal of sociological interest attaches to the letter from the fact that it was written to a woman, and the following sentiment should win much applause from a *fin-de-siècle* audience: "Neither trouble thyself much whether thou be male or female in body, nor look on thyself as a woman, for I did not approach thee as such. Flee all that is womanish in the soul, as though thou hadst a man's body about thee."

BOOKS OF THE WEEK.

Anderson, Col. Edward. *Camp-Fire Stories*. Chicago: Star Publishing Co. 25c.
Belzoe H. de. *A Bachelor's Establishment*. London: Dent; New York: Macmillan. \$1.50.
Cooper, J. F. *The Last of the Mohicans*. Boston: Houghton, Mifflin & Co. 60c.

Messrs. Henry Holt & Co. invite the attention of discriminating readers of light literature to the books they are publishing under the general title of

"THE PROTEAN SERIES."

The numbers so far ready are:

WISDOM'S FOLLY. A study in Feminine Development. By A. V. DUTTON.
THE QUICKSANDS OF PACTOLUS. A Novel of California Life. By H. A. VACHELL.
THE WAY THEY LOVED AT GRIMPAT. Village Idylls. By E. RENTOUL ESLEY.
IN THE VALLEY OF TOPEHET. Powerful connected stories of English mining regions. By H. W. NEWISON, author of "Slum Stories of London."

Forthcoming Numbers are:

A STUMBLER IN WIDE SHOES. Scenes in Amsterdam and Rural England. The hero is an artist.
THE TOUCH OF SORROW. A story of English society by one who plainly knows it, with good character drawing, and a moral.
THE BOOK OF THE PLAY. A story of a gossipy New England town. By Elizabeth Lyman Cabot.
A DIPLOMAT IN LONDON. From the French of Charles Gavard. Graphic accounts of diplomatic experience under the Commune, and also of the social experience natural to a French diplomat in London.

16mo. Cloth. Price \$1.00 per volume.

ESTABLISHED 1780.
WALTER BAKER & CO., Limited,
DORCHESTER, MASS.
Breakfast Cocoa, absolutely pure, delicious, nutritious.

Yale Mixture.

A GENTLEMAN'S SMOKE.

You won't know the luxury of Pipe-Smoking until you use Yale Mixture.

A two oz. trial package, postpaid, for 25 cts.

The Nation.

NEW YORK, THURSDAY, JUNE 18, 1896.

The Week.

SINCE the Federal Government was rescued from the shameful subserviency to slavery which characterized it before the civil war, there has been no session of Congress so disheartening to a patriot as that which ended on Thursday. At no date within the lifetime of the present generation has the public opinion of the national Legislature been so contemptuous, and so deservedly contemptuous. Never since 1860 have the tendencies in Congress been so unhealthy and even alarming. The Senate has reached its lowest ebb. The House, if not so bad as the Senate, emulated that body's folly in Jingoism and in recklessness of appropriation. It shelved free coinage, indeed, and it refused to endorse repudiation, although the leaders of the Republican majority lacked the courage to stamp it out by a direct vote. Complaining that Democratic legislation had caused a deficit, the same managers refused to adopt the simple and practicable method of raising the \$25,000,000 or \$30,000,000 a year needed by doubling the tax on beer, but, instead, pushed through a buncombe tariff bill, which they knew could never pass the Senate or secure the President's signature. After this assurance that the deficit must continue, they proceeded to increase it by passing, under a suspension of the rules and without a chance for debate, the largest river-and-harbor bill ever framed, and repassing it over the deserved veto of the President. Republicans, Democrats, and Populists have all had a share in this most discreditable performance.

Our happy-go-lucky system of national finance is usually put on exhibition at the close of a session of Congress. The chairman of the committee on appropriations makes a speech congratulating the House on its frugality and careful use of the people's money, while, of course, not refusing any appropriation manifestly for the public good, and then prints a table showing how, if you leave out this, that, and the other bill, the total is much less than the extravagant Congress controlled by the other party had voted. Then the representative of the minority on the same committee follows, proving by his table that there never had been such a reckless and spendthrift Congress, and announcing, without a flicker of the eyelid, that an outraged people will hold the majority to a strict account. This year the show was more than usually diverting because our finances are more than usually chaotic. Deficit heaped on deficit, the majority of the House strenuously insisting that the Government has not revenue enough, the

Speaker opening the session with the cry of economy, and the chairman of the committee on appropriations echoing it, one must confess to some surprise at finding the appropriations larger than in any one fiscal year since the last years of the civil war. The total for the session is \$515,759,820—an increase of \$18,751,000 over the appropriations of the last preceding session. In addition should fairly be reckoned in contracts authorized for \$78,241,000 more, for which coming Congresses will have to find the money.

The way Chairman Cannon meets this situation is by calling the appropriations "wise and economical, not scant and insufficient," and by saying that if you leave out the river-and-harbor bill and the permanent annual appropriations, the record is not so black as it might appear. Messrs. Sayers and Dockery, for the minority, affirm that "this Congress is the most recklessly improvident and riotously extravagant Congress since the establishment of the government." If these assertions and denials had not been made so regularly, the country would pay more attention to them. What really gives them special point this year is the critical situation of the Treasury, and the fact that this was laid clearly before Congress by Secretary Carlisle. For the fiscal year just ended he estimated a deficit of \$17,000,000, which, in effect, turned out to be \$27,000,000. For 1896-97 he figured a surplus of \$6,900,000, but on what basis? On the basis of total appropriations of \$457,000,000. In the face of this, Congress has voted \$515,000,000—or, in other words, has deliberately voted a deficit of \$52,000,000. A Congress that does this writes itself imbecile in finance.

President Cleveland's apparent loss of influence with his party is the theme of many philosophic comments by Republicans. Never was the fall of a party idol and dictator so complete. Yes, but poor Mr. Cleveland may comfort himself by reflecting that if he has not got on very well with Democrats, he has converted Republicans with astonishing rapidity and success. The latter are now following his lead with beautiful docility. Eight years ago they denounced him for having "dishonored" silver; three years ago they allowed themselves to be dragged by him by the scruff of the neck into completing the dishonor of silver through the repeal of the silver-purchase law; two years ago he began boldly to advocate the gold standard, *eo nomine*, amid vast Republican carping, and now the party at St. Louis is enthusiastically getting on his platform. Such success of an apostle turning to the Gentiles is truly unprecedented in the annals of political

evangelization. And the conversion is likely to extend also to the issuing of bonds for gold. If Republican Congresses go on voting appropriations \$50,000,000 a year more than the revenue, more bonds will have to come. One of the first acts of the supernatural McKinley may have to be a call for bids on Government bonds. It certainly will be if Mr. Cleveland follows the after-us-the-deluge methods of President Harrison.

One of the striking utterances coming from the Babel of tongues at St. Louis is the following from Congressman Grosvonor, McKinley's second in command, to the editor of the *New York Herald*:

"Just as soon as this insanity blows over, the tariff will become the leading issue. When this convention and the Democratic convention have adjourned, the tariff will come to the front."

The "insanity" here referred to is the demand that the words "gold standard" shall be inserted in the Republican platform. This is so far the leading issue at present that nothing else is talked of or thought of; but, when it "blows over," the tariff will take its natural place at the front, says Grosvonor. That depends, for as it takes at least two persons to make a bargain, it takes at least two parties to make a political issue. If the Democrats put the free coinage of silver in their platform, the tariff will not come to the front this year, and probably not next year nor the year after. The fight that the McKinley men are making at St. Louis is not so much against the gold standard as it is against giving precedence to the gold standard as an issue. It is precisely because they know that the money question is the dominant one, and that McKinley on a gold platform is an illogical candidate, that they are so stoutly resisting the use of the word gold.

With McKinley's nomination for the Presidency assured, and his election probable, the thing for sound-money men, without distinction of party, to do at once is to organize a campaign for the election of a House of Representatives which will be sound on the financial issue. McKinley's election would give the country, for the first time since the soft-money agitation began after the war, an executive who could not be expected to veto any act which Congress might send him. A Republican Congress might pass an inflation bill under Grant, and the nation could hope to escape through his refusal to approve it. A Democratic Congress might pass a bill to coin the seigniorage under Cleveland, and the country knew that it could never become a law. But whatever the representatives of the people in the Senate and House may agree to in the

way of financial legislation from 1897 to 1901 will be sure to pass the White House with McKinley as its occupant. As for the executive's exercising any restraint upon Congress, as Hayes did when he thwarted the movement for the repeal of the resumption act, or Cleveland when he kept a Congress that wanted to pass a free-coinage bill from really doing it, McKinley would never think of attempting such a thing.

Still another vote of McKinley's needs to be cited to complete his record in Congress on the currency question. On the 29th of April, 1878, the House of Representatives was called upon to decide whether it would pass a bill making it unlawful for the Treasury thereafter to cancel or retire any more legal-tender notes, and providing that when any such notes should be redeemed or received into the Treasury under any law from any source, they should not be retired, cancelled, or destroyed, but should be reissued and paid out again and kept in circulation. The proposition was opposed by the sound-money men on both sides of the chamber, including Garfield of Ohio, Hewitt, Hiscock, and Potter of New York, Claflin, Crapo, and Robinson of Massachusetts, Frye of Maine, and Gibson of Louisiana. But the same crowd which a few months before had voted for free coinage supported this measure also, and McKinley was again found among them. The man who expects to be the next President is thus among those who are responsible for the continuance of the policy by which the Government must keep on indefinitely paying out the same greenback and redeeming it in gold, instead of getting rid of the promise to pay once for all.

Gov. Morton is entitled to much credit for the straightforward manner in which he has held himself as a candidate before the St. Louis convention. He is the one candidate who has had the courage to define his views on the A. P. A. question, saying quite simply that if he were charged with the duty of administering the office of President, he should "endeavor to treat all classes without discrimination as to their religious belief." That is not a very difficult thing to say, and when it is said there is really nothing to add to it, and no rational mind can see any criticism to pass upon it; yet what a curious light it throws upon the McKinleyized political situation that no other candidate finds himself able to say it, lest by doing so he might lose a few votes. The Governor's course in regard to a vice-presidential nomination was equally dignified and discreet. He was placed in a position of being "played" by Platt for first place if he could get it, and, failing that, as a willing candidate for second place. He upset that scheme by sending a telegram to Mr. Depew refusing to have his name used for second place.

The forthcoming number of the *Forum* magazine will contain an article by M. Leroy-Beaulieu, the distinguished French publicist, on McKinleyism as it looks to an intelligent foreigner who has no personal interest in our politics. In the first place, he tells us that the name of McKinley stands in Europe for something more than a protective tariff—an exaggerated form of protection intended seriously to restrict trade. The election of such a man, he says, would give a new and powerful impetus to protectionism in Europe. European protectionists, who are mainly landowners, want higher duties on agricultural products. In France they are now clamoring for an increase of 30 or 40 per cent. on wheat. In Germany they are equally fierce, and in England they are beginning to make some headway, putting forward the idea of a great British Zollverein, which is protection under the guise of a closer political union with the colonies. Any new outburst of protectionism in Europe would be a backward step in civilization, and would be especially injurious to the United States as an exporter of agricultural products. One thought might be added to Leroy-Beaulieu's lucid reasoning. If the new outburst of protectionism in Europe really takes place and throws back our fifty-cent wheat on the hands of American farmers, they may get their eyes open a little sooner to the fact that protection is a downright swindle to them. *Rusticus expectat*, said the Latin poet. The farmer has been waiting in this country more than a hundred years for the tariff to begin to benefit him, and he is still waiting. Perhaps if he finds that other nations can play tariff also, he may change his notions.

The chief part of Leroy-Beaulieu's article, however, relates to McKinleyism and the silver question. McKinley is understood in Europe to be a silver man or a silverish man. There is a difference between the two. A silver man is one who is in favor of free coinage at some ratio, preferably the ratio of 16 to 1. A silverish man is one who has no particular views, but who wishes to be considered "friendly to silver"—just friendly enough to get the votes of the silver men, but not friendly enough to lose those of the gold men. Leroy-Beaulieu takes this occasion to tell us what is the status of international bimetalism at the present time. Although a small clique of agitators continue to make themselves heard (they had a small private conference at Brussels the other day), the movement is as dead as possible. As to free coinage of silver at the ratio of 16 to 1, that is simply inconceivable. So far are the nations of Europe from moving in the direction of bimetalism, the only one that has not the single gold standard now is striving eagerly to reach it, and will soon accomplish that end, Russia has been accumu-

lating gold for this purpose steadily for a series of years, and drawing her supplies chiefly from the United States. She now has the largest quantity on hand that can be found in any one place, viz., \$420,000,000. This is considerably larger than the gold reserve of the Bank of France. Does anybody suppose that Russia, at the end of her long, persistent effort to resume specie payments on the gold basis, is going to give any countenance to bimetalism, national or international? No more is Austria-Hungary likely to do so. As for France, with which Leroy-Beaulieu is more intimately concerned, he tells us that the French bimetalists themselves say that they can do nothing without the coöperation of England, and that nobody expects England to change her standard. In short, while the United States might give a new life and impetus to protectionism in Europe, it cannot galvanize the corpse of bimetalism.

The Democratic convention in Minnesota last week, with its unqualified declaration for the maintenance of the present gold standard, is a fresh illustration of the fact, to which we have repeatedly called attention, that the States with the largest proportion of foreigners are doing much more to sustain the financial stability of the nation than those which are peopled almost entirely by the native-born. In Virginia less than 3 per cent. of the population are of foreign parentage; in Minnesota the proportion exceeds 75 per cent. Yet the Democrats of Virginia went for free coinage at the ratio of 16 to 1 by a vote of four to one, while those of Minnesota sustained the most uncompromising sort of gold platform by a large majority. The leading Democratic journal of the Northwestern State, the *St. Paul Globe*, is entitled to honorable mention for its persistent and effective work on the right side in that party; as is the *Pioneer Press* of the same city for the same sort of instruction to Republicans during the long agitation for soft money in one shape or another.

The Senate took a turn at art last week, and left the experts looking as silly as so many defeated gold-bugs. The idea of a committee of sculptors undertaking to teach battle-scarred generals anything about artistic merit! As Senator Mills said, a body of men who "arrogate to themselves an exclusive knowledge of art" were the last persons on earth to whom an untamed Texan would refer a question about the Sherman monument. The Connecticut idea of art was luminously set forth by Senator Hawley, who asserted that what was wanted was not "a mere work of art," but something that the old soldiers would recognize "a mile off" as the real Old Tecumseh. It only remained to add, as Senator Allison did, that the whole thing grew out of per-

sonal enmity against the successful artist, and that the decision and protest of the committee were based on spite and envy, not on æsthetic principles. On the whole, it was a bad day for presumptuous experts, who were taught the needed lesson that Art may err, but Nature (in the shape of a Senate giving its mind to monuments) cannot miss.

It is to be said of the Greater New York Commission that it is probably the best which the Governor was able to form, and that it will accomplish as much as any Commission could under the conditions in which it will have to do its work. Several members of it are admirably well qualified for the task before them, and, if the prospects for performing useful and lasting public service had been better, we have no doubt that others equally well qualified could have been induced to accept positions with them. As it stands, it is much more of a Brooklyn than a New York Commission, and, however great the abilities of some of its individual members may be, as a whole it is not a body which gives promise of performing successfully the practically impossible task set for it, which is the evolving of a charter for one of the greatest cities in the world within about eight months. Even if it were to prove equal to this tremendous task, it must proceed about it with the possibility, in the end, of having its work rejected by the next Legislature. The Commission must, in fact, carry forward its task under conditions prepared by Platt and Lexow, who in arranging them had no interest whatever in the formulating of a scheme of municipal government, but were looking only for the creation of such a situation as would enable them to capture, in the interest of spoils politics, the governments of the two great cities affected.

The English education bill is exciting fierce opposition from the Liberal party, especially from the Dissenters. The Liberal party is opposed to it because it breaks up the arrangement made by them twenty-six years ago through the late Mr. Forster, which was the first serious attempt not only to establish popular education in England, but to make popular education undenominational. As a general rule, such popular schools as had existed in England before that time were adjuncts of the parish church, and were completely controlled by the Anglican minister, to the great disadvantage or at least discontent of the Dissenters. Mr. Forster's bill established popular schools ruled by elected school boards, but it compromised by giving Government assistance, at a stated proportion to voluntary subscriptions, to denominational schools. As the years have rolled by, the school boards have gained on the clergy; the voluntary subscriptions to denominational schools, and consequently the Government aid, have fallen off, until,

to use their own language, "the strain [on them] has become intolerable." It is now proposed to abolish the school boards, to remit the management of the schools to the county councils, to increase the assistance to the denominational schools, and to hand religious instruction in the schools over to the clergy of different denominations. In order to secure some such legislation, the Anglican clergy are accused of working with great vigor at the last election to get Tory majorities. Worse than all, since the election, Lord Salisbury has openly made common cause with them by treating the church as "we" and the Dissenters as "you," in conversations with the Dissenting delegations who came to remonstrate with him about the bill. Principal Fairbairn, the most scholarly Nonconformist, the head of the Dissenting college at Oxford, has just contributed a bitter article on the subject to the *Contemporary Review*, in which, passing over machinery and details, he denounces the policy of the bill as a distinct return to mediæval clerical methods in popular education, and as due in the main to the efforts of the Anglican clergy, who are not, he says, what they used to be. They used to be part and parcel of the gentry, younger sons or brothers, men of family. They are now, he alleges, more sacerdotal, more purely professional, more separated from the community at large, and more imbued with a sense of "apostolic succession." To this change in the character of the body he ascribes the new attempt to regain control of the schools and root out purely secular education among the people.

The full text of Mr. Gladstone's letter to Cardinal Rampolla on Anglican orders does not make it clear why the Nonconformists should have been so cut to the heart by it as the cable reported that they were. It contains no view which Mr. Gladstone has not been long known to entertain. He is a high-churchman, and as such is bound to welcome the inquiry which the Pope has set on foot in Rome respecting the validity of Anglican orders. That "any immediate, practical, and external consequences" would follow a favorable decision, he does not imagine, but simply hails the proposed investigation as an act of wisdom and charity on the part of the Pope, in whom it argues great courage and "an elevation above all the levels of stormy partisanship," and as a step towards the only form of church unity now possible—a united and tolerant bearing of witness to the essentials of the Christian faith. Why the expression of such opinions should be fiercely denounced by Nonconformist ministers as "a betrayal of the liberty of the country" and "a miserable trifling with Rome," does not appear to a mind untrained in the niceties of theological logic. In the course of this very letter Mr. Gladstone paid a handsome tribute to "those independent religious

communities" with which his political life had brought him much in contact; but this contact has taught him little if it has not made him aware of their extreme sensitiveness and hysterical fervor on all subjects relating to the Scarlet Woman. What Walter Bagehot wrote of the English feeling about Rome is still very much in point. Referring to the Oxford movement, he said that it had vexed the English people by crossing "their one speculative Affection, by encountering their one speculative Hatred." Of a Tractarian clergyman the instinctive English judgment was, "the system which trained him must be bad."

"Such is our axiom. Tell an Englishman that a building [at Oxford] is without use, and he will stare; that it is illiberal, and he will survey it; that it teaches Aristotle, and he will seem perplexed; that it don't teach science, and he won't mind; but only hint that it is the Pope, and he will arise and burn it to the ground."

Mr. G. S. Fort, who writes in the last *Nineteenth Century* on "The True Motive and Reason of Dr. Jameson's Raid," was private secretary to Sir Henry Loch while the latter was Governor at the Cape, and is on the most intimate terms with both Rhodes and Jameson. He states "positively" that the chief object of Jameson's rush was, not to overthrow the Dutch Government, not to redress the grievances of the Outlanders, but to "secure documentary evidence" of the secret alliance between the Transvaal and Germany, which evidence "was believed, on reliable authority, to be in possession of President Krüger in Pretoria." According to Mr. Fort, the intrigues of the Germans in the Transvaal had been divined by Cecil Rhodes, who saw in their success the "death-blow to his lifelong work," and determined to thwart them by getting hold of the secret treaties and holding them up to the scorn of the world. If Mr. Chamberlain had allowed him, he would have, when in England, "gone down to Trafalgar Square" and proclaimed this as the true motive of the raid. This is more curious than convincing, and even the solemn Mr. Fort has to admit that this theory "is necessarily to a certain extent hypothetical." One thing not hypothetical is that Rhodes said that which was not when he avowed to Chamberlain that he was entirely ignorant of the raid. And the idea of sending 800 troopers to steal some documents! One skilled burglar would have been much better. It would have been just like the wicked Krüger to burn every last secret treaty the moment he heard the English raiders were coming. The guilty old man would know what they were after. There is also a certain humor, of which Mr. Fort seems wholly unaware, in sending a man after incriminating documents who himself was loaded down with incriminating documents. Dr. Jameson ought at least to have swallowed the key to the cipher telegrams captured with him.

PROSPERITY'S ADVANCE ORATOR.

In a little volume of 'McKinley's Masterpieces,' lately published, the good news is revealed that "William McKinley stands high among America's greatest orators." Everybody would have believed this if McKinley had never delivered or printed any orations. As it is, the assertion may be tested by the fact. The small book of condensed McKinley oratory is put forth to "meet the needs of the busy man." But we prefer the large and complete edition of McKinley's speeches, on the ground that a little dullness is a dangerous thing, and that one should drink deep of the Major's oratorical flow before reporting on its quality. Even so, there are perils in writing of an orator who belongs to Dr. Johnson's category of men who not only are dull, but provoke dullness in others. However, in the cause of discovering one of America's greatest orators, we are ready to run all risks.

Lord Rosebery's oratory has been defined as English in substance, but with a surface addition of French polish. No such discrimination can be made in McKinley's case. Substance and surface are all of a piece in his oratory; and whether you plunge into it, or skim over it, the sense of touching something wooden is unmistakable. There is scarcely a gleam in the whole 654 deadly pages—not a phrase or thought to serve as a watchword of party or epigram of debate; not one flash of happy characterization; not one generous burst of unpremeditated enthusiasm; hardly an apt passage cited from poet, orator, or statesman. Nothing can reconcile one to this dead level of monotony except McKinley's occasional efforts to rise above it. The luckless reader of his address to the Mahoning Valley Pioneers, with its beautiful quotation from "a gifted songstress of this valley," or of his discourse to the Ohio State Grange, with his easy flinging about of all that "Cato, the eloquent orator and great general," "old Virgil," "the historians of China," and a long line of ex-Presidents had said about farming (all obviously drawn fresh from some book of elegant extracts)—one condemned to witness the dray horse thus frisking about will cry out, we say, for a return to the old shambling trot. The appetite developed by a slight experience of McKinley flowers of fancy for a column of McKinley figures and extracts from the *Iron Age* is simply amazing to one who has not tried it.

These may seem slight tests of oratory, but they are really among the most searching. The oratorical temperament is in nothing more truly revealed than in its incidental, its extemporized graces and felicities. Their absence, or miserable failure in laboriously attempting them, is a surface indication, to be sure, but an indication just as fatal as bad spelling or bad grammar would be in one setting up for an educated man. (There is, by the way, a deal of bad grammar in this McKinley tome, despite its revision by Mr.

McKinley himself, assisted by the Ohio State Librarian.) Consider, too, the matter of insight into character, judgment of a man, a movement, or an institution. The really great orators throw these things off in a fine glow—as Burke threw off his tribute to Charles Townshend—and in nothing is the exaltation of the oratorical nature, with its swift intuition and vitally metaphorical language, more clearly displayed. Remember this, and then listen to McKinley declaring (to take only a few examples) Oberlin "unrivalled in university annals," and "scarcely second to the best institutions of the world" (p. 571); affirming that Logan ("Black Jack") had achieved "a success in both careers [military and civil] almost unrivalled in the history of men" (p. 375-6); asserting that William D. Kelley ("Pig-Iron Kelley"), as "a student and master of political economy, was probably without a superior in the present generation" (p. 448). Of a man capable of such things we can only say, as Disraeli once said cynically of himself, "Circumstances have forced me to do a good deal of talking, but nature meant me to be a silent man."

But logic, force, impact of relentless argument are, after all, the weightier matters of political oratory, and it may be said that herein lies McKinley's title to rank with Webster. As to logic, he is evidently of De Quincey's opinion, that any fool can reason correctly from given premises, but that the true logician is known by the choice of the premises from which to reason. Hence comes his peculiar greatness in varying his premises to suit the conclusion he wishes to draw. Take his one fundamental doctrine, of which he is a master if he is of anything—the doctrine that the foreigner pays the tax. This is an absolute and unqualified truth in Virginia (p. 185) and Ohio (p. 372); but in Georgia (p. 342) it becomes the assertion that "the duty is rarely paid by the consumer," and in Washington (p. 411) the admission that "it [the tariff tax] may add a little temporarily to the cost to the consumer." On the main question we say nothing, and refrain from pitting Hamilton against McKinley; but as a specimen of deft changing hands and ability to dispute on either side, we submit that it shows McKinley to have a logical faculty beyond anything that Webster ever dreamed of.

In one respect, we admit, McKinley's oratory is overwhelming and irresistible. No man ever lived who was his equal in demonstrating what nobody questions, or in cramming down the throats of his adversaries the propositions with which they themselves start. His unique impressiveness is best seen when he is arguing some such thesis as that a government must have a revenue. The Union League Committee on Political Reform have come dangerously near him on this subject; but, on the whole, not even those fierce slayers of the slain can rival McKinley in

this chosen field. He rides down all opponents like a whirlwind. Ill betide the man who should dare to maintain, in the face of his noble wrath, that a government can pay its bills without money, that revenue may rain into the Treasury from the clouds, that neither internal nor external taxes are necessary. All such suggestions McKinley dashes aside impetuously and with lofty scorn. He pursues the wretched sophists who assert that a government needs no revenue, into every hole and corner where they seek a refuge from his lightnings, and drags them out trembling and begging for mercy. America never before had an orator capable of such feats. And few can she have had able to invite comparison with McKinley on such a theme as "The American Home." His panegyric on that institution, his stern and unyielding opposition to everything that threatens it, his defiance, in his own single person, of all its enemies, his bold assertion that "the good home makes the good citizen, and the good citizen makes wholesome public sentiment"—who, we ask, can read or hear all this without paying the orator the tribute of a tear, or mayhap a groan?

We should be glad to think more highly of the intellect, as of the convictions and courage, of the man whom, as Col. John Hay informs the *London Times*, "a singularly spontaneous movement of the voters" has already chosen President of the United States. If we had that form of gratitude to McKinley which consists of a lively sense of favors to come, we might be able to see in him, as Col. Hay does, "unusual qualities, extraordinary ability and force of character." But having no other means of judging mind than by the products of mind, we see no reason for calling upon any of America's greatest orators to take a lower seat and give place to one worthier; and if any one, after surviving 654 pages of McKinley, thinks differently, we should be as anxious as Charles Lamb to be allowed to examine that man's phrenological development.

THE ALBANY POLICE JUDGMENT.

THE *Albany Law Journal* justly insists on the great gravity of the doctrines laid down by Judge Herrick in delivering the opinion of the Appellate Division of the Third Department in the Albany police case. It is true that the opinion has not yet been affirmed by the Court of Appeals, but the fact that it came from a majority of four out of five members of the Appellate Division raises a probability that it will receive the sanction of the Court of Appeals also. Should it do so, its importance for all municipal reformers in this State, for all civil-service and municipal reform associations, and all persons laboring to form "a municipal party" here or elsewhere, cannot be overrated, and we call to it the earnest attention of all such persons.

Most of our readers will remember that

during all the recent agitation for the divorce of municipal administration from party politics, we were met, by both enemies and many well-intentioned friends, with the argument that this was impossible as long as the power of the Legislature over the city was exercised as at present, and that even if we were only municipal men during city elections, we should have to be party men when we came to elect members of the Senate and Assembly. It was difficult or impossible to reply to this argument. The candidates for the Legislature were sure to be either Republicans or Democrats, and the Legislature itself was sure to exercise constant control over city affairs. This control not only exists, but has been growing for thirty years. The cities of the State have each a charter or organic law, but this law is liable to, and undergoes, incessant modification at the hands of the Legislature, generally against the will of the city. During all this period, not one city of the State has enjoyed what is called local self-government or "home rule" in any sense in which the term is ordinarily used. The police, the lighting, the education, the petty justice, the street-cleaning, the taxation of every city in the State are controlled by the Legislature. That is, its local affairs are all in the hands of men who do not live in it, who have no knowledge of it, and cannot have, humanly speaking, much concern about it. We cannot in New York pave a street, open a public school, employ or promote a policeman, fix our rate of taxation, light or clean our streets, without legislative sanction and regulation. The same is true of every other city.

Originally—that is, forty or fifty years ago, when the effect of railroads on the growth of cities first began to be felt—the motives for this interference may have been good. People were called on to deal rather suddenly with a new problem, and self-government in large communities like this seemed to be breaking down, and State interference, in the first moments of surprise and alarm, seemed called for. But very early, as early as 1870, it was found that the matter had another and very serious side, that cities had grown too large to be successfully managed in this way; and, soon after the Tweed scandal, both parties began to inscribe "home rule" on their flags in obedience to a growing sentiment, but without the least intention of carrying it into practice. In the meantime 60 per cent. of the population of the State has come to live in the cities, and their united annual revenues, if we may judge from New York, amount to about \$75,000,000, and the practice of interference with them from the outside—that is, of regulating their government and their taxation, and of filling their offices in the interest of people who may not and generally do not live in them—has become a regular business by which a small army of men make their livelihood either as legislators, "owners" of

legislators, bosses, lobbyists, or politicians.

This class is now very large and increasing, and generally makes enough in the winter by minatory or corrupt legislation directed against cities, or corporations having their seats in cities, to live with comfort during the remainder of the year. Many profess to be lawyers; others are supposed to be in "real estate," but the bulk of them do not take the trouble to assume any occupation at all. They are Toms, Dicks, Charleys, Mikes, Abes, Jakes, Barneyes, often not only without any recognized calling, but with too little character to get places with any private employer. They are nominally in the service of one party or the other, but their business is to threaten, defeat, or delay legislation about cities at Albany. This, too, is done in the most arbitrary way, and without assigning any reason. City offices are often, as in the case of Buffalo, Albany, and this city, filled without notice by the boss in control of the majority, so that a class of adventurers, like the two Sheehans, has grown up, who are moved about from city to city to fill its leading places as the boss or they themselves may think best. Against such proceedings the protests of the city itself or its officials are useless. The late amendments to the Constitution gave the mayors a consultative voice in local legislation, thinking it would check these practices, but, as we see in the Greater New York case, it has not had the slightest effect. The opposition of the two mayors has had no effect, although the legislation emanated from a small village on the Hudson and from a distant county.

We might fill columns with illustrations of this system. The general result is that, as is shown in the Albany police case, local self-government, as it has always existed and been insisted on by the Anglo-Saxon race, preceding all written constitutions, has practically disappeared in this State. There is less of it than in any European country. Charters are granted here, but they are altered annually by persons not residing in the locality, and in defiance of the inhabitants, which is centralization in a form hardly seen since Louis XIV. The recent decision in the Albany case characterizes this sort of thing fitly, and absolutely denies the right of Legislatures to interfere in local concerns, as long as they are conducted constitutionally. They have no right to alter the constitution of police boards, or say how they shall be filled; to say whether a street needs paving or how it shall be paved; to say whether the city shall be united to some other city, or how its schools shall be conducted. All this is local matter for local decision.

Should the decision of the Appellate Division be sustained, it will almost work a revolution in this State. It will make the establishment of real municipal government easy all over the State. It will kill all the organizations, from Tammany down, which live by controlling and af-

fecting legislation. It will deliver corporations from the blackmail of the bosses, and it will bring the reason and good sense of the inhabitants to bear on municipal concerns. It will put a stop to those annual sorrowful expeditions of good citizens to Albany to resist rascality, by arguments addressed to a lot of venal Boys, whose only answer is that "it is sure to pass." Should the Court of Appeals confirm the judgment, all reform organizations will have a new weapon to work with, before which everything must go down. The Boys are already sorrowful over the competitive examinations. Take away from them the legislative business, and want, crime, or honest industry would stare them in the face.

FREE TRADE IN ENGLAND.

THE rubbish which some of our papers allow their London correspondents to prepare for the American market is receiving another striking exemplification in the pretence that free trade in England is in some danger. We are fresh from something of the same kind in the case of bimetallism. For years it was impossible to persuade American bimetallists that their cause was not making rapid progress in England; and when Mr. Balfour came out strongly on their side, we were told that his advent to power would be the signal for the pound sterling to share its honors with silver at some ratio or other. Well, he has got into power, and the new ministry has no more thought of meddling with the currency than the old one. The present Chancellor of the Exchequer makes nearly as merry over the bimetallists as Sir William Harcourt did. In other words, the nation pays even less attention to Mr. Balfour's views on the currency than it pays to his views on the Unknowable.

We are just witnessing a similar phenomenon in the case of Mr. Chamberlain. This gentleman has got into a Conservative Ministry without having a single rag left of the causes and beliefs to which he devoted his earlier life. The Tory Ministry is using its enormous majority to attack or damage the causes for which he once stood, and is taking no notice of the beautiful promises he has recently made to the poor and the aged and forlorn. Consequently, it has considerably given him a place in which his former record cannot well be used for his detriment. Hitherto he has had nothing to do with the colonies, good, bad, or indifferent. For him they are virgin soil. Accordingly he is Colonial Secretary, and his first act was to promise that something should be done for the colonies, and that this would probably take the form of a sort of imperial federation, based on a customs union. The colonies nearly all, if not all, raise their revenues, as they now have a right to do, by customs duties. These duties are mainly levied on English goods. Their own products are admitted duty free into Eng-

land. It was proposed, therefore, that they should remit or greatly reduce these duties in consideration of being members of an imperial confederation, being protected in time of war, etc. The colonies promptly refused. They needed the money badly, and were ready to take the risks of war. This, combined with distance, diversity of interests, difference in form of government, etc., seemed to dispose of the imperial-federation idea. A federation one leading member of which was in America, one in the South Pacific, and one in England, seemed little more than a beautiful dream.

This was bad for Mr. Chamberlain. How was his something for the colonies to be done? He had, when the chambers of commerce came together, after his unsuccessful attempt on old Krüger, to say something. So he intimated gently, tentatively, that if the colonies would propose that Great Britain should put a tax on everything she receives from other parts of the world, except the colonies, they would not meet with an immediate refusal. This is probably true, but the reason why they would not meet with an immediate refusal is that probably no notice, beyond a mention in Parliament, would be taken of the proposal. It would be received, like the bimetallic idea, as an absurdity. No ministry would venture to show it any favor. It would be far more than a reduction of duties on colonial products, for colonial products come in duty free. It would be a proposition to clap a duty on French, German, Russian, Italian products, on nearly every article of comfort and necessity from all parts of the world which an Englishman now uses, and which he now receives duty free. He would be asked to do this, too, not because the English people are dissatisfied with free trade, for the country, as the late statement of the Chancellor of the Exchequer shows, was never so prosperous as under free trade, but to oblige Mr. Chamberlain, Lord Salisbury, and the colonists.

Here again there is a striking resemblance to bimetallicism. During the whole bimetallic agitation there was not a pretence that the English people, or its great merchants or traders or exchange dealers, were dissatisfied with the gold standard. What was said was that Senator Morgan, and Senator Lodge, and President Andrews, and Mr. Bland were dissatisfied, and that if England did not abandon the gold standard, there would be trouble. Senator Lodge proposed to discriminate against her goods on account of it, and ascribed American hatred of England to that cause, solely or mainly. But the English people paid no attention to these objectors. It was ready to confer with them as much as they pleased, but it had no more idea of touching the pound sterling than of dethroning the Queen. This simple, plain, conspicuous truth has needed twenty years in order to dawn on our silver and bimetallic fanatics. It would have taken longer, but for the advent of

the Salisbury Ministry, which, curiously enough, was a striking product of English conservatism, and yet was expected to begin its reign by a tremendous change in the mechanism of English business.

A recent striking article in the London *Economist* on this subject treats the protectionist apostles with the contempt they deserve. But, in commenting on the failure of Cobden's prophecies about the adoption of free trade elsewhere, it fails to notice the fact that, since Cobden's day, the government of all the leading countries in Europe has passed into the hands of a different class. That is, they have all become democratic. He could not now make his French treaty with France or any other of them. Nor, probably, could Sir Robert Peel adopt free trade. Trade and currency have been taken hold of by the masses, and they are learning their lessons about them. Protection is the natural resort of the ignorant or inexperienced man. To keep the market to himself is the one expedient of the thoughtless or uninstructed. The great conditions of commerce and exchange are hard to understand. "Protection and cheap money" will therefore be the cry of the uninstructed whenever they have possession of a government until they learn better. The failure of "Cobdenism" to spread is really not nearly so wonderful or so unexpected as the control, thirty years after his death, of the currency of a commercial nation of 70,000,000 by a popular assembly partly composed of ignorant and venal negroes, whom the two adverse interests accuse each other of purchasing for cash. Cobden did not foresee this, and would not have believed it; why should he?

THE AMHERST ECLIPSE EXPEDITION TO JAPAN.

HONOLULU, May 24, 1896.

AFTER fifteen days of voyaging over the lonely Pacific Ocean, the rugged cliffs and peaks of the Hawaiian Islands broke the ocean horizon with a serrated welcome. The *Coronet* came to her anchorage in lovely Honolulu harbor late in the evening of May 10, and the next morning showed calm water all about, many vessels at anchor (our nearest neighbor being the United States steamship *Adams*), ranges of precipitous mountains, and the city lying at their feet, while sunshine almost tropical in its warmth reminded us of our latitude, as the Southern Cross had done the night before. While the scientific gentlemen became immediately absorbed in details of work, others of the company were more interested in the immense eruption of Mauna Loa, which had been in progress for more than two weeks on the island of Hawaii; and during the *Coronet's* stay at Honolulu, a secondary trip was planned to the volcano. The weekly steamer sailed the next day for the voyage of 270 miles, and, quite as if they had not just come from more than 2,000 miles of ocean travelling, the *Coronet's* party gayly embarked on the steamer *Hall* for Hawaii. The forward deck of the *Hall* contained a motley but most interesting crowd of passengers. Chinese, Japanese, native islanders, Portuguese, and every conceivable half-breed combination were lying about

in picturesque confusion. Small Japanese babies with their shaved heads and hair fringes, Chinese infants with their queues, diversified the scene where the deck was so thickly covered with the various reposing nationalities, all in their native attitudes, that stepping-room was out of the question.

No one who has not visited the islands can properly appreciate their remoteness from one another. The map appears to indicate the little group as lying close together, perhaps an hour or two's sail apart. But the steamer takes two days and a night to go from Oahu, on which Honolulu is situated, to Hawaii, where are Mauna Loa and Mauna Kea and Kilanea. The scenery of the different islands passed was unusual and impressive—Molokai and Lanai, with their cliffs and ravines, and Maui, with a wonderful sunset light on its red-lava mountain slopes and bright green sugar-cane fields. By the courtesy of the purser we landed on Maui at the little town of Lahaina, for an hour or two—a purely native town, full of cocoanut palms and strange vegetation, a fine beach, and curious houses. But the first interesting stop on Hawaii itself was the next day, at Kealahou Bay, where Captain Cook is buried and a monument stands on guard in his honor, shadowed by an enormous cliff over 400 feet high, and fronting a bay where the water is as clear and green as an emerald. It seemed odd to be able to telephone from any of these little native towns to all other places on the island, but a perfect telephone system is one of the blessings of this fair republic. The news about Mauna Loa was, however, discouraging. Every fresh reply over the wires was to the effect that its eruption was unmistakably over—no fire could be seen. But hope still lived that something might yet remain when we reached our port, at the foot of that great mountain, 13,700 feet high, whose base is so enormous and the slope so gradual that its true proportions are quite disguised. All day the rugged shores of Hawaii were skirted, the top of the superb mountain lightly veiled in mist, the coast a series of lava cliffs in which are caves where often native dead are buried, and where the surf breaks in tremendous walls of white, with spray flying high, and all the air filled with its resounding boom.

The landing was made at Punaluu in small boats through the surf—a very exciting trip, as the great breakers chased us from behind, raised us in a wild rush forward for a moment, broke themselves on the lava reefs on both sides, and still the natives kept calmly on, guiding the boat through the dangerous passages, taking each wave just right until we were safely brought up beside the little wharf, filled with a crowd of natives and Chinese, and one more jump brought us among them. It was here that the famous mud flood of 1888 swept down so rapidly that many inhabitants were killed, and miles of valuable land made useless. Farther up the coast we had passed the great lava flow of that year, when convulsions of all sorts stirred the island to its foundations. A tidal wave buried the Punaluu road deep in permanent breakers, and earthquakes moved houses quite off their foundations, and broke vases and china indiscriminately, so that now dining-room closets are fitted up like a ship's galley, with guards in front of every shelf. Fortunately, the lava flows very slowly—but a few inches a day—and there is plenty of time to remove goods and prevent any fatalities. The flow of 1881 went toward the town of Hilo, and, keeping steadily on its way, caused great depression in the minds of the inhabitants and the price of

real estate. Lands of ancestral memory were sold for a song. But when within three-quarters of a mile of the town, the Princess Ruth, a member of the old royal Kamehameha family, went out with a company of friends to appease if possible the wrath of Pele, goddess of fire. Bottles of brandy and gin, pigs, chickens, silk handkerchiefs and locks of hair were thrown into the sluggish stream with appropriate ceremonies, and the flow stopped the next day, dividing itself and dying out harmlessly. But the real estate could not be bought back by its former owners. Neither terror of Pele nor gratitude was sufficient for that.

At Punaluu, society seems to be in a state of primitive simplicity. After walking up to the little hotel through a path between lily-ponds bordered by rushes, no proprietor was apparent. Everything was open, all on one floor, doors and windows hospitably wide, beds carefully made, and not a soul in sight. So we took possession and slept calmly, a Chinaman preparing a delicious breakfast next morning. A short ride on the funniest little rusty toy railway imaginable, through a desolate lava country where white poppies bloomed lavishly, took us to Pahala plantation, where tons of fine sugar are made annually. The methods and machinery were of great interest, but horses were waiting, and an ancient stage took its burden, while the others rode the rough but capable horses of the region—the ladies riding man-fashion, in the style of which Kate Field approved when not carried to excess, and which is universal here. After the charmingly hospitable manner of the islanders, we were entertained at luncheon at the Kapapala Ranch, a garden of beauty in the midst of great barrenness; and here a vivid account of the great eruption was given—the summit crater (Mokuaweoweo), a lake of liquid fire, while two great fiery fountains played upwards from its midst more than 800 feet. From the depths of a heavy snow-storm the benumbed and half-fainting company watched through the night this gigantic spectacle and listened to the never-ceasing roar of the flames and the internal seething of this indescribable cauldron. And that was but a few days before, when ships at sea could view the pillar of fire on Mauna Loa's crest for 150 miles, and now it was all out and gone; not a breath more of this terrific energy, and only a calm summit reposing peacefully above, innocently laying its huge crest against the sky like any New England hill. But Kilauea remained, only about one-third the height of Mauna Loa, to be sure, yet always interesting and evidently preparing for an eruption of its own.

With much reluctance the plan of climbing nearly 14,000 feet into the air was abandoned, since the great sight had seethed itself into rest, and the Volcano House at Kilauea was made the objective point. The ride over lava, stiffened as it flowed into weird shapes and crawling circles, occasionally heaped into wild mounds, but always smooth and rounded—the *pahoehoe* of the islander—was one to be long remembered. Brilliant yellow and scarlet milkweed blossomed lavishly all along the way, standing decoratively against black lava backgrounds, while armies of brown butterflies looked as if they had escaped from some New England meadow to this strange and foreign scene on the uplands of Hawaii. The goddess Pele seems very fond of red, as naturally she might, since red flowers, red leaves, red berries, and red birds abound on the slopes towards her citadel. But she is a very jealous lady, and no flower or berry must be picked on the way up to Kilauea, for that would imply that one

admired them—and homage must be paid her first; otherwise she will send rain or other damper to the satisfaction of the traveller. No native would think of plucking anything on the way to the crater. Pele's particular flower, the *ohia*, grows on large trees, a magnificent fringe of scarlet, very tempting to the visitor. Towards evening a cloud of white steam indicated the nearness of Kilauea, and steam bursting out of holes and cracks in the ground all about, very hot and fringed with exquisite sulphur crystals, formed the suggestive approach to the Volcano House. Perched high on one wall of the enormous crater, the hotel commands the entire scene of desolate grandeur. A lake of black lava, $8\frac{1}{2}$ miles in one direction by $1\frac{1}{2}$ in the other, is surrounded by nearly perpendicular walls varying from 750 to 300 feet high, at one end of which a secondary crater sends out volumes of sulphur steam. Mauna Loa rises grandly towards the west, and, in the north, Mauna Kea raises its more rugged peak yet higher.

The descent into the crater, on the sure-footed horses, is a memorable experience. Back and forth the narrow path winds, down the wall, through masses of ferns and foliage, until the great cliff behind shuts out half the sky, and high up from its thick verdure a single bird-song came out airily into the dewy morning. But the lake was unspeakable desolation, with its black lava in writhing, curling, creeping masses as far as the eye could reach, growing hotter to the feet as the steaming crater was approached, until a stick thrust slightly into a crack came out in flames. Strange contradiction of this fast-dying nineteenth century, a telephone wire crosses this Hades of desolation, and, though useless now, once served to connect the Volcano House with a little house close to the active crater. But, in the picturesque language of the natives, "it was eaten up by the fire"; that is, the hot lava walls caved and the little house fell in one day. The lake is full of "blow-holes" in this region, too frightfully hot to stand near, and every tiniest crack sends out heat like a register in winter when the furnace below is red hot—only in Kilauea one may not send down impatiently to know why the furnace drafts have been forgotten. The crater is a bewildering mass of tumbled lava, hissing sulphur steam and unbearable heat. Another great eruption like that of last January is daily expected, but did not break out before we left. The dreary grimness of a slumbering but restless volcano is beyond any words to express. One morning the whole crater, lake and all, was filled with mist and showers, while the early sun shone brilliantly elsewhere, and a superb rainbow arched the great black pit with heavenly radiance.

Kilaueaiki, near by, is well worth the walk through ferny uplands. Another lake of dead lava sunk more than seven hundred feet into the woods, and about a mile across, the great bowl has nearly perpendicular sides, heavily wooded, at the bottom of which wild goats browse. This crater has never been active in historic times. If space permitted, much might be said of the beautiful and tropical road to Hilo, on the other side of the island from Pahala, where rains are almost constant, where coffee is being extensively raised as a probably very successful experiment, and where many curious sights and people may be seen, and of the royal native luncheon made for us on our return by the hospitable friends at Kapapala Ranch, where young pig and chicken wrapped in leaves and roasted under ground, with *poi* in various forms, were the

chief articles on the table. Out again from the jet-black lava sand beach, where pure white surf breaks through the tumbling waves to the steamer anchored beyond, and the return journey was begun. At Kealahou Bay, Miss Kate Field came on the steamer, looking very ill, and, as she said, quite worn out with interminable riding over lava beds, and visits at native houses, searching for material in her exhaustive study into the condition of the islands. She wanted me to sit by her for awhile in her state-room, which I did, and had a very lively conversation with the brilliant but evidently very ill writer. A friend accompanied her as far as the next stopping-place, but otherwise she was quite alone, and the physician of our expedition found her well along in an attack of pneumonia, which must have begun several days before. He worked over her for some time, and was with her all night, but told us in the morning that she would probably not live twenty-four hours. She herself had no idea of her condition, and it devolved upon me to tell her, and to take her last messages and the addresses of friends. By constant stimulants she was kept alive through the day and until we reached Honolulu, but she died within an hour after landing. She had made many friends in Honolulu, who filled the church for her funeral and heaped the luxuriant island flowers about her as she slept. Much of her latest material was left in such form that it cannot be used. She tried to dictate somewhat to me at the last, but her mind continually wandered, and "it will need a lot of editing" seemed to be the burden of her thought.

Honolulu has been more than hospitable to the Expedition, and it is with general regret that the *Coronet* sails off to-morrow toward Japan, even though it is another sunny land, full of friendliness and flowers.

MABEL LOOMIS TODD.

THE PARIS SALONS.

PARIS, May, 1896.

AT this season I am ready to agree with Chassagnol, in the Goncourts' 'Manette Salomon,' that it would be well to discourage some few thousand painters a year. The impression made by the galleries in London is only confirmed by the salons in Paris. Far too many men nowadays play at being artists, or, what is worse, try to wrest an income from art. The exhibition is at the root of the evil; and the evil has grown to such proportions that it threatens to kill the exhibition. Already the French critic is asking, Will there be any more big picture shows in the twentieth century? The need to produce a novelty, startling if possible, as regularly as the horse-chestnuts blossom in the Champs-Élysées and along the Boulevards, has all but exhausted the resources of talent. Genius, fortunately, has seldom stooped to the annual struggle for the *réclame* of a day.

In the old Salon the "interval of fatigue," as I have heard it called, has led to so inevitable a monotony—each new show being but a repetition of the last—that I think I could have described this year's pictures before ever I had looked at them. I could have answered for the supremacy of M. Rochegrosse among the manufacturers of the huge machine, even without seeing his 'Angoisse Humaine,' with its fatuous, if well drawn, pyramid of men and women in modern dress, striving, their arms uplifted, to reach an iridescent figure floating in the sky above, and symbolizing—who cares what? I could have known that M.

Gervais's subject would be an excuse for a study of the nude in brilliant light, though I doubt if I should have foreseen that the painter of the "Three Maries" of a few years since would condescend to anything so vulgar as the ceiling whose ultimate destination the Catalogue does not disclose. I could have called attention to the expected horrors and bloodshed. I could have pointed out the correct commonplace in the portraits of M. Bonnat and M. Benjamin Constant, the vapid classicism of M. Bouguereau, the wasted seriousness of M. J. P. Laurens and M. Gérôme, the ivory flesh and vague shadows of M. Henner. For are not these things as inevitable in the *Champs-Élysées* as splendor and color in the Louvre? Indeed, I could have declared with certainty that the exceptions in the vast array of misdirected industry were M. Poitelin's poetic sketches of barren heath and moorland; the romantic landscapes of M. Français and M. Harpignies, still true to the traditions of 1830; the woodland idylls of M. Fantin-Latour; the paintings of foreigners, more especially of Americans and Englishmen. It is not surprising that, in Paris, voices are heard lamenting the disappearance of French art in the cosmopolitan invasion! The pictures to catch my eye were Mr. Bisbing's landscape with cattle, Mr. Loeb's portraits, Mr. Pierce's shepherds, Mr. Picknell's long straight road through open country, Mr. Inness's old garden, Mr. Dodge's ceiling for the Washington library, which, if not very original, is at least a model of restraint compared to M. Gervais's light and nakedness run mad; while I regretted not finding Mr. MacEwen in his accustomed place. Or else it was Mr. Orchardson's "Young Duke" that arrested me, or Mr. Lorimer's "Mariage de Convenance," a work I have already described when it was shown in London.

So, also, with the sculpture. M. Frémiet's "St. Michel" has something of the elegance, something of the dainty swagger, of his Joan of Arc in the Place des Pyramides. M. Falguère has set all Paris talking by his "Danseuse" (an entirely nude and very modern figure), not because of its merit, but because, as a portrait of a popular ballet-dancer, it has given every one, from the wit of the *Journal* to the poet of the *Courrier Français*, a chance to exercise his ingenuity in gossip or in verse. But there is nothing that comes more legitimately by success than Mr. MacMonnies's two contributions: the fine, dignified Shakspeare after the Droeshout portrait already seen in the statuette of last year, and the "Venus and Adonis," which I wish he had called by another name. For, if it is very charming as a group, very refined and masterly in the modeling, the woman who stands with so much coquetry, so much jauntiness, by the side of the beautiful youth is not Venus, but a *cocotte*, a model of the *quartier*. However, a name that offends merely one's associations matters less when the work has unquestioned charm and distinction.

At the Champ-de-Mars I find the general fatigue, the general exhaustion, still more marked, for the simple reason that it is but a very few years since the new Salons made so promising and brilliant a beginning. But the artist is not an automaton warranted to grind out a masterpiece with unflinching punctuality. Mr. Whistler does not exhibit, though never was his influence more strongly felt; neither does M. Alfred Stevens, nor M. Carrière, too busy probably with his own show in the Salon de l'Art Nouveau, nor M. Lhermitte. Again, a fashionable fad, dependant for success upon

its freshness, cannot outlive more than a couple of seasons. There is no new sensation, and mysticism has degenerated into absolute childishness with M. Léon, into a poor copy of Botticelli with M. Point; the religious excitement is so wholly spent that M. Binet is reduced to the expedient—blasphemous surely to the devout—of representing Mary Magdalen quite naked as she weeps over the dead Christ, and M. Jean Béraud gives up the Scriptures altogether to preach, presumably, a social sermon. But though "La Poussee" draws the crowd as he meant it should, I doubt if any one, if he himself, could explain just what is intended by the sudden raid of the rabble upon an elegant dinner party painted with a tedious elaboration and a tightness enchanting to the multitude, disheartening to the artist! M. Dagnan-Bouveret, it is true, has chosen a religious subject, and with very conspicuous results, for his Last Supper is one of the largest canvases in the exhibition. But he has not relied upon eccentricity of treatment for his effect—content rather to be scrupulously conventional in arrangement and costume. The color is unpleasant, and the concentration of glaring yellow light upon the central figure theatrical; the Christ seems far too effeminate, the pose of the Apostles far too self-conscious and photographic. But, at least, it is a sober, dignified piece of work that commands respect to-day even if it be forgotten to-morrow.

Portraits, usually, are painted to fulfil a definite commission rather than to snatch a chance notoriety, and their greater excellence is therefore easily accounted for. It is among the portraits, however, that Englishmen and Americans are here preëminent. Of course, many of the French or Continental painters whose portraits one always seeks are not absent: M. Bernard, with the half-length of a lady in yellow seen in brilliant light; M. Aman-Jean, to whom once more each sifter has proved the motive for a lovely harmony of color; M. Boldini, as always undeniably clever, but yielding to his mannerisms, until now his Princesses and Countesses wear gowns slipping so swiftly from their shoulders and drawn so tightly about their legs that one can but look with apprehension; M. Blanchet, with a large, vigorous presentment of M. Thaulow, the Norwegian artist, and his family; M. Zorn, so uncompromisingly realistic that he does not hesitate to show himself on canvas as big and burly as the typical butcher; M. Gandara, who, for sake of variety, has turned his tremendous dexterity to the painting of a pink satin gown instead of the long familiar white. And there is one lesser known man, M. Simon, who, of a portrait group, has made a decorative panel (his name for it) which, could he have lent it the charm of color, would be one of the most distinguished pictures in the show. But quite as striking as these canvases, perhaps more so, is the work that comes from Glasgow: portraits by Mr. Guthrie, Mr. Lavery, Mr. Walton, Mr. Cameron, of which I need say no more, since I did them full justice when they were exhibited in one or another of the London galleries. Miss Cecilia Beaux's delightful arrangements in white are counted among the year's triumphs, even by the French critic who resents the foreign encroachment. No one has made a more distinct advance than Mr. Humphreys-Johnston with his portrait of his mother. It may be that the stately white-haired lady in black, seated gracefully on a green couch, might never have been painted just as she is had there been no Whistler. But Mr. Johnston has had, first of all, the intelligence to accept a good master, and next the

artistic sense to adapt and not copy too slavishly that master's methods. The picture has a dignity and repose conspicuous where restlessness and eccentricity are prevailing features. Again, you recognize the Whistlerian influence in Mr. Alexander's lady in rose and black, his one contribution this year, in Mr. Herter's Japanese fantasies, even in Mr. Sargent's "Graham Robertson, Esq.," from last spring's Academy. But Mr. Sargent, in his turn, has been the inspiration of Mr. Dana's "Otero," the Spanish dancer, who, though arrayed in vivid green, is reminiscent to her own loss, of the golden "Carmencita" of the Luxembourg. Were there space I should speak also of Mr. Melchers and of two younger men, Mr. Cushing and Mr. Hopkinson, whose portraits are still immature, but give hope for the future.

The landscapes are not wonderful. M. Cassin, M. Billotte, M. Griveau are interesting, but—I say it with hesitation—monotonous. M. Bernard, M. Sisley, M. Eliot are brilliant, but with a brilliancy that has grown too familiar for further criticism. There are amusing impressions of Paris streets, rendered as none but M. Raffaëlli can render them; marines by Mr. Harrison, skilful, but their variety in danger of being staled by custom; and the Norwegian streams and snows that Mr. Thaulow paints with more truth than poetry. The fact is that, in outdoor work, there is nothing very remarkable unless M. Puvis de Chavannes's ideal and decorative landscapes can be so classified. These are the five large panels for the Boston Library—Virgil, Homer, Æschylus, History, and Astronomy. It cannot be repeated too often that one never knows what is in M. de Chavannes's work until it is seen in the place for which it is designed. I shall restrict myself, then, to the statement that the decorations, where they now hang, strike me as more rhythmical in line, more tender and yet splendid in color, than last year's panel. I seem to recognize many of the figures, much as one recognizes again and again the angels of Perugino or Botticelli's maidens, who, no doubt, were too lovely to be confined to a single wall or decoration. But I can remember nothing else by the same artist as rich and glowing as the Æschylus, with its deep blue sea that surrounds the lonely rock where Prometheus hangs; the tragedy not grim but made beautiful by the classic serenity of the scene.

Besides showing these designs, M. Puvis de Chavannes has filled a large room with his sketches and drawings—an important collection, explaining, as it does, the painter's methods of study and work. But it deserves not merely a gallery, but an article to itself. And this brings one face to face with what is at once the great attraction and the great drawback to the Champ-de-Mars Salon. Year by year it is becoming less an exhibition than a collection of exhibitions. M. de Chavannes is not alone in holding a special show of his own. Another room is reserved for Mr. Abbey's Shakspeare drawings. Those who have seen only the illustrations as they appeared in *Harper's* can have no idea of the delicacy and strength of the originals. The knowledge they reveal is amazing; architecture and landscape are as carefully studied as figures and costume, while the composition is far more decorative than the stilted primitiveness so assiduously cultivated under that name in Birmingham. Mr. Abbey, in Paris as in London, has scored an enormous success. M. Paul Renouard, an illustrator as clever in his particular field, has a third room; M. Deabols, the sculptor, a fourth; M. Dubufe a fifth. It is simply the

possible to devote to each the notice he deserves.

Were it not for M. Desbois and for M. Rodin, who sends several marvellous impressions in marble, the sculpture would be sadly insignificant. Black-and-white has lost not a little of the vitality which for the last few years has made it so important a section of this Salon. M. Lepère, however, convinces one of the scope of his powers by showing his wood engravings and woodcuts side by side. There are dry-points by M. Helleu, etchings by M. Blancha, lithographs by M. Lunos, lithographs printed in color by M. Rivière, M. Charpentier, and M. Roche; these last two using a new process of stamping for which they have found the name *Lithographie gaufrée*. Mr. McCarter's drawings for the Green Tree Library edition of Verlaine are here, and also his Easter designs published in *Scribner's*. And of the master whom he has studied with so much sympathy, M. Carlos Schwabe, there are two examples, less satisfactory in some ways than others exhibited in the past. M. Vallotton, quite unaccountably, is among the rejected. Pastels and water-colors are not very notable, though in the one medium "Gyp" has an amusing portrait, as full of character as it is indifferently drawn and modelled; and in the other Mr. Albert E. Sterner has some good sketches. Two other American painters who give promise are Mr. Kendall, with a large study of the nude, and Mr. Lambert with several landscapes. N. N.

UNPUBLISHED LETTERS OF THOMAS PAINE.

LONDON, May 18, 1896.

THE following letter (the original of which has just come into my possession) is of both personal and historical interest. It was addressed to "Thomas Walker, Esq'r, Rotherham, Yorkshire." In the corner, beneath the address, he wrote, "Single Sheet" (it is on large foolscap), and on the reverse is the endorsement, "T. Paine, Esq'r, Mch. 12, 1789," this being probably by Walker, and showing the date of his reply. Half of a large seal remains which leaves (apparently) part of a P, and there is a post-office mark. Mr. Foljambe, whose letter is quoted, was a nephew of Sir George Saville, and lived three miles from Messrs. Walker's iron works, where the large arch of Paine's iron bridge (110 feet) was constructed for exhibition at Paddington Green, London.

The political part of the letter relates, as will be seen, to the exciting constitutional question which arose in the autumn of 1788, as to the condition of the three estates of the realm under the incompetency of George III., who had become insane. Pitt maintained that the King's authority had not lapsed, but that the two Houses had a right to devise means for the representation of that power by a Commissioner. The Whigs maintained that the royal authority passed to the Prince of Wales by hereditary right, and that the two Houses had no right to legislate at all without the King, whose seal would be "forged" if attached to any act by any non-royal hand. Pitt carried his point, but it was a *reductio ad absurdum* to select the Prince (the man most odious to the people) to be the "Commissioner," with restricted powers, if, as the Tories contended, he had no more claim to be Regent than any private individual. It is sufficiently curious to find Paine arguing the superior right of the Prince, but it will be seen that his constitutional position was con-

sistent: the two Houses, unable to act without the throne, could deal with the matter (as in 1689) only as the nation itself in action. But the nation had not elected either House, and they were, Paine thought, usurping an authority belonging only to a national convention.

LONDON, February 26, 1789.

DEAR SIR.

Your favour of the 23d is just come to hand, for which I thank you. I wrote to the President of the Board of Works last Monday, wishing him to begin making preparations for erecting the arch. I am so confident of his judgment that I can safely rely on his going on as far as [he] pleases without me, and at any rate I shall not be long before I revisit Rotherham.

I had a letter yesterday from Mr. Foljambe, apologizing for his being obliged unexpectedly to leave town without calling on me, but that he should be in London again in a few days. He concludes his letter by saying—"I saw the Rib of your Bridge. In point of elegance and beauty it far exceeds my expectations, and is certainly beyond anything I ever saw." You will please to inform the President what Mr. Foljambe says, as I think him entitled to participate in the applause. Mr. Fox of Derby called again on me last evening respecting the Bridge, but I was not at home. There is a project of erecting a Bridge at Dublin, which will be a large undertaking, and as the Duke of Leinster and the other Deputies from Ireland are arrived, I intend making an opportunity of speaking to them on that business.

With respect to News and Politics, the King is certainly greatly amended, but what is to follow from it is a matter of much uncertainty. How far the nation may be safe with a man of a deranged mind at the head of it, and who, ever since he took up the notion of quitting England and going to live in Hanover, has been continually planning to entangle England with German connections, which, if followed, must end in war, is a matter that will occasion various opinions. However unfortunate it may have been for the sufferer, the King's malady has been no disservice to the nation: he was burning his fingers very fast in the German war, and whether he is enough in his senses to keep out of the fire is a matter of doubt.

You mention the Rotherham Address as complimenting Mr. Pitt on the success of his administration, and for asserting and supporting the Rights of the People.

I differ exceedingly from you in this opinion, and I think the conduct of the Opposition much nearer the principles of the constitution than what the conduct of the Ministry was. So far from Mr. Pitt as asserting and supporting the Rights of the people, it appears to me taking them away. But as a man ought not to make an assertion without giving his reasons, I will give you mine.

The English nation is composed of two orders of men, Peers and Commons—by Commons is properly meant every man in the nation not having the title of Peer—and it is the existence of those two orders, setting up distinct and opposite Claims, the one hereditary and the other elective, that makes it necessary to establish a third order, or that known by the name of the Regal Power, or the Power of the Crown.

The Regal Power is the Majesty of the Nation collected to a center, and residing in the Person exercising the Regal Power. The Right, therefore, of the Prince is a Right standing on the Right of the whole Nation. But Mr. Pitt says it stands on the Right of Parliament. Is not Parliament composed of two houses, one of which is itself hereditary, and over which the people have no controul, and in the establishment of which they have no election, and the other house, the representatives of only a small part of the Nation? How then can the Rights of the People be asserted and supported by absorbing them into an hereditary house of Peers? Is not one hereditary power or Right as dangerous as the other? And yet the Addressers have all gone on the Error of establishing Power in the house of Peers,—over whom, as I have already said, they have no controul,—for the inconsistent purpose of opposing it in the prince, over whom they have some controul.

It was one of those cases in which there ought to have been a National Convention elected for the express purpose; for if government be permitted to alter itself, or any of its parts be permitted to alter the other, there is no fixed constitution in the country. And if the Regal Power, or the person exercising the Regal Power, either as King or regent, instead of standing on the universal ground of the Nation, be made the meer [sic] creature of Parliament, it is, in my humble opinion, equally as inconsistent and unconstitutional as if Parliament was the meer creature of the Crown.

It is a common Idea in all countries that to take power from the Prince is to give liberty to the people, but Mr. Pitt's conduct is almost the reverse of this—his is to take power from one part of the government to add it to another, for he has increased the power of the Peers, not the Rights of the People.—I must give him credit for his ingenuity, if I do not for his principles; and the less so because the object of his conduct is now visible, which was to [keep] themselves in pay after they should be out of [favor] by retaining, thro' an Act of Parliament of their own making, between four and five hundred thousand pounds of the Civil List in their own hands. This is the key of the whole business, and it was for this, and not for the Rights of the People, that he set up the Right of Parliament; because it was only by that means that the spoil could be divided. If the restriction [on the Prince Regent] had been that he should not declare war, or enter into foreign alliances without the consent of Parliament, the objects would have been National, and have had some sense in them, but it is that he should not have all the money.—If Swift was alive he would say, "8—on such Patriotism."

How they will manage with Ireland I have had no opportunity of learning, as I have not been at the other end of town since the Commissioners arrived. Ireland will certainly judge for itself, and not permit the English Parliament or Doctors to judge for her.—Thus much for Politics.

I very sincerely congratulate you and the families on the probable recovery of Mrs. Jon^s. Walker, and hope soon to have the pleasure of seeing you all hearty, happy, and well. I write by the return of the Post that it may come to hand before you receive the final orders of your Commanding Officer; and as I have written it all off at a dash, and have to go out to dinner at the other end of the town, I do not hold myself responsible for Errors.

With sincere respect to all the families, and in hopes of seeing you in London before I set off for Rotherham, I am, D^r Sir, your sincere friend and humble servant,

THOMAS PAINE.

Mr. Whiteside's Compt^r.

Paine's office in London was in No. 18 Broad Street Buildings (City), the establishment of Peter Whiteside (of Philadelphia), merchant, whose failure fell so heavily upon the author and his bridge enterprises.

Paine's reference to Ireland will be remarked. He afterwards visited that island, and I have a draft, in his writing, of the beginning of a note (1788) as follows: "I have the honour of presenting to the gentlemen present a letter I have received from the United Irishmen of Dublin informing me of my having been elected an honorary member of their Society. By this adoption of me as one of their body I have the pleasure of considering myself on their" (the rest is wanting).

One more letter I will add, as it has never appeared except in Lanthomas's translation of Paine's 'Decline and Fall of the English System of Finance.' I recently found in the National Archives at Paris a copy of it in French printed by order of the Council of Ancients, April 27, 1796:

CITIZENS: I present you with a small work entitled *The Decline and Fall of the English System of Finance*, in which I have explained and exposed the finances of your principal enemy, the government of England. If I have any capacity in judging of circumstances, and from thence of probable events, the fall of that government is very nearly at hand.

The condition in which that government finds it-

self at this moment is curious and critical, and different to anything it ever experienced before. It is now pressed by two internal and formidable opponents that never appeared during any former war. The one is, the great and progressive change of opinion that is spreading itself throughout England with respect to the hereditary system of government. That system has fallen more in the opinion of the people of that country within the last four years than it fell in France during the last four years preceding the French revolution. The other is, that the funding system of finance, on which the government of England depends for pecuniary aid, is now explaining itself to be no other than a governmental fraud.

In former wars the government of England were supported by the superstition of the country with respect to a nominal non-existing thing which is called a *constitution*; and by the credulity of the country as to the funding system of finance. It was from these two popular delusions that the government of England derived all its strength, and they are now deserting her standard. When this monster of national fraud and maritime oppression, the government of England, shall be overthrown, the world will be freed from a common enemy, and the two nations may count upon fraternity and a lasting peace.

THOMAS PAINE.

It was the opinion of William Cobbett that official maltreatment of an humble exciseman, Thomas Paine, cost England her American colonies. However extravagant that may seem, there is little doubt that the outlawry of the author of the 'Rights of Man,' in 1792, not only broke the Bank of England in 1797, but founded that traditional hatred of French progressives for England which, as radicalism acquires power in France, amounts almost to a one-sided *vendetta*. Yet were Paine alive today, the general constitution of his native country would probably come nearest his ideas of republican government.

MONCURE D. CONWAY.

Correspondence.

A CORRECTION.

TO THE EDITOR OF THE NATION:

SIR: The following words appear in the *Nation* of March 26, reviewing the *Transactions* of the Asiatic Society of Japan: "But his [Clay MacCauley's] discourse on 'Silver in Japan' is not considered orthodox enough to go in as a body article, and hence is printed in small type in the appendix."

The reviewer must have been more than usually careless in glancing through the "Transactions" even for the purpose of review. The author of the discourse on "Silver in Japan" is not Clay MacCauley, and it was not printed in the appendix because it lacked orthodoxy, but because it was only an address or lecture, and not a regularly prepared paper submitted before reading to the council. A lecture or address is always supposed to be printed in the appendix. The same number of the "Transactions" contains a lecture (also in small type) in the appendix by Prof. Chamberlain, whose orthodoxy on the subject of the Japanese language has not, I believe, been questioned.

GARRETT DROPPERS,

Corr. Sec'y of Asiatic Soc. of Japan.

TOKYO, May 11, 1896.

[We cannot explain away our inadvertence.—ED. NATION.]

Notes.

T. FISHER UNWIN, London, announces a work

on 'The London Burial-Grounds,' by Mrs. Basil Holmes, "written in a chatty style."

Flood & Vincent, Meadville, Pa., are about to bring out a new edition of Mr. W. C. Brownell's 'French Traits'; 'The Growth of the French Nation,' by Prof. George B. Adams of Yale; 'A Survey of Greek Civilization,' by Prof. Mahaffy; 'A History of Greek Art,' by Prof. Frank B. Tarbell of the University of Chicago, and 'A Study of the Sky,' by H. A. Howe of the University of Denver.

The Peter Paul Book Co., Buffalo, will soon publish 'The Diary of a Peculiar Girl,' by George Austin Woodward.

From the *Bollettino* (May 15) of the National Central Library in Florence, it appears that the Du Rieu-Sijthoff project of reproducing MSS. cannot be carried out as respects the *Æschylus*, *Virgil*, and two *Tacitus* MSS. in the Laurentian Library at Florence. The *Æschylus*, indeed, has already been published by this library, and the rest it will now take in hand, preferring not to concede the privilege to others. The same number of the *Bollettino* registers the gift to the National Central Library of a great collection of more than 20,000 engraved portraits gathered by Prof. Antonio Buonamici of Pistoia. They are arranged partly by nationalities, partly by categories.

In the revival of present-century classics, a reprint of Carleton's 'Traits and Stories of the Irish Peasantry' was deservedly undertaken and has been carried out with the taste and simple elegance common to the publications of J. M. Dent & Co. (New York: Macmillan). The fourth volume, just issued, crowns the series, and one may now enjoy at his leisure "Phelim O'Toole's Courtship," "Shane Fad's Wedding," "Larry McFarland's Wake," "The Party Fight and Funeral," and all the other inimitably humorous and historically truthful pictures of Irish peasant life and character. From the same source we have two more volumes of the Balzac translations, 'The Unknown Masterpiece, and Other Stories,' and 'A Bachelor's Establishment,' each with an introduction by Prof. Saintsbury; and three volumes of a translation of Daudet's works, his 'Kings in Exile,' 'Tartarin of Tarascon,' and 'Tartarin on the Alps'—charming volumes in gray linen with a pale-blue flowered stamp, the illustrations not quite up to the rendering of the originals, the versions by different hands, and none masterly.

Macmillan Co. publish for the American Economic Association a valuable reprint of the letters of Ricardo to J. R. McCulloch from 1816 to 1823, edited with excellent notes by Dr. J. H. Hollander of Johns Hopkins University. It is interesting to remark that McCulloch was affected by the idea, now prevalent in some parts of our country, that national debts ought to be scaled down when the price of grain falls. The discussions are abstruse, but by no means without present application.

A valuable contribution to the history of taxation is made by Mr. Edwin Cannan in his 'History of Local Rates in England' (Longmans). The matter is, of course, excessively technical, and possesses principally antiquarian interest, but Mr. Cannan endeavors to connect it with modern conditions by confining his exposition to such facts as throw light upon the two great characteristics of the English rating system which give rise to most complaint. These are the facts that rates are paid only in respect of certain kinds of property, and are levied from the occupiers and not the owners of that property. The explanation is to be found in the circumstance that the levying of

rates was not originated by any central authority, but was the outgrowth of innumerable local customs, which were based on no uniform theory—hardly on any theory. Statutory enactments have, of course, much complicated the matter, which is in so chaotic a state as greatly to tempt the zeal of reformers.

In the same direction is Mr. Frederic C. Howe's 'Taxation and Taxes in the United States under the Internal Revenue System, 1791-1895' (New York: Thomas Y. Crowell & Co.). Mr. Howe very properly acknowledges his own debt, and that of every laborer in this field, to Mr. David A. Wells, "whose careful and scholarly investigations of almost every phase of the revenue experiences of the time, as well as the industrial aspects and influences of the same, are an inexhaustible fund from which to draw, and greatly alleviate the labors of those who may follow after him in a field which he has made completely his own." It is convenient to have the history of our internal-revenue system summarized, and Mr. Howe has done the work with evident care; but many of his inferences are of doubtful validity, and some of his theories are more than doubtful. His lamentations over the decision of the Supreme Court against the income-tax do not excite our sympathy. The idea that we may be hampered in some future emergency because we cannot tax incomes is preposterous. Provided the country has the necessary wealth, the Government will secure the necessary revenue if the people support it, without recourse to a tax on incomes.

The literature, if such it may be called, of the "Labor Problem" in Great Britain is assuming vast proportions. The recent report of the Royal Commission was as long as the moral law, and might well have sufficed for a generation. M. Paul de Rousiers, however, has thought it worth while to furnish his impressions on the subject to his countrymen, and Mrs. F. L. D. Herbertson has thought it worth while to translate them for the benefit of Englishmen, under the title 'The Labor Question in Britain' (Macmillan). It must be admitted that M. de Rousiers has produced a very readable volume, filled with entertaining incidents, and giving a comprehensive view of English industry. We may safely follow him in the conclusions that English workmen are better off than French, and that the general elevation of laborers constitutes the only true solution of the labor question. Socialistic measures, in the author's opinion, are not adapted to bring about this elevation, which has been proceeding rapidly in England under the influences of freedom.

A remarkable consolidation of our knowledge of magnetism has taken place during the past ten years. This has been due to a realizing sense of the value of Faraday's conception of lines of magnetic force, and to the application of quantitative measurements to them. When the trolley car was first used, it was feared that the watches of the passengers would be magnetized by the motors of the car. If this had happened, the electric railroads would speedily have become bankrupt, for the stray lines of magnetic force which could magnetize the passengers' watches would indicate a very uneconomical design of electric motor. Their magnetic circuits would have had a great air resistance, and the magnetic field which must be generated in order to propel the car would have been proportionately weak. We have come to speak of the magnetic circuit just as we had hitherto spoken of the electric circuit. The resistance of iron in a

magnetic circuit is very small because a large number of lines of force can be urged through it. The resistance of air, however, is large. In designing dynamos and electric motors, care is taken to have a magnetic circuit of small resistance, in order to avoid the straying of lines of magnetic force out of the field where they are needed to effect the proper transformation of energy. Dr. H. Du Bois's treatise, 'The Magnetic Circuit in Theory and in Practice,' translated by Dr. Atchison (Longmans), is a lucid account of the growth of our systematic knowledge of the magnetic field; and it may be called at present the classic on this important subject.

Prof. Francis B. Crocker, author of 'Electric Lighting' (D. Van Nostrand Co.), believes that this mode of lighting has now reached a sufficient degree of perfection to warrant the preparation of a treatise which will not be out of date even before it is published. The dynamo admits of very little further improvement, and is now one of the most efficient of modern machines. Then, too, the present systems of distribution of lights, the methods of wiring, and the safeguards will probably remain unchanged in their main characteristics. Prof. Crocker, indeed, calls attention to the striking fact that, among all the important features of an electric-lighting system, the steam engine is the one which is being modified the most. He discusses the various sources of electricity, and shows that steam is still the chief. He has little faith in recent endeavors to obtain electricity directly from coal, and in this connection he touches upon the use of carbon in a fused alkali—a process which is now attracting attention in certain quarters. He describes only those machines which experience has proved to be useful, and his suggestions and criticisms possess a peculiar value, for he not only has taught the theory of the dynamo, but has also, in collaboration with Mr. Wheeler, produced one of the most efficient dynamos now used in the arts. The present volume is principally devoted to the generating plant, and will probably be followed by another on the various systems of electric lighting.

Why was Paderewski able to earn \$247,000 in five months while most other pianists barely make enough to pay expenses? His technique is no better than that of several other pianists now in the field; his superiority lies entirely in the fact that he plays with expression, and therefore touches hearts which others leave cold. The same lesson was taught by Liszt and Rubinstein; yet music-teachers continue to devote 99 per cent. of their pupils' time to mere technical exercises which are as insufficient to make a real pianist as mere erudition is to make an author. Whoever shall write a perfect treatise on the art of musical expression will erect for himself a lasting monument. Pending the appearance of such a book, students may derive considerable advantage from C. A. Ehrenfecker's 'Delivery in the Art of Pianoforte Playing' (Scribners). It treats lucidly, in sixty pages, of the questions of accentuation, phrasing, and tempo. While fault may be found with the fact that all the examples are taken from Beethoven's sonatas (in which there is less opportunity for expression than in the works of Chopin and Schumann), the writer's remarks are usually sound, and will be useful to all who are not born musicians. The following will serve as an example: "The most common fault with regard to tempo is to play slow movements not slow enough and quick movements not quick enough. The first is mostly due to a want of power of correct perception and true musical feeling.

The second most generally is due to insufficient technical qualification." The author's substitution of "non-legato" for "semi-staccato" (p. 44) is a palpable absurdity.

Prof. Albert Barrère's 'Dictionary of French and English Military Terms,' Part II., French-English (London: Hachette; Boston: T. H. Cator & Co.) is a thin little volume of which the execution merits much praise. It is, over and above the definitions, a mine of practical information respecting the French military service. Under *école* we meet with an enumeration of the several institutions scattered over France, with their special training; under *maréchal* is given the legal limit on the number of marshals; under *mariage* (of officers) the consent of the secretary of war and a marriage portion are reported necessary, etc. The appendix supplies much statistical matter respecting the headquarters of army corps, ordnance, small arms, pay, pensions, court-martials, etc.

Those who wish to comprehend the political situation in France will derive assistance from a little book by M. Léon de Seilhac entitled 'Le Monde Socialiste; Groupes et Programmes' (Paris: Armand Colin et Cie.). Besides some minor factions the Revolutionary Socialists are divided into three sections—the Allemanists, the Broussists, and the Guesdists. There are other Socialistic parties or groups, concerning all which and their plans M. de Seilhac gives a discriminating account.

A monthly journal, *What to Eat*, will be started in July by Pierce & Pierce at Minneapolis (New York: Tribune Building). A novelty will be the restriction of advertising to what pertains to "food, drink, table furnishings, or table decorations."

The fore-matter of the *Harvard Graduates Magazine* for June possesses an unusual degree as well as evenness of interest. Mr. Robert S. Peabody discusses the university grounds and buildings with reference to their haphazard disposition, in the absence of any controlling scheme of landscape gardening and architecture. He lays a proper stress on the one great opportunity yet left in this direction by connecting the college territory immediately with the Charles River, towards which the gift of Soldiers' Field is more and more forcing the pent-up athletes. Historically he might have added that this proposition is nearly ten years old, but still awaits the "some benefactor" invoked by Mr. Peabody. Mr. Edwin H. Abbot's sketch of the late Gen. Francis C. Barlow, reinforced by Gen. Miles's competent testimony, will do much to prolong the memory of that remarkable soldier, whose incredibly boyish face is pictured with the article. A fine portrait of the late Dr. Furness, by Gutekunst, accompanies a brief notice by the Rev. Charles G. Ames. Mr. Arthur Gilman shows what a wealth of historic association clusters about Fay House, the seat of Radcliffe College; and the Rev. E. E. Hale discourses pleasantly on the well-known portrait group of five living presidents and ex-presidents of Harvard, from Josiah Quincy to Dr. Felton. The anonymous writer of the observations "From a Graduate's Window" makes a proper criticism of the sad festival known as the Commencement Dinner; but it would be a pity to change the scene of it from Memorial Hall. The remedy is to reduce the attendance.

Prof. Skeat, in the *Academy* for May 30, attacks the current etymologies of the word *loop*, and leans to a Norse origin. He thinks "loop-hole" may be found to refer "to the course of light, as being a place where the light may leap in." "The sense of noose in a string is

later; it easily follows from that of a bore or hole in a wall. But there is a possibility that it meant 'running-knot.'" He might well have been reminded of a combination of these significations in FitzGerald's version of Omar:

"And Lo! the Hunter of the East has caught
The Sultan's Turret in a Noose of Light."

While the perennial interest in the history of the ill-fated daughter of Maria Theresa centres naturally in her tragic end, every new detail of her earlier life at the French court that comes to light reveals more fully the pathos of that period as well. M. Pierre de Nolhac's account of it, in the *Revue des Deux Mondes* for May 15, is in part derived from unpublished sources, and shows the fifteen-year-old Dauphine in a charming light. The idea that there should be any relation between the conduct of this child toward Mme. du Barry and Louis XV's attitude on the Polish question might have been a fruitful one for Scribe. Mme. de Campan, in her *Memoirs* (vol. i., chap. iii.), mentions among the ladies who met Marie Antoinette at Kehl, on the frontier, the Duchesse de Cossé, "sa dame d'atours." This is evidently an error, since M. de Nolhac relates the circumstances under which Mme. de Cossé's appointment took place nearly a year after the arrival of the young Archduchess in France. "Papa," she said to the King, "j'espère que vous me donnerez une de mes dames." "Non, sûrement," replied Louis, "et je compte que vous recevrez mon choix avec respect." It was after this conversation that Mme. de Cossé was appointed.

Petermann's *Mitteilungen* for April contains the conclusion of Baron von Oppenheim's account of his journey from Damascus to Bagdad. A description of the political divisions of South Africa is accompanied by a large map, in which we notice with some surprise the omission of Beira, the terminus of the Mashonaland Railway. Five years ago an unknown sand-pit, it is now a thriving port with large business houses and a weekly European mail, and is a place of call for half-a-dozen steamship lines. There is also a curious map so ruled as to show the time of the latest rising and earliest setting of the winter sun in nearly every part of Germany.

From an address recently delivered at Havre by M. Jules Gautier, representing the Minister of Public Instruction, it appears that a genuine revival has of late been witnessed all over France in the establishment and support of courses of instruction for adults and children above school age. Thousands of these courses are conducted in city and country districts, mainly by private initiative, encouraged and aided by the Government. More than this, the circumstances attending the movement in its present form (its beginnings date back more than thirty years, to the Ministry of Victor Duruy) seem to warrant the belief in its permanence and further growth. The speaker referred to the earlier history of similar enterprises in order to point out the injurious influence of Governmental interference with affairs in which liberty of action and unhindered adaptation to local wants are essential.

The Amherst Eclipse Expedition to Japan, under the direction of Prof. Todd, which left New York April 6, arrived at San Francisco ten days later, and sailed for Honolulu on April 25, in Mr. Arthur Curtiss James's yacht *Coronet*, reaching that port on May 10. The time at sea was utilised by different members of the expedition in adjusting and testing the operation of many of the newer instruments devised especially for the coming eclipse, which this expedition will observe on August

9 in the Hokkaido, or northern Japan. The Expedition sailed on May 25 for Yokohama, expecting to reach that port about June 20. Eight years ago the *Coronet* made the same trip in twenty-two days.

The excavations at Corinth of the American School of Classical Studies at Athens have been attended with as marked success as could be expected for the first year's campaign. The theatre has been discovered, lying ten or fifteen feet beneath the surface of the ground. Near the upper part of the cavea many archaic terracotta figurines have been found, indicating the neighborhood of a temple, probably of Aphrodite. A magnificent Greek stoa or passageway, east of the temple, is important in itself, and is another indication of the nearness of the agora. Since the discoveries afford the first fixed point for the study of Corinthian topography, they are manifestly of the greatest importance.

—The Century Co. have put forth a new edition of their *magnum opus* under the title of 'The Century Dictionary and Cyclopædia.' It is in ten consecutively numbered volumes, of which the last two comprise the former single-volume 'Cyclopædia of Names,' and are distinguished by the sub-title "Names" stamped on the back. Heeding a suggestion made by others, perhaps, as well as by ourselves, the publishers have filled out the half of vol. x. with a full array of maps, but have not, in these, sought after novelty or high excellence of execution. The several States of the Union are shown in detail, and will serve ordinary purposes of consultation while there is as yet a great deficiency in our atlases of the United States. But the maps have no index of names, and are themselves not numbered, dependence being placed on their alphabetical arrangement. The new volumes stand about one inch lower than the sumptuous original issue, and are as much less wide. They have, consequently, parted with some of their generous margins, and in quality of paper as in binding (which is very tasteful and serviceable) correspond to the endeavor to reduce the price of the work while sacrificing none of the essentials. Intrinsically, the Dictionary is more accurate, and hence more valuable, than when first published. The corrections are too numerous and minute to trace without enormous labor. They and a few insertions in the vocabulary have obviously been made without renewing the plates. The Names section in particular has been very extensively overhauled on the same condition. To sum up, for less money the public can now procure the Dictionary at its best, and that best is, among all completed dictionaries of the language, easily at the front. It does not supplant all the rest, but in daily practice we turn to it first and seldom without satisfaction. Until the completion of the Oxford and the Dialect Dictionaries, it is little likely that any rival will appear. For that reason, we hope that revision will still be the order of the day, and that another five years may witness a fresh edition, perhaps even cheaper than the present.

—In 'Money and its Relations to Prices,' (Scribners), Mr. L. L. Price undertakes an inquiry, by scientific methods, which the American people are obliged to answer by the method of universal suffrage. The book consists of lectures delivered by the author at University College, London, and bears the mark of careful preparation. After a review of the various "index numbers," and methods observed in preparing them, Mr. Price con-

cludes that, "within its limits, the index number, as generally constructed, is a useful, if not indispensable, instrument of economic and statistical inquiry, and that, within its limits also, it is an instrument sufficient for its purpose." He appears to favor the idea that rising prices "kindle the imagination and encourage enterprise," and that this tendency is greatly increased and intensified where the credit system prevails. From this he reasons that as employers are of the "debtor class," which represents the active, enterprising people "engaged in the production of fresh wealth," while the creditor class consists of the inactive and unindustrious who live on the wealth created in the past, it is beneficial to the community to have a rise of prices. The reasoning, of course, proves that prices must always be kept moving upward in order to maintain the benefit. So convinced is Mr. Price of the advantages of inflation that he maintains that it is on the whole for the interest of laborers that prices should rise. He is quite ready to adopt the view of Jevons—by whom he has been greatly influenced—that rising prices have the effect of "a discharge from his debts to the bankrupt long struggling against his burdens." This sentiment will be loudly applauded by many people in some parts of our country, and by some people in every part; but thoughtful people will insist on a satisfactory explanation of the method by which prices are to be kept always rising. They think not only of the prosperity, or fancied prosperity, accompanying a rise in prices, but also of the disaster and ruin, not fancied but real, that must inevitably succeed. Mr. Price's essay is very ingenious, but he does not consider this difficulty; and, so far as we have observed, he ignores the fall in the rate of interest—a fact of which the creditor class is painfully aware. It will be easy to controvert many of his statements; but his book is, with all its fallacies, worthy of examination.

—Mr. F. W. Bussell's 'The School of Plato' (London: Methuen & Co.; New York: Macmillan) is an extremely abstract survey of the course of Greek speculation from Thales to Plotinus, accompanied by copious reflections on the necessity that an acceptable philosophy should meet the yearnings of the individual soul for happiness or peace, and on the failure of many ambitious modern systems in this regard. The writer has evidently studied his Pater, his Burnet, and his Zeller, and is not unacquainted with the sources. His reflections on the systems that glimmer by us in ghostly outlines on his pages are frequently just and occasionally acute. But he has reserved all footnotes, exact references and illustrations for a later volume, and the consequent vagueness and apparently capricious unevenness of his treatment throw an air of unreality over the entire work and make it very hard reading. His main theses seem to be (1) that philosophy is, in its inception, the revolt of the individual against the shackles imposed and the sacrifices demanded by absorption in the communal life of the primitive city state, and is pursued as a selfish quest for some principle of reconciliation between the finite soul and the infinite power or powers that hem her in; (2) that the spiritual life of the Roman empire is of special significance for us, because, owing to the assumption of all civic responsibilities by the state, the spirit of individualism, by which, after the dissipation of illusions, our own religious and philosophical systems must in the end be tested, had free scope to develop itself; (3) the

dominating influence throughout this development was Platonism on its mystic or religious side. Platonism first transformed and then broke up the chief philosophic religion of the Empire, Stoicism, and then endeavored vainly in the neo-Platonic doctrines of emanation and negative theology to meet those needs of the individual soul which only the Christian religion could satisfy.

—M. Aulard, whose knowledge of the history of the French Revolution may be called exhaustive, and who has already destroyed more than one legend of that epoch, has, in a recent number of the *Revue de Paris*, run his pen through another popular belief dear to the makers of historical hand-books. "It has been generally believed," he says, "that the *coup d'état* of the eighteenth and nineteenth Brumaire in the year VIII brought brusquely to an end all free manifestation of public opinion in our country, and that on the twentieth Brumaire France awoke to find itself enslaved and gagged." But that was not the real course of events. Things never happen in any such symmetrical and rounded fashion. In reality, on the morrow of the eighteenth Brumaire, Bonaparte was very far from being willing that the consequences of the *coup d'état* should be seen. Everything was made to run as smoothly as possible. The plot itself was *bien machiné*; there was a minimum of violence. The stroke of genius in the thing was the spreading of the report of a pretended conspiracy of the Jacobins against the two consuls. To this was added the clever fable of the daggers, with which it was said that the Five Hundred had attempted to strike at Bonaparte on the nineteenth Brumaire. This assured the intervention of the troops. Thenceforward all went smoothly. A part of the Ancients and of the Five Hundred came together again to name the three consuls. A list of proscribed persons was also drawn up by them, but this was merely a matter of form, not meant to be serious, and was revoked a fortnight later. The language of the new saviours of society was most modest, especially if it be compared with the language of the conquerors of the 31st of May, of the ninth Thermidor and of the eighteenth Fructidor. "No one spoke of military dictatorship; Bonaparte exchanged his general's uniform for civil dress (the newspapers announced it), and it was a civil government which was to be established. There were no boasts of doing anything great or anything new, but only professions of a desire to do what was best without disturbing people more than was necessary." Paris remained perfectly quiet, although the nineteenth and twentieth Brumaire were days propitious for a "descent into the street." The nineteenth was a Sunday, and the twentieth a *décadi*, and the weather was fine; but no one budged. Fouché spread his falsehoods abroad through the cafés and theatres, and stirred up a good deal of indignation at the attempt to poniard the hero of Egypt. Business men looked with favor upon the new government. The Bourse rose, Government stocks almost doubling their value within a week; which gave Talleyrand, at a later period, ground for his well-known answer as to the sources of his fortune.

—At Paris, after Brumaire, the Royalists were in exultation. They jumped at once to the conclusion that Bonaparte would act as a second Monk, and restore the monarchy, and propositions to this end were made to him; Republicans, and especially the Five Hundred,

were turned into ridicule on the stage. But the propositions were declined and the theatre warned, and Bonaparte set himself to reassure the Republicans. Then the clergy spread a report that the Republican calendar was about to be suppressed and the Catholic religion restored. A bishop, Royer, preached a sermon at Notre Dame in honor of the *coup d'Etat*. He was promptly silenced. Bonaparte himself wrote with his own hand answers to the few protests which he received from former associates and others. He made to all the same protestations, that he had entered upon "the way which leads to organization, to true liberty, and to happiness." One by one his opponents came in, Barère naturally among the first. In brief, the government of Bonaparte, during the provisory consulate, was as far as possible removed from despotism. According to M. Aulard, the policy of that time was "presque aussi *temporaire* que celle de Barras, mais plus douce, plus cordiale et plus française."

EGYPTIAN ARABIC.

An Arabio-English Vocabulary of the Colloquial Arabic of Egypt. Compiled by S. Spiro of the Ministry of Finance. Pp. xii, 661. Cairo: Al-Mokattam Printing Office; London: Bernard Quaritch. 1895.

OUR Arabic lexicons are remarkable for being voluminous and incomplete; indeed, it would almost seem as though their incompleteness were in direct ratio to the size and number of the volumes. Witness the cyclopean labors of E. W. Lane, whose death prevented the finishing of his great lexicon (whereby the latter part has had to be published almost in skeleton)—the work, however, still covering over three thousand triple-columned quarto pages. Yet Lane limited himself to purely classical Arabic, and the significations to be found in his work are such as were in use only during the first two centuries after the Prophet's death. In other words, mediæval Arabic—all the great historical, geographical, philosophical, and other literature subsequent to the eighth century A. D.—is left entirely unnoticed. Now it will easily be understood that the original language of the Desert, however rich, had to be considerably modified and extended to suit the use of those who governed the various lands stretching from Spain to the Wall of China, who had evolved a theology more intricate than that of the Schoolmen, and whose philosophers were credited with a thorough knowledge of Aristotle. Hence it follows that though Lane is indispensable to the scholar, his great quartos will not suffice the learner who wishes to understand, say, the Chronicle of Tabari, or even to read ten successive pages of the 'Arabian Nights.' Furthermore, Lane, like all previous lexicographers, has for the most part merely translated into his work the information supplied by the native Arabic dictionaries. These latter, of course, are little more than lists of synonyms; for an Arabic dictionary, in Arabic, must, in the nature of the case, explain what a thing is by saying that it is something else.

The Dutch scholar Dozy sought to supply the lack in Lane and others by his two great quarto-volumes of 'Supplément aux Dictionnaires Arabes.' This was a stride in the right direction; all the meanings there registered were from cited passages, and the work was the fruit of extensive reading, not merely the result of compilation made from the explanations given by the native authorities. But even with all that has been accomplished (and,

needless to say, others have followed in the lines traced out by Lane and Dozy), how incomplete our Arabic lexicons still are is proved by the fact that never does a properly edited text appear—even of the simplest—without a shorter or a longer glossary of words with meanings not to be found in either the 8,000 quarto pages of Lane or the 1,700 of Dozy. The fact of the matter is that this rich literature, covering in unbroken line more than a thousand years, and produced in countries situated as far apart as Morocco and Mesopotamia, can with difficulty be squeezed between the covers of a single set of volumes. It is as though one should try to gather into one list all the words used in classical and mediæval Latin, together with those common to all the modern Romance languages.

At the present day the focus of any literary activity that yet remains to the Arabic-speaking people is undoubtedly in Egypt. The dialect there may not be classical, but it is copious. Furthermore, it shows an adaptability to modern ideas and usage which stamps it as one of the conquering languages of the world—at any rate for Africa. Mr. Spiro is happily endowed for the work that he has undertaken; Arabic is his native language, but his education has been English. He has produced in a convenient form a vocabulary which may justly claim to "represent almost all that a foreigner would meet with in conversation with the natives of Egypt." The immense value of the present compilation lies in the fact that it registers the colloquial words, now adopted into official and administrative use, which, though not to be found in Arabic dictionaries, have yet become part of the written language of modern Egypt. Mr. Spiro is well aware that "no single compiler can hope to make an exhaustive collection," but we trust that his deserved success in this instance will induce him to extend his labors, and in due time bring out a second and improved edition of his book; in view of which eventuality we shall make some few criticisms on points worthy of his attention, and indicate what might possibly be changed to advantage in a future issue.

To transliterate Arabic perfectly into Latin characters is an almost insoluble problem, and, as Mr. Spiro remarks, "the adoption of a system is a matter of taste." The system here adopted is that of the late Spitta Bey, which, from a philological point of view, has many advantages. It must, however, be carefully studied, and Mr. Spiro would have done well to print an explanatory note indicating especially that in his transliteration the English *sh* sound is represented by the *s* dotted above, and that his *j* is to be pronounced, as with the Italians and Germans, like the English *y* (this last letter is used to represent the long *i* or *ee* sound). Mr. Spiro prefaces his work with some useful lists of common words, the Numbers, the Names of the Months, Weights and Measures, the Administrative Divisions of Egypt, and other like matters. The list of numerals prompts the remark that the due use of the hyphen in transliteration would vastly aid the learner in keeping the syllables properly distinguished. It is curious, in passing, to notice how the classical case-ending of the noun is still at times preserved in the modern dialect; thus, the Arabic for "three hundred" is pronounced *talat-miya* (for the classic *thalathu miya*), but Mr. Spiro transliterates this (likewise the succeeding hundreds) in one word *talatumiya*, which is, we hold, a mistake, for the foreigner will infallibly take the first two syllables to be *talum*,

and then, adding *ya* (or *eyya*), will be perfectly uncomprehended of the people. All these and like words should be carefully separated by the hyphen, e. g., *talat-miya*, *arbu'-miya*, etc.; for in Arabic especially the difference is to be strongly marked between (we may give an example in English) an ice house and a *nice* house, and running words together nullifies this distinction.

Coming to the vocabulary, it will be noticed that derived words are given partly under the root form (as is the rule in dictionaries of the classical language), partly in alphabetical order. Mr. Spiro on this subject aptly remarks: "Those experienced in teaching Arabic to foreigners in Egypt know that only a small percentage of these study the syntax and the grammar, and that the Egyptians themselves are often at a loss to find a word in a purely Arabic lexicon where the derivatives are given only under the root-verb." So far so good, but what is astonishing to any one who has made the classical Arabic his study is to find that Mr. Spiro, abandoning orthography, spells many of his words phonetically—and says nothing about it. The following examples will show how far the modern Egyptians have progressed on this convenient but downward path. Certain people, as all know, having a constitutional inability to pronounce the sound of *th* and the kindred *dh* (which in English is likewise written *th*), put an *s* for the former and a *z* for the latter. Most Frenchmen, for instance, pronounce "this thing" as "*siz sing*," and in like manner both Persians and Turks, after borrowing half their dictionary from the Arabic, consistently confound the Arabic *s* and *th*, pronouncing both as *s*, while the four Arabic letters *s*, *dh*, *d*, and *th* are indifferently uttered as *s*. For it should be remarked that the dialect of the Desert is very rich in these dental and palatal sounds. We have both *t* and *th*, *d* and *dh*, then (dotted or palatal) *t* and its corresponding *th*, also a dotted sibilant *s* and its corresponding aspirated *d*. The Persians and Turks, however, stick to orthography, and pronounce consistently *s* and *z* according as the unpronounceable letter has the *th* sound or the *dh*. The modern Egyptian, on the other hand, is remarkable for being inconsistent in pronunciation, and, if Mr. Spiro is to be taken as our guide, often, as already noticed, throws orthography to the dogs. For sometimes *th* is pronounced as *t*, sometimes as *s*. Thus the classical *thalatha*, 'three,' becomes plain *taltha*, but under the initial *th* in the vocabulary Mr. Spiro writes "see *s*," and *thal-bil*, 'firm,' is given as *ad-bil*, while *malhal*, 'a proverb,' becomes *masal*; and many other examples follow.

It is, however, among the letters *d* and *s* that the most remarkable confusion occurs. In classical Arabic, *dira'* means 'a cuirass,' while *dhird'* (which a Persian or Turk pronounces *sird'*), is 'the ell or cubit'; now both these words Mr. Spiro writes indifferently with the plain initial *d*, thus confusing two different roots and significations. Again, under the letter *s* of this vocabulary there are some wonderful words. It will be sufficient to point to the common and very classical root *darata*, which is used in the vulgar dialect in such an expression as *Darta fih*, explained by Mr. Spiro to signify, "I laugh at you. You are beneath my notice." But this is here given under the letter *s* (and spelt with the Arabic *sd*), thus confounding it with the root *sarata*, "to swallow a mouthful," and entirely upsetting just notions of propriety.

It is for the astonishing number of new words and secondary meanings that the present Vo-

cabulary is remarkable. The compiler has supplied many useful examples of idiomatic usage, as in the column of racy vernacular given under the heading *rihl*, 'foot.' Foreign words have rightly been marked with an asterisk, but it is none the less a shock to find such a classical and orthodox word as *salāma*, 'safety,' registered with the signification of 'sausage' (to wit, the Italian *salame*, now doubtless imported into Egypt). Common words have also a surprising way of lengthening their vowels in the modern dialect; for instance, the classical *ragwl*, 'a man,' becomes *rdgll*, with a long *alif* that would entirely alter the meaning of the word in the classical speech. On the other hand, a good old loan-word like *dāldb* (which the Arabs borrowed from Persia when the first Moslems conquered the Sassanian Empire) still keeps its original meaning of 'water-wheel,' but adds thereto the secondary signification of a 'cupboard,' or 'wardrobe.' Further, and doubtless because from the signification of 'water-wheel' *dāldb* came to signify 'wheel' in general, and then any clever 'wheeled-machine,' an additional meaning has grown up in its now common use to denote 'a ruse or trick'; and a 'business man' in modern Cairo is now understood under the phrase *rdgll dāldb*, literally, 'a man of ruse,' for which terms the classical dictionary offers no interpretation. In many instances Mr. Spiro would certainly confer a benefit were he to add further explanation of the strange meanings which have come to be attached to words.

Mr. Spiro has done very much to facilitate the labors of such as desire to get a practical knowledge of Arabic. To readers of the 'Thousand and One Nights' this vocabulary will be an indispensable adjunct, while the English official in Egypt, who has to wade through the pages of dispatches and administrative reports, will find here "financial, engineering, mechanical, and military words" explained which he will seek for in vain in the pages of either Lane or Dozy.

JAPAN AND CHINA AT WAR.

The China-Japan War. By Vladimir. Charles Scribner's Sons. 1896.

The Japan-China War. By Jukichi Inouye. With photo-engraved plates by Ogawa. Yokohama: Kelly & Walsh; New York: Charles Scribner's Sons.

BOTH of these works are largely compilations, and both are drawn mainly from Japanese sources. The first, whose author adopts the pseudonym of Vladimir, is of the greater permanent value, giving a clear and consecutive narrative of the war, as well as of the circumstances leading up to it and of the various negotiations that led to its close and the establishment of peace. The illustrations are very poor, and in this respect the second work is much the superior—its illustrations, by Ogawa, being mainly from photographs, well defined and of considerable size. To some extent, and in this respect, one work supplements the other. Inouye's work, however, confines itself to the three principal events of the war—the battle of the Yalu, or Haiyang Island, the campaign on the Regent's Sword, resulting in the fall of Port Arthur, and the military and naval operations in and about Wei-hai-wei Bay.

It is difficult not to agree with Vladimir in his introductory pages as to the characteristics of the three peoples concerned in the China-Japan war. Much as they have in common of religion and learning, and alike as they are in

origin and mode of thought, they nevertheless differ radically in most physical and intellectual traits. The Japanese, to begin with, form a curious compound. Warlike by nature and tradition, they are at the same time amiable and artistic; quick and vivacious, they possess insatiable curiosity, and a desire to learn not always accompanied by thoroughness of digestion and assimilation. The Chinese, on the other hand, though quiet, laborious, and conservative, and naturally pacific, can with proper treatment and training make excellent seamen and soldiers. They are, we believe, naturally better seamen than the Japanese, and, under the American flag and in arctic expeditions, have shown as much courage and endurance as their neighbors the Japanese, or their shipmates and companions of European and American origin. Certainly, as seamen on mercantile vessels they are preferred by European commanders to Japanese, in Eastern waters. With China's lack of internal communication and want of homogeneity of dialect, it is to be considered the prevalent general indifference, if not hostility, to the ruling classes. As a result, it is not a matter of wonder that the Chinese are so wanting in that patriotism which the Japanese possess almost to fanaticism. As to the Koreans, they differ from both the Japanese and the Chinese. They seem to lack the virtues of both. For centuries subjects of a tributary kingdom, and victims of constant maladministration, they have, as Vladimir truly states, become slothful and indifferent to a degree which would be beyond belief to those who do not know them. In physical appearance they are perhaps the finest of the three nationalities, but they lack sadly the industry and stability of the Chinese, as well as the courage, enterprise, and patriotism of their insular neighbors of Japan.

The relative value of the war forces of China and Japan seems to have been singularly misunderstood, not only by the civilized world at large, but more particularly by most Europeans and Americans residing in the extreme Orient. The general tendency was to compare populations and geographical extent rather than war-like spirit and military and naval efficiency—a mistake not uncommon with our own legislators when comparing the standing of the United States with that of other naval and military Powers. Although the numerical force of the Chinese army in its four classes was nominally much superior to that of the Japanese, it was not really so, and it was badly officered and disciplined, and inefficient, as a rule, in its organization and armament. The fourth class of the Chinese troops, known as the drilled or trained army, was alone worthy of the name. It was composed of men who had been drilled in the European manner, and in numbers was estimated by different authorities to consist of from 50,000 to 100,000 men. The numbers of the other classes were even more uncertain; their training was neglected, and they were armed with weapons of all sorts, including spears as well as bows and arrows. The Japanese army, on the contrary, was a model of its kind. It has been deservedly praised for the perfection of its organization, the celerity of its mobilization, and the precision of its movements. Formed upon the best European model, the standing army at the outbreak of the war was but little short of 70,000 men, capable of expansion by the addition of the reserve and territorial army to at least twice this size. The infantry and cavalry were armed with the Murata rifle, a breach-loader invented by a Japanese officer of that name, while the light artillery consisted of

pieces of compressed bronze made upon the system of an Austrian at Osaka. The power of rapidly concentrating and transporting troops was possible to China only by means of the sea and by chartered transports; this means cut off, there remained but the badly kept canals and worse roads. The Japanese in their own country had the advantage of the railway system, and for transports they drew largely upon the many steamers of their own great company—the Nippon Yusen Kaisha. The insular conditions of Japan are such that transports can effectually aid and supplement the concentration of troops by rail. The transportation of material was effectively done by the Japanese, the organization being very thorough; coolies took the place of the wagons and beasts of burden of western countries.

As to the Chinese naval force engaged during the war, it may be said to have consisted almost entirely of the Pei-Yang or northern squadron; the vessels of the southern squadron and flotillas remaining in their respective localities. The Chinese navy was superior in personnel in every respect to that of the army, and, furthermore, in its equipment, was superior to the navy of Japan, but in its ships alone; for, notwithstanding the bitter criticism and neglect of their navy by the Japanese, its personnel was excellent in morale and discipline, and never lacking in dash and bravery. Inouye, in his preface, tells under what disadvantages the navy had been placed of late years. He adds that "the Japanese have never been great sailors, the laws of the Tokugawa Government having prohibited the construction of large ships. It was possible, then, that the Japanese officers might, by their defective navigation and unskilful manoeuvres, run their war-ships into danger." These fears were soon dispelled by the battle of the Yalu; and the Japanese, with inferior ships, accomplished what the Chinese, with upon the whole a superior naval force, failed to do. Had the vessels asked for by Vice-Admiral Kabayama in 1890 been given by the Japanese Parliament, and the battle-ships now building been at the command of Admiral Ito, the command of the sea would have been secured at the beginning of the war, and the beginning of the winter would have found the Japanese army before or in Peking instead of in Manchuria. Japan possessed during the war no battle ships and no armored vessels fit to cope with the *Ting Yuen*, or its sister ship, the *Cheu Yuen*.

By the middle of July, 1894, the Korean question had become so involved that war with China and Korea seemed to present the only solution to the Japanese. Popular feeling ran high, and the whole nation was resolved not to suffer more humiliation in Korea. China was considered the instigator of all that had happened in the peninsula, both as to insults offered and lives lost, and the hand of the Government would have been forced even if it had been unwilling. But it was not unwilling. The march of events was rapid. On the 18th of July the Korean Government requested the withdrawal of the Japanese troops; on the 19th the Chinese Minister left Korea and returned to China; on the 20th the Japanese Minister in Korea sent an ultimatum to the Korean Government, to which, on the 23d, the Korean Government responded unsatisfactorily, and as a result, on the 23d, the Japanese troops attacked the King's palace and became masters of that labyrinth and consequently of the Government. Since that time, until the late flight of the King to the Russian frontier, Korea has been practically under Japanese control. With the capture of the Korean

lace at Seoul on the 23d of July, the regular hostilities between Japan and Korea began and ended.

The war between Japan and China also began, as most wars of modern times begin, with the actual hostilities preceding the formal declaration. History has established this as the rule, the reverse as the exception. The hurrying of the forces from China and Japan to Korea made the collision inevitable, and its approach known to all well-informed persons in China and Japan. On the 21st of July and upon the days immediately succeeding, eleven steamers, carrying more than 8,000 men, were sent from Tientsin, the port of Peking, to Korea. Some were sent to the Yalu River, and others direct to Asan, near Chemulpo, the port of the capital of Korea. The former were assembled to bar the approach to China from Korea, the latter to reinforce the Chinese troops already in Korea and near the capital. To secure and preserve the advantages of the position in Korea held by the Japanese, quick action was necessary; and as soon as it became known that the transports had left Tientsin, three of the fastest cruisers of the Japanese navy left Sasebo, the naval station in southern Japan, on the 23d of July, reaching the vicinity of Asan on the morning of the 25th, falling in at the same time with two small Chinese men-of-war coming from Asan, at which place the attack upon the palace of the 23d inst. was known. Which side opened fire is in dispute, but it mattered not: the train had been laid, and the application of the torch was inevitable. Japan by this time meant war. The engagement resulted in the defeat of the Chinese vessels—the loss of one and the flight of the other. Before the pursuit of the Chinese vessels was over, the British steamer *Kow-shing*, chartered and acting as a Chinese transport, was sighted in company with a small Chinese dispatch vessel, which was at once captured. The *Kow-shing* was found to have 1,200 Chinese troops on board, fully armed, besides twelve field guns, ammunition, etc. The Japanese cruiser *Naniwa* boarded the *Kow-shing*, and her captain, an Englishman, was directed to bring her to anchor, which he did under protest; but the Chinese troops with their leaders refused to surrender to the Japanese or allow the Europeans in the ship (among whom was Von Hanneken) to do so.

The destruction of the ship followed, and was justified by international law, but the loss of the 1,000 persons on the *Kow-shing* does not seem to have been necessary or unavoidable. Engaged as she was upon unneutral service, her position was not unlike a foreigner enlisted in an army which becomes by the outbreak of hostilities belligerent. His engagement in a military service without regard to war involves the possibility of taking part in war and warlike operations, with all its risks and penalties. But the *Kow-shing* matter was badly managed. Granting that the ship itself could not be taken possession of from the numerical force of the Chinese on board, it could nevertheless have been disabled, and its immediate destruction was not necessary, as the ship was at anchor and under the guns of the *Naniwa*. It does not seem to have been established that the Japanese fired upon the Chinese in the water, but there seems to be also no evidence or claim that they made any attempt to save those who were in the water with their boats. It is stated that the agents of the *Kow-shing* had inserted a proviso securing indemnification in case the vessel suffered any casualty from the incidents of war, which

showed an expectancy and assumption of risk that weakens the claim of innocence in transporting troops to what was generally known as a most probable theatre of war. So far as can be ascertained, the British Government has not taken advantage of the offer of reparation made by the Japanese Government if the act should be proved to be a breach of international law.

No more troops were attempted to be landed in the vicinity of Chemulpo, and the campaign of the Japanese against the Chinese in Korea was soon under way, the Japanese forces being rapidly and largely reinforced without any interference with their disembarkation on the part of the Pei-Yang squadron. A fine opportunity for an active and aggressive enemy was here lost. The feebly opposed operations of the Japanese through Korea caused great loss of prestige to the Chinese, besides rendering complete the subjugation of Korea and the Koreans; but this campaign, with the operations that followed in Manchuria, had no decisive effect upon the war. Even if the war had been prolonged, the positions held at the last in Manchuria would have been easily obtained from the Kinchow peninsula after the fight of the Yalu and the consequent command of the sea there obtained.

The three great events of the war are rightly given by Inouye—the battle of the Yalu (or, more correctly, of Haiyang Island), the capture of Port Arthur, and the naval and military operations at Wei-hai-wei, resulting in its capture and that of the Pei-Yang squadron. First in importance and in time came the great naval battle off the Yalu. The meeting of the two fleets is now known to have been a matter of accident; neither was in full force when the smoke from each fleet revealed its presence to its antagonist. Little time was given for the formation of tactical plans, but some general plan of operations had been formulated on both sides in case of meeting with the enemy. The approach was not rapid for modern fleets; the main body of the Chinese had but a speed of six knots, while the principal squadron of the Japanese moved at the rate of ten knots. The Chinese line of battle was intended to be that of the indented line, but it became, by force of circumstances, an obtuse double echelon; both of these formations are not favored by the best tacticians of the day, and certainly they received no additional prestige from the results off Haiyang Island. The Japanese fleet had not been without preparation in fleet tactics, for Admiral Ito, months before, had drilled his commanders in tactical movements by means of steam launches. He made his approach with system and coherence, and although signals were misunderstood and movements miscarried at times, and at others were hampered by weak and slow vessels, his plans were in the main carried out and in the main were successful. At no time did the two squadrons of the Japanese lose their organization or unity, or resign themselves to the individual duel and mêlée. By a concentration of attack upon the flanks of the Chinese fleet, and by the movements to protect the weaker and slower vessels, the Japanese commander-in-chief destroyed the flanking vessels of the enemy without losing a single one of his own, notwithstanding his own inferiority of force and the superiority of the two Chinese battleships. These vessels, however, saved the rest of the Chinese fleet.

Fortunately for the Japanese, it was not necessary to come to close range to secure effectiveness of fire on their part; the Chinese vessels destroyed were at a range of 8,000

metres, and the superiority of speed gave the Japanese a choice of positions for concentration of fire, which the lack of initiative on the part of the enemy further resigned to them. The Chinese, thus encircled and hemmed in, not only received the full effect of this concentration of fire, but were at the further disadvantage of being compelled to repair damages and put out the accidental fires constantly occurring on their vessels under this severe and continuous hammering. The Japanese, on the contrary, could haul out of action, repair damages, and resume fighting, or seek safety with impunity. The advice and instructions of Von Hanneken, formerly of the German Army, encouraged the lack of initiative already existing on the part of the Chinese and their leader, Admiral Ting. While the subordinate officers and men of the Chinese fleet doubtless still felt the effects of the discipline and administration of Lang, it is doubtful whether the superior officers ever mastered the manoeuvres and evolutions practised under him. Admiral Ting, distinctively a military officer, a Chinese military officer at that, knew nothing of ships until he was about forty years of age, and, though intelligent and of undoubted bravery, he was in no sense a naval leader or tactician. Personally honest, he stands out in unselfish devotion to his cause as the best character we know on the Chinese side during the war, and the tribute to him by the Japanese after his death was no less creditable to them than to him. But, when all is said, he still remained as inferior to Admiral Ito as Ito was inferior to a Farragut or Nelson.

The victory of the Yalu not only disabled for the time and partially destroyed the Pei-Yang squadron—the only active naval force of the Chinese—but so disheartened and demoralized its personnel that it never again took the open sea except to escape from Port Arthur to Wei-hai-wei, and the command of the sea, with all that this implied, came entirely into the hands of the Japanese. There were two acts left to be played in the drama of the war, both following and possible through this command of the sea. The operations against Port Arthur, and the campaign preceding it on the peninsula of the Regent's Sword, came first. In this short campaign the work was done almost exclusively by the army, and it was well done, and, where necessary, bravely done. The landing was unopposed, and the forts as a rule unworthily defended. The Chinese naval force at anchor at Wei-hai-wei did not leave their port of refuge, and neither disturbed the landing of the Japanese, nor fired a shot in defence of the port and fortresses created for their safety and welfare!

Winter soon came on, and it is both severe and stormy in the Yellow Sea and Gulf of Pechili. The courage of the Japanese fully equalled their powers of endurance, and a winter campaign against Wei-hai-wei was determined upon. On the 10th of January, 1895, over fifty transports left Ujina, in the inland sea of Japan, for Tallienwan Bay near Port Arthur, under command of Marshal Count Oyama, who had organized the attack upon Port Arthur. Arriving at Tallienwan on the 14th of January, the final preparations were made, and on the 19th and succeeding days of the same month the expedition left in three divisions for Yungching Bay on the Shantung Peninsula, thirty-seven miles distant by land from Wei-hai-wei. The disembarkation commenced on the 20th of January upon the arrival of the first division in the midst of a snow-storm. The landing, discovered by the Chinese, was

but slightly opposed, the disembarkation being so rapidly effected that on the 26th of the same month the forward movement began, and was so far advanced that the attack upon the forts of Pohchihyaisu, on the south shore of the bay, was successfully made on the 30th of January, and the Chinese fleet was compelled to take up a position on the opposite side of the bay, which runs in a northeasterly and southwesterly direction. A heavy gale coming up caused a delay in the naval and military operations, and gave Admiral Ting an opportunity to destroy the guns in the ports commanding the anchorage of the Chinese fleet, and thus render his position under Liukung Island tenable so long as the island itself was in the possession of the Chinese. This prolonged the resistance after the capture of the town of Wei-hai-wei and the other ports on the mainland, which was effected by the afternoon of the 2d of February. In addition to the protection of the ports on the two islands in the harbor, that of Lih Island being still intact, the entrances to the bay were protected by formidable booms. In the defence made by the Pei-Yang squadron, which consisted of twenty-five vessels of all kinds and sizes, from torpedo boats up to battle-ships, Admiral Ting and his command did their best work, while the Japanese proved themselves on their side to be especially well fitted by national characteristics for daring torpedo-boat work. On the 18th of February, 1895, Admiral Ting sent his letter of surrender to the Japanese commander-in-chief, and the drama of the war came to a close with the tragic death of the unfortunate admiral by his own act.

Alpine Notes and the Climbing Foot. By George Wherry. Cambridge, Eng.: Macmillan & Bowes; New York: Macmillan. 1896.

THE Alpine literature of 1896 opens up with a review of mountaineering in the years 1891-95. Mr. Wherry, when returning from Switzerland, jots down in the train a record of the season's adventures, and publishes it in the *Cambridge Chronicle*. Five annual letters have thus appeared, and he reprints them with the addition of two new papers, "On the Climbing Foot" and "On Accidents." Together, they make a very neat and a very readable little book.

The increasing audacity of Alpine climbers is brought home to one with every fresh heralding of their deeds. Mr. Wherry's exploits furnish a new illustration of this threadbare theme. The Meije is still a dangerous mountain, a mountain to be respected even under the most favorable conditions. To climb it with a broken rib is a feat of personal pluck worth mentioning, however pernicious the example. "I gained the summit at nine o'clock, but, just at the final struggle, where it is necessary to straddle on a sharp, red-rock ridge, called the *cheval rouge*, with fine precipices below, my rib gave way, and went completely broken through. . . . I could feel and even hear the ends of the broken rib grating together; but I kept at it, going down steadily and slowly with groans and grunts." Mr. Wherry's climbing has really been of the first order, and the complete absence of vainglory in his narrative adds much to its value with those who know how easy it is to make a desperate adventure—on paper—out of a small peak.

Mr. Wherry is university lecturer in surgery at Cambridge, and men of his profession are always observant. Mr. Dent is another example. A cardinal merit of his classic, 'Mountaineering,' in the Badminton Library, is dis-

quisition on the work of the body in active exercise. Mr. Wherry is much less comprehensive than Mr. Dent, dealing with one anatomical feature of climbing, and not with its broad physiological aspects. His essay on the climbing foot is the true *raison d'être* of the present book and an interesting study in adaptation. Leslie Stephen once observed that the best amateur should feel modest when he reflects on his inferiority to a second-class guide. Of course an extra-good man, such as Stephen himself in his climbing days, or the Rev. Charles Hudson, who was killed in the first ascent of the Matterhorn, is far better than the average Chamonix hireling. Yet no amateur ever equalled Melchior Anderegg or Christian Almer. Practice tells. The climbing foot is not the gift of God, nor does it come by nature. It is a physical adaptation due to perpetually walking up hill.

Mr. Wherry states this physical difference between guides and amateurs as follows: "It has often been noticed in mountaineering that a guide can go face forward and whole-footed up a slope, while the amateur following, and coming to a steep part, cannot plant his whole foot upon the slope, but has to go on his toes or else turn sideways." To explain the cause of the difference, Mr. Wherry begins with photographs of an infant five weeks old. At this tender age the instep can be made to touch the shin by slight pressure of the finger. Gradually freedom of movement is lost in gaining strength. With the guides the instep becomes modified so that, without pressure, the foot is bent upward beyond the limit which can be reached by an amateur with pressure. Captain Abney has taken careful photographs of the feet of Alois Kalbermatten and Peter Perren for contrast with the feet of good amateurs. The most casual glance at them shows why it is that amateurs go on their toes while the guides walk flat-footed. There is a climbing foot as distinctly as there is a baseball hand.

Mr. Wherry's interest in the guides is not confined to their feet. Unlike a good many recent Alpine writers, he has warm, even enthusiastic, words for their moral qualities. One laments to hear of any decadence when he remembers the traditions of the early school, and of late it has been the habit to notice the activity of the mountaineers in the race for money. Two passages in different parts of this book may be placed side by side to show that, after all, the feeling of old and new-school climbers for their guides is the same when the guides are themselves worthy. "Wandering into Couttet's Hotel at Chamounix quite without intention, I witnessed a touching farewell between Mr. M— [presumably Mr. C. E. Matthews] and Melchior [Anderegg]. To see an undemonstrative Englishman kiss his gray-bearded old guide on both cheeks, when these two have climbed together for forty years, gives one suddenly a glimpse of the pathos of life impossible to recall without emotion." And then, concerning his own guides: "How do these men, Xaver Imeng and Alois Kalbermatten, win my regard? Xaver has an angel face and Alois a form like Hercules. It is not only their courage, skill, and devotion to duty, but their sympathy with my delights or difficulties—this is the great charm."

Mr. Wherry says of his own "poor tracts" in the preface: "Only of this I feel assured, that similar notes, put into my hands when I began climbing, would have been read by me with avidity." We can say for our own part that we have read his 'Alpine Notes' if not with avidity, at least with very considerable pleasure.

Current Superstitions: Collected from the Oral Tradition of English Speaking Folk. Edited by Faany D. Bergen. With Notes and an Introduction by William Wells Newell. Boston: Houghton, Mifflin & Co. 1896.

What They Say in New England: A Book of Signs, Sayings, and Superstitions. Collected by Clifton Johnson. Boston: Lee & Shepard. 1896.

MRS. BERGEN's work is published as the fourth volume of the *Memoirs of the American Folk-Lore Society*, and is limited to 450 copies. As stated in Mr. Newell's introduction, it is the first considerable printed collection made in America of superstitions belonging to English-speaking folk. Mrs. Bergen has also collected the superstitions connected with animal and plant lore, which will make a volume of equal size with the present one. There is no pretence that completeness has been attained; but of course the number of variants of the same belief is infinite, and the main requirement is a judicious classification. Mrs. Bergen's principal rubrics are Babyhood, Childhood, Love and Marriage, Death Omens, Mortuary Customs, Dreams, Luck, Projects, Physical Characteristics, Wishes, Festivals, Weather, etc. She has found the possession of a pet superstition or two an open sesame to many beliefs of this sort held by servants and other plain people; but much information has been derived from cultivated persons who have been observant in this direction.

It is hardly necessary to say that most beliefs of this character have their roots in older lands than ours, and Mrs. Bergen has limited her list to items taken down from the narration of persons born in America. This limit is somewhat arbitrary, since what such persons narrate may have been of direct and even recent importation. But unless a comparative folk-lore were attempted, perhaps no better limit could have been chosen. To a certain extent the locality of superstitions is significant, and Mrs. Bergen has made it a rule to state the place where each belief prevails. But all that can be said on this subject is that in the regions of backward civilization superstition is more active and more primitive in form. A superstition, according to Mr. Newell, is properly defined as a belief respecting causal sequence, depending on reasoning proper to an outgrown culture. We should be inclined to add that the reasoning must be of a fallacious character, for sound reasoning is not a matter of epochs. Most of the reasoning of common people is invalid; but as the invalidity of an inference becomes apparent with the increase of knowledge, the inference becomes discredited and falls into the category of superstitions. However this may be, Mrs. Bergen has made a fascinating collection of obsolescent but still vigorous traditions, and her labors will undoubtedly be productive of large results. Every one will find familiar beliefs and sayings in her list; and nearly every one, probably, will be able to add to it.

Mr. Johnson's little book is very similar both in origin and in spirit to Mrs. Bergen's, but it is less systematic, and the material has been gathered from a restricted field, principally in western Massachusetts. He does not limit himself to superstitions, but includes proverbs, rhymes, tricks and catches, songs, stories, nursery tales, etc. Many of our childhood's friends will be recognized here, and some new acquaintances made. The book is attractive in appearance, and has some appropriate and very interesting illustrations, but the author is rather scanty, and must be taken as such.

tribution to our entertainment rather than our knowledge.

Introduction to Political Science: Two Series of Lectures. By Sir J. R. Seeley. Macmillan & Co. 1896.

THE editor of this volume, Prof. H. Sidgwick, commends it to the public as mainly valuable, not for the purpose of imparting a complete system, but of communicating a method of study. For this purpose it is, to our mind, at once interesting and disappointing. The lecturer, late professor of modern history at Cambridge, had a mind of great acuteness and remarkable skill, both in the use of language and in the analysis of terms. This skill, indeed, seems to produce a defect: it leads him into the common pitfall of subtle thinking—reasoning founded on significations devised by the thinker himself. Misled by his facility, we often find ourselves ready to yield to some conclusion which, on reflection, does not appear to be rationally connected with the premises laid down as supporting it. When, in the end, the method has been communicated, and with the aid of it we have the scheme of the entire history of the world flashed on the lecturer's screen, we cannot help asking ourselves blankly, "Is that all? If the rationale of political science is so simple, why has the world persisted in missing it during all these centuries?"

The lecturer announces at the outset that he hopes to be able to disentangle a true science of politics from the mass of narrative which we call History, and that the science is to be inductive. What it is to teach us is the nature, aim, and purpose of the State—not what ought to be its aim and purpose. He then proceeds with an analysis of a number of the terms commonly used in political discussion, and makes in the course of this analysis many interesting and acute observations. As he unfolds his method, he applies it to history, past and contemporary; notwithstanding which the method still remains obscure, partly for the reason already suggested, that the terms in common use describing the conceptions analyzed are used by him in novel and uncommon senses. *State*, for instance, he seems to extend so as to cover *Tribe* (pp. 36, 58). Now, a *State* may undoubtedly be conceived without a definite territory, continuously possessed, and a *Tribe* may be conceived as having a settled territory; but the word *State* universally imports definite territory, the word *Tribe* an organization based on kinship. If we talk about a tribe as a sort of state, we might as well bring the primitive family under the same head, and it is not at all clear that the student would not be justified in inferring such to be the lecturer's intention. But surely for purposes of analysis and classification the differences between the *State* and the *Family* are quite as important as the fact that one has been historically developed out of the other.

Another peculiarity connected with this is what we can describe only as an attempt to dispense with all recognized legal conceptions. It is very much as if the desire of the lecturer had been to frame a theory of government without taking any notice of Law. Consequently, we have no discussion of such subjects as Sovereignty, nor of the separation of the three departments of government, which, since the time of Montesquieu, has been at least as important as the old Aristotelian classification of Aristocracy, Monarchy, and Democracy. Now undoubtedly part of the history of the world can be discussed without

taking Law into account. But, in modern times and in civilized states, government and law go hand in hand, and to attempt a theory of politics without paying any attention to Law must lead to very peculiar results. Examples are not difficult to find. When it is said that the law-making body in England "does not govern, but makes, supports, and destroys the government," this not only lodges the government in one body and the sovereignty in another, but eliminates altogether from the problem the fact that what the author calls the government-making organ—Parliament—is itself the agent of the whole body of electors. We are not surprised after this to find Louis XIV. made to govern by consent, because France had physical resources enough to have overturned his government, and James II. demonstrated to have been a responsible King. In fact, we are not surprised at anything in the way of demonstration, for the method of the lecturer—not that which is communicated, but that which is actually employed—would enable him to maintain anything.

On the other hand, no one can possibly read the book, still less study it, without learning something. The analysis of the term *Liberty*, for instance, as having no esoteric value, but meaning nothing more nor less than freedom from restraint or interference, leaves nothing to be desired. It is the sphere of uncontrolled action in any state, and it has no necessary connection with parliamentary government. There was probably much more liberty in some directions among the Saxons in England than there is in Massachusetts to-day. It is just here, however, that germs of a theory of political science seem to show themselves founded on principles which we believe to be essentially wrong. Buckle thought he could deduce history from the physical circumstances of a race; Sir John Seeley seems to have suspected that history might be traced to the relation between the geographical features of a country and the objects of its government. His syllogism would be: Nations with exposed frontiers, and hence military, produce governments severely limiting liberty. A is a country with an exposed frontier; hence A will produce such a government. The major premise is obviously faulty, because a country with an exposed frontier may be overrun and subjugated. The argument correctly stated would, we believe, be as follows: A state fighting for its existence cannot be carried on without a strong government, encroaching more and more on Liberty. A is such a state. A's government will be marked more and more by encroachments on Liberty—examples: France, under Napoleon, England under Pitt, the United States during the war of the rebellion, Prussia under Frederick the Great. We are firm believers in political science, but it is not a science by which we can predict history.

Die Erlanger Burschenschaft 1816-1833. Ein Beitrag zur innern Geschichte der Restaurationzeit. Von Friedrich Reuter. Erlangen. 1896. 8vo, pp. 415.

No period of German history presents a more striking picture of the appalling obstacles against which modern constitutional life has fought its way than the period of reaction which set in after the downfall of Napoleon, and which made it possible for such narrow-minded autocrats as Nicholas I. of Russia and Prince Metternich to maintain themselves for more than thirty years as the arbiters of Europe. Public opinion, which, in the days of Stein and Fichte, had at last become a power

in national life, was again reduced to naught. For although, in the constitutional monarchies of South Germany at least, there was enjoyed a certain degree of parliamentary freedom, the political strength represented by these miniature states was so small that the debates of their legislatures had seldom more than academic value and hardly ever stirred the nation as a whole. While Austria and Prussia, too, were foremost in pursuing a policy of persistent and relentless coercion, the educated public of Vienna and Berlin was engrossed in discussing the latest literary scandal or the advent of a new ballet-dancer on the operatic stage. No wonder that this should have been the time in which renegades to freedom like Friedrich von Gentz and K. L. von Haller were praised as great political philosophers; in which the "Fate Tragedy," with its pallid faces and meaningless horrors, with its hopeless gospel of submission to a blind chance, achieved its greatest theatrical triumphs; in which the hollow phantasms of a spiritualistic juggler like Amadeus Hoffmann were admired as marvels of poetic fiction. No wonder that such a hopeless pedant as Raupach should have been exalted by this age as a master of the historical drama; that the lyric dilettantism of the period should have found an organ in those numberless poetic almanacs and keepsakes embellished with inane steel engravings, the thought of which forced upon the lips of the manly Gervinus the words of *Holstenthor*:

"I had rather be a kitten and cry mew,
Than one of these same metre ballad-mongers."

No wonder that even the best minds of the nation—a Grillparzer, a Rückert, a Lenau, a Heine, a Platen, a Schopenhauer—should have been affected by this universal repression of public activity; that they too should have been crippled in their natural development, alienated from their own day and their own country, led astray in their tastes and propensities, discouraged in their views of life, debarred from truly constructive achievements.

The author of the book before us, favorably known through his contributions to the biography of Rückert, has attempted to give us an inside view of this sad epoch by depicting its effects upon German student life in general, and upon the various "Burschenschaften" of the University of Erlangen in particular. He brings before us in characteristic types the spirit of joyous liberalism which animated the generation of students who had taken part in the wars against Napoleon. He introduces us to the Wartburg festival and other scenes of juvenile frolic, in which this spirit found a harmless, if boisterous, expression. He gives a detailed account of the epidemic of persecution which followed the assassination of Kotzebue, the deed of an irresponsible fanatic; how hundreds of students were expelled from the universities and put into prison for the heinous crime of having worn the German colors in their buttonholes; how professors were suspended and put under police surveillance for having spoken of national duties and national aims. And although the author does not bring his narrative down to the Revolution of 1848, he lets us witness, partly at least through the eyes of actual participants, those occasional sporadic risings and outbursts of popular feeling, like the Hambacher Fest and the Frankfurter Attentat, which finally culminated in the March Revolution. Throughout the book the author appears as one of those chivalrous German idealists whose type has been made familiar to Americans through men like Follen, Lieber, or Schurz. His attitude of mind could not be better expressed than by

the words in which he himself, in the preface, characterizes his intellectual affiliations:

"Die müssen Feinde sein, die die Knechtschaft wollen, die müssen Feinde sein, die die Wahrheit fürchten, die müssen Feinde sein, die das Recht verdrehen, die müssen Feinde sein, die von der Ehre weichen."

JUST PUBLISHED.

Hale's Constructive Rhetoric.

By EDWARD E. HALE, Jr., Professor of Rhetoric and Logic at Union College. 353 pp., 12mo, \$1.00 net.

Deals with rhetoric as an art; it aims to be constructive rather than critical; it tries to develop the power of thought as well as the power of expression. In following out these ideas, the book considers first kinds of composition (excepting Argumentation), discussing the doctrine of Narration, Description, and Exposition, and offering exercises which have for an object to get the student to think of the best things to say on any subject, and in general to order them rightly. It then turns to the Paragraph with a view of developing and putting into a more definite shape the ideas got together. Thirdly the Vocabulary is considered; the exercises of this part are meant not so much to purify and refine the vocabulary as to enlarge and strengthen it and to increase its range and flexibility. The other topics are Figure and Illustrations, The Sentence, and Argumentation.

THE PROTEAN SERIES.

16mo, Cloth, \$1.00 per volume.

JUST READY:

V.—THE TOUCH OF SORROW.

A story of life in the English upper classes, by one who evidently lives it. A moral conveyed, but not obtruded.

VI.—A STUMBLER IN WIDE SHOES.

A story of temptation and self-sacrifice. The scenes are laid in Holland and England. The hero is an artist.

ALREADY PUBLISHED.

I.—IN THE VALLEY OF TOPHET.

By H. W. NEVINSON, author of "Slum Stories of London."

THE JUNE SCHOOL REVIEW.

This will be one of the most notable issues of an educational periodical ever published in the United States. The special features will be:

FIRST.—A tabular statement of the entrance requirements in the leading colleges and universities of the United States. This table has been prepared with greatest care, and revised by officers of the various institutions represented. It will therefore be a reliable handbook for all interested in this subject.

SECOND.—Official preliminary report of the Committee of Ten of the National Educational Association on College Entrance Requirements. This report is in part a discussion of the above-mentioned tables. Among those who will participate in it are Supt. A. F. Nightingale, Professor F. W. Kelsey, Professor B. A. Hinsdale, Professor Paul H. Hantz, Professor Charles S. Palmer, and Principal J. B. Bishop.

The usual strong departments will be maintained in this issue. The number will contain 128 pages, will be handsomely illustrated and may be had for 30 cents in stamps. Address

THE UNIVERSITY OF CHICAGO,

University Press Division, CHICAGO, ILL.

The subscription price is \$1.50 a year. New subscribers may begin with September and receive the June issue free.

EUROPEAN SUMMER RESORT.

INNSBRUCK, TYROL, AUSTRIA.

1,900 feet above the sea, with dry, bracing climate. CENTRE FOR COACHING TRIPS AND EXCURSIONS OF ALL KINDS.

Fine University, Hospital, etc.

HOTEL TIROL.

Open all the year. CARL LANDSKE, Proprietor. Large airy, sunny rooms; modern conveniences; superior cuisine. Reduced rates in winter. Best references. Illustrated pamphlets sent on application.

The Nation.

NEW YORK, THURSDAY, JUNE 25, 1890.

The Week.

It is well known, and is highly characteristic, that the choice of the Jewish Rabbi to deliver the opening prayer at the St. Louis convention, was due to a wish not to offend the A. P. A. by employing a Catholic, nor the Catholics by employing a Protestant. In fact, the prayer was to be part of the general humbug for which the convention has been held. We doubt if any similar body has met in the United States with less sincerity. McKinley is probably the first candidate for the Presidency whose friends before the convention have had to confine themselves to apologies, whom hardly any one dared to praise, and whose own language showed his unfitness for the place; who refused to speak out, lest he should anticipate the platform, yet secretly fought hard to draw the platform to suit himself; who is surrounded by a mass of gold men who were silver men a fortnight ago, and stands on resolutions which the drafter and he have been fighting for some years. Lodge and McKinley as gold men are a sight most offensive to honest men. What, then, must the whole spectacle, including the Rabbi's prayer, be to the Almighty, whom it is evidently intended to hoodwink along with everybody else? When one considers what prayer professes to be, and to whom it is addressed, the use now made of it in Congress and in these political assemblages is fully as shocking as free coinage of silver at 16 to 1. What must the "niggers" who were "stolen" from Hanna by the gold men, who "treated them well," have thought of the Rabbi's invocation that they might be filled with "a deep and abiding sense of the transcendent dignity and nobility of American citizenship and the sacred obligations which should attend it"?

Picking one's way here and there among the miscellaneous gems of the platform, things rich and rare appear on every hand. Four years ago the platform shed bitter tears over the sufferings of the Jews in Russia. This year it holds up to scorn those "alien syndicates" (meaning Jewish syndicates) which have the credit of our government in pawn. This is pretty hard on the Rabbi chaplain. It is also pretty hard on John Sherman, who pawned the credit of the Government, on still harder terms, to the same alien syndicates. And what has become of home rule in Ireland, with which, four years ago, the Republicans so deeply sympathized? It seems to need sympathy now more than ever; yet the platform has not a throb of sympathy except for "wise temperance and the struggling Cubans.

We note with pleasure the ringing demand that women be admitted "to wider spheres of usefulness," though we are pained to find no more "reaffirming" of the one-cent postage plank or the Force-bill plank. Still, we are to build and own the Nicaraguan Canal, buy "the Danish Islands," have a big navy and unlimited coast defences, and be ready for half-a-dozen foreign wars; all which gives some idea of the kind of taxation that is going to be imposed in order to meet "the necessary expenses of the Government."

Civil-service reform cuts only a small figure in the Republican platform, and was not mentioned in the discussion of issues among the delegates. However, the resolution in which the party "renew our repeated declarations that the civil-service law shall be thoroughly and honestly enforced, and extended wherever practicable," is all that could be asked. The important thing is whether the candidate who will stand on the St. Louis platform is a man who can be trusted to live up to this plank in case of his election. We are glad to say that McKinley's record on this question in Congress is a good one. He has never had much to say on the subject, but what he did say was excellent, and his votes were on the right side. His name is recorded among the yeas on the passage of the original Civil-Service act under Arthur's Administration, and he has always favored sustaining the commission in its work. On one notable occasion he declared himself a firm believer in the reform, and earnestly opposed a proposition favored by not a few of his own party to strike it down.

On the 24th of April, 1890, the executive, legislative, and judicial appropriation bill being before the House, Mr. Houk of Tennessee, one of the few Southern Republicans in Congress, moved to strike out the entire appropriation for the Civil-Service Commission, on the familiar ground that it was "an impracticable machine," and that the system was "inconsistent with the genius and spirit of our institutions." Mr. Cheadle, an Indiana Republican, followed in a similar strain, denouncing the whole theory of the civil-service law as "un-American in all its provisions," as "class legislation," and as finding its "great motive power in the educational institutions of this country, which want to find permanent place for their graduates." McKinley, who was the chairman of the ways and means committee, and so "leader of the House," closed the debate in a brief but excellent speech, which was followed by the rejection of Mr. Houk's motion, 128 to 61. "My only regret," began Mr. McKinley, "is that the committee on appropriations

did not give to the Commission all the appropriation that was asked for, for the improvement and extension of the system." He proceeded to declare that, "if the Republican party of this country is pledged to any one thing more than another, it is to the maintenance of the civil-service law and its efficient execution; not only that, but to its enlargement and its further application to the public service." He pointed out that the law was put upon the statute-book by Republican votes, and that every national platform of the party since its enactment had declared not only in favor of its continuance in full vigor, but in favor of its enlargement so as to apply more generally to the public service. He maintained that "this is not alone the declaration and purpose of the Republican party, but it is in accordance with its highest and best sentiment—aye, more, it is sustained by the best sentiment of the whole country, Republican and Democratic alike." He concluded with these remarks, which he might well repeat as part of his letter of acceptance:

"Mr. Chairman, the Republican party must take no backward step. The merit system is here, and it is here to stay; and we may just as well understand and accept it now, and give our attention to correcting the abuses, if any exist, and improving the law wherever it can be done to the advantage of the public service."

The most prominent feature of the nomination of Mr. Garret A. Hobart for Vice-President at St. Louis is its proof of the command which the McKinley delegates had over the convention in every respect except the precise wording of the financial plank of the platform. It was not disguised from the time the delegates began to assemble that Mr. Hobart was Mr. Hanna's choice for the place. Had he not been supported in this way, his ambition would never have been satisfied. It is not the habit of national conventions to go for Vice-Presidential timber to small States whose electoral vote has been habitually cast for the opposite party. Mr. Hobart is a man of entire respectability and a good business man, yet there were probably not a dozen men in the convention, outside of the New Jersey delegation, who knew anything about his public or business career. In his own State, the most that can be said for him is that as a lawyer he has managed skilfully the affairs of some embarrassed corporations committed to his charge, and has made a fortune for himself by his practice; that he has impressed his party associates in the State with his ability as a campaign manager, although under his direction Republican candidates for Governor have steadily been beaten until the peculiar situation of affairs last year carried Mr. Griggs into the Governor's chair. When Mr. Hobart, as a member of the national Republican committee, arrived in St.

Louis last week, he joined his fortunes at once with those of Mr. McKinley, going even so far as to vote in that committee to seat some of the anti-Platt delegates from this city. If the Platt men could have defeated him with one of their own New Yorkers, they would have done so, but they were prevented from carrying out their plan in this regard by the position taken by Gov. Morton as to the second place on the ticket, and by the general disinclination of the delegates to take any man from a State like New York, where the cliques in the party were so bitter towards one another. The New Jersey platform spoke out squarely for gold, and Mr. Hobart has not attempted to dodge that issue. In that light, therefore, he may be considered as leaven to the ticket.

Mr. Hobart's speech, at the meeting in his honor at Paterson on Monday evening, gave the country its first sample of the intellectual quality of the Republican candidate for the Vice-Presidency, and a disheartening sample it is. No candidate is compelled to be an orator, but he is or should be compelled to know when he is not. Mr. Hobart might surely have bowed his thanks to his friends and neighbors, and there made an end; but to have rambled on with such ineptness and grotesqueness as he did for ten minutes was to deprive himself at a stroke of that title to be considered a great man which has been said to consist in a strong conviction that one is not a great man. Intellectually, the candidates appear to be true yoke-fellows, though, mediocrity for mediocrity, one may think McKinley entitled to the first place he holds, and may hope Mr. Hobart's functions will, providentially, never go beyond presiding over the Senate, for which he is qualified by experience.

The first speeches which Major McKinley has made as a candidate all indicate a disposition on his part to make the tariff the chief if not the only issue of the campaign. He has made half-a-dozen speeches, and in but one of these has he even squinted at the currency issue, while in several of them he has laid stress upon the tariff as the remedy for all our financial ills. He assured the Milholland McKinley Leaguers of New York, when they called upon him on Friday:

"All we have to do this year is to keep close to the people, hearken to the voice of the people, have faith in the people, and, if we do that, the people will win for us a triumph for that great masterful principle which, in all the years of the past, has given us plenty and prosperity."

On Saturday he said to a delegation which called upon him with banners made of "sheets of home-made tin":

"What we want in this country is a policy that will give to every American workingman American wages; a policy that will put enough money into the Treasury of the United States to run the Government; a policy that will bring back to us that period of prosperity and

of plenty that we enjoyed for more than thirty years."

Later, on Saturday, he said to a delegation of workingmen:

"I cannot misunderstand—nobody can misunderstand—the meaning of these demonstrations on the part of the workingmen. They mean just one thing, and that thing is, that in the mind of every American workingman is the thought that this great American doctrine of protection is associated with wages and work, and linked with home, with family, with country, and with general prosperity. That, fellow-citizens, is what all these demonstrations signify. They mean that the people of this country want an industrial policy that is for America and for Americans. They mean they intend to return to that policy which lies at the foundation of our national prosperity, which is the safest prop to the National Treasury, and which is the bulwark of our industrial independence and financial honor."

Nobody would infer from these utterances that the great issue which overshadowed all others in the St. Louis convention was that of the currency, or the gold standard.

Major McKinley made another speech on Monday, which is notable as containing his first allusion, since his nomination, to the currency issue of the campaign. After his usual remarks about the boundless prosperity which a high tariff always brings, he said: "And, my countrymen, there is another thing the people are determined upon, and that is that a full day's work must be paid in a full dollar." What is a "full dollar"? The silver men say a sixteen-to-one silver dollar is "full," and that a gold dollar is more than full. The Greenbackers always claimed that a greenback was a "full dollar." Suppose the St. Louis platform, instead of mentioning the gold standard, had compromised on the declaration: "Resolved, That we are in favor of a full dollar for a full day's work," what would have been the effect upon the country? Would the business interests have accepted that as a satisfactory assurance that, with McKinley as President, there would be no danger of the country's passing to the silver standard? There are intimations that Hanna has decided to have Major McKinley make no more speeches at present, and this is a wise precaution, for if the strongest sound-money utterance that he can make after nearly a week of cogitation is that he is in favor of a "full dollar," the sooner he stops talking, the better.

President Cleveland's deliverance against the free-coinage madness on Wednesday week seems to have been what the sound-money men in the Democratic party were waiting for, though they should not have needed to be thus taken by the ear, as it were, in order to make them do their duty. The most shameful feature of the canvass for the Chicago convention has been the cowardice and inactivity of the element in the party which believes in the gold standard, and which knows how disastrous the silver policy would prove, not only to the nation if it could be enacted

into law, but to the Democratic organization if it should be made the platform next month. While the free-coinage men have everywhere been earnest and zealous, the sound-money men have done practically nothing to stem the tide. It is the simple truth to say that more work has been done by Democratic public men and journals for the right side in the South, where it required great courage to oppose the overwhelming sentiment, than in the North, where the men who advocate the gold standard have the people with them. Here, for example, is the great State of New York—which should have led off in the demand for a sound-currency plank at Chicago weeks ago—waiting until a few days before the national convention to define its position, and thus throwing away all the influence that it should have exerted before the delegates meet on the 7th of July.

The favor lent the free-coinage idea by the Democrats of Maine will surprise only those who are not familiar with the political history of that State. It is the one corner of the East where, during the last twenty years, the soft-money fallacy has secured a foothold. In 1878 the Greenbackers, or Nationals, carried one of the five congressional districts outright, and another with the help of the Democratic voters, while in each of the other three the Republican candidates received fewer votes than were divided between the Democrats and Nationals. In the September election of 1880 a fusion of the Opposition defeated the Republicans on the governorship and in two congressional districts, while Reed was saved by only 117 majority and one of his colleagues by but 467. Many people jumped to the conclusion that Garfield was going to lose the country two months later, but before November the Republicans of Maine had recovered their hold of that State, while Greenbackism elsewhere in the country cut but a small figure. The poison of cheap money, however, has never been entirely eliminated from the Maine system, and such a recurrence of the attack as is now seen must be regarded as liable to happen at any time.

The Democratic State convention in Florida illustrates the possibilities which were open if the sound-money members of the party throughout the country had made the fight they ought. This commonwealth is bordered by States that have been carried by the silverites, and Senator Call has always been a blatant advocate of free coinage. But the friends of sound money, under the leadership of the Jacksonville *Citizen*, insisted upon making a fight, and in last week's convention they defeated the free-coinage men on a square test, and rejected Call as a delegate to Chicago, a majority of the delegation chosen being for the maintenance of the gold standard. This ele-

ment in the South has been greatly hampered by the inaction of those Northern Democrats who believe in the gold standard, and their apparent readiness to let the silverites have their way at Chicago without a protest. If the Democrats of New York had served notice upon the country last March that free coinage was not to be thought of, and that a silver platform would destroy all chance of party success next fall, other Southern States than Florida would have "turned down" their Calls, and sent sound-money men to Chicago. The salvation of the party is not impossible even now, but it is infinitely harder than it need have been.

The death of Gen. Bristow deprives the country of a man of great intellectual force, who was also a moral hero. Most people have forgotten that he was the candidate of the better element of the Republican party for the Presidential nomination in 1876—the year when Hayes was nominated—and that he received 113 votes in the convention, the other leading candidates being Blaine, Conkling, and O. P. Morton. Most people have forgotten the circumstances that caused him to be chosen by the better element as their candidate. Gen. Bristow was Secretary of the Treasury under President Grant. The whiskey frauds, implicating some of the President's most intimate friends, including his private secretary, Gen. Babcock, were unearthed at this time, either at the instance of the Secretary or with his active coöperation. Gen. Grant's mental constitution was such that any attack upon his immediate friends became an attack upon himself, and Gen. Bristow was somewhat later forced to resign. The fact that he would not bend a hair's breadth in the prosecution of the Whiskey Ring to accommodate the interests of the private secretary or the prejudices of his chief, gave him a powerful hold on the consciences of his countrymen. Of course it was charged that he was doing it all for political effect, whereas it was with the greatest reluctance that he allowed his name to be used at Cincinnati, and with the conviction that he could not be nominated. He simply yielded to the necessity that there should be some rallying-point for the members of the party who could not follow Blaine, Conkling, or Morton.

There was an element of humor in the situation evolved last week by the Senate bond-issue investigating committee, which partly offsets the sense of humiliation felt by all readers of the proceedings. The committee, or at all events its free coinage majority, came to New York determined to prove that the contract of 1895 was a dishonest and infamous collusion, and they apparently had little doubt of their ability to do so. Before the examination of witnesses had lasted two days the silver committeemen were in a sort of panic, and were refusing to ask any fur-

ther questions of the witnesses, simply because the answers already made had upset so completely the committee's theory. What their now adjourned investigation has disclosed is exactly what all newspaper readers were perfectly aware of a year ago, that banking experts went to Washington in January, 1895, to warn the Government that a financial crisis was impending; that the crisis was near at hand by the close of January; that the Secretary of the Treasury sounded several New York bankers on the chances of a foreign bond issue, and received unfavorable answers; that eventually, when action could no longer be deferred, the leading international houses of New York were applied to for the purchase of gold, and that terms were at last agreed upon. Most of last week's extraordinary cross-examination of the witnesses seemed to be conducted on the theory that Mr. Belmont went to Washington in January to propose the purchase, by his foreign correspondents, of a new Government bond issue. Any answer remotely suggesting such a purpose was hailed with glee by the committee, and the keenness of their disappointment when they failed to prove the fact was evident.

Strange as it may seem, the inquiries of the committee virtually stopped with this. There were other lines of inquiry not only open to the committee, but properly involved in their investigation. Any one would suppose, for instance, that the following questions would necessarily have suggested themselves: Why did the syndicate of 1895 make so wide a difference in their bid for an ordinary bond and for a gold bond? What was involved in the syndicate's contract pledge to protect the Treasury? Why were the large European bankers reluctant to buy our bonds? Not one of these questions was put by the learned Senators, and when Mr. Morgan, at the close of a purposeless cross-questioning, asked permission to go into some of these further phases of the matter, he was shut off with a promptness which left no doubt as to what part of the truth the inquirers preferred not to have on record. Over the remarkable suggestions and queries of the committee on points of foreign exchange and banking, we are glad to draw a veil of charity. It is possible that Senator Vest, Senator Jones, and Senator Walthall have obtained, during their official visit to New York, some much-needed information on these business questions. We wish we could hope that they would use it.

Those nails which Mr. Chamberlain was driving into the coffin of Cobdenism do not seem to have met the Scriptural requirement of being fastened in a sure place by a master of assemblies. In fact, nail-driving is notoriously an extra-hazardous occupation, and bruised thumbs and bad language are a frequent product. Mr.

Chamberlain is an expert at concealing his own discomfiture, but even he cannot cover up the general condemnation in England of his "happy-thought" scheme for an Imperial Customs Union. The Congress of Chambers of Commerce, before which he first broached it, gave it the go-by almost contemptuously, and responsible statesmen in various colonies at once declared it wholly chimerical. The *Economist* makes a ghastly show of the whole thing, as it has before had occasion to do with some of Mr. Chamberlain's colonial grandiloquence. It points out, in the first place, the extraordinary absurdity of supposing that the way to reconcile two opposing views is to offer a third to which each of them is equally opposed. The protectionist colonies will never give in to free-trade England, or vice versa. Very well, says Chamberlain, let each abandon its principles and practice under the name of "a third course." This, says the *Economist*, with cruel disregard of a lucid intellect, is sheer and unintelligible stupidity. It then shows that Mr. Chamberlain, as usual, had gayly made his proposals without any idea of what the actual facts were, and produces the figures of colonial trade to prove that his scheme would be entirely unworkable even if it were conceivable that it might be adopted.

The literary as well as the political duello continues to flourish in France, if we may judge by the exchange of shots now in progress between Zola and Gaston Deschamps. The latter, in a review of 'Rome' in the *Temps*, gave some examples of the way in which the novelist had "documented" himself for his work. The documenting, in fact, had in some cases gone perilously near to slavish and literal copying of authorities, of which Deschamps furnished several delicious examples. Zola made a furious return-fire in *Figaro*, disdaining to mention his adversary by name, but calling him an "assassin," a "scratcher of paper," a "library rat," and other sweetly reasonable things. It is rather amusing to find him admitting, or, rather, boasting, after all this fanfaronade, that Deschamps was quite right in accusing him of plagiarism. There was much more of it in 'Rome' than had been charged. Of course he had read books about Rome, and of course he had been at no particular pains to see that phrases, passages, or perhaps whole pages were not transferred bodily to his novel. That was "the right of a novelist." As for those vermin of critics, when they had done the work and won the fame that he had, it would be time for them to open their heads. Deschamps, in his turn, argues that there are rights of critics as well as authors, quotes from a private letter of Zola's, on another occasion, fulsomely praising the critic whom he now reviles, and serves notice that the great man will hear from him further in this matter.

THE REPUBLICAN NOMINEE.

McKINLEY's nomination has been for some months a foregone conclusion, and he is, in our opinion, the proper nominee for a party in the condition of the Republican party—bereft of true leaders, without any cause or idea in its keeping, and without settled views on finance. He is exactly fitted for the place he has got. The party has been searching for him ever since Blaine's death. There has not been a time since 1861 when the country so much needed a man of strong character and clear views as this year. In 1860 it got a man of clear views, because its own views were clear. Lincoln led to victory a party which, as Cromwell said of his russet-coated captains, "knew what it wanted, and loved what it knew." McKinley is going to lead a party which does not know what it wants, except money, and holds no clear views on anything, human or divine. McKinley's absence of settled convictions about leading questions of the day, and his want of clear knowledge of any subject, make him emphatically the round man in the round hole. If the party had nominated anybody else, it would have made a great blunder. Even Reed would have been a mistake, for, if a trimmer, he is not mud-dle-headed.

The alarm of the country over the virtual nomination of McKinley in advance of the convention has forced a large number of silver men to turn gold men and put a gold plank in the platform. So far so good. It saves us, for the present at least, from the execution of McKinley's plan of turning all the silver products of the country into coin and making them legal tender. But that is about all it does. It makes it pretty certain that we shall not deliberately get down on the silver basis. If we ever reach that, it will be by accident and by some especial display of weakness on McKinley's part. But should he be elected, as he probably will be (for the Democrats are making an awful show of themselves), there are certain dangers and risks to be guarded against and looked out for, which we beg to submit in their order.

What will be done about the currency will depend on the Congress to be elected next November, about the probable composition of which no one knows anything. There will be no restraint on it except the platform adopted last week, and what this will amount to no one can tell. McKinley will be no restraint, because he is virtually pledged to sign anything that Congress sends him. Avowing, as he does, that the opinions of the party on all subjects are virtually his, there is no reason why he should not keep this pledge. Secondly, he will have been elected, among other things, or rather before all things, as the champion of the tariff, or a representative of the protected interests, and to deliver the country from the horrors of the Wilson tariff. To get a new tariff passed, therefore, either in March or in

December, will be his first duty. How will he do it? The Senate is filled to a majority with enraged silver men, who feel that he and the party have cheated them, and that silver is as much entitled to protection as wool or iron. In what way can they be induced to pass a tariff? In one way only—by "doing something for silver." There are various things one can "do" for silver without openly violating the platform. One is buying it, which McKinley has steadily advocated. We do not think this way will be adopted. But in order to pass a tariff, some way will have to be found. A large body of the public want silver, and almost worship it. Mr. Teller's shedding tears over it in the convention shows what a place the metal has found in the hearts of the people. Silver is, we think, the first raw metal that has ever been wept over. Iron is twice as patriotic and has done five hundred times as much for civilization, but it has never drawn tears, in the pig state. It has to be turned into a weapon, like a sword or halbert, in order to move strong men.

McKinley's character is so vague, and so little forecast of what he is likely to do can be got either from his career or from his language, that a good deal of uncertainty must mark the first year or two of his administration, at a period when certainty is of priceless value. We must not overlook the fact—the experience of the human race forbids us—that he has a certain number of unpaid creditors—not legal creditors, it is true, but still creditors whose claims on him it is difficult for any ordinary man to resist who has many favors to bestow. Our sole guarantee that they will not be improperly rewarded lies in McKinley's private character, which is, we believe, very good; but we must remember that, in dealing with them, one virtue will have to contend with another—gratitude with the sense of public duty. The experiment of putting an insolvent man at the head of the government is one never before, we believe, tried in a constitutional state, and it will be watched with interest.

Nothing marks more clearly than McKinley's nomination the mistake of turning nominating conventions into vast excited crowds, doing their work under the eyes of a larger crowd, more excited still. There can be little doubt that the gold in the platform was forced on the convention by the business men, and that, had the convention been a deliberative body, McKinley's unfitness to stand on any such platform would have been recognized. But the pledges given by the delegates before they ever met or compared notes, made it impossible to choose any other. About the platform they were free, but about the candidate they were tied up, so that they were compelled to put him astride a body of doctrine with which he has never been in thorough sympathy. But the formal recognition of the doctrine by the party at least insures discussion, and encourages us to hope that there

will be no more difficulty in killing the silver heresy through the country by free debate than there has been in getting such a collection of politicians as met at St. Louis to declare for the gold standard. What is debauching and will continue to debauch the people is the legislation to enable individuals to make money, which goes by the name of "protection to native industry." Every man who sees this wants his share.

THE ST. LOUIS PLATFORM.

APPROVAL of the gold-standard plank adopted by the Republican national convention must not be taken as approval of the remainder of the platform, or as condonation of it. We are aware that platform deliverances on subjects not of vital interest are considered by the public very much as stage-thunder, intended to carry on the movement of the play, and therefore not worthy of much attention even if it is bad *per se*. The tribe who make their living out of politics take advantage of this indifference to side issues, to weave into the platform all sorts of fraudulent schemes, so that they can go before Congress at a future time and make claims upon the public confidence on the ground that they have the authority of the national platform, the broadest mandate of the party, for doing so. Thus platforms are constructed in log-rolling fashion like river- and -harbor bills, so that, apart from the chief and vital issue or issues, there may be a collection of the rottenest material that the country affords. We think that the St. Louis platform, aside from the gold-standard plank, answers this description.

The "arraignment" paragraph is usually placed at the beginning, and is made very hot for the opposing party. As a general thing the opposing party deserves some buffeting. The Democratic party deserves a good deal, but mostly of a different kind from what it receives in the bill of particulars. Among other accusations laid at its door is this:

"In administrative management it has ruthlessly sacrificed indispensable revenue, entailed an unceasing deficit, eked out ordinary current expenses with borrowed money, piled up the public debt by \$262,000,000 in time of peace, forced an adverse balance of trade, kept a perpetual menace hanging over the redemption fund, pawned American credit to alien syndicates, and reversed all the measures and results of successful Republican rule."

We shall not go back to the causes of the "unceasing deficit" of revenue, although it would be easy to find them in the unimpeachable testimony of Charles Foster, Secretary of the Treasury under President Harrison. Let that pass in order to reach the "pawning of American credit to alien syndicates." What is meant by that? It means that the Administration now in power is blamable for selling bonds to maintain the public credit. It admits of no other construction. Is any particular stress laid on the word "alien"? If bonds are to be sold at all, they are to be sold at

the best price offered. The best price can be obtained only in the widest market. Shut out the foreign bids and you make a home monopoly—the very charge that produces the greatest outcry even when the charge is false. Any Secretary of the Treasury who should limit bids to American buyers—any one who should advertise “no foreigners need apply”—would be impeached by Congress and universally execrated. Therefore the gravamen of the arraignment is that the present Administration is censurable for selling bonds to maintain the gold standard.

No matter how the deficit came about, this is the real crime. How does this sound, how does this look, beside a plank affirming that the existing gold standard must be maintained? It looks as though the arraignment plank and the gold-standard plank had been drafted by two different sets of hands, or sub-committees, and slapped together without any comparison of views either before or after the drafting, and that the arraignment set did not know what they were talking about. For, as surely as the sun rises, the McKinley Administration will have to sell bonds to redeem the promises of its own platform if it is confronted by the same conditions as those which have four times confronted the Cleveland Administration. We think that it will be confronted by such conditions, and that the result will be due to the extravagant and reckless appropriations made by the terrible Congress that has just adjourned.

There is so much else that is bad in this platform that we hardly know where to put our finger first. Foreign policy occupied a large share of the committee's attention, and while this part of it is not so bad as might have been expected, considering the stampede which Mr. Cleveland produced among Republican Congressmen by his Venezuelan message, it is essentially a Jingo production, offensive and undignified in tone, betraying the half-grown, loud-talking, self-asserting frame of mind, far removed from gentlemanly and civilized deportment and from the reserve which accompanies genuine courage and real strength. The slime of Henry Cabot Lodge is over it all. Our foreign policy, it says, should be firm, vigorous, and dignified, and for this reason we ought to have a great many expensive things, such as a Nicaragua Canal, a large navy, the Danish Islands, to be acquired by purchase, and “a much-needed naval station in the West Indies.” All of these things, or any of them, will hasten the time when McKinley, if elected, will have to sell bonds to meet current expenses and maintain the gold standard. All or any of them will help to get us into foreign trouble which the whole American people, except a few speculators and contractors, are most deeply interested in avoiding. The Danish Islands are a misfortune to any country that possesses them. They were rejected by us after investigation when Mr. Seward was Secretary of State.

“Much-needed naval station in the West Indies.” That also was rejected by us after investigation when Gen. Grant was President. It now reappears in the St. Louis platform, for no better purpose than to let Mr. Lodge out of the bad scrape he fell into when he tried to out-Jingo President Cleveland and “got left.”

As for the protective plank, it leaves McKinley looking almost as much of a misfit candidate as does the currency plank. “We are not pledged to any particular schedules.” That is to say, do not fear, good people, that we shall break our leg a second time on the McKinley tariff. The platform is for a “reasonable application” of the protective principle; the awful inference lies on the surface that there have been unreasonable applications of it. “The country demands a right settlement, and then it wants rest.” Business men say they want rest immediately, and dread nothing more than to be harried another four years by tariff agitation. Finally, the platform explicitly throws over the sugar bounty, which was a great and essential feature of the McKinley tariff. In other words, it is for McKinley, but not for McKinleyism.

THE SILVERITE SECESSION.

SENATOR TELLER announced to the committee on resolutions at St. Louis, when his free-coinage plank was rejected, that he could not support a candidate standing on a gold platform. He is quoted as saying that the Republican party had become “the slave of Wall Street and Lombard Street,” and that it was a matter of conscience with him to abandon it. This kind of talk seems to have been taken in good part by Senator Lodge, although nothing could have been more insulting except a charge that the majority of the committee and of the delegates had been bought with money. Lodge is reported to have replied, in a feeling manner, that he had the utmost respect for Teller, who had just described him and his associates on the committee as slaves of English bankers. Then the representatives of Utah, Idaho, Montana, and Nevada endorsed and repeated what Teller had said—in other words, took themselves out of the party. The Californian on the committee did not go so far. He contented himself with saying that his State would be lost to the Republicans by 40,000 majority, which is probably a gross exaggeration.

Next to the adoption of the gold-standard platform, the secession of the silverites is the best thing that has happened since the repeal of the Sherman act in 1893. It is beneficial in a number of ways. It accentuates the fight on the money question, makes the division of public sentiment deeper, prevents future straddling, and, last but not least, it probably holds the Senate against the McKinley tariff fanatics. At all events, it relegates the tariff to the second place in the campaign, and furnishes opportunity for a

similar division and secession at Chicago in case a free-coinage platform is adopted there. With a free-coinage platform it would hardly be worth while for the Democrats in the East to nominate electoral tickets. They might better follow the example of Teller, Dubois, and Cannon, and abstain from further proceedings in the convention after the platform is adopted.

All signs point to the sharpest possible division on the silver issue—so sharp that the personality of McKinley will be mainly lost sight of. This will be a desirable feature of the campaign, in the East at all events, since his name inspires no enthusiasm here, even among Republicans. Anything which serves to put him in the background will be an advantage to the ticket, which will depend for success upon votes that would never be given to him except as an alternative to the silver standard and business chaos resulting therefrom. What the future may bring us tariff-wise cannot now be predicted, but the immediate danger is a financial crisis of the first magnitude growing out of a change in the standard of value. In comparison with this the tariff question, although unsettled, is relatively small. Nobody is going to change his opinions on this subject merely because circumstances have compelled him to subordinate this issue to another one for the present. Nor will the fight be given up for that reason.

How much the secession of Teller and his faction will amount to in electoral votes cannot be known until after the two platforms and the two tickets are announced. It is our belief that no Northern State east of the Mississippi River will be found in the free-coinage column in November, and that of the States west of that boundary the party favoring the gold standard has the best prospects in Kansas, Nebraska, the two Dakotas, and Wyoming. Some doubts have been expressed as to Iowa, but the doubters have not made account of the sound-money Democrats of that State, who constituted more than one-third of the recent State convention. These men have already begun to organize against free silver, like their friends in Chicago, and they may be depended on to fight. There will be no whipping-in after the convention, because the business interests of these men are at stake. They have no option, because they are fighting for their bread and butter.

In Indiana the contest will be sharp, but we have every confidence that the gold standard will win. The same result will follow in Michigan, although the Republicans there have been under bad leadership. In that State the line of division runs as sharply through the Democratic as through the Republican ranks. In the South we find many encouraging signs. Maryland, Delaware, Kentucky, and West Virginia are almost certain to be ranged against free coinage, while the chances of defeating Bland in Missouri and Harris

in Tennessee are fairly good. It may turn out that the Republican majority in the next Congress will not be as large as it is in the present one, but that will be no misfortune to the party. The shocking blunders in the present Congress were due mainly to the unwieldy strength of the party. If they had had only twenty or thirty majority, Speaker Reed would not have lost control of them. He would have been able, in all probability, to keep them from passing the extravagant appropriation bills which constitute the present menace to the Treasury reserve. Hence the Republicans can lose some of their top-heaviness in Congress with advantage to themselves.

Whether the Teller secessionists go to the Democrats or to the Populists, or set up a party of their own, makes little difference in the long run, though the probability is that all the silverite factions will come together eventually. Meanwhile they have nominated Teller for President, and have put forth an insidious and deceptive address to the people which it will probably be necessary to answer a good many times before the end of the campaign. Almost every line of it is either an unsupported assertion or a manifest falsehood. Take this one as a sample:

"The country cannot much longer exist free and independent against all the rest of the world, nor can its people be free in the noblest sense of the term, if the United States, a debtor nation, shall follow a policy dictated by creditor nations."

What is meant by existing free and independent *against* all the rest of the world? The phrase has a quasi-belligerent ring. Ever since the close of the Revolutionary war we have existed free from and independent of other nations, and we have been free and independent *against* them whenever we have been at war with them, which has been only five years out of one hundred and six. These facts show that we can be free and independent of them or against them as the case may be, although we have been a debtor nation all the time and have found it profitable to ourselves to be so. There is no external force compelling us to be a debtor nation. Debt is incurred by borrowing money, and there is no law compelling men to borrow. They borrow when they find it advantageous to do so if they can find lenders. The most unfortunate borrowers are those who cannot find lenders, and the most unfortunate lenders are those whose borrowers cannot pay. Ability to pay means generally that the borrower has made a profit, or at all events that he has not made a loss. In the jargon of the Populist camp, it is always the borrower who is suffering because he cannot pay. He is the object of commiseration, whereas the one to be really pitied is the lender. It is his money that has "gone up the spout." The borrower has had the use of it. He may have consumed it or lost it in bad speculations, but evidently the lender is the real sufferer if the borrower

cannot pay. If he can pay, however, that fact shows that the loan has been a mutual advantage, which is a gain to the world.

But the bolters tell us that the people "cannot be free in the noblest sense of the term if the United States, a debtor nation, shall follow a policy dictated by creditor nations." Do they mean that foreigners are dictating our policy without our knowing it? If so, the wrong term has been used, because dictation implies knowledge on the part of dictator and dictatee. If our policy is framed for us abroad without our knowledge, then the word deception should be used in place of dictation. No evidence is offered to show that foreigners are using either deception or dictation as to our currency system. As a matter of fact they are concerned only with their own. We have tried three times to get them to change their system. They have never tried once to induce us to change ours. It is evident that in the single sentence quoted from the bolters' address there are four or five falsehoods or suggestions of falsehoods—about one to each line. We judge from a cursory examination that the proportion of lies to truth in the whole address is not less than 16 to 1.

THAT "INTERNATIONAL AGREEMENT."

In this country nothing in politics comes suddenly. Almost all waves of popular feeling are prepared or stimulated by persons who are more knowing than the masses. This was distinctly true of the Jingo movement, for instance. For two years a band of politicians kept the air full of threatenings against England, and abuse of Cleveland, in the interest of what was called a "more vigorous foreign policy." As time rolled on, the talk grew fiercer. The flag was hoisted on all the schoolhouses as a measure of defiance. The children were drilled, and there finally arose a call for war, not with England, but with anybody, as a means of moral discipline. If we did not go to war with somebody, the Jingoes said, there was no knowing what would become of our character. "Patriotism" ceased to have any civic meaning, to connote love of law, or order, or integrity, or good government. It meant simply for awhile a desire to fight somebody, or admiration for people who were going to fight. With the Venezuela outburst, Jingoism totally collapsed. After "standing behind Cleveland" a few minutes, the Jingoes all dispersed to their homes, and became utterly peaceable, showing that if agitators only kept quiet, the people had no thought of fighting anybody.

Very much the same thing has happened with regard to the silver agitation, except that it has had a little more assistance from events. The panic of 1873 combined with the fall of silver to start it, but its absurdities, in our belief, would have killed it long ago had it not been

nourished by the body of much more instructed men known as "bimetallists." The ignorant masses have constantly heard from these people, during the last twenty years, that although the extreme view of the silverites was idle, there was something behind it; that the scarcity of gold had lowered prices; that a double standard composed of both silver and gold was possible, through international agreement; that the hated England was the main obstacle to this agreement, and that our business was to force her into it. This talk of professors and "philosophers" has kept this pest of the modern world alive for a quarter of a century, and has caused the holding of three absurd conferences, in which we were almost the only members who really desired success. The others attended and debated to humor us. In not one of them did there appear to be the smallest hope that ultimate agreement could be reached, but the preaching at home continued. The hope was constantly held out, and is held out to-day, that another conference will be held, when we shall get what we want. This passion for, and promise of, a conference keeps the ignorant masses of the South and West in constant expectation and constant irritation. What they are waiting for is not a conference to see whether a double standard would be a good thing, but a conference that will end in bringing it about. They think England is the main obstacle and they want to fight her. This was actually the explanation Lodge gave, a few months ago, in a letter to a friend in England, of the excitement over Venezuela.

The latest contributor to this literature of mischief is Mr. W. C. Whitney. He printed a letter in Monday's press full of wise reasoning as to the danger and folly of free coinage just now. But, as usual, he assured the silverites that their cause was good and its triumph was coming:

"There has never been a time when the prospects of international action favorable to the joint standard were at all as promising as at the present moment. But an ill-advised, unsuccessful attempt here would discredit the cause the world over. What is the situation as regards this? From the discussion of the last twenty years, it has come to pass that among the persons in Europe who are trained, recognized scientists upon monetary and economic questions, scarcely one is not at the present moment advocating the desirability of the joint standard as the real solution of the monetary difficulties of the world. This includes every professor engaged in teaching or lecturing on these subjects in the universities of Great Britain. They are agreed upon the desirability of it, and that it is entirely practicable if established and maintained by agreement of the principal commercial nations."

This is the kind of talk which, coming from such quarters, keeps the silver movement alive in this country, and keeps, or will keep us for some time to come in constant danger of its success. We deny totally the assertion that in Europe among "trained, recognized scientists upon monetary and economic questions there is scarcely one who is not at the present moment advocating the desirability of the joint standard."

dard as the real solution of the monetary difficulties of the world." The direct contrary of this is nearer the truth. If Mr. Whitney does not wish to be accused of deceiving his countrymen, he will give them the names of these persons and samples of what they say. He is simply repeating here an absurd statement of Mr. Balfour's, who is a fair specimen himself of the "philosophers" who want a double standard. There is hardly one recognized authority in England on financial questions who desires or believes in the possibility of a double standard, or would think for one moment of doing business in it if it were established. There are professors who preach it, but, like our "ethical" professors here, few of those who have the English pound sterling in their keeping pay any attention to them. But give us their names, Mr. Whitney, and the names of their universities. Nothing does more to bring about this immense silver delusion, with its disastrous consequences, and to make men like McKinley the leaders of the American people, than this sort of talk. As long as the famous "international agreement," with the foreign "scientists" behind it, is kept hanging before the eyes of the public as a strong probability, we shall never have business peace or stability.

One by one the arguments of the bimetallicists have deserted them. The earliest one, that the scarcity of gold had lowered prices, has gone, partly because so many causes are at work to cheapen modern commodities that it is impossible to connect it by proof with any one; partly because the supply of gold has within a few years increased enormously and is still increasing. The second one, that the gold standard was in any country causing scarcity of money to people who had collateral or credit to borrow on, has perished under the smiles of real business men. The third one, that, absurd or not, the nations are going to agree to give silver or any other commodity an arbitrary price in a conference which England is to attend "on her knees," is kept afloat in default of anything better. It is the sole support to-day of the silver movement. It is the expectation or hope of this which keeps the agitation alive among the masses, as well as among rational bimetallicists. Concerning fanatics of the Teller type, or ignorant men of the "Coin" school, we have nothing to say. "Non ragioniam di lor, ma guarda e passa." We appeal to sensible and patriotic bimetallicists of the community to try silence for a few years. Their cause is a lost cause, like that of the Stuarts or of the Confederacy. It may be well to have fought in it, but it is better now to forget it. The remembrance does nothing but turn away the minds of their countrymen from frugality and industry, as the true sources of wealth, and fill their hearts with bitterness against the great managers of money at home and abroad, to whom civilization in every

country is so much indebted, and to whom, whatever their faults may be, it is of even more importance than to any one else that the standard of value should be kept as far as possible steady, that credit should be kept intact, and that all workers of every nation should, about money as about other things, be clothed and in their right mind.

THE TORY COLLAPSE.

THE breakdown of the English Ministry on the Education bill, in spite of the largeness of their majority, is doubtless due in part to the public disappointment. Although their majority in the House, owing to small majorities in various counties and boroughs, was in the beginning 150 (now 146), it was in reality, if the House fully represented the voting population, only 14. The knowledge that it has nearly half the public behind it has, therefore, made the Liberal Opposition much fiercer and more truculent than its strength in Parliament appeared to warrant. It has been so strenuous on the Education bill that the Government has abandoned it with a somewhat ludicrous promise that it will go to work at it again next year.

But the trouble goes further back than the Education bill. The Ministry came in with a great flourish of trumpets, especially about foreign affairs. Almost immediately after it took office occurred the Armenian fiasco. Nothing has occurred in English history more humiliating or more shocking to the moral and religious public, especially to the Nonconformists, than Lord Salisbury's standing by idly and allowing the massacres to go on in Armenia, and then pretending that he had not provided for this contingency in making the Berlin treaty, and that the cession of Cyprus was not meant as a pledge that this sort of thing should not happen again. He was easily convicted of evasion out of the speeches he made when he came back with Disraeli, as well as out of the treaty itself. He has cut an equally lamentable figure in the Egyptian matter. After efforts to conceal from the House of Commons what the advance in the Sudan was for, it has crept out, through the Italian Green Book, that it was intended in its inception to help the Italians in Abyssinia, that Salisbury's dispatches were almost dictated at Rome, and that the story of Dervish restlessness was a pure invention.

So much as regards foreign policy. At home the Ministry were to avoid the Liberal folly in attempting great constitutional changes, such as home rule for Ireland and the reform of the House of Lords, and confine themselves to domestic reform in the interests of the poor and the old. There is no sign of any measure of this kind. Mr. Chamberlain, who was the leading apostle of this sort of thing, seems to have withdrawn his attention from it wholly, and is occupying himself

in building up an Imperial Zollverein, amid the jeers and laughter of his old associates. Only two capital bits of legislation have been produced after a whole autumn and winter of reflection and preparation. Both are what is called class legislation. One is for the benefit of the impoverished landholders, the other for the benefit of the Anglican clergy. The first relieves the land from \$7,500,000 of taxes by which landlords, not farmers, would profit. The other not only saves the church schools from extinction, but alters the whole school system as settled, after forty years of agitation, by Mr. W. E. Forster in 1870. It abolishes the elected school boards, and gives the government of the schools to the county councils. It removes the limit of four dollars and a half a child, given as aid by the Government to every denominational school, and, worse than all, reintroduces religious instruction into the schools on the demand of the parents, and allows it to be given by the clergyman of their choice.

The importance of this is that Dissenters are satisfied with the public schools. Among them denominational schools can hardly be said to exist. Denominational schools are, as a rule, Church or Roman Catholic schools. It is these which have mainly profited by the Government money. But as time has gone on, and as their supporters have become impoverished, the subscriptions to them have diminished, and the ability to profit by the Government aid by producing pupils, has diminished with it. They were more and more threatened with extinction when the Conservatives returned to power. The first act of the new Ministry, as we see, was not to improve the public schools, but to raise the importance of the denominational schools and discredit all others. This is the measure which the Liberals in Parliament have been opposing tooth and nail. Now that Irish home rule is out of the way, there can hardly be a doubt that the great body of the Liberal party in the country is again behind them. It is most likely that the Land bill will share the fate of the Education bill.

But there is more still. It is now acknowledged, or at least not denied, that Mr. Balfour's leadership of the House has been extremely bad. In fact, we can recall no instance when any one in such a position, with a majority of 150 behind him, has been compelled to abandon important legislation in his first session. This alone would be a confession of failure. But it has been long foreseen. Mr. Balfour's rise into the front rank during the Irish crisis was one of the strange episodes of that remarkable period. He was one of the four young men of fortune and fashion who, in earlier days, used to go down to the House mainly to "guy" Gladstone. He was not much known otherwise. His assumption of the Irish Secretaryship excited general surprise. But he filled it in a way that was

at that time immensely gratifying to London society. His immediate resort to coercion delighted the clubs. His indifference to the vulgar Irish abuse delighted the drawing-rooms. He became a hero in society, as "the brave Mr. Balfour." His oratory, halting at first, improved greatly, and he locked the Irish up, like a colonel administering martial law, so resolutely that he came out of the home-rule fight with all the honors there were for a Conservative. After Gladstone's victory in 1892, he was in opposition, resting, so to speak, on his laurels. But his character as well as capacity seems to have been strangely misconceived. He is really a charming metaphysical philosopher, and his conversion into an administrator of perturbed provinces, a political economist, and the leader of a stormy assembly at a great crisis in the world's affairs, has probably astonished him as much as anybody. Both he and Mr. Chamberlain are finding out that to be a statesman something more is necessary than to be a Liberal Unionist.

WHY ITALY IS NOT RICH.

ROME, June 10, 1896.

It is a curious fact that while, in modern times, Italy has become to a certain extent synonymous with poverty, it was in ancient times regarded, as it is in fact, potentially the richest country in Europe. No other part of Europe presents such varied and abundant resources for development, and no other makes such slight demands on the individual for existence. Why, under such circumstances, the people and the Government alike should be at the foot of the list of nations enjoying the privilege of controlling their own fortunes, must seem to the outsider a problem of difficult solution. I will try, in a superficial way, to show why this is so.

Firstly, the Government is poor because it is prodigal and dishonest, not in its relations with its creditors, but in those with its factors. In gathering its income, the dishonesty of its functionaries is the cause of the taxation falling oppressively on the classes which a wise statesmanship would protect and make more prosperous, leaving the minimum of burthen on those who are capable of bearing the maximum. Italy is governed in the interest of the wealthy classes—a fact which has the result, on one side, of diminishing responsibility and enterprise in those who ought to lead in the latter and feel the fullest weight of the former, and on the other of discouraging thrift in those who ought to be encouraged in economy. The collection of taxes in the more abundant springs is directed by favoritism, by official prescription, and by bribery. An acquaintance who has large interests in Tuscany, in mines and real estate, said to me that he paid only the quarter of the tax which the law required, but added that he would willingly pay the whole if the law would allow him to import the artificial fertilizers free of duty. Another bought a house and farm, including the furniture of the former, and, as the import on house and land transfer is heavy, and that on furniture is light, the price of the house and farm was put at a fraction of the value, and that of the furniture swelled to fill the total to the amount actually paid. There is no income tax in the sense in which that term is used in Eng-

land and the United States, but a so-called professional income tax, which was, by the old law, fixed at seventeen per cent. on half the estimated income, and which is somewhat increased by the new law of Sonnino, in which there are variations according to the sources of the income. But in the assessment of the income, political and politico-personal influence passes for so much that, to use the words of a functionary to myself, if one has influence in the Government it is possible to have the assessment made at a small fraction of the real income. Now as the small incomes are not easy to disguise, and their possessors have no influence in official regions, it follows that the owners of them cannot escape their taxes, but the larger incomes are so easily disguised that they pay only on a fraction. Thus, one of the most prominent physicians of Rome, whose income is estimated at from one hundred to one hundred and fifty thousand francs, is known to pay on one of 7,000, and I am told of a Deputy whose income is certainly 100,000 a year, but who pays on 200 a month. Wherever concealment is possible this is the case, more or less, and, the income of the state being of necessity fixed, it follows that the poorer citizens pay the heaviest taxes in proportion. The secondary consequence is the general contempt of the law, and the universal evasion of it when possible.

The Government is again impoverished in the expenditure, and especially in that on public works. It is enough to see how the railways are built to form an idea of the openings for rascality and fraud. They are not built by contract, but on estimate. A building company estimates that a certain line will cost a certain sum, and receives the job, which is always indeed a "job." The Government guarantees a certain income per kilometre, and the constructor makes the road as long as possible; but when the grant (which is made in bonds of the state) for the amount authorized is exhausted, the constructor coolly tells the Ministry that the road must stop there unless the Ministry makes another grant, which is of course done, and the invariable result is that the original estimate is nearly, or quite, or even more than, doubled, with the consequence that none of the roads, as they are made, ever pay their expenses and interest on their cost of construction. More than that, they are so burdened with deadheads that it is estimated that only 40 per cent. of the passengers they carry pay full fare, the remaining 60 per cent. paying from nothing up to 75 per cent. of the fare. Deputies and Senators travel free everywhere in the kingdom, but, as the state pays a block sum for their privilege, it is not a dead loss, though as every Deputy who travels insists on having a whole compartment for himself, the road becomes anything but a profitable one. Worse than this: while writing this letter I note, in the proceedings of the Chamber of Deputies, the following statement made by a reforming Deputy:

"I remember to have seen in an express train a child of eight years, son of a high employee, travel alone in a compartment of eight places. Another case: these gentlemen, the employees, are not content with filling the carriages of the Italian Society, but fill even those that come from abroad for the use of international travellers. The other day a gentleman who wanted to go from Rome to Vienna could not take a seat in the car reserved for the international service to which he had a right, because, in a compartment of eight places, a high railway employee had installed himself comfortably. It was useless to appeal to the courtesy of the station master at Rome; it seems that he was helpless against his superior."

Every employee of both the great systems of railway has the right to make three journeys a year on each one, where he likes, and with his family, and the consequence is that some of them ruin themselves taking long railway journeys for which they have not the money to pay the expenses. And they are 60,000, with as many more pensioned off who have the same privilege; and, as all travellers know, the railway fare is the smallest part of the expense of a journey.

Another disastrous interference with the riches of the state is the system of taxing all business enterprises, after they have been established three years, at rates which in some cases swamp the profits, while idle capital, simply paying interest, escapes. A general income tax, equalizing all these interests in the incidence, would prevent all this injustice, but the influence of the personages who profit by the present system prevails to hinder it. Add to all these causes for the deficiency of income and excess of outgo the continual and all pervading evasion of all forms of impost, and the very general feeling that it is a laudable thing to cheat the Government or to rob it, and it is clear that the state has a hard time of it to attain a balance of the budget, and of course the state is poor.

The population cannot be said to be poor, and on this subject there are great delusions abroad; but it is not as rich as it might be, and, in fact, in comparison with France and England, it may be said to be poor. But Lombardy, Piedmont, and parts of Tuscany compare well with other parts of Europe, even with France, with which the comparison would be most just. As a whole, Italy is getting rich even faster in proportion to the already acquired wealth than is France, the annual increase of total national wealth being estimated at a milliard of francs a year, or 2 per cent. of the total. But it is impossible not to admit that Italy is not profiting by her natural facilities for enriching herself, except in parts of the extreme north, and the reason is simple—the people have not, as a rule, the ambition of getting rich. The Italian has the reputation of being lazy, and all who know the people know that it is quite the contrary. They are "indolent," which is another thing. The word is Italian, and has a correct Italian meaning, which is that one follows his "indole," or natural bent. Everybody who has had to deal with Italian laborers knows that they are among the best to be found, and, when they please to work, they require less supervision than most others. But, let a holiday come, a great *festa* of the people or the Church, and you could no more get them to lose the enjoyment of it for wages than you could get them to do a thing they had never been trained to. As a rule, the Italian, even of the lower classes, does not aspire to accumulate means; if he does, it is limited to the acquisition of a cabin and a piece of ground for a garden. The ambition to become rich and to accumulate for the sake of accumulation, which is the spring of what is called national prosperity, is wanting. There is a degree of contentment and *bonhomie*, under a condition approaching privation, which is remarkable, and the evident happiness of the lowest stratum of society, especially in the southern part of the peninsula, might well be envied by the people of more prosperous countries. No doubt this has a very important bearing on the question, Why is the Italian poor? and, in this direction, answers it satisfactorily, and explains why the nation, as a whole, is less progressive materially than, for instance, France, where the

lower classes are affected by the tendency to accumulate. This condition, is, however, yielding to the general human tendency, and the indication that the habit of saving is growing is in the fact that the accumulation of the sums in the postal savings banks has reached the amount of fifteen hundred millions of lire (\$300,000,000).

But there the classes join on a dead level of apathy. Beyond the most elementary accumulation the enterprise of the nation does not aspire. Except in the north, and especially about Milan, there is almost no disposition to embark in undertakings of a speculative nature, and this is a general reason why Italy lags behind the other European nations in the increase of prosperity. Whatever the cause of this aversion to investing money in new operations—whether apathy, indifference to increase of fortune, or distrust of the result—the fact is that the reluctance to embark in commercial or industrial affairs is phenomenal, and most of the serious undertakings in the country are carried on with foreign capital, though the accumulation in Italy is sufficient for all that needs to be done. This appears, in looking at it from the outside and without the study of occult motives, like an excessive timidity in business affairs, but it is most likely simple apathy. Thus we may see that in the production of wine, which ought to be the specialty of Italy—climate, soil, and general condition offering the peninsula a supremacy in it, both as to the variety and the treatment of the wines—in general there is a complete indifference as to quality or kind, and for many years the wine-growers were satisfied to produce the crudest material for treatment in France and Germany, while they could produce at home every variety of wine, from the lightest product of the high mountain region to the strongest wines known, in Sicily. It is true that, here and there, individuals are awakening to the advantages of home ripening of wines, but the greater part by far of the exportation is still due to the wine-makers of other countries, who ask for what may be considered as the raw material of the trade.

The fruit market is in the same condition. The climate and soil of the peninsula would, among all European countries, enable it to produce the greatest variety of fruits, both as to species and quality, and in a few cases, as if nature had tried to show the people the way, the fruits are of the finest quality. The peach, under cultivation, is equal to the best, but to find a choice variety, carefully and intelligently selected as in France or America, and put on the market with common attention to condition, is almost unknown. If one suggests to an Italian any such source of emolument, the general reply is, "Very good, but get us English capital and we will see." The same thing appears in the commonest kinds of business. It is not unknown to shoppers in Rome that a shopman will tell his customer that he has not an article, to avoid the trouble of hunting it out in his stock. The Germans and the Jews are coming largely into trade in Italy, and their ways are driving the old fashioned Italians into desperation, and leaving them in many cases out of competition.

After all, though to the foreigner who comes into Italy for the first time it seems as if progress had stopped, and the country was content to be poor, one who has been here for thirty years can see that there is life, and, like Galileo, can say, "Eppur si muove." X.

MADAME DE CHASTENAY.—II.

PARIS, June 5, 1896.

WE left Mlle. de Chastenay conversing freely with Gen. Bonaparte at Châtillon, and receiving the confidences of the man who was soon to be the master of the world, playing with him at what is called in France the "petits jeux" (forfeits), and, in consequence of a *gage touché*, seeing a moment at her feet the man who afterwards saw Europe at his feet. Bonaparte left with Marmont; he did not go to Brittany. Mlle. de Chastenay learned that he had returned to Paris. "I don't pretend," she says, "to write history. I only know that there was in Paris a commotion; that Gen. Bonaparte, who was enrolled on the side of the Convention, or of its majority, and of the Directory which was soon to be created, defended the Tuilleries and used his artillery, and that a decided victory consolidated a power which the nature of things then imposed." The allusion is to the thirteenth Vendémiaire, the day of the defeat of the royalist sections by the troops of the Convention commanded by Bonaparte.

Times had become hard, and the Chastenays were almost in want. The assignats, the paper money of the day, had lost all their value. "Their nominal value was such that if you wanted four gold louis, you would have to give twenty-five thousand francs in assignats." The Chastenays had to go almost without bread, and had to sell from time to time a watch or a jewel to get a little flour, which they baked themselves. Mlle. de Chastenay was sometimes in Burgundy with her father and sometimes in Paris. She has curious notes on life in Paris at that period:

"People lived much concentrated in quarters, for want of carriages. It was perhaps this cause which constituted the Faubourg St.-Germain one of the representatives of the old régime. The Faubourg Saint-Honoré remained more sociable, and ended by becoming, in some respects, a set; and the Chaussée d'Antin became peopled with the new rich. It was there that were invented the Greek costumes and the antique furniture; and this innovation, shorn of some grotesque exaggerations, renewed the taste and gave a new impulse to art. . . . The style of living of our old acquaintances was of great simplicity. Each one carried a bit of candle to mount the staircase of a friend; toilette, receptions, lodgings—everything was simple; people made a point of being simple and economical in everything; they only wished not to be wanting in elegance. The time thus spent was generally found sweet by those who enjoyed it."

Mlle. de Chastenay, who was very cultivated, began to make for herself a name in what was called the republic of letters. She became notorious by a translation of Anne Radcliffe's 'Mysteries of Udolpho.' The marriage of her brother, Henri de Chastenay, to Mlle. de Laguiche was a great event. The Laguiches were great landowners in Burgundy. The times grew less hard; the revolutionary régime was losing its worst features; there was a sort of renewal of life in society.

"Paris offered then a singular spectacle. It was the time of the triumph of the Chaussée d'Antin, the time when Madame Récamier, handsome as the day, affected to appear everywhere with a simple fichu of linen on her head, always disposed in the same manner. The young ladies who by birth belonged to the old régime followed the new style of elegance and luxury, all the more because it harmonized with a small outlay. The young men had their hair cut *à la Titus*; the young women had it arranged after the busts of antiquity. A slight moulin with a knot of ribbon composed an exquisite parure, and only very cross old ladies regretted powder and high-heeled shoes. I do not consider these details superfluous."

The émigrés were coming back one by one,

sometimes with false passports, sometimes after having succeeded in getting their names erased from the lists made during the Terror. They appeared like strangers, and were "doing" Paris—a Paris which they had never known. Of all the friendships which Mlle. de Chastenay made at that time, the most important to her was that of Réal. He had saved the life of her father. He was, she says, full of *esprit*, of vivacity, of kindness.

"His independent opinions, when merely shown in conversation, gave it a movement, a lightness, and, at the same time, an elevation which had for me the greatest possible charm. I went to see Mme. Réal and her family, in the midst of which she led a simple and quiet life. I had some conversations with M. Réal. His opinions were not all mine, but ideas marched so fast with a mind like his that it was not worth while to dispute over a few of them; we left them aside, and it was only after the too famous event of the 18th Fructidor that our relations became as intimate as indispensable."

A catastrophe was preparing; the royalist party was reviving and the Directory became alarmed:

"The press was absolutely free; the papers which were opposed to the Revolution, especially to the revolutionists and to the Directors even more than to the Directorial Government, were numberless. . . . This false compass deceived the émigrés, and they became, by fashion, even more ardent than they really were; it deceived the opinion which I will call national, and which wished only for quiet and for the return of the absent, but which feared a sort of reaction."

Two of the Directors, Carnot and Barthélemy, were favorable to the reaction. "Nobody at the time of the Restoration," says Mlle. de Chastenay, "remembered or wished to remember the proscription of Carnot after the 18th Fructidor. Still, there was, at that moment, a return towards royalty which was the secret thought of the unseen leaders." As for Barthélemy, he had been a clerk in the Foreign Office whom circumstances brought to the front. He signed the treaties of Bâle with Prussia, with Spain. The Swiss had erected triumphal arches on his passage; on his return through France he received the most flattering homage. In Paris and in the Directory, this prestige soon disappeared and was replaced by injustice. "Pale, tall, without dignity, little accustomed to speak and to give out his ideas, . . . the poor Barthélemy was quite stupefied by the hopes and the hatreds which his Presidency of the Directory seemed to excite. . . . He did not know a single person. I have never seen anybody so null." On the 17th Fructidor, Mlle. de Chastenay went to a soirée with her mother and sister; she went home at two o'clock in the morning, having noticed nothing in the streets.

"At the dawn of day the streets were full of soldiers and bayonets; at nine o'clock in the morning Carnot had fled, Barthélemy was a prisoner, an immense number of Deputies, of journalists, and other people were in prison. . . . The day of the 18th Fructidor was disastrous; it destroyed all the prestige of the Constitution of the year III. It showed that the laws were no protection, constitutions no safeguard. Journalists, Deputies, Directors, even, were transported to Sinnamari (in French Guiana). . . . It traversed all the straight lines of opinion. The Republic, on its trial, was nothing but the victory of a party. Two new Directors were appointed. Everything assumed a character of violence and of conquest. The Treasury failed—that is to say, two-thirds of the public debt was repaid in paper money. This measure cost us 12,000 livres of revenue, by a stroke of the pen; our fortune, after the ruin of the assignats, never recovered from this terrible shock."

The laws against the émigrés were again put

in force with renewed severity. Mlle. de Chastenay had to take great pains in order to obtain the definitive erasure of the father of her sister-in-law, M. de Laguiche, who was erroneously on the dreaded list of the émigrés. Réal served her again on this occasion. He had rooms at the Police Bureau, as he had been charged by the Government with the examination of the papers which proved the relations of Gen. Pichegru with the English Government and with the Prince of Condé. Réal was still at the bar, but he spent several hours every day at the Police Bureau, where Mlle. de Chastenay went to see him, took his instructions, and consulted him on her family affairs. Mlle. de Chastenay was twenty-six years old, Réal forty.

"We both had youth; I had real youth, he was young in character, though his hair was already almost white. His attachment for me increased every day; my gratitude, my confidence in him, became every day more imperious duties, and duties which I found it easier to fulfil. I expected everything of him, and, in order to imagine what I felt, you must understand our situation. It was a question of the whole of the fortune of my sister-in-law; if the name of M. de Laguiche was not struck off, it was total ruin for him and for his brother."

When Bonaparte came back from Italy, Mlle. de Chastenay hoped to find in him an ally.

"The conqueror of Italy was not of the common run of generals. Notwithstanding his addresses on the 18th Fructidor, all the malcontents placed their hope in him. He was coming back to make a *coup d'état*—such was the general opinion. The Directory received Bonaparte with misgivings: Bonaparte treated the Directory with an affectation of levity and contempt. He shut himself up, and, to gain time and to multiply his chances, he prepared the expedition to Egypt. I remember that he said to Réal: 'These people don't know how to govern; but the Government still goes on, and I don't want to be a rebel!'"

Réal finished his work at the Police Bureau; he entered into a company of army contractors, and Mlle. de Chastenay saw many of his partners, among whom was Fouché. "My first impression of him was perhaps painful," she says, but it did not hinder her from often seeing Fouché, "who gave me judicious advice about men and things. He manifested towards me the most obliging interest, and begged me to consider him in future as a counsellor whose experience might not be without use to me. I used this advantage, and had several times occasion to applaud myself for so doing."

Mlle. de Chastenay saw, it is clear, a very mixed company. The canoness was thrown among men who had been Terrorists; she frequented much the literary men of the time, and seems to have been altogether very sociable. "I went everywhere," she says very frankly. She became acquainted with Barras, with Larevellière. The first visits to the Terrorists were made in the interest of the Laguiche family. "It will never be known how much courage they required. I don't speak of the obligation always to make my visits on foot, of the simplicity of my dress, but of the profound isolation in which I was in this society, and which was very terrible at first to me." By degrees the ice was broken. This is her portrait of Barras:

"A noble, and at heart very glad to be one, he preserved in his manner the dignity, the politeness which prejudice attributes to us and imposes on us. . . . He was tall, brown; his countenance was haughty, his eye bright; his person was thoroughly distinguished and really imposing. He wore a long blue redin-

gote and boots. He had taken the finest apartment in the Luxembourg; a fine gallery succeeded the drawing-room. I have seen it sometimes almost full of more or less remarkable men. He passed from group to group."

Mlle. de Chastenay describes the salon of Barras, and cites the men and women who were the chief guests of the Director, among others Madame Bonaparte, Madame Tallien, the greatest beauty of the time, Madame de Staël, Benjamin Constant, Talleyrand. "I was to Talleyrand," she says, "an object of surprise, and I don't think he ever quite understood me. I have never been at ease with men of his stamp, who employ any instrumentality, and who play at *profondeur*. . . . I don't know how this politician one day came to reveal to me the secret of his life: 'You must always,' said he, 'put yourself in a situation where you can choose between two resolutions.'" By her *esprit* Mlle. de Chastenay made herself rapidly important in the governmental sphere of the Directory; many people now began to ask for her aid, and she became a sort of connecting link between the remains of the old régime and the powers of the day. Her protection was understood to be the protection of Réal, who had made himself more and more influential.

But we must take leave of Mlle. de Chastenay, and wait patiently for the publication of the second volume of her Memoirs. We will, however, improve the occasion to complain of this new habit of publishing volumes of important memoirs separately and sometimes at long intervals.

Correspondence.

DENTISTS IN SOCIETY.

TO THE EDITOR OF THE NATION:

SIR: In an editorial in a recent number of the *Nation*, entitled "Political Gentlemen," these words appear: "We rarely meet . . . dentists in society." From this one is to suppose that there is something in dentistry which is antagonistic to refinement, education, and other things which go to make a gentleman. Is this true? As well say one rarely meets an oculist in society, or one rarely meets a rhinologist in society. Dentistry is nothing if not a part of the great medical profession, and is so acknowledged by the American Medical Society, as one section in that association is wholly devoted to dentistry. The term of pupillage of the dental school is the same as that in most of the medical schools. The fundamentals, viz., anatomy, chemistry, physiology, materia medica, are the same. The requirements for entrance to the schools are the same. A goodly number of those now entering the dental schools have degrees from the best scientific and literary colleges in the country. Many dentists are men of good breeding, have good manners, and have refined and educated tastes. There are about seven physicians to one dentist, and the proportion is even greater between the lawyer and the dentist, so it will be seen that one would naturally meet fewer dentists in society than either physicians or lawyers; besides, one may often meet a dentist in society and not be aware that he is a specialist, as the title Doctor is not discriminating.

There was a time when dentistry was on a low plane; so was surgery when practised only by barbers.—Yours truly,

THOMAS L. GILMER.

CHICAGO, June 19, 1896.

"AS YOU LIKE IT" AT SMITH COLLEGE.

TO THE EDITOR OF THE NATION:

SIR: Three performances of Shakspeare's "As You Like It" have been given by the class of 1896 as part of their graduation exercises. The first, a dress rehearsal, was necessarily somewhat crude; the third, on Saturday evening, June 13, was the most finished piece of dramatic study, the Greek play "Electra" excepted, yet undertaken by the students of Smith College. The task would perhaps not have been entered upon—it would certainly have been less confidently carried out—without the example of last year's class in "Midsummer Night's Dream." All the motives influencing the Seniors of 1895 to undertake a play of Shakspeare were felt with equal force by the present Seniors. They, too, desired to entertain their guests and to get the intellectual and æsthetic discipline afforded by training for such a representation. To the former careful study of the text was added this year great attention to the stage business. Mr. Alfred Young, the trainer, made a careful study of all the presentations of the play, and collated the "business" of each part for the benefit of the respective performers. The result was highly interesting.

The play was cut to remove all passages unsuitable for modern presentation and to reduce its length. Very long speeches were avoided whenever practicable. *Sir Oliver Martext* and *Dennis* were entirely omitted, and also *Rosalind's* epilogue. The order of scenes was changed, in conformity with customary stage usage, to make the action more coherent and intelligible. These changes render the acting play markedly different from the play as read. The characters appear in different lights, and certain traits in changed proportion. *Rosalind*, for instance, becomes gentler and on the whole more romantic. The character of *Celia* grows in interest and attains more significance. On the other hand, certain passages in the play usually cut were left in, with the general effect of bringing out the serious and romantic side of the story and characters. The minor parts received careful attention throughout, the mobs, crowds, and attendants being made distinctly parts of the action as well as of the spectacle. Such changes as ensued from the circumstances under which the play was given, or from the cutting, may be considered incidental. One change was deliberately made, that of interpreting *Jaques* as the bitter cynic and libertine instead of the romantic philosopher.

Mr. Abbey's Shaksperian illustrations were used as guides in costuming. Great ingenuity was shown in adapting the pictures to stage effect, particularly as most of the costumes were made by a committee of the class. The scenery was arranged to make the woods-life as prominent as possible, and four different scenes gave glimpses of the Arden forest. The grouping of the exiled followers of the banished Duke, his earnest and dignified view of life, the occupations and recreations of the little community, were all very delicately and suggestively conveyed. The songs were given after old versions by Dr. Arne, Bishop, and Morley, transposed and arranged for four parts. Refrains from these songs appeared as dramatic motifs in the introduction of *Phoebe* and *Salvia*, of *Orlando* and *Adam*, in the exit of *Rosalind* and *Orlando* in Act III., and in the dance with which the play was ended.

Of the acting, it must be said that it far exceeded the expectations of even those who had watched the progress of the study.

The voices of the girls were much more adequate to the demand than was to have been expected, and the rendering of some of the most difficult parts was most successful. The part of *Touchstone* was extraordinarily well given by Miss Dustin. A tinge of melancholy made the final suggestion in the personation of one of Shakspeare's typical fools. The lines were nowhere better delivered than by Miss Hall in the character of *Adam*. The leading parts were so well taken that nobody missed the significance of *Celia*'s intelligently sustained character, found the disguise of *Rosolind* absurd, or the sudden conversion of *Oliver* incredible. Perhaps the severest test endured by the acting was that of the love scenes, which were uniformly interesting and in several places really charming.

It should be said that no English play has ever been given by students of Smith College in which all the work was so directly the outcome of special study and preparation in the Department of Elocution. Miss Peck, the head of this department, feels that this performance does much to put such work in its proper relation to dramatic and literary study, both inside and outside the college. R. D.

NORTHAMPTON, MASS., June 15, 1896.

Notes.

A. P. TVERSKOV'S 'Sketches from the United States of North America,' already heralded in these columns by a correspondent, Dr. Leo Wiener, is a translation announced by Macmillan Co.

The Robert Clarke Co., Cincinnati, will publish next month 'Nathaniel Massie, a Pioneer of Ohio,' by David Meade Massie, with portrait and map. The work will have a place beside the St. Clair Papers.

A chart, showing the "Descent of England's Sovereigns," that may be folded in any historical work, is to be published at once by D. C. Heath & Co.

In the current Proceedings of the State Historical Society of Wisconsin we read that the long-expected catalogue of its bound newspaper files is still delayed by the difficulties incident to so novel and important an enterprise. It will be arranged geographically and chronologically by decades, will classify by special features, and will be enriched with historical notes. An alphabetical index to editors and publishers will conclude this most useful labor.

Harper & Bros. follow up Mark Twain's 'Huckleberry Finn' with 'A Connecticut Yankee in King Arthur's Court,' uniform in style and also illustrated. The series is prettily bound, and will find a welcome.

The Messrs. Putnam's "Mohawk Edition" of Cooper's works proceeds with 'The Sea Lions, or the Lost Sealers,' which completes the second section of six volumes. We have only to renew our praise of the openness of the typography and the general comeliness of this issue.

Another handful of volumes in the little wine-colored series of "Stories by English Authors" comes from Charles Scribner's Sons. The tales relate respectively to London, France, Italy, and Africa—an itinerary quite conformable to that of present-day tourists. Good portraits of Barrie, Weyman, Payn, and Doyle furnish frontispieces to the two hundred pages of brief fiction by twenty-two writers in all.

The Minister of Education for the Province of Ontario, Mr. George W. Ross, has contributed to the International Education Series an

extremely lucid and satisfactory account of the school system over which he presides (D. Appleton & Co.). Dr. Harris, in his editorial preface, truly remarks that "it may be doubted whether there is another instance in America of so wise a use of money and supervising power as is shown in this Province of Ontario, excepting the administration of the Peabody and Slater funds for the stimulation and nurture of education in our Southern States." The striking features of the Ontario school system are the close organization and correlation of its several parts, higher and lower; the insistence upon the employment of trained teachers only; and the provision for denominational schools, subject to the same standards of efficiency as the public schools. Centralized supervision and apportionment of school moneys assure the maintenance of the legally prescribed standards in all these respects. Many of the strongest points of the Ontario system are being consciously or unconsciously imitated in several of the more progressive States, notably in New York and New Jersey.

Prof. Hinsdale of the University of Michigan is a cautious and painstaking student of education, and these qualities are reflected in his two latest books. The one, 'Studies in Education' (Chicago: Werner School Book Company), is largely made up of the author's recent contributions to the *Educational Review*, the *Forum*, and other periodicals. Of these papers two are specially noteworthy. They deal respectively with the Dogma of Formal Discipline and the American School Superintendent. His other work, 'Teaching the Language-Arts' (D. Appleton & Co.), is more ambitious, and attempts to construct a consistent theory of grammatical, linguistic, and literary training.

'Education,' by H. Holman, M.A. (Dodd, Mead & Co.), is largely devoted to psychology, and is written in apparent ignorance of the current literature of education in Germany, France, Italy, and the United States. The author is grievously mistaken in his supposition that the conception of the book is "entirely original." The conception not only is not original, but is commonplace and imperfect.

The considerable interest in the Moravian reformer, Comenius, that was aroused by the celebration, in 1893, of the three-hundredth anniversary of his birth, and the intrinsic merit of the book itself, justify the publication of an English version of his 'Didactica Magna' (Macmillan Co.). The editor, Mr. M. W. Keatings, has supplied a useful and voluminous introduction. It is to be noted that the book is not "translated," as is usual, but "Englished."

'Sketches of English Glee Composers,' by David Baptle (Scribners), is a little volume of 285 pages which will doubtless be warmly welcomed by the numerous glee clubs in our colleges and elsewhere. Brief sketches are given of the lives of about two hundred composers of glees between the years 1785 and 1860, with lists of their best pieces, and indications of the voices for which each piece is written, to enable caterers for glee clubs or choral societies to choose what they desire. The author, being an Englishman, is patriotically proud of the glee, which is England's principal contribution to the world's treasures of music. He justly holds that, in this field, England is unrivalled. Gounod, Ambroise Thomas, Abt, Köcken, Kreutzer, Mendelssohn, and others have written beautiful part songs, but "it is in a different style from the English glee, and that is still the best." On the second page the author gives his reasons for this

statement, which are interesting if not convincing.

A professional reviewer is apt to shudder when a "new method" of singing is placed on his desk. It is therefore a pleasure to meet with a book like 'Voice-Building and Tone-Placing,' by Dr. H. Holbrook Curtis (Appletons). This treatise is intended to be of use to physicians as well as to students of the voice; it exposes fallacious theories regarding the so-called registers, and includes exercises for the restoration of cords injured by improper vocal methods so much in vogue. The author, besides being familiar with the latest work of scientific specialists, has had much practical experience with eminent singers, the results of which are incorporated in the text, and there are valuable suggestions regarding breathing, hygiene, tone-placing, voice-building, etc., with abundant illustrations. Even the general reader will find something to entertain him in the last chapter, which has a number of pictures showing the lovely figures of seaweed, flowers, ferns, and shells that can be produced by tone vibrations after the method of Mrs. Watts-Hughes, as first described in the *Century Magazine* for May, 1891. Altogether, this is an exceptionally valuable book of its kind, though the introductory sketch of the "Origin of Music" might well have been omitted. The volume is dedicated to Jean de Reszké.

The first volume of the "Library of Early English Writers" begins with Yorkshire writers, singling out "Richard Rolle of Hampole, an English Father of the Church, and his Followers" (London: Swan Sonnenschein & Co.; New York: Macmillan). It is edited by Prof. C. Horstmann, well known from his editions of 'Altenglische Legenden' and other works. Our acquaintance with Hampole has been hitherto through his 'Prick of Conscience,' but now we have for the first time an edition of his various minor treatises. The "Introduction" discusses scholasticism and mysticism, and is incomplete, preparing the way for a consideration of Hampole himself, who is regarded as the typical English mystic. He entered upon the hermit life in his nineteenth year, and forms a direct contrast to Duns Scotus, the opposition of feeling to intellect. While writing much in Latin, "he was the first who to any great extent employed his mother-tongue." Many short treatises in both prose and poetry are included in this volume, among the latter being the poem beginning—

"When Adam delf and Eve span, spt, if thou wilt spede,
Where was then the pride of man, that now merres
his mede?"

It is hoped that the next volume will be provided with an index, or with a table of contents at least, and will tell us something more about Hampole himself.

It was a happy thought that led Mrs. Martha Foote Crowe to edit the later 'Elizabethan Sonnet-Cycle,' which have hitherto been inaccessible to the general. There is a natural unity running through these sequences of poems which makes it highly desirable to have them together at hand for comparison. The attractive little volume before us promises a series which will make this possible. In her first volume Mrs. Crowe gives the full text, spelling modernised, of Lodge's "Phyllis" and Giles Fletcher's "Licia." Her several introductions offer essential biographical facts and some popular criticism, but make no pretence of original research. The publishers are Kegan Paul, Trench, Trübner & Co.

It would hardly be expected that the His-

tory of the Twenty-second Regiment of the New York National Guard would make an interesting chapter in our war history, yet such is the fact. It was organized early in 1861, from business men, to supply a local protection in New York city which was felt to be indispensable when the older militia regiments had mostly gone to the field. Although its members were men whom strong duty required to be at home, the regiment volunteered for brief field-service at Harper's Ferry in 1862, and again in the Gettysburg campaign of 1863, and, though it saw no severe fighting, its story is among the most interesting as to marching, bivouac, and rough camp-life. It did good service, also, in the draft riots and in other local disturbances. Its history is among the best illustrations of the close relations of State troops to the national army. Gen. George W. Wingate has made a sumptuous volume of the regimental annals, and E. W. Dayton has published it in excellent form with maps and photographic illustrations.

'The Confederate Soldier in the Civil War,' edited by Ben LaBree (printed by the *Courier-Journal* Co., Louisville) is a ponderous folio, compiled from various sources, profusely illustrated with process reproductions of portraits, maps, and scenes. It cannot claim to be a history, but is one of those encyclopædic collections of documents, narratives, battle-reports, biographies, and anecdotes which contain much of the crude material of history, and make amusing reading for such as love to pick and choose among a diversified mass of material more or less authentic. Its collection of portraits is very large, and, as photography has been mostly relied upon, the gallery of soldiers and statesmen is well worthy of study for the types of character to be seen in the noteworthy group of men who planned secession and led its soldiers in the field.

Every student, on taking up a new subject of investigation, has found his greatest difficulty lie in the effort to acquire a knowledge of its bibliography; and even in the conduct of old studies it is not easy to keep abreast with the constantly multiplying mass of publications in books and periodicals. With the view of lightening this labor for historians, M. Ch.-V. Langlois has undertaken a 'Manuel de Bibliographie Historique' (Paris: Hachette & Cie.), of which the first part has just appeared, comprising a condensed critical review of the innumerable bibliographies devoted to history and its *Hilfswissenschaften*. To workers in history it will prove a handy and efficient guide in showing them what has been done and is now doing towards furnishing them with the aids necessary to the prosecution of their labors. The wide and exact erudition of M. Langlois is well known, and he is, furthermore, fitted for his present task by the fact that, unlike most French scholars, his horizon is not limited by national boundaries. What has been accomplished in this country in the matter of bibliography receives ample attention at his hands, but perhaps the most striking feature of his little volume is the enormous preponderance which has been secured by German laborers in this field. The second part of the book promises to contain an account of the original sources of history, and, if executed with thoroughness, will prove of even greater utility than the present one.

Tourists in France, whether afoot or on the wheel, should equip themselves with J. Berthot's 'Guides du Cycliste en France' (Paris: G. Boudet), embracing nine 12mo volumes. All the routes radiate from Paris, with runs to Geneva, Marseilles, Bordeaux, Brest, Havre,

etc. Colored route-maps and plans of cities are abundantly supplied, with other needful information. The editor is a devotee of Alpine climbing as well as of the bicycle. The phrase "chemins non vélocables" introduces us to a neologism which one will seek in vain in Littré.

The Rev. C. C. Carpenter, Secretary of the Alumni Association of Andover Theological Seminary, continues the necrology of the institution in his usual admirable manner. Although the number deceased in 1895-6 largely exceeds that of previous years, reaching 56, it need not be supposed that this indicates a decline in the longevity of Andover graduates. The average age of the 56 decedents was 74 years and four days. Three of the number were over 90, twenty were between 80 and 90, fourteen between 70 and 80, twelve between 60 and 70, and only two below 50, one of whom was nearly 49. All were college graduates, and four had been college presidents. Among the notable names are those of Edward Beecher, Harvey D. Kitchel, Prof. Daniel S. Talcott of Bangor, Dr. Samuel F. Smith, and Drs. Clark and Alden of the American Board. Prof. Park, at the age of 87, now heads the roll of living alumni.

Mr. F. Gutekunst, Philadelphia, has surpassed his "imperial panel" photograph of the late Dr. W. H. Furness in a photogravure from the same negative, we believe. This permanent print preserves to a remarkable degree the delicate detail of a face "each several point" of whose benevolent expression was

"Tremblingly bright with the inward grace,"

as Lowell said of Mrs. Follen's countenance. Dr. Furness's autograph in facsimile is affixed to the plate.

The Sierra Club has just issued a new edition of its "Map of the Central Portion of the Sierra Nevada," first issued in 1893, and now extensively revised in accordance with the latest authorities and explorations. The map is on a scale of four miles to the inch, and has side maps on a larger scale of the Yosemite Valley and the Hetch-Hetchy Valley. It is conveniently folded for the pocket in covers or dissected and mounted on cloth (San Francisco: T. S. Solomons, 508 California Street, R. 12).

—*Bibliographica* (London: Kegan Paul; New York: Scribners) is notably successful in maintaining the interest and value of its papers. Part ix. opens with a survey of Japanese illustrated books, by Robert K. Douglas, whose concern is purely historical, and who has no technical information to impart. The sample illustrations, of which several are colored, are numerous and striking. Mr. Douglas misses the direction of the flight of wild duck in describing Plate ii.; they are departing, not approaching the musician. Natalie Rondot writes in French on wood-engraving at Lyons in the fifteenth century, and, amid much crude work, exhibits specimens of a high degree of attainment. A kindred theme enlists Mr. Alfred W. Pollard in "The Woodcut Designs for Illumination in Venetian Books, 1469-73." Mr. Pollard has made the not insignificant discovery that borders were stamped on pages as a guide to the illuminator—the same work being found with and without such impressions. He infers that this was done outside of the printing office. "It is possible that each printer had business relations with a distinct firm of illuminators, to whom he sent a few copies of his books for decoration," and that the private buyer resorted, on his part, to one or another such firm as suited his taste, as

"where we find a Jenson book with a Vindelino border, or *vice versa*"—i. e., where the printer's taste and customary dealing have been ignored. Still more important is Dr. Garnett's essay towards mapping the intellectual currents of the fifteenth century as manifested in the *incunabula*, in the case of the Italian book trade. The peculiar characteristics of the publications of Rome, Venice, Bologna, Ferrara, Florence, Milan, and Naples from 1467 to 1500 are set forth in more or less detail, with the conclusion that Italian Renaissance literature was "far more utilitarian than that of ages often stigmatized as matter-of-fact and prosaic." Classical authors were reproduced "either for the information they contained, or as books for school or college." Outside of these, beyond impressions of Dante, Petrarch, and Boccaccio, "very little of a fanciful or imaginative character appeared." It was in Venice that the public proved a better patron than those in authority, though "Florence understood the duty of encouraging contemporary talent better than any other city." We have room only to mention Mr. W. Barclay Squire's "Notes on Early Music-Printing," Mr. H. B. Wheatley's "The Strawberry-Hill Press," and Mr. Joseph Pennell's laudatory account of *Once a Week* as "a great art magazine." Like the foregoing, these articles are amply illustrated.

—The third volume of "Harvard Studies and Notes in Philology and Literature" (Boston: Ginn & Co.) contains Prof. Kittredge's 'Observations on the Language of Chaucer's Troilus,' issued in 1894 as one of the publications of the Chaucer Society for 1891, and republished in this volume. It is a thorough and searching grammatical and metrical investigation of Chaucer's "Troilus," which extended over many years, and is "intended to furnish some materials for the large induction necessary to reasonable certainty in the matter of Chaucer's language, particularly his use of final *e*." The study is based on the MSS. as edited by Dr. Furnivall for the Chaucer Society, and is arranged by parts of speech, all forms being noted that are necessary for a complete grammatical view of the language. The numbering of the lines is continuous, and a comparative table prefixed gives the correspondences in Furnivall and Morris. Prof. Skeat's edition did not appear until the table had been sent to the printers, but the statement is made that his numbering corresponds with Dr. Morris's for Book I., and with Dr. Furnivall's for the other books. Skeat's edition, however, contains 8,239 lines, not 8,232, as in Prof. Kittredge's MS. A, on which the study is chiefly based; hence one stanza, inserted as in Morris after st. 127, must be added. A comparison for the unusual form *arm* in Chaucer shows that the three cases occurring in "Troilus" are all recorded. The form *beth*, third person plural, cannot be found in Skeat at the reference given (6020). Interjections are omitted in Prof. Kittredge's chapter on "Adverbs and Other Particles." A search for the rare *adieu* failed to find it; there is but one instance in "Troilus" (l. 1041). This, perhaps the earliest instance on record of the use of the interjection, is not given in the Oxford English Dictionary, although another is there recorded as a noun, "and his *adieu* made" (ll. 1085, but this is an incorrect reading, doubtless from the text of Bell, who gives it. Prof. Skeat has here "And radde it over," without variant. Prof. Manly has made a similar mistake. Prof. Kittredge, of "The Legend of Good Women," in "Harvard Studies," published in 1894, has

other poems of Chaucer are now under investigation in the same way. Prof. Kittredge's work has already produced good fruit.

—At the May meeting of the English Goethe Society, Prof. Dowden delivered the Presidential address. He assumed the rôle of the Devil's Advocate with a thoroughness that caused a stir in the court of devotees. His address has now appeared in the June number of *Cosmopolis*. The chief defects in Goethe's character and works are therein set forth with brevity and clearness and without modifying phrases. The paper will be read with interest by the admirers of Goethe as an example of the ease with which a trained scholar may speciously wrest his facts to false conclusions. The late Prof. Carrière of Munich once published an essay in which, by the use of the "philological method," he proved that Lessing wrote Goethe's "Faust." The work was skillfully executed, and some dull men imagined that a "Baconian" theory had actually invaded the field of Goethe literature. Prof. Dowden has accomplished a similar *tour de force*, but has missed the fine strain of irony. Any reader familiar with Goethe's life and works can frame his own reply as he reads. Indeed, in the replies which it elicits will be found the only real value of this article. A statement so frankly one-sided can exert scarcely more influence in England than was produced in Germany by Grabbe's ill-natured arraignment of Shakspeare. It is, however, a pity that the zeal of the *Advocatus Diaboli* should have led him into misstatements, as, for instance, when he says that in the treatment of "Faust" "the results of a century's criticism tend more and more towards disintegration." But, after all, the chief harm which this kind of intellectual athletics can do is to supply with plausible catchwords the vocabulary of those who, in their insular ignorance, are fond of depreciating the German poet; and this class of persons will be very ready to doubt the sincerity of Prof. Dowden's intentions as a friend of Goethe in disguise. This "Case against Goethe," however, is, as Edmond Schérer said of "Hermann und Dorothea," "a factitious work."

—Mr. W. A. Shaw, whose "History of Currency" at once made him an authority on monetary science, has collected a number of papers bearing on the subject, which are published under the title "Select Tracts and Documents Illustrative of English Monetary History, 1636-1730" (London: Clement Wilson). The authors from whose writings the collection is made are Sir Robert Cotton, Henry Robinson, Sir Richard Temple, "J. S.," Sir Isaac Newton, John Conduitt; and extracts are added from the Domestic State Papers at the Record Office. The compilation, Mr. Shaw tells us, is meant as an object-lesson in currency history, and is intentionally restricted to a century which cannot be called controversial. It illustrates, at five different periods, "the one main difficulty which the monetary systems of every state of Europe experienced, as the result of a mechanism inherited from the Middle Ages, and which they continued to experience until the reforms of quite modern times." This difficulty was substantially that recognised and stated by Sir Thomas Gresham, or, as Mr. Shaw expresses it, the buying up of better money by means of inferior kinds. It is not true, he says, that bad money drives out good; but, under favorable conditions, the merchant exchanger can buy up the good money by means of the bad, the unworn

by means of the worn, the more valuable by means of the less valuable. In such operations the provisions for free coinage, as the mints of no two countries put the same values on the metals, were of great assistance; and the great reform of this century has consisted in the abolition of this privilege. Mr. Shaw's selections graphically illustrate the incessant perplexities and dangers encountered by the mint directors of the period, and are extremely interesting as showing the practical working of bimetallicism with free coinage.

—Senator Luigi Chiala has done more than any other living Italian to collect and preserve the most valuable private documents of the men who made Italy a generation ago. His edition of Cavour's letters, enriched by ample notes, must always remain an original source for every student of European history between 1847 and 1861. Senator Chiala has now edited the papers of Giacomo Dina (Turin: Roux, Frassati & Co.), a man interesting for his own character and attainments, and important as being the chief journalistic supporter of Cavour's nine years' ministry. Dina was a Jew, born at a time when his race had neither civil, political, nor social rights in Piedmont. Before he was twenty he had acquired an extraordinary amount of learning, for which he had no outlet, the only employment open to him being that of primary-school teacher at sixty dollars a year. The reforms of 1847, however, allowed the establishment of newspapers, and to one of these, the *Opinione* of Turin, Dina was called as an assistant. Subsequently he rose to be the managing editor, in the days when that paper was the recognized mouth-piece of the Cavourian party. Senator Chiala reprints many of Dina's leaders on important events—the expedition to the Crimea, the conference at Plombières, the war of 1859, Garibaldi's Sicilian expedition, etc.—together with private letters to and from Dina, and an un-failing stream of explanation. Dina's articles have for the historian the added value of representing the point of view which Cavour wished the public to take; but they also deserve attention on Dina's own account. He was a man who held the highest ideal of a journalist's mission—a man, therefore, who belongs to a type which seems to-day, except for a few rare exceptions, as obsolete as is that of paladin or knight errant. Dina believed that the journalist should educate, should form and lead public opinion, should speak the truth, and trust without doubt or wavering to the final verdict of reason.

JAMES WILSON.

The Works of James Wilson, Associate Justice of the Supreme Court of the United States, and Professor of Law in the College of Philadelphia; being his Public Discourses upon Jurisprudence and the Political Science, including Lectures as Professor of Law, 1790 '92. Edited by James de Witt Andrews. 2 vols. Chicago: Callaghan & Co. 1896.

NOTWITHSTANDING the important part played and the high position held by him in public affairs, the name of Wilson has almost lapsed into oblivion. His present editor feels it necessary to insist with emphasis upon his undoubted claims to remembrance. Not only was he a member of the convention which framed the Constitution, but it was in a great measure due to his eloquent good sense that the ratification of it by Pennsylvania was secured. He was one of the first judges of

the Supreme Court, appointed by Washington, and may be said to share with Marshall and Jay the honor of having formulated and made effective some of the cardinal legal principles of our government. His remains make it seem very probable that, had he lived (he died in 1798 at the age of fifty-six), he would have been known as a great federalist judge; as it was, he had an opportunity, in the case of *Chisholm vs. the State of Georgia*, to render a judgment which made it for the first time plain that the Constitution had called into existence a new sovereign state.

This case, reported in the second volume of Dallas's Reports, came before the Supreme Court in 1793, four years after the new government had gone into operation. It came up in a matter-of-fact way, upon a motion by Mr. Randolph, Attorney-General, that unless the State of Georgia should enter an appearance in defence of the action, judgment should be entered against the State by default; nevertheless, it was what would now be called a very sensational suit. It involved a question so important that the decision in it resulted in one of the few amendments of the Constitution adopted between 1787 and our own time. The question was whether a State could be sued in the federal courts on a money demand by the citizen of another State. The Chief Justice was Jay; his associates were Iredell, an excellent lawyer, Blair, Wilson, and Cushing. All delivered opinions *seriatim*, and all felt that in a measure the future complexion and even fate of the new government hinged upon their decision. The Constitution provided that the judicial power should extend to controversies between a State and a citizen; did this mean that any one to whom a State owed money could obtain federal process to compel payment by the State? Four years before, such a suit would have been inconceivable. That a sovereign was exempt from suit was a legal commonplace familiar to every student of Blackstone and Coke. If Georgia, a sovereign State in 1789, was now subject to an action of *assumpsit* at the suit of any one to whom she owed money, it could only be because her sovereignty *pro tanto* was gone. This was the fundamental question which the judges were to decide.

Their opinions were characteristic of the men who delivered them. Iredell's was that of a lawyer and strict constructionist, Jay's that of a lawyer who was also a statesman, determined to give the most liberal construction to the charter he was called upon to interpret, but determined at the same time to put his judgment upon grounds impregnable to attack; Wilson's that of an orator, a publicist, a scholar, and a metaphysician, dissatisfied with himself unless he could show that the decision he had reached was called for, not merely by the Constitution, but by all history, all law, and finally by all philosophy. Iredell's argument was in substance that, even if a State could be sued under the new Constitution, still the power to entertain such a suit had not been conferred on the courts by Congress, and a new statute was necessary for the purpose. He strongly intimated the opinion, however, that no such power existed. The meaning of the clause in the Constitution was merely that the courts were to take cognizance of such controversies between a State and a citizen as had been cognizable before the adoption of the Constitution—i. e., suits in which the State was plaintiff, or in which it consented to be sued. The Chief Justice's opinion was purely practical. He did not cite a single case, but relied first upon the fact that Georgia was not

sovereign in the sense or to the extent in which the King of England was sovereign; that her limited sovereignty was compatible with suability, and that, finally, the Constitution (to which Georgia was a consenting party) expressly authorized such a suit.

Wilson's opinion, on the other hand, while quite as logical as Jay's, is an ornate rhetorical essay. Not satisfied with what he justly calls the "uncommon magnitude" of the question involved, he magnifies it still further at the outset by declaring it to involve one more important still—"Do the people of the United States form a nation?" Having determined that this is the question before him, he opens the discussion with a quotation from Reid, explains that he intends to use the words state and sovereign in new senses; that the state is merely a useful and valuable contrivance brought into existence by the real sovereign, the people; that consequently the State of Georgia is not, as to the purposes of the Union, a sovereign at all; that the notion of sovereignty on which the State had relied for exemption was purely feudal in origin, the sovereign being a king—we have no feudal system and no king here—while, on principles of general jurisprudence, laws are founded not on the command of a superior, but on the consent of those who obey them. There is in these principles nothing to exempt the State of Georgia from suit. In the second place, many precedents warrant such a suit. The cases cited are from Isocrates, the history of Spain, Sparta, France, and the Saxons. In the third place, the exemption of a state from suit being thus shown to be unwarranted by history and general jurisprudence, the only remaining questions are: Could the Constitution vest a jurisdiction over the State of Georgia? Has it done so? Both of which are answered in the affirmative, and the conclusion reached that judgment must be rendered for the plaintiff, by default.

But execution never issued. So astonished was the public at the novelty of the idea that States were subject to the jurisdiction of the federal courts, that an amendment to the Constitution exempting them from it was shortly afterwards proposed and adopted, and, in 1798, all suits of the kind were swept from the records of the court. Curiously enough, and as if to wipe out any vestige of the decision, the successors of Jay and Wilson have in our day gone out of their way to declare that the decision of the court in *Chisholm vs. Georgia* was wrong. In 1889, in the case of *Hans vs. Louisiana*, we find a new attempt made to sue a State, under another clause of the Constitution. The court, after an interval of a hundred years, reexamines the subject, and announces that it was *Iredell*, and not Wilson and Jay, who was right, chiefly on the ground that the interpretation of the Constitution antecedent to its adoption, by Hamilton in the *Federalist*, and by Madison and Marshall in the Virginia convention, had established that States were not suable. This criticism of the earlier decision is entirely extra-judicial, for it was not at all necessary to the decision of the Louisiana case, and we shall therefore take the liberty of expressing the opinion that, were the main question still open to argument, the decision of the Supreme Court itself, rendered after the adoption of the Constitution, by Wilson, Jay, and their associates, ought to be more weighty than *ex parte* arguments of advocates of the adoption of the Constitution whose main object was to minimize whatever objections were urged against it.

But whatever view may be taken of the technical correctness of the decision, who can

but deplore the results of the failure of these judges in their bold attempt to settle for ever the supremacy of the new Government? What has exemption from suit brought in its train but millions of debt repudiated and thousands of innocent people plundered? How much better would it be if the tribunal which has always enjoyed unquestioned obedience where two States are parties, or where the most powerful corporation or the most populous city or subdivision of a State is concerned, had not been shorn of the power to enforce justice between a State and a citizen! Indeed, when one reads these early opinions and reflects on the subsequent history of the country, one is tempted to go much further, and to echo the wish expressed by Jay, that "the state of society were so far improved, and the science of Government advanced to such a degree of perfection, as that the whole nation could in the peaceable course of law be compelled to do justice." Repudiated by the States and swept from the records of the court the decision might be, but the principles underlying such judicial opinions could no more be effaced than the Constitution itself. The sovereignty of the Union had been recognized, the idea of the State as a subordinated political agency had been formulated—views to be wholly lost sight of, and to be vindicated two generations later by force of arms in a conflict which ended in their complete triumph. One of the earliest heralds of the true constitutional meaning and scope of that great conflict seems to have been Wilson. The opinion in *Chisholm vs. the State of Georgia* is really his best monument.

An edition of his works, published under the direction of Bird Wilson, in three volumes, appeared in 1804. The greater part of the contents of both the earlier and later edition consist of the lectures on Law delivered in the College of Philadelphia in 1790-91. The present editor has added a good many notes of his own, which are mainly valuable in so far as they refer the reader to cases and other writers. The speculative opinions advanced in them do not seem to add anything to the text, and are calculated to produce the erroneous impression that Wilson's views of jurisprudence are those of modern scholars. How the editor has succeeded in persuading himself of this we do not know. Wilson was essentially a man of his time, though in advance of it also. Born and educated in Scotland, and coming here while still very young, he had a greater knowledge of the principles of the Roman law than most of his English or American contemporaries. His reading was wide, and he entertained on all public subjects advanced and humane views. Like the authors of the *Federalist*, his reasoning as to human institutions is always founded upon a perception of the great truth that they are carried on by men acting from observed tendencies and impulses, and that the first question is whether, with human nature as it is, a projected institution will or will not accomplish a given result. Thus, he clearly foresees (vol. i., p. 359) exactly how division of responsibility as to appointments must produce bad appointments. It could not be made clearer, even by a study of bi-partisan commissions in New York. His whole chapter on government is a most enlightened essay. In his eleventh chapter he points out that, under our system, an unconstitutional law cannot but be held void by the courts—in this anticipating and explaining what was to be the course of decision. In his remarks on the philosophy of evidence he points out, far in advance of his time, that a competition between opposite analogies is the principle into

which legal controversies may often be resolved. In his "Considerations on the power to incorporate the Bank of North America," the principle of the decision in the Dartmouth College case is anticipated in a very remarkable way (vol. i., p. 566). He favored the fusion of Law and Equity (vol. ii., p. 136), and protested against the failure of the common law to provide compensation for the death of a human being (p. 360). On the other hand, he knew no more than his contemporaries of the historical method of studying law—although his inquiry into the probable derivation of the word *feloony* shows a philological sense which would have greatly helped to equip him for it—and the basis of his philosophy of jurisprudence was metaphysical and theological. Consequently, the greater part of his speculative writing, while deserving of preservation owing to the light which it throws upon the development of law, is no longer of any other value. The reason why Mr. Andrews does not perceive this is that he himself, as his note on "Who are the People?" shows, is a metaphysician too, while his evident leaning toward socialism does not help to render his metaphysics any clearer.

It cannot be honestly said that Wilson's abstract speculations about law are of much more value than those of Puffendorf, though they are one degree more modern. He traces law and custom to consent. It has been proved over and over again since his time that this is a mere assumption, and opposed to the facts of history. Law had its origin partly in brute force, partly in custom, and partly in regulations enforced by a sovereign. As to the latter, no consent was asked, and as to custom it is impossible, with regard to many primitive social rules, that there can have been any antecedent consent. To say nothing of such customs as suttee, circumcision, human sacrifices, cannibalism, or marriage accomplished by violence, we have no proof that a rule of property such as primogeniture or dower was introduced by any such means. The argument as to consent is, first, that law cannot be imposed by superior right, for one human being has by nature no superior right over any other. I have no more right to make rules for you than you for me. But since law rightfully exists, and we are under a necessity to assign some origin to it, there is none discoverable but an act of consent on the part of the governed that he shall be subject to certain rules. The vice of the argument is that it confounds the right to govern with the fact of government. We know nothing about the right to govern unless, ascending from the plane of metaphysics to that of theology, we assume (as almost every one did down to the present century) that the right is derived from God. If we say that the right to govern *ought* to be derived from the people, that is the expression of an opinion that a government so derived better answers the ends of government. No existing government is based on the consent of the whole people: women, children, and generally large numbers of adult males have no voice in it.

Of the man Wilson little has come down to us. Yet, with the aid of the old-fashioned portrait prefixed to the earlier edition of his works, we cannot be far out of the way in ascribing to his character qualities corresponding to those of his mind. A kindly and humane wisdom marks every line that he wrote, and looks out at us through his spectacles. His face alone explains why Washington should have preferred him to the distinguished lawyers of his own State as an instructor

for his nephew. He was an accomplished publicist and skilful debater, with a Scotch persistency which sometimes makes us smile, though rather with than at him. Who but the man himself would ever have thought it worth while to suggest, in the course of a judicial opinion on jurisdiction, that constitutional accuracy is incumbent upon us, not only in our common but "even in our convivial language"?

"Is a toast asked? 'The United States' instead of the 'People of the United States' is the toast given. This is not politically correct. The toast is meant to present to view the first great object in the Union; it presents only the second. It presents only the artificial person instead of the natural persons who spoke it into existence. A State, I cheerfully admit, is the noblest work of Man, but Man himself, free and honest, is (I speak as to this world) the noblest work of God."

TURKS AND MONGOLS.

Introduction à l'Histoire de l'Asie: Turcs et Mongols des Origines à 1405. Par Léon Cahun. Paris: Colin & Cie.

WITH a part of this work students are already familiar in the chapters which M. Cahun has lately contributed to the general work of Lavisse and Rambaud; but so much is there condensed into so little space that an amplification is very welcome. Well as he writes, with all the ease and mastery of a good French style, his book can never be popular, for the mass of Eastern names is alone enough to frighten away many readers. Although he uses a most varied set of authorities, from Chinese chronicles to the latest European travellers in Central Asia, he seems to rely chiefly on Turkish sources, writing from an Eastern point of view, interested in and admiring his characters, and not mainly concerned with any possible relations between their actions and the destinies of western Europe. The clearness and decision of his opinions, if distinctly impressive as being based on much learning, in the end provoke criticism. M. Cahun knows too exactly the motives of everybody. We very much doubt whether his native authorities are sufficiently explicit or trustworthy to be a sure foundation for many of his theories, which only too often appear to be the result of mere *a-priori* reasoning, expressed as if there could be no question as to its accuracy.

"The Turks and the Mongols were the intermediaries between the civilization of the Chinese and that of the Persians." We find them first under the name of Hlung-Nu, a general term applied to the barbarian tribes against whom the Great Wall was built, and who, as mercenaries and invaders, played much the same rôle in Chinese history as the Germans at one time in that of the Roman Empire. Gradually they were pushed back until, in the beginning of the Christian era, they were separated into two parts, some driven northwards, while great masses were forced to the west by the Chinese general Panchoe, who even reached the Caspian, and was preparing to attack the Parthians when recalled by his Emperor. Under the name of Huns, the mere vanguard of these hordes of wandering Mongolians nearly destroyed western Christendom. In 559 the powerful central Asiatic King of the Tu-kiu, as the Chinese called them, or the *Töwke*, according to the Greeks, sent ambassadors to Justin II. and to the "Son of Heaven" in order "to form an alliance between the two great civilized States, between China of the East and the Ta-Tsin, the great China of the West,

the Roman Empire; he and his Turks serving as the intermediary, the man at arms in the pay of the allies." Nothing came of this alliance. For centuries the Sassanid sovereigns of Persia kept back the Turanians to the north of them until they themselves were crushed by the Arab invasion of the followers of the Prophet. This was the chance of the Turks; in large bands or small, as enemies, or more often as mercenaries, they flowed southward; they adopted Mohammedanism; they were the best warriors of the Caliphs, who became puppets in their hands, and finally they founded mighty empires of their own, such as that of Ghuzna, which conquered much of northern India, that of the Seljuks, who overran Asia Minor and Palestine and brought on the crusades.

Meanwhile their distant kin, north of the Great Wall, remained as before, preying on China when she was weak, her vassals when she was strong, until their scattered bands were united by Genghis Khan. This extraordinary man, who was born in 1168, was gifted with a clear cold mind; his ambition was boundless, but he was moderate and cautious in action, while never varying from his purposes, a statesman and an organizer, the first slave to the Yassak or Rule he had created, and which embodied the punctilious bureaucratic spirit that the Mongols probably caught from the Chinese, and that was so unbearable to subject people. Though one of the greatest conquerors the world has ever seen, he made no pretence of being a military genius, but picked out his generals with wonderful discernment. The early career of the future Emperor was arduous enough, for, having lost his father while still a youth, he and his mother had great difficulty in keeping together the warriors attached to the family. Gradually, however, tribe after tribe was overcome by a mixture of force and diplomacy. The Christian Sultan of the Kerait Turks, the Prester John of European legend, was defeated and killed, and in 1206 Genghis Khan, fixing his capital at Karakorum in Mongolia, south of Lake Balkal, proclaimed himself the "Inflexible Emperor." China was at that time divided into two empires, Manchu in the north, and a purely native in the south. The northern state was attacked in 1210, but did not finally succumb until after a struggle of twenty-four years, at the cost of torrents of bloodshed. While this war was still going on, in 1219, the Mongols assailed, not without provocation, the Turkish empire of Kharezm in Central Asia, and did not rest until they had subdued it. In spite of difficulties and rivalries as to the succession, the death of Ghengis, in 1227, seemed only to increase the momentum of his followers, whose ranks were now swelled by great numbers of their conquered kin. Batu, one grandson of the Inflexible, subjugated Russia and laid waste lands in Central Europe. Kublai, another, as the Great Khan, subdued southern China, while his younger brother, Hulagu, overthrew the Persians and pressed on almost to the Mediterranean, till his progress was checked by the Mamelukes.

In all these conquests M. Cahun insists again and again that the success of the Mongols was owing to their superior generalship and organization, not to the immense numbers credited to them by the frightened chroniclers of the time and accepted even to-day by many historians. "In the thirteenth century in military art it was the Mongols who were civilized, while the barbarians were the people whom they defeated in all due form, thanks to the genius of their generals, the experience of their captains, the discipline of their troops, and

not at all to their numbers. Their campaign of 1214 (against Kharezm) was as regular and as well ordered as our classic one of 1805." Certainly the two years' raid of Jöbe and Subutai, a generation later, was marvellous enough. Starting with 35,000 cavalry from Samarkand, they tracked the Sultan of Kharezm to his death, passed along south of the Caspian, overthrowing Turks, Persians, Georgians, all who opposed them, crossed the impenetrable Caucasus, crushed or swept before them the nations of the steppe, defeated at the River Kalka a Russian army, whose numbers are given by Karamsin as 82,000 men, pushed on to the Dnieper, then returned tranquilly to the heart of Asia. In the great invasion of Russia nominally commanded by Batu—an easy-going prince very different from what the terrified imagination of the West painted him—but really led by Subutai, according to trustworthy Turkish and Chinese accounts, the Mongols mustered some 150,000 men, most of whom had come from immense distances, and when, later, they divided, they can have had in Poland but about 40,000; in Hungary 60,000 to 80,000 troops. With this by no means overwhelming force, they overran nearly the whole of Russia, which they held in subjection for centuries, and they destroyed "in six weeks all the military strength of Poland, Hungary, and Eastern Germany." The division that swept through Poland, carrying all before them in less than thirty days, defeated a combined army of Slavs and Germans at Liegnitz, then plundered Lusatia, Moravia, and Silesia, scornfully heedless of the army which King Wenzel of Bohemia kept safely in the mountains. The main body in Hungary, after a first success, covered 296 kilometres in less than the three following days—a feat perhaps without parallel in military annals—won a victory on the morrow, driving the enemy into marshes from which but four escaped; and finally, a month later, by splendid manoeuvring, defeated a superior army of Hungarians, Germans, Croats, and Western volunteers at Miskolcz, with a loss of thirty to forty thousand men. More extraordinary still, if anything, is the fact that this invading swarm of cavalry, with perhaps a few Chinese engineers and light battering-machines, should have captured every town it seriously besieged from Kiev to the impregnable Gran on the Austrian frontier. The death of Ogdai, the Great Khan, caused Batu to retrace his steps eastward, while Subutai returned to the wars in China, but soon withdrew to die peaceably. "From Corea to Friuli, he had conquered thirty-two nations and won sixty-five pitched battles."

The decline of the Mongol empire was rapid. Under Kublai the capital was removed to Peking, where the Great Khans and their followers had become Buddhists and Chinese in character; yet within a little over a century they were overthrown by the national movement which brought about the Ming dynasty. The great dependencies to the east were from the first practically independent. They soon adopted Mohammedanism, and the Christians, once so numerous among this most tolerant of races, entirely disappeared. The kingdoms broke up, yet one of them had one more moment of great glory and empire under the famous Timur, with whose reign M. Cahun closes his book. His conclusion, in taking leave of the people for whom he has evidently so much sympathy, is noteworthy. He ascribes their decline to their belief:

"I have pointed out how refractory the Turkish nature is to controversy and theology,

how naturally prone to discipline. In accepting Islam as a state religion, the Turks of Turkestan, of Transoxania, of Kharezm, adopted it as a whole without discussion, in a military manner, like a password. During a hundred years the monks and theologians of Bokhara were able to mould their brains at will without being embarrassed by a contradiction, a subtlety, or a simple commentary. Thus the Renaissance in Central Asia was nothing but a renewal of the Middle Ages. While the Europeans, under the spur of Hellenism, and dazzled by the rediscovery of antiquity, were launching boldly out towards the unknown, towards free research, towards revolt, the Asiatics, their equals till the fifteenth century, let themselves docilely be brought back to the School as conceived by the sages of the orthodox Khalif. They discovered as a novelty Aristotle (as deformed by the Arabs), they returned to the 'Amalgam,' they plunged into Avicenna, their compatriot, they began again in Turkish the epoch of the Sassanids; they 'marked time,' but never advanced (*ils pèti- nèrent sur place*). All their intellectual activity, and they had as much as others, spent itself in scholasticism, in jurisprudence, in rhetoric; with great efforts they reconstituted Euclid, Ptolemy, Galen, Hippocrates—they hardly dared touch Plato; to go further would have been to lose themselves. Little by little, with the help of the monks, they came to think only of their salvation and to be content with the Koran."

On Parody. By A. S. Martin. Henry Holt & Co. 1896.

DR. JOHNSON had a very low opinion of parody, and so, no doubt, had Wordsworth; the former considered it too easy. But then, nobody ever contended for anything more than that it was an effective and very amusing form of satire. The very greatest writers of all ages have made use of it, and, so long as man retains the capacity of being amused by contrasts, so long he will continue to enjoy parody. Mr. Martin's book consists of an essay on parody, with numerous examples, many of which are good. Going back to the Greeks, and tracing parody down through the Roman and mediæval period to our own time, we find the Greeks and our own race to have been its masters. There is a good deal of mediæval parody that must have made the monks, friars, and priests laugh, but we have to mount to Aristophanes before we find the same kind of travesty that we enjoy so much nowadays. In English literature parody has been the test of fame; with the exception of Shakspeare, every serious writer, and especially every serious poet, has had his parodist, often himself a great writer. Throughout English literature, parody is the laughing echo of all serious verse, and in our own time it has become a regular branch of literary business, each new writer possessed of a distinct style being welcomed by a chorus of travesty. This has been for years a specialty of *Punch*. It is surprising how much this book owes to verse contributed to that journal by unknown writers.

Mr. Martin's survey is not by any means complete. He does not seem to know of Sir F. Pollock's extraordinarily clever verse, which certainly deserved mention; we miss also

"Not a son had he got, nor a penny or note."

Maginn is cited only for

"My heart leaps up when I behold
A bailiff in the street."

Canning's "Needy Knife-grinder" would have been far better than "Despairing beside a clear stream." But the book is full of good examples. We are glad to see some mention made of Mr. James Davis, a writer for the press whose name is far less known than it deserves to be. His parodies were devoted—at least such of them as we remember—to satire

of the attempt to found a cult or religion upon agnosticism. His creed, concluding with an avowal of belief in "the disunion of the saints, the survival of the fittest, the persistence of force, the dispersion of the body, and in death everlasting," is the only thing given in full (p. 23). His lines in imitation of Addison's should be, if we remember right:

"Yon orb which shines to light the Day
One hundred million miles away,
Evolved from nebulous creation
By forces and their correlation,
Shall keep us whirling in its orbit
Till force and motion reabsorb it."

A verse is missing from the hymn in praise of the spectroscope: and if his book reaches another edition, we hope Mr. Martin will look up the tract about the good little Positivist boy brought up in an atmosphere of pure agnosticism (being allowed only to read such literature as the above, and to play only with philosophical toys), whom a little Christian boy misled for a time with his wicked Christian books and toys, until in the end the little agnostic caught cold and lay on his death-bed, when, fortunately, his parents were able to rescue him from the depraved influences to which he had sunk a victim, so that the little fellow died with a happy smile on his face murmuring, "Home—home—homeogeneous Evolution."

Animal Symbolism in Ecclesiastical Architecture. By E. P. Evans. With a bibliography and 78 illustrations. Henry Holt & Co. 1896. Pp. xii, 375.

THIS is a book of a class once more common than it is now, for it is rare in these times to see, at least in English, great masses of strange information put together without definite and declared purpose. This is not a history of animal or other symbolism in architecture, ecclesiastical or other, or in mediæval art taken together. There is in it a most entertaining account of the pagan statues, bas-reliefs, and gems which have been taken over into ecclesiastical service by attributing to John the Baptist what originally belonged to Mars, and to the Virgin what had been dedicated to Venus (pp. 306 to 315). The well-known seated statues in the Vatican of the Greek comic poets, Poseidippos and Menandros, were, we are told, adored as saints after their discovery in Rome in the sixteenth century. This is rather a late instance, but such ascriptions were common enough in earlier years. The peacock and the eagle, as the attributes of Juno and Jupiter, are common on the sarcophagi of Emperors and Empresses; hence they were used for Christian tombs; from these they invaded other Christian decoration. Being received as common emblems in Christian art, their presence had to be accounted for, and strange legends are accepted as sufficient explanation. Thus, the peacock's flesh not being subject to decay, it is emblematic of the incorruptible spiritual body. St. Augustine was desirous of ascertaining whether the flesh of the bird had really this unusual property, showing in this a scientific spirit worthy of so great a thinker; and, the legend relates, he found that it was strictly true.

In another part of the book we hear of the wonderful marine bishop who was caught as any mere merman might have been caught in the fifteenth century and in the Northern seas. The ecclesiastical dignitary refused or was unable to speak, but gave its episcopal blessing to its captors when they released it, by the well-known gesture (made, it appears, "with its fin"). The unicorn, with all its strange asso-

ciations with maidens, by whom alone it can be caught, is of course a favorite attribute of the Virgin, and the picture common in the latter middle ages of a unicorn hunted and flying to a maiden as if for shelter is capable of being explained in many different ways. Pearls are drops of dew, which a certain sea-creature, coming to the surface, receives direct from the sky. This legend has also several explanations.

Stories like these, selected from many ancient authorities, or traced in the carvings of the earlier middle ages and in prints of a later time, fill this book from cover to cover. A very full index serves to unlock all its mysteries in their turn. It is as well read by the use of the index as in any other way. For example, we found our curiosity greatly excited by the entry, "Luther, Martin, on the aqueous origin of swallows," and on turning to page 149 read how Luther, in his commentary on Genesis, confirms the text about the waters bringing forth living creatures by pointing out that, even in his time, the swallows lay dormant under water all winter long and emerged every spring, even as they emerged on the fifth day of creation. To any one who desires a large amount of this sort of information, not very successfully organized, this book may be recommended.

The Story of Cuba: Her Struggles for Liberty, the Cause, Crisis, and Destiny of the Pearl of the Antilles. By Murat Halstead. Illustrated. Chicago: The Werner Company. 1896.

MR. HALSTEAD'S volume, apart from the historical portions, has a certain value as the report of a newspaper correspondent who has recently visited Cuba, though the evidence it contains is mainly what lawyers call "cumulative." The author does not seem to have seen anything of the island outside of Havana, nor to have ever been behind the scenes either of the Spanish or the insurrectionary side. We hear, as usual, a great deal about the wrongs and oppressions of the Spaniards, but, owing, no doubt, in great measure to the fact that the rising is not in the hands of political men, no definite explanation is given of what sort of redress is contemplated, beyond emancipation from the Spanish yoke. To all inquiries "Cuba libre!" is the invariable reply, just as it might have been in the time of Bolívar. But the world, having grown older and wiser than it was in Bolívar's time, wants to know now not merely that some one is struggling to be free, but what use he is likely to make of his freedom after he has attained it. On this point the Cubans are absolutely silent, and their present lack of anything like an organized civil government makes it extremely difficult to say even whether they have any political plan. Our politicians, therefore, very kindly answer the question for them by saying that of course Cuba will become part of the United States.

No doubt this would in the end redeem the island, but it would be a frightful piece of work for us. Not only should we have to settle with Spain, for a debt of millions has been heaped up on account of Cuba for which Spain is responsible, but we should add to our domain the country which Mr. Halstead describes—an island nearly the size of England, inhabited by a couple of millions, or less, of blacks and whites, the former only recently freed, and neither race having shown any political qualities, while both are fond of fighting and lawlessness. Outside the cities (Gallenga, in his prophetic 'Pearl of the Antilles,' describes the beginning

of the process; the cultivated territory is relapsing into waste, and, as the present war is a marauding and predatory war, the entire sugar and tobacco "plant," outside the places guarded by troops, is being destroyed. But if we are to consider ourselves as heirs of the property, this fact is not of so much importance as that the place of everything destroyed is being taken by debt, and that the population is composed of very poor materials for self-government. The island is naturally so rich that a few years would repair the waste, but what Senators it would send to Washington, what delegates and alternates to national conventions! Our Southern slaveholders' longing for Cuba was the natural diseased craving for a stimulant adapted to reinvigorate an exhausted social organism; the Southern demagogues' present passion seems to spring from causes quite as unhealthy.

To our mind, Mr. Halstead's facts destroy the arguments suggested by political fancy. The argument from "destiny," however, is unanswerable, and always has been to those who believe in it. Cuba belongs by destiny to the United States, just as Canada and Mexico do, to say nothing of South America; it is also part of destiny that the present owners of these countries should vigorously resist parting with them, so that it will probably be centuries before destiny is accomplished satisfactorily to all parties. Newspaper correspondents, however, occupy themselves much with the future, and we are glad to know from Mr. Halstead that it will all turn out right in the end.

Women in English Life, from Mediæval to Modern Times. By Georgiana Hill, author of 'A History of English Dress.' 2 vols., 8vo, pp. xx, 850-362. London: Richard Bentley & Son; New York: Macmillan.

"THE sixteenth century was England's great literary renaissance. Fresh streams of intellectual life were poured into the nation. There was activity in all departments of thought. The study of poetry, of theology, of the classics went on apace. The printing-press was letting loose floods of knowledge. The tide swept the women of the nobility along in its course."

Seven hundred pages of stale "statements" of this kind do not make a book to be warmly welcomed; and the many chapters, and the countless paragraphs of sentences eight, ten, twelve words long, chopped off with an abrupt full stop, are not easy reading. The truth is, there is no pulse of vitality in these volumes: the deadness of mechanical production pervades them. They contain a mass of information—many names, rather—but for the most part of a somewhat trivial quality, and which few persons could profitably select from and cook the facts for themselves, while, in its present condition, no literary stomach could digest it. The reader can only regret that so much ability for painstaking has been so misapplied, and that such attractive looking volumes should contain so little for either an idle or a studious hour. A heap, however large, of unsorted pebbles, even though they may have been brought from a distance, creates only a cairn that does not long detain the steps of the traveller.

The work treats of five "periods." Period I., "Women in the Days of Feudalism," is dismissed in a hundred pages. Period II., "England after the Renaissance," occupies two hundred; Period III., "Life in the Last Century," one hundred and thirty; and Period IV., "Women in the Victorian Era," just twice as many. The longest "periods," the nineteenth century

and the seventeenth, are the most readable. The glimpses of the great ladies and city dames of the Stuart ages in their domestic life and in their petitions to Parliament afford some entertainment; but here especially is needed careful information regarding the difference in the value of money then and now, to which the authoress only casually refers, and which constantly bears an important relation to the matters touched upon. The sketches of her contemporaries given by Miss Hill present with praiseworthy impartiality a view of the philanthropic, the professional, the political woman we all know—the public woman, the "modern woman." The account of the Primrose League and the Women's Liberal Federation is too short to do more than excite curiosity as to the methods of these organizations; but it succeeds in doing that. Everywhere there is a deplorable lack of accurate references to the "authorities" of the compiler, to her sources of information, which makes it entirely impossible to study "after" her, to "look up" any point of interest in her companionship. There are few glaring mistakes. One occurs in vol. II., p. 17, where Horace Walpole is spoken of as the brother (not the son) of Sir Robert Walpole.

Strikes and Social Problems. By J. Shield Nicholson. Macmillan & Co. 1896.

THE title of this book is not very well chosen. It suggests that we are to consider the relation of strikes to other phenomena in the industrial world; but this is only partly true. What we have here is really a collection of essays on a number of interesting subjects—essays which have little more unity than what comes from being bound within the same covers. Nevertheless, they are so meritorious as to be worth reading by economists, and to deserve the careful attention of thinking people in general. Their distinguishing mark is common sense—not the distinguishing mark of a good deal of the recent writing on economic subjects—and they are extremely clear and simple in statement. Their significance from the economic point of view is their decorous but unmistakable repudiation of the socialistic tendencies that have largely prevailed in England since Mill and Cairnes passed away. It is high time for protest of this kind, and Prof. Nicholson will find plenty of people ready to be converted.

We can mention but a few of the fallacies which have had much popularity with this generation, and which Prof. Nicholson punctures. It has been so vehemently asserted as to be commonly believed that the rise of wages during the last fifty years has been due to the trade unions. Trade unions have insisted that wages should be raised, and wages have risen; that has established the relation of cause and effect for many people in England, just as the tariff is held to be the efficient force in this country. Prof. Nicholson points out that these unions have not invented machines, or opened markets, or extended credit. They have probably, on the whole, diminished production and discouraged enterprise; and if they follow the leaders that are now most prominent, they will seriously interfere with commercial prosperity. So of the "living-wage" theory. Prof. Nicholson says flatly that to suppose that any class of laborers can obtain higher wages by refusing to work for lower wages is a gross and mischievous fallacy, and he supports his assertion by sufficient proofs. Combination is futile to effect it except when competition would effect it. And,

after all the abuse that has been heaped upon competition, it is the great preserver of freedom and promoter of equality.

We cannot follow the arguments with which Prof. Nicholson disposes of the philosophers of the Fabian school, or exposes the shallow critics of the great economists of former days. We must content ourselves with general praise of his methods and specific commendation of the essay on the "Reality of Industrial Progress," that on the "Classical Political Economy," and the "Plea for Industrial Liberty." Altogether, the book is wholesome and stimulating in a high degree, and time spent in reading it is time well spent.

The Sun. By C. A. Young, Ph.D., LL.D. New and revised edition. Appletons.

THIS popular work, originally published fifteen years ago, has already passed through four or five editions, in which it has been kept measurably up to date by the expedient of notes and appendices. But during this fertile period the advances in our knowledge have been so great as to necessitate a thorough rewriting. Past investigations upon the sun's distance have been so corrected that one can now rely upon the round value 93,000,000 miles, and a corresponding parallax a trifle less than 8".8, with practical certainty that no subsequent research within the next quarter century can displace it. Dr. Gill of Cape Town and Prof. Newcomb of Washington have mainly contributed to this result. Prof. Young makes, however, a very proper reservation as to the embarrassment of the aberration method due to the newly found fluctuation of terrestrial latitudes; and it is altogether probable that our next noteworthy improvement in the sun's distance will come from a research taking full account of this perplexing variation. So thoroughly at home is Prof. Young in all the varied lines of solar work that one need fear no inaccuracy in his account of the labors of others. His presentation of recent advances in photography of the solar spectrum embraces a new and interesting plate of the great Princeton spectroscope; and proper regard is paid to Prof. Rowland's epoch-making work at the Johns Hopkins University (dating from about 1880), and now everywhere accepted as the standard, to the extraordinary clearness and beauty of execution which characterize the detailed photographic maps of Mr. Higgs of Liverpool, and to the excellent maps of the late M. Thollon of Nice, showing the varying appearance of the spectrum corresponding to different altitudes of the sun. The presence of known terrestrial elements in the sun has been very fully investigated by Prof. Rowland in the last few years, and he can thus far reckon with certainty about forty elements. Iridium, platinum, tungsten, uranium, and a few others are doubtful; chlorine, fluorine, iodine, and bromine are among those not yet tried by Prof. Rowland; while antimony, gold, phosphorus, mercury, sulphur, and about ten others less prominent are not yet found in the sun. But, as Prof. Rowland has himself remarked, his failure to find them is very little evidence of their absence from the sun itself. Two other elements require especial notice from their manifestation of bright lines—coronium, not yet traced to earth; and helium, finally identified by Ramsay last year, in connection with his researches upon argon, discovered by Lord Rayleigh and himself as a hitherto unrecognized constituent of our atmosphere. Helium, it has been found, can be obtained from nearly all the uranium minerals, in some instances

commingled with argon and in others nearly pure. Meteoric iron contains it, also the waters of certain mineral springs in the Pyrenees and the Black Forest; indeed, as Prof. Young says, it turns out to be very widely distributed, although only in very small quantities, and probably never free. But whether the new element is really elementary or a double compound is not yet known, and this question is still under investigation by Runge of Berlin and other leading spectroscopists, who have found that the lines of its spectrum divide up to two sets mathematically independent of each other.

Perhaps the most remarkable recent advances in methods of scientific research are due to Prof. Hale of the University of Chicago, whose ingenious spectro-heliograph records full elucidation at the hands of Prof. Young. Nor are the pictorial results obtained with it neglected, whether they be faculae, which Prof. Hale was the first to photograph in belts across the sun's disk, similar to those in which the ordinary dark spots occur, or the protuberances which he (followed by Deslandres of Paris) now photographs at any time by monochromatic light, at any or all parts of the sun's limb where they may show themselves.

We can hardly afford space for even mention of all the modern researches sufficiently treated by Prof. Young; but we have detected no omission on his part. Not only are all observational results dealt with, like Howlett's faithful thirty-five-year spot series recently completed, but the speculative theories of Brester and Schmidt receive that fair and careful treatment which their authors deserve, although neither of these theories can be said to commend itself in all particulars to practical students of solar physics. Also, we must pass by the late determinations of the effective temperature of the sun's surface, equal to about 14,000 degrees Fahrenheit, by Le Chate-

lier and Wilson independently, and Hale's repeated but unsuccessful attempts to photograph the sun's corona without an eclipse. But no modern solar research has aroused intenser interest than Prof. Langley's investigations of the infra-red portion of the solar spectrum through a highly sensitive heat-measurer of his own invention. His most recent achievement with this instrument is an ingenious method, accessory to it, by which all the rapid fluctuations of the tract in question are automatically photographed in a form precisely comparable with the upper portions of the spectrum as ordinarily recorded. We have now, indeed, a complete chart of this invisible heat spectrum ten times as long as the sun's entire luminous spectrum, and there are indications of heat even farther below the red. So sensitive is this delicate instrument that a change of temperature no greater than the millionth part of a degree centigrade is detectable. But the explanation of the geometrical arrangement of the lines in this invisible spectrum is a work hardly yet begun.

A typographical inaccuracy here and there, as Burckhardt for Burckhalter (p. 258); and a slip as to the residence of Bigelow of the Signal Service, Washington, needs correction in a subsequent issue, which the great importance of the subject and the rapid growth of solar investigation will early render necessary.

BOOKS OF THE WEEK.

America and Europe: A Study of International Relations. Putnam. 75c.
Becke, Louis, and Jeffery, Walter. A First-Fleet Family. Macmillan. \$1.50.
Clark, Isaac. The Victory of Eury Gardner. T. Y. Crowell & Co. 75c.
Delitzsch, Prof. F. Anfängliches Handwörterbuch. Viertel (Schluss) Teil. Leipzig: J. C. Hinrichs; Baltimore: Johns Hopkins Press.
Fenn, G. M. The Tiger Lily: A Story of a Woman. Cassell. 50c.
Fuller, Anna. A Venetian June. Putnam. \$1.
Goldsmith, Oliver. The Vicar of Wakefield. Boston: Houghton, Mifflin & Co. 50c.
Hardy, Thomas. Wessex Tales. Harpers. \$1.50.
Hichens, R. S. The Folly of Eustace, and Other Stories. Appletons. 75c.

Honor Ormthwaite: A Novel. Harpers. \$1.
Hooper, Emma M. Home Dressmaking Made Easy. New York: The Economist Press.
Hume, James. The Dwarf's Chamber, and Other Stories. Ward, Lock & Bowden.
Hutton, W. H. King and Baronage. [Oxford Manuals of English History.] Scribners. 50c.
Hutton, W. H. Philip Augustus. Macmillan. 75c.
Knapp, Mary C. Whose Soul Have I Now? Arena Publishing Co.
Knight, William. Poetical Works of William Wordsworth. Vol. IV. Macmillan. \$1.50.
Knowles, R. G., and Morton, Richard. Baseball. [The "Oval" Series of Games.] London: George Routledge & Sons.
Kobbe, Gustav. My Rosary, and Other Poems. G. H. Richmond Co.
Koch, Richard von. Camilla: A Novel. T. Y. Crowell & Co. \$1.25.
Malone, Walter. Songs of December and June. Philadelphia: J. B. Lippincott Co.
Marchmont, A. W. Parson Thring's Secret. Cassell. 50c.
McCarthy, Justin. The Riddle Ring. Appletons.
Michel, André. Notes sur l'Art Moderne (Peinture). Paris: Colin & Cie.
Mitchell, J. The Evolution of Bird-Song; with Observations on Heredity and Imitation. London: A. & C. Black; New York: Macmillan. \$1.75.
Molloy, J. F. The Most Gorgeous Lady Blessington. 4th ed. 2 vols. Scribners. \$4.
Morris, William O'Connor. Ireland, 1494-1868. With two introductory chapters. Cambridge: University Press; New York: Macmillan. \$1.60.
Moulton, Prof. S. G. Deuteronomy. [The Modern Reader's Bible.] Macmillan. 50c.
Palmer, Prof. Arthur. Catullus Veronensis Liber. [Par-nassus Library.] Macmillan. \$1.10.
Phillos, Démétrios. Eleusis, ses Mystères, ses Ruines et son Musée. Athens: Anestis Constantinides.
Pinsent, Ellen F. No Place for Repentance. London: T. Fisher Unwin.
Poetical Sermons: A Thank-Offering of Song. Brooklyn: W. E. Davenport.
Robertson, C. G. The Making of the English Nation. [Oxford Manuals of English History.] Scribners. 50c.
Rogers, R. C. Will o' the Wasp: A Sea Yarn of the War of 1812. Putnam. \$1.25.
Rolf, W. J. The Coming of Arthur, and Other Idylls of the King. Boston: Houghton, Mifflin & Co. 75c.
Ross, E. G. History of the Impeachment of Andrew Johnson. Santa Fe: New Mexican Printing Co.
Salt, H. S. Life of Henry David Thoreau. London: Walter Scott; New York: Scribners. \$1.
Savage, R. H. Checked Through. Rand, McNally & Co. 50c.
Say, Léon. Les Finances. [La Vie Nationale.] Paris: Léon Chailley.
Schmid, C. A. Beiträge zur Geschichte der gewerblichen Arbeit in England während der letzten 50 Jahre. Jena: Gustav Fischer; New York: Lemcke & Buechner.
Sharp, Elizabeth A. Lyra Celtica. Edinburgh: Geddes; New York: Scribners. \$3.25.
Sheiton, Thomas. The History of Don Quixote. [Tudor Translations.] Vols. I, II. London: David Nutt.
Stecher, W. A. Text-Book of the German-American System of Gymnastics. Boston: Lee & Shepard. \$3.
Stories by English Authors: Italy. Africa. Scribners. Each 75c.
Thacher, J. B. The Continent of America: Its Discovery and its Expansion. W. E. Benjamin. \$3.
Thayer, Prof. J. B. Evidence at the Common Law. Part I. Development of Trial by Jury. Boston: Little, Brown & Co.
Weber, Prof. Alfred. History of Philosophy. From the fifth French edition. Scribners. \$2.50.

Francke's Social Forces in German Literature.

A Study in the History of Civilisation. By KUHO FRANCKE, Assistant Professor in Harvard University. \$3 net.

The author endeavors to give an account of the great intellectual currents of German life as expressed in literature, to point out the mutual relation of action and reaction between these currents, and the social and political conditions of the masses from which they sprang or which they affected—in short, to trace the history of the German people in the works of its thinkers and poets.

Judson's The Latin in English.

By HARRY PRATT JUDSON, Professor in the University of Chicago. 16mo. Uniform with Goodell's "The Greek in English." \$1.00 net.

The primary purpose of this book is to afford such linguistic knowledge of Latin—inflection, derivation, and the meaning of ordinary root-words—as is necessary to follow the Latin element in English. Of course this implies the use of common Latin words in sentences, but involves little syntax except incidentally. Inflections are uniformly treated as a matter of stems and suffixes. Throughout the exercises the endeavor is to use Latin words which occur in English derivatives. It is believed that the book will serve as an introduction to Caesar for those who decide to continue the study of Latin.

THE PROTEAN SERIES.

16mo, cloth, \$1.00 per volume.

I. IN THE VALLEY OF TOPHET.

By H. W. NEVISON, author of "Slum Stories of London."

II. WISDOM'S POLLY.

A Study in Feminine Development. By A. V. DUTTON.

III. THE WAY THEY LOVED AT GRIMPAT.

Village Idylls. By E. RENTOU ELIER.

IV. THE QUICKSANDS OF PACTOLUS.

A Novel. By HORACE ANNELEY VACHELL.

V. THE TOUCH OF SORROW.

By EDITH HAMLET.

VI. A STUNTLER IN WIDE SHOES.

HENRY HOLT & CO., N. Y.

JUST PUBLISHED.

The Hare.

Natural History. By the Rev. H. A. McPHERSON.

Shooting. By the Hon. GERALD LASCELLES

Coursing. By CHARLES RICHARDSON.

Hunting. By J. S. GIBBONS and G. H. LONGMAN.

Cookery. By Col. KENNEY HERBERT.

With 8 full-page illustrations. Crown 8vo, \$1.75.

LONGMANS, GREEN, & CO.,

PUBLISHERS,

91 and 93 Fifth Avenue, New York.

The Continent of America,

By JOHN BOYD THACHER

(Just issued) is an important historical work relating to the discovery and naming of America. It contains many facsimile reproductions of heretofore inaccessible rarities, including a series of fourteen maps showing geographical knowledge of America from 1478 to 1670. Only 250 copies elegantly printed on finest paper. \$25.00.

* Full descriptive circular, address WILLIAM EVARTS BENJAMIN, Publisher, 10 West 22d Street, New York City.

NATION.—FIRST 60 VOLS., unbound, perfect in every particular, for sale. No reasonable offer refused. Address ANXIOUS WIDOW, care of the Nation.

Complete Index to Little's Living Age, to the end of 1896. E. BORN, 1185 Pine St., Phila.

Yale Mixture.

A GENTLEMAN'S SMOKE.

You won't know the luxury of Pipe-Smoking until you use Yale Mixture.

A two oz. trial package, postpaid, for 25 cts.
